# AMERICAN ENCYCLOPÆDIA OF COMMERCE,

MANUFACTURES, COMMERCIAL LAW,  
AND FINANCE:

COMPRISING

DESCRIPTIVE AND STATISTICAL ACCOUNTS OF COM-  
MODITIES, WITH CUSTOM-HOUSE AND INTER-  
NAL REVENUE REGULATIONS, DUTIES, &c.

MANUFACTURING PROCESSES IN THEIR PRESENT  
STATE OF ADVANCEMENT.

COMMERCIAL STATISTICS OF THE DIFFERENT  
COUNTRIES OF THE WORLD, INCLUDING THEIR  
PHYSICAL CHARACTER, PRODUCTIONS, TRADE,  
COMMERCE WITH THE UNITED STATES, SEA-  
PORTS, MONEYS, MEASURES, FINANCES, &c.

PATENT LAWS AND REGULATIONS, RAILROADS  
AND RAILROAD COMPANIES, INSURANCE AND  
INSURANCE COMPANIES, SHIPPING, WARE-  
HOUSING, &c.

SUMMARY OF THE PRINCIPLES OF COMMERCE,  
FINANCE, AND BANKING, WITH STATISTICAL  
ILLUSTRATIONS.

DIGEST OF COMMERCIAL LAW, INCLUDING INSUR-  
ANCE, PARTNERSHIP, PRINCIPAL AND AGENT,  
BILLS OF EXCHANGE, SALE, GUARANTY, INSOL-  
VENCY, SHIPPING, AND CONTRACTS AND OBLI-  
GATIONS IN GENERAL.

COMMERCIAL ARITHMETIC AND ACCOUNTS, EX-  
CHANGES, COINS, WEIGHTS AND MEASURES,  
INTEREST, ANNUITIES, &c. WITH NUMEROUS  
TABLES.

NATIONAL DEBT, NATIONAL BANKS, &c.

DEFINITION OF TECHNICAL TERMS USED IN COM-  
MERCE AND IN THE MANUFACTURING ARTS;  
TOOLS, INSTRUMENTS, MACHINES, &c.; BESIDES  
A VARIETY OF MISCELLANEOUS INFORMA-  
TION.

TO

VISCOUNT FERDINAND DE LESSEPS,

THE ILLUSTRIOUS ENGINEER,

**This Work is Dedicated**

BY HIS ADMIRER AND OBLIGED SERVANT,

THE EDITOR.

## PREFACE.

---

THE present is essentially a practical, commercial, and industrial age: newspapers, lecturers, popular authors, all lend their efforts towards the diffusion of sound and useful knowledge among the masses; and the commercial and industrial element has become the leading feature of instruction. The reason of this is obvious, if we but glance at the amazing strides of American commerce, the wide range of products and manufactures in which we are interested, the constant and rapid intercommunication carried on with foreign countries, and the unparalleled progress of our national industry. The trade and commerce of all nations are now daily brought prominently before us through the press; new products are continually introduced, new trades are established, and the raw materials of commerce now imported are so numerous, and so widely different from what they were a quarter of a century ago, that it is difficult for those who are not specially engaged in a particular trade to keep pace with the general information necessary to be acquired.

We have scientific dictionaries in abundance, purely technological, or devoted to one or other of the arts and sciences. We have popular and useful encyclopædias, — works chiefly devoted to the history of nations, cities, and great men, the natural history, the geography of countries, etc., — but we have hitherto had no popular and practical encyclopædia of commerce in all its branches, which might be consulted by merchants, traders, manufacturers, bankers, ship-owners, etc., in conducting the details of their respective business; and also by young men, to acquire that general knowledge of commerce which ought so powerfully to contribute in securing for them a successful career in their particular lines of trade. It has been our ambition to fill that blank, and to produce a work that should be generally useful, particularly to merchants and traders, and which should be creditable to ourselves. Neither labor nor expense has been spared to entitle this encyclopædia to the public confidence and patronage. The editor has been almost incessantly engaged upon it for several years, and, owing to the nature of his previous works, it may be said that few persons have possessed such peculiar facilities for the undertaking.

The best sources of information have been consulted in preparing the different articles, and a free use has frequently been made of them; the editor, in presence

of an undertaking of such magnitude, caring less for complete originality than for accuracy. He has also derived valuable assistance from some distinguished official gentlemen, and from many eminent merchants; and has endeavored, whenever it was practicable, to base his conclusions upon official documents. In very many instances, however, he has been obliged to adopt less authentic data; and he does not suppose that, amidst conflicting and contradictory statements, he has had sagacity enough to uniformly select those most worthy of being relied upon, or that the inferences he has drawn are always such as the real circumstances of the case would warrant. At all events, he has done his best not to be too much wanting in these respects.

It must be well understood that this work is framed with the view, not of instructing the business man in relation to his own immediate and daily pursuits only, but also of placing within his reach information which it is always important, and often necessary, that he should possess, which many engaged in active business might find it exceedingly difficult to procure elsewhere, and which, being presented under an alphabetical arrangement, may be advantageously consulted even by those who have access to more expensive books.

In regard to the matter of the work, as distinct from its form, the editor's aim has been to give the greatest possible amount of facts in the smallest number of words. The plan excludes, in general, long essays and treatises; for even those subjects which require considerable space for their proper treatment have, in most cases, been subdivided and discussed under separate heads in a manner which, it is hoped, will be found better adapted for reference than if they had been wholly contained under one title. Thus, while shipping is the subject of one general article, separate heads are devoted to affreightment, master, seamen, tonnage, demurrage, bill of lading, blockade, embargo, salvage, stranding, barratry, and other matters relating to that department. It has, in short, been the leading object throughout, to adapt the work to the wants of mercantile men,—a class to whom ease and rapidity of consultation, if united with accuracy, are matters of pre-eminent importance.

Commodities are described under their English names; those which they bear in the other principal languages of Europe being also given when thought useful. The account embraces generally, not only a description of the commodity and its uses, but a notice of its growth or manufacture; of the marks by which its quality and genuineness are ascertained; and, in the case of the most important articles, the progress and present state of the trade, and a description of the machinery used in the latest processes of manufacture. The fiscal laws principally affecting each commodity will be found either under its name, or under other heads to which reference is given, according to circumstances. The rate of customs duties is given at the end of each article.

The commercial statistics of the different countries of the world form another leading feature. After a brief description of the position, extent, population, and form of government of each country, there is furnished, in smaller type, according to the latest authorities, a succinct account of its physical character; productions and manufactures; its inland trade; its commerce with other countries, especially the U. States; its finances, banks, railroads, etc.; and a table containing an account

of its measures, weights, and moneys. The article is closed with a descriptive list of its principal seaports.

American commercial law occupies a large portion of the work; the articles being given with a fulness which, it is hoped, may, for all common purposes, make a reference to other books unnecessary.

The remainder of the work cannot be classified. It includes articles on commerce, money, banking, taxation, credit, book-keeping, exchange, interest and annuities, railroads, insurance, customs and internal revenue, regulations, patents, weights and measures, emigration, and a considerable body of miscellaneous information; besides a definition of upwards of 10,000 technical terms used in the arts and on board ship, the greater portion of which could not be found in any other book of reference.

We do not flatter ourselves with the notion that the reader will consider that all that has been attempted has been executed in every case with entire success. In a work embracing such an extreme range and diversity of subjects, respecting many of which it is exceedingly difficult, if not quite impossible, to obtain accurate information, no one will be offended should he detect a few errors. The editor, while soliciting indulgence on this ground, can at least say that no exertions have been spared to procure sound information, to convey it in clear and concise language, and generally to produce a work at once accurate and useful. He will be glad to be favored with any suggestions or corrections for adoption in future editions.

L. DE COLANGE.

NEW YORK, February, 1881.

# COLANGE'S

## ENCYCLOPÆDIA OF COMMERCE.

### A

**A1**, an affix to a vessel's name at Lloyd's, the letter denoting the first-class character of the hull for build and sea-worthiness; the figure 1 that she is well-found in rigging, gear, etc.; the figure 2 would imply that she was insufficiently found.

**A No. 1**, expresses the highest mark of mercantile credit.

**Abaca**. See **MANILLA HEMP**.

**Abandonment**, in *Marine Ins.*, takes place in those circumstances when the insured may claim as for a total loss. The insured may abandon when, by any of the events insured against, the voyage is lost, or is not worth pursuing, when the subject is so damaged as to be of no value to the owner, when the salvage is very high, when the part saved is of less value than the freight, or when further expense is necessary and the insured will not undertake to defray it. When **A.** is accepted by the underwriters, or a total loss paid for, a subsequent recovery will not give a right to revoke the transaction. The insured is in no case bound to abandon. In America and England, the time for giving notice of **A.** depends on circumstances; in France, Spain, and other countries, it is limited by law. When the insured receives intimation of a total loss, he must communicate his election to the underwriter without delay. He is entitled to a reasonable time for ascertaining the state of the case, but must not treat it in the first instance as a partial loss, and abandon on finding his choice disadvantageous. The underwriter, if he object to the **A.**, must give timely notice. See **Loss**.

**Abas**, a Persian weight for pearls, equal to  $2\frac{1}{2}$  gr. troy, or  $\frac{1}{4}$  of a carat.

**Abatement**, a rebate or discount allowed for prompt payment, damage, overcharge, or other reasons.

**Abattoir**. See **SLAUGHTER-HOUSE**.

**Abbreviation**, the contraction of a word or phrase, made either by omitting some of the letters or by substituting certain characters in their place. Those most frequently used in commerce and for general purposes are subjoined:

<b>A</b> or <b>a</b> , approved, accepted.	<b>ac.</b> , acres.
<b>@</b> , at, as 10 lbs. @ \$1.50; <i>to</i> , as	<b>A.D.</b> , the year of our Lord.
20 gallons brandy, \$3.10 @	<b>A.M.</b> , forenoon.
\$3.15 (it is to say from \$3.10	<b>amt.</b> , amount.
to \$3.15).	<b>Ar.</b> , Arabian.
<b>%</b> , account.	<b>bal.</b> , balance.

<b>bar.</b> , barrel.	<b>£.</b> or <b>L.</b> , pound (sterling).
<b>bbls.</b> , barrels.	<b>lat.</b> , latitude.
<b>bdis.</b> , bundles.	<b>lb.</b> , lbs., pound, pounds
<b>bgs.</b> , bags.	(weight).
<b>bkts.</b> , baskets.	<b>Led.</b> , ledger.
<b>bls.</b> , bales.	<b>lon.</b> , longitude.
<b>bot.</b> , bought.	<b>L. S.</b> , the place of the seal.
<b>b. o.</b> , buyer's option.	<b>m.</b> , miles.
<b>bque.</b> , barque.	<b>manuf.</b> , manufacture, manu-
<b>br.</b> , brig.	facturer.
<b>bu.</b> , bushel.	<b>m. d.</b> , months after date.
<b>bxs.</b> , boxes.	<b>MS.</b> , manuscript.
<b>c.</b> or <b>cts.</b> , cents.	<b>N.</b> , north.
<b>c.</b> or <b>cen.</b> , centimes.	<b>N.B.</b> , observe.
<b>cap.</b> , capital.	<b>No.</b> , number.
<b>char.</b> , charterer.	<b>N. P.</b> , Notary Public.
<b>cks.</b> , casks.	<b>N. S.</b> , new style.
<b>%</b> , care of.	<b>%</b> , per cent.
<b>Co.</b> , company.	<b>org.</b> , organize.
<b>C. O. D.</b> , collect on delivery.	<b>O. S.</b> , old style.
<b>com.</b> , commerce, commercial.	<b>oz.</b> , ounce.
<b>Cr.</b> , creditor.	<b>per.</b> , per.
<b>cs.</b> , cases.	<b>pd.</b> , paid.
<b>cwt.</b> , hundred-weight.	<b>pk.</b> , peck.
<b>d.</b> , pence.	<b>pkgs.</b> , packages.
<b>D.</b> , d., or <b>dol.</b> , dollar.	<b>plts.</b> , plates.
<b>d. d.</b> , days after date.	<b>p. o. d.</b> , pay on delivery.
<b>do.</b> or <b>ditto</b> , the same.	<b>P. O. O.</b> , Post-Office Order.
<b>doz.</b> , dozen.	<b>Por.</b> , Portuguese.
<b>Dr.</b> , debtor.	<b>prox.</b> , next month.
<b>d. s.</b> , days after sight.	<b>P. S.</b> , postscript.
<b>dwt.</b> , pennyweight.	<b>ps.</b> , pieces.
<b>E.</b> , east.	<b>pt.</b> , pint.
<b>E. E.</b> , errors excepted.	<b>pun.</b> , punchcon.
<b>E. G.</b> , for the sake of example.	<b>qr.</b> , quarter.
<b>E. and O. E.</b> , errors and omis-	<b>qt.</b> , quart.
sions excepted.	<b>q. v.</b> , which see.
<b>ex.</b> , per, by or from.	<b>R. R.</b> , railroad.
<b>exch.</b> , exchange.	<b>Rec'd.</b> , received.
<b>Exp.</b> , export, exporter.	<b>Rec't.</b> , receipt.
<b>F.</b> , Fahrenheit.	<b>S.</b> , south.
<b>fin.</b> , financial.	<b>s.</b> , shilling.
<b>Fo.</b> , folio.	<b>\$.</b> , dollars.
<b>f. o. b.</b> , free on board.	<b>Sa. Rs.</b> , Sicca rupees.
<b>Fr.</b> , French.	<b>schr.</b> , schooner.
<b>fr.</b> , francs.	<b>sh.</b> , ship.
<b>ft.</b> , foot or feet.	<b>s. o.</b> , seller's option.
<b>gal.</b> , gallon.	<b>Sp.</b> , Spanish.
<b>G. B.</b> , Great Britain.	<b>sp. gr.</b> , specific gravity.
<b>Ger.</b> , German.	<b>sq. m.</b> , square miles.
<b>gr.</b> , grain.	<b>s. s.</b> , steamships.
<b>gr. or grs.</b> , gross.	<b>str.</b> , steamer.
<b>hf. chts.</b> , half chests.	<b>tres.</b> , tierces.
<b>hhd.</b> , hogshead.	<b>ult.</b> , the last month.
<b>i. e.</b> , that is to say.	<b>U. S.</b> , United States.
<b>Imp.</b> , import, importer.	<b>ves.</b> , vessel.
<b>in.</b> , inches.	<b>W. I.</b> , West Indies.
<b>inst.</b> , the present month.	<b>W. S.</b> , writer to the signet.
<b>inv.</b> , invoice.	<b>w.</b> , weight.
<b>I. O. U.</b> , I owe you.	<b>y.</b> , yard.
<b>It.</b> , Italian.	<b>Xmas.</b> , Christmas.

**Abbs**, a term in the wool-trade for the yarn of a weaver's warp.

**Abgangs-rechnung**, in German commerce the amount of tare allowed on goods.

**Abkar**, a maker or retailer of spirituous drinks in India.

**Aboard**, a nautical term signifying in the ship; on the deck of the ship:—hence, in a railroad car, etc.

**Abordage**, the French term for a collision between ships at sea.

**Abraum**, a red ochre used to darken new mahogany. It is obtained chiefly from Germany.

**Abreast**, a nautical term for alongside of, or in the same line with.

**Absinthe**, is a liqueur consisting of alcohol, holding in solution the active principles of the wormwood (*artemisia absinthium*), and several other aromatic plants. It is used with water as a drink, has an agreeable taste, and is said to provoke appetite; but it acts considerably on the nervous system, and is very prejudicial to the health if taken too frequently.

**Abyssinian Tea**, the dried leaves of the *Catha edulis*, used by the Arabs as a substitute for China tea.

**Acacia**, an extensive genus of trees or shrubby

**Acceptance of Bill**, is an engagement on the part of the drawee to pay a bill in full if the A. is unlimited. According to the usual practice, the acceptor writes the word "accepted" on it, and signs his name. Though no condition can be appended by the drawee of a bill, it may be by the acceptor, and he will not be responsible till the condition be fulfilled. The holder is not bound to take a conditional A., but if he do so he will be held to have made his election. To preserve the responsibility of drawers and indorsers entire, notice of a condition to an A. should be immediately sent them. By custom, the drawee is allowed twenty-four hours, or till next day, to consider whether he shall accept, unless the post leave in the interim. If A. be refused or delayed, a protest should be taken, and notice should immediately be transmitted to any party liable, intimating the non-acceptance, and that recourse is to be had against him. A. cannot be withdrawn after the bill is returned to the holder.—A bill may be accepted by procuration, but the holder is not bound to take such A., unless a claim and express authority from the principal be produced. A. is held as recognition of the drawer's signature,

so as to preclude the acceptor from pleading against an onerous holder that it is forged; but it is not held on admission of an indorser's signature, though the acceptor must be considered bound to notice any condition attached to an indorsement. The payee, by accepting, transfers the debt from the drawer's shoulders to his own; he is thenceforth considered the party liable; and after the bill is in circulation, when it is paid, it is presumed to be with the acceptor's funds. Although the bill were not drawn for value, the acceptor is presumed to have had value for it, and he can only reargue the presumption by evidence, unless it be admitted by the party on oath that there was no value.

**Acceptance for Honor or Supra Protest** is an engagement to pay the bill if not paid by the drawee, entered on after it is protested against the latter for non-acceptance. It is performed by a party who professes to be under no obligation to accept, and for the purpose of preventing the bill from being returned dishonored. It may be by a third party, in the absence of, or on the refusal of the drawee himself, who refuses to accept the draft

of the drawer, but accepts for the honor of an indorser. The drawee may even refuse to accept the bill absolutely, and may then, after protest, accept for honor of the drawer. The acceptor for honor only renders himself liable in a recourse, in case of non-payment by the proper party, and so the bill should be presented to the drawee for payment when it falls due, notwithstanding his refusal to accept it. The acceptor for honor has recourse against the person for whose honor he has accepted, and succeeds to whatever claim that person may have against the drawee.

**Accommodation**, a significant term applied by merchants to the credit fabricated by means of a bill of exchange, drawn solely for the purpose

Fig. 1.—ACACIA VEREK.

plants of the Mimosa tribe, generally inhabiting the tropical parts of both the old and new world. Some of the species yield gum arabic, gum senegal (Fig. 1), and catechu; others yield a large quantity of tannin. They are generally very ornamental trees. The silk-tassel A., cultivated in the temperate parts of Europe and America, is remarkable for its light, airy foliage, and for the great beauty of its clusters of lilac flowers.

**Academy**, in popular phraseology a school; thus there are educational academies, dancing academies, etc.

**Acajou**, the French term for mahogany.

**Acajou-nut**, a German name for the cashew-nut.

of being discounted, and not sanctioned by an actual sale of goods. Such a bill is called an *accommodation-bill*, also a *wind bill*, a *kite*, or a *fictitious bill*. A bills are of various kinds. The following description of one may suffice: A being in want of \$500, requests B to accept a bill drawn at two months, which B, therefore, on the face of it, is bound to pay; it is understood, however, that A will take care either to discharge the bill himself or to furnish B with the means of paying it. A obtains ready money for the bill on the joint credit of the two parties. A fulfils his promise of paying it when due, and that concludes the transaction. In general, A. bill transactions are carried on for the joint benefit of the parties, by means of *cross acceptances*, or bills mutually drawn, accepted, and exchanged; and when two names are not enough, others are obtained sufficient to give currency to the bills. The payment of these bills is, among needy men, provided for by their again reciprocally drawing upon each other; and this is repeated until, the system of expedients failing, insolvency sooner or later overtakes the principal parties, and, not unfrequently, all who are brought within the circle of their operations. The loss of credit which the use of accommodation paper, when once perceived, generally occasions, the higher rate of discount, and particularly the double liability for the terms for which cross acceptances are given, should deter the respectable merchant from having recourse to this dangerous expedient. But it must be admitted, at the same time, that when, from some unexpected events or commercial revulsion, a merchant is unable to bring his commodities to a fair market so as to meet his payments, his credit may be saved by the temporary assistance of friends, through the medium of bills, and he may be enabled to hold his goods till some proper opportunity of sale presents itself; and (although such contingencies cannot be too anxiously guarded against) there are perhaps few who have transacted business long and extensively, who have not, at particular times, received support in this way. An A. bill differs in no respect from the form of an ordinary bill; its legal effect, however, is different as respects parties between whom they do not represent a real debt. The drawer is generally the person accommodated, the acceptor not being indebted to him, but merely putting his name on the bill to give it currency in the market; if he has to retire it, therefore, the drawer becomes his creditor. That the paper is merely an A. bill, as between any two parties who appear on it, cannot, however, be a defence against a third who has given value to it, and even though he knew it to be an A. bill when he took it, he has the ordinary means of obtaining payment. A person who appears as debtor on a bill or note is always presumed to have had value, and in a question with the immediate creditor, he must prove want of value by evidence. In a purely A. bill, the drawer is not entitled to notice of dishonor, the use of notice being to enable the drawer to take precautions for his safety and indemnification, if he has funds in the drawee's hands; but it can never be safe to omit notice, for if the drawer had at any time, from the period of drawing to that of acceptance, funds in the drawee's hands, he is entitled to notice. See **ACCEPTANCE, BILL, NOTICE**.

**Accordion**. See **HARMONIUM**.

**Account**, a term applied generally to a com-

putation, reckoning, or statement of anything by numbers.—*Account-current* is a statement of the transactions between two parties, drawn out chronologically in a plain circumstantial manner, and disposed in the form of debtor and creditor in opposite pages.—*Account sales* is a document giving a detailed statement of the sale of goods. It exhibits the quantities and value of the gold sold, the attendant charges, and the net proceeds.

**Accountant**, a professional or official calculator, skilled in posting and balancing the books of merchants or companies.

**Account-book**, is a ruled book for entering details of receipts and expenditures.

**Accoutrements**, the military dress, fittings, and equipage of a soldier.

**Accrue**, to increase; to appear as profits.

**Aceite**, a Spanish name for oil.

**Acetic Acid**, formerly called *radical vinegar*, is the sour part of vinegar, and that to which its peculiar and valuable properties are owing. It is obtained, 1st, by the fermentation of saccharine matter; 2d, by the distillation of wood. The product of the former constitutes, when diluted, the common vinegar, which in France, etc., is made from wine, and in this country from an infusion of malt, termed *wort*. The A. acid from wood is obtained by the destructive distillation of the dried branches of trees in hollow iron cylinders. The hard woods, such as oak, ash, birch, and beech, are alone used; and the average product of crude acid from 8 cwt. of wood is 35 gallons. This acid, formerly called *pyroligneous acid*, is now largely employed, when purified, for almost all the purposes to which acetic acid or common vinegar is applied. A. acid, when pure, is fluid (except at a low temperature, when it crystallizes), volatile, and colorless, of an exceedingly pungent smell, and very acid taste. In this state it is used in chemical investigations. In a less pure state it is employed for preparing acetate or sugar of lead, acetate of copper or verdigris, and acetate of alumina, largely used by calico-printers and dyers as a mordant. In the form of *pyroligneous acid* it is employed to preserve meat, etc., and in the state of vinegar it is applied to a variety of purposes too well known to require notice. A. acid is frequently adulterated with sulphuric acid, which, however, is readily detected by the addition of acetate or sugar of lead, when an insoluble sulphate is precipitated should any sulphuric acid be present. *Import duty*, 30 cts. per lb. when sp. gr. is above 1.047, and 5 cts. per lb. when it is not above 1.047. See **VINEGAR**.

**Acetometer**, a species of hydrometer, for testing the strength of acids.

**Achat**, the French name for a purchase.

**Acheteur**, the French name for a purchaser.

**Achiote**. Same as **ANNOTTO**, q. v.

**Achira**, is a plant of Central and S. America, a species of *Canna*, with a large esculent root, which yields a quantity of starch said to be superior to the ordinary arrow-root.

**Achita**, in the East Indies, a cartload of ten Charas, or about two tons.

**Achtel**, in Germany, the eighth part of a weight or measure; also an old measure for grain.

**Acidimeter**. Same as **ACETOMETER**, q. v.

**Acids**, a most important class of chemical compounds, distinguished by the following general properties:—1. Their taste is for the most part sour; and in the stronger species it is acrid and

corrosive. 2. They generally combine with water in every proportion, with a condensation of volume and evolution of heat. 3. With a few exceptions, they are volatilized or decomposed at a moderate heat. 4. They usually change the purple colors of vegetables to a bright red. 5. They unite in definite proportion with the alkalies, earths, and metallic oxides, and form the important class of *salts*. This may be reckoned their characteristic and indispensable property. Some acids are gaseous in form, others are fluid or solid. Most of them are colorless; some are inodorous; while others are pungent. The most important,

Fig. 2.—ACONITE.

in a commercial point of view, are the Acetic, Benzoic, Boracic, Citric, Gallic, Hydrochloric, Nitric, Nitrous, Oxalic, Prussic, Sulphuric, Sulphurous, and Tartaric; an account of which will be found under these several heads.

**Acidulous Waters**, mineral waters which contain free acids in solution.

**Acier**, the French name for steel.

**Acknowledgment**, a receipt; an admission.

**Aconite**, MONK'S-HOOD, or WOLF'S-BANE, a European plant (*Aconitum napellus*) cultivated in gardens for its handsome purple flowers (Fig. 2). From its roots is prepared the powerful alkaloid *Aconitine*, one of the most virulent of poisons, but, at the same time, a very valuable medicine.

**Acorn**, the seed or fruit of the oak, used in medicine, and also as food in the form of bread in some parts of the East. The *A.* of the Italian oak, which is quite sweet, is roasted, ground, and sold as a substitute for coffee. *Imp.* duty on *A. coffee*, 3 cts. per lb.

**Acorn Cups**. See VALONIA.

**Acorus**, or *Sweet Flag*, a medicinal plant (*Calamus aromaticus*), found in moist situations in many parts of Europe and Asia, and chiefly imported from England. It is slightly aromatic, and is occasionally used as a stimulant. The part employed is the dried creeping stem, improperly termed root, which should be chosen tough, cleared from fibres, and free from worms—to which it is very subject.

**Acquittance**. See RECEIPT.

**Acre**, a measure of land. The imperial standard acre contains 4 roods, 160 sq. perches, 4840 sq. yards, or 10 sq. chains; and 640 acres make 1 sq. mile. 1 Scots acre = 1.2612 imp. acre; or 134 Scots acres = 169 imp. acres nearly. 30½ Irish acres = 49 imp. acres. 1 imp. acre = 0.4047 French hectare; or 42 acres = 17 hectares nearly.

**Acrospire**, is a name given by maltsters to the sprout or plumula of barley when germinating.

**Actinometer**, an instrument for measuring the intensity of the rays of the sun. The *A.* built by Arago (Fig. 3) consists of two mercurial ther-

mometers, enclosed in glass pipes A and B, in which the vacuum is made, and one of these glass pipes is blackened. In the dark, the two thermometers mark always the same temperature, but during the day, even when there is cloudy weather, the thermometer with a blackened glass pipe marks a higher temperature than the other. The difference between the respective temperatures is the *actinometric degree* or measure of solar radiation.

**Action**, is the French name for share; hence the owner of an *A.* in a company is styled *actionnaire*—equivalent to our shareholder.

*In Music*, the term *A.* is applied to the movements or working parts of a stringed or wind instrument, which is operated by a key-board, such as an organ, piano-forte, melodeon, etc. It includes the portion between the keys and the strings—the portion engaged in striking and damping. The

Fig. 3.—ACTINOMETER.

Actions are known by a peculiarity in the instrument, as grand, square, piccolo, single, double, upright actions.—*Knight*.

**Actuary**, a person skilled in the doctrine of life annuities and insurances, and whose business is to give opinions upon cases of annuities, reversions, etc.

**Adamantine Spar**, or *Common Corundum Stone*, is, with exception of diamond, the hardest substance known. Sp. gr. 4. It contains about 90 per cent. of alumina, with a little iron and silica, and is generally of a pale gray or greenish color, but sometimes of red and brown tints. It is found in India, China, and some parts of Europe. The Indian variety is considerably whiter than the Chinese, and is considered the purest.

**Addendum**, something added to.

**Addressing Machine**, is a machine for addressing newspapers and magazines, in which the same series of names is repeated from time to time as the day of issue recurs. There are two modes. One is to print the addresses consecutively upon slips which are gummed on the back and fed intermittently to the cutter, which cuts off each address. This is then pressed upon the folded paper or pamphlet, which is placed in position to receive its direction. The other mode is to set up the type of each address in a form, and so arrange the forms that they are necessarily presented at a spot to which the enveloped papers are consecutively fed. Over 20 patents have been granted in the United States on machines for this purpose.—*E. H. Knight*.

**Adelaide**. See SOUTH AUSTRALIA.

**Adelantadillo**, red wine, made of the first ripe grapes in Spain.

**Aden**, a seaport of the S. coast of Arabia, lying in 12° 52' N., 44° 59' E., 118 m. from the entrance to the Red Sea, belonging to Great Britain, and under the administration of the government of Bombay. It is a place of considerable strength, its situation between Asia and Africa resembling that of Gibraltar between Europe and Africa. Its excellent port renders it a valuable station on the way from India to Europe as a coaling dépot. Its trade is almost exclusively with England. Pop. 22,000.

**Adhesive Felt**, is a cloth used for covering ships' bottoms. It is chiefly imported from Belfast and Glasgow. Imp. free.

**Adirondack R.R.** runs from Saratoga Springs to North Fork, N. Y., a distance of 60 m. This Co., whose offices are in New York city, was chart. in 1839 to construct a R.R. from Saratoga to Ogdensburg, N. Y., 185 m., and was completed to its present terminus in 1870. In 1874 it was placed in the hands of a receiver, by whom it has since been operated. *Financial statement* 30 Sept., 1877:—Cap. stock authorized, \$5,000,000; issued, \$4,263,000 less \$500,000 held by trustees for adjustment of claims. Funded debt authorized, \$6,000,000. Bonds issued, \$640,000, interest 7 per cent. Floating debt, exclusive of interest and commissions, \$1,971,734.68. Total liabilities, \$6,374,734.68.

**Adjustment**, in *Marine Ins.*, a calculation of the sums to which the insured is entitled from the respective underwriters, on a loss occasioned by any of the risks insured against, generally prepared by a professional person, indorsed on the policy, and signed by the several underwriters. It is compared to a note of hand, being presumptive against them, and not requiring the consideration to be proved by the holder, but admitting of a valid defence being raised and proved by the underwriters. See *LOSS, POLICY*.

**Adjutage**, the tube through which a fountain is played.

**Admeasurement**. See *TONNAGE*.

**Admiralty Court**, the name of the English supreme marine tribunal which holds jurisdiction over causes arising on the high seas and coasts. In the United States the admiralty cases are under the exclusive jurisdiction of the District and Circuit Courts.

**Adrift**, a sea term for loose or unfastened; a boat broken away from moorings or fastenings.

**Adulteration**, the injuring or debasing by foreign or spurious admixtures. There are several kinds of A.: conventional, to suit the taste and demands of the public; accidental or unintentional, arising from carelessness in the preparation of the staple or commodity at the place of growth or shipment; fraudulent, for deception and gainful purposes. In Pennsylvania, and other States, A. of articles of food and drink, and of drugs and medicines, is made a misdemeanor, punishable by fine or imprisonment, or both.

**Ad Valorem**, [Lat.] according to the value. This term is used in commerce chiefly in reference to those duties (hence called *ad valorem duties*) which are levied on commodities at certain rates *per cent.* on their value.

**Advance**, usually denotes money paid on the security of property consigned or deposited. Merchants frequently advance from one-half to two-

thirds of the value of goods consigned to them on receiving invoice, bill of lading, etc.

**Adventure**, a term sometimes used to express a shipment by a merchant on his own account. A *joint adventure* is when the shipment is made by two or more parties on joint account.

**Advice**, in commercial language, means information communicated by letter. The term is used chiefly in reference to bills of exchange. Bills are sometimes made payable "as per advice;" at other times "without further advice;" and generally without any of these words. In the former case the drawer may not, but in the latter he may, pay before he has received advice.

**Adze**, a tool (Fig. 4), especially valuable to

shipwrights, differing from the axe in having a curved blade, whose edge is at right angles to the handle, while the blade of the axe is parallel to the handle. Its forms and sizes differ with the character of the work, and in some cases the bit is gouge-shaped in addition to its curve in the plane of its motions. The blade is usually from 2 to 4 lbs. in weight.

Fig. 4.—ADZE.

**Aerated Waters**. See *SODA WATER*.

**Affidavit**, a declaration in writing, made on oath before a magistrate or some competent officer.

**Affreightment**, in *Shipping*, is the contract by which a vessel, or the use of it, or the use of some part of it, is let out on hire. The contract is of two kinds: *charter-party* and *general ship*, or *ship on general freight*. The contract does not require to be in writing. The obligations, generally expressed, and always understood, on the part of the shipmaster, are, that the vessel must be seaworthy, provided with all necessaries, and in every way fit for the voyage undertaken. The crew, also, must be sufficient in number and ability. Where such is the usage, he must have a pilot on board. The vessel must be at the port, ready to receive goods, for a reasonable period, and must sail at the appointed time, weather and tide permitting. She must be properly navigated, and also directed to her port of destination by the usual and approved course. If she deviate unnecessarily, the master and owners are responsible if loss be occasioned, though it should be by the act of God or the republic's enemies. The master must not incur risk by sailing with contraband goods on board, or without the proper papers. He must use every effort to convey the cargo in safety. When he cannot proceed on his own ship, he must forthwith adopt such means as may be best suited to preserve the safety and value of all the property committed to his charge. Trans-shipment for the place of destination, if it is practicable, is the first object, because it is in furtherance of the original purpose; if that be impracticable, return or a safe deposit may be expedient. The merchant should be consulted, if possible. A sale is the last thing a master should think of, because it can be only justified by that necessity which supersedes all other laws. If he sell without necessity, his owners, as well as himself, will be answerable to the merchant. On his arrival, the master must report his

ship and crew, exhibit his manifest, and deliver the cargo to the consignee on payment of charges. (See BILL OF LADING, FREIGHT.)—The obligation on the part of the freighter or merchant, is to furnish a sufficient cargo—if he has covenanted for a full one, he must provide it, though it exceed what was specified as the burthen of the ship, becoming liable in compensation for any portion not occupied. This compensation for the freight of cargo stipulated for, but not supplied, is called *dead freight*. Certain days are generally specified, during which the merchant is entitled to delay the vessel in loading or unloading; these are termed *lay-days*. A specific sum is, in some cases, covenanted to be paid, should the vessel be longer detained, and if a rate is not agreed upon, a charge may be made of the nature of damages. (See DEMURRAGE.) Before receiving delivery of the cargo, the consignee must pay the freight.

**Afloat**, merchandise which has arrived at the port or in the harbor, but still on board the vessel.

**African Hemp**, one of the names of the fibre obtained from the leaves of the *Sesuviera Guineensis*. This plant grows also in Ceylon, from whence the fibre is more frequently obtained. *Imp. free.*

**Agar-Agar**, a sea-weed (*Sphaerococcus spinosus*), forming a large article of commerce in the Eastern seas, being used for making jellies, and for stiffening purposes.

**Agaric**, a fungus (*Boletus*) growing on trees. The *boletus ignarius*, commonly called *Amadou*, was formerly valued as a styptic, but is at present chiefly used for preparing the tinder or touchwood called *Punk*, or *German tinder*. It is found in most countries, on the trunks of old ash and other trees. That which grows upon the oak (Fig. 5), however, is most esteemed.

Fig. 5.—AMADOU OF THE OAK.

is one of the modifications of form under which silica is found in almost a state of purity. The silicious particles are not arranged so as to produce the transparency of rock crystal, but a translucent, sometimes almost opaque, substance, with a resinous or waxy fracture; and a variety of shades of color are produced by a minute quantity of iron, for the beauty of which, together with the high polish they are capable of receiving, *A.* are highly prized as ornaments. They are usually met with in that variety of trap rocks called amygdaloid or mandelstein. They vary in size from that of a pin-head to a foot in diameter, but those of one to three inches are the most common. They are found in many parts of Scotland, Sicily, etc.; but the principal supply is procured from Oberstein, in Germany. The stones known by the names of Carnelian, Chalcedony, Onyx, Sardonyx, Mocha-Stone, Blood-Stone, Chrysoprase, and Plasma, are closely allied to *A.*

**Agave**, AMERICAN ALOE, or MAGUEY, is a succulent plant, cultivated in Mexico, and from

which is obtained a valuable fibre used for mats, for brushes, and as a substitute for curled horse-hair for stuffing cushions. From it also the Mexicans obtain a favorite drink, called *pulque*, or agave wine. From pulque an ardent spirit is distilled, which is known by the name of *Mezcal* or *Aguardiente de Maguey*.

**Age**, the time when a person assumes legal authority to act for himself or herself. According to American law, a person becomes of age when he or she is 21 years old. Before this age one cannot make a valid commercial contract.

**Ageing**, in calico-printing, a process by which a mordant, after being applied to a cotton fabric, is placed in circumstances favorable to its being completely incorporated with and fixed in the fibre.

**Agenda**, a list or memorandum-book of business to be done.

**Agent**. See PRINCIPAL AND AGENT.

**Agent de Change**, the French name for a stock-broker.

**Agio**, a term applied in some parts of Europe to the premium or percentage allowed on a better sort of money when it is given in exchange for an inferior kind. Thus, at Hamburg, when 100 marks banco are exchangeable for 120 marks currency, the *A.* on banco is said to be 20 per cent.; it being always reckoned upon the more valuable money. In France, again, where payments can be demanded only in silver coin, a small premium is sometimes paid by the receiver in order to obtain gold coin; this premium is called the *agio* on gold.—When the percentage, or difference, is considered with regard to the inferior sort of money, it is called *discount*. Thus, when \$100 in notes were exchangeable for only \$90 in gold, the discount on the paper was said to be 10 per cent.

**Agiotage**, the French term for stock-jobbing, speculation on the rise or fall of the public funds.

**Agreement**, is a mutual bargain, contract, or covenant. Every State has particular laws on this important matter. It may, however, be noticed, as a general rule, that every *A.* that, by its terms, is not to be performed within one year from the making thereof; every special promise to answer for the debt, default, or miscarriage of another person; and every contract for the sale of any goods, chattels, or things, for the price of \$50 or more, is void, unless, 1st, a note or memorandum of such contract be made in writing, and be subscribed by the parties to be charged thereby; or, 2d, unless the buyer shall accept and receive part of such goods, or the evidence, or some of them, of such things in action; or, 3d, unless the buyer shall, at any time, pay some part of the purchase-money.

**Agricultural Implements**, are the various mechanical implements and tools used for tillage, garden, nursery of plants, and stable. These are treated in this work under their respective heads. Many of them, manufactured in the U. States, command a ready sale in the European markets. Their exportation, which is continually increasing in importance, amounted to \$2,623,722 for the year 1878.

**Aground**, stranded; applied to a ship or vessel touching the bottom.

**Aguardiente**, a name for alcohol, principally applied to brandy in Spain.

**Ahm**, an old German liquid-measure, varying in different places from 36 to 41½ gallons.

**Aigrette**, a pointed tuft of feathers, jewels, etc.  
**Air-Bed**, an India-rubber or other air-proof case or mattress inflated with air for the use of invalids.

**Air-Cushion**, an inflated seat for railroad-carriage, chairs, etc.

**Air-Gun**, a pneumatic machine for projecting bullets, in which the moving power is the rush of condensed air allowed to escape.

**Air-Pump**, a pneumatic machine for producing a partial vacuum. It substantially consists (Fig. 6) of a circular brass plate, on which is placed a bell-glass called a receiver, and two vertical brass cylinders, each of which has a piston attached. A hole in the centre of the plate, and a connecting tube, form a medium of communication between the receiver and the cylinders. The air is expelled from the latter by a movement of the piston; a portion of the air then escapes from the receiver, and a valve is placed at the orifice of the connecting tube, so that no air can return to the receiver. Another valve in the piston opens outwardly and allows the air to have vent.

**Akee**, is a tree (*Cupania sapida*), a native of Guinea, and transplanted to the West Indies. Its reddish-yellow fruit, about the size of a hen's egg, is highly esteemed in Africa, having an aril with a grateful sub-acid flavor.

**Akey**, the money standard of the Gold coast of Africa. As a weight for gold-dust it is considered to be equal to 20 grains.

**Alabama**, a Southern State of the U. States, bounded N. by Tennessee, E. by Georgia, S. by Florida and the Gulf of Mexico, W. by Mississippi. It lies between 30° 10' and 35° N. lat., and between 85° and 88° 30' W. lon.; area, 50,722 sq. m. Improved land, 4,982,340 acres; unimproved land, 9,491,270, of which 8,034,700 acres are woodland. The soil of the State is various, but mainly productive. In the southern part there are considerable tracts of sandy barrens, but the river bottoms are remarkably fertile. Some portions of the highlands in the north are not worth cultivating, while by far the greater portion is very excellent land, having a productive soil of variable depth, resting on a limestone bed. A. has numerous navigable rivers, the principal of which are the Mobile, Alabama, Tombigbee, Chattahoochee, Coosa, and Tennessee. The great river of the State is the Mobile, formed

Fig. 7.—SEAL OF ALABAMA.

by the confluence of the Alabama and Tombigbee, about 50 m. above Mobile Bay, into which it empties at Mobile. The Tombigbee rises in N. E. Mississippi, and is navigable for light-draught steamers to Columbus, about 300 m. The Black Warrior, a branch of the Tombigbee, has its source in N. Alabama, empties near Demopolis, and is navigable for steamers to Tuscaloosa, 285 m. from Mobile. The Alabama, which is the eastern branch of the Mobile, is navigable to Montgomery, about 320 m. The sea-coast is broken by

Mobile Bay, a beautiful sheet of water, 30 m. in length and from 30 to 18 m. in breadth, with 22 feet of water at the main entrance at low tide; but the channel for 10 m. below Mobile is not more than 8 to 9 feet deep at low tide. The climate of A. is healthy, except in the low river-bottoms, where the prevailing diseases are intermittent, congestive, and bilious fevers. The mean temperature of the State is about 63°, and the mercury seldom rises above 95°. Agriculture forms the principal occupation of the people,

Fig. 6.—AIR-PUMP.

manufacturing being carried on only to a limited extent. The chief productions are cotton and Indian corn. In 1878 there were in the State 205,000 milk cows, 375,000 oxen and other cattle, 270,000 sheep, 952,300 hogs, 108,500 horses, and 105,400 mules. A. has 1,496 m. of completed railroad. The principal cities are Mobile, Montgomery (the cap.), Huntsville, Selma, Madison, Tuscaloosa, and Gainesville. Pop. 996,992. The maritime commerce of A. is almost concentrated at Mobile. See MOBILE.

**Alabama Central R.R.**, runs from Selma to York, Alabama, a distance of 81 m. This Co., located at Selma, was chartered in 1850, under the name of Alabama and Mississippi R.R. Co.; assumed later the name of the Selma and Meridian R.R., and was reorganized under the present title in 1871. *Financial Statement*: Cap. stock, \$2,000,000; funded debt, \$1,600,000; bills payable, \$316.73; other liabilities, \$9,587.61; total, \$2,609,904.34. Bonds issued by the Selma and Meridian Co. in June, 1871, bear interest @ 8%, payable in Jan. and July, and become payable July 1, 1901. Net earnings for 1877, \$86,487.83.

**Alabama Great Southern R.R.**, runs from Chattanooga, Tenn., to Meridian, Miss., 296 m. Office at Montgomery. It was chart. in 1853, under the name of N. E. & S. W. Ala. R.R., was reorganized in 1868 as Ala. and Chattanooga R.R., was taken possession of by the State of Ala. in 1872, was sold in 1875 to the 1st mortgage bondholders, and lastly, in 1877, to Erlanger and Co.,

of London, who, on November 30th of same year, organized the present Co., the State of Ala. having appropriated \$1,000,000 State bonds, bearing 2% interest until 1 Jan., 1881, and thereafter 4% for 25 years, for redemption of the endorsement of the Ala. and Chattanooga R.R. bonds. *Financial Statement.* The cap. stock of the new Co. is fixed at \$783,000 preferred and \$7,830,000 common; total stock, \$8,613,000; funded debt, \$1,750,000; total stock and bonds, \$10,363,000. Net earnings for the year ending Feb. 28, 1878, \$99,593.99, applied to reconstruction purposes.

**Alabaster**, [It. *alabastro*; Fr. *albatre*,] a species of gypsum resembling marble, but softer, takes a duller polish, and when pure is much whiter and semi-transparent. Some stones, however, of a veined and colored appearance, and also certain transparent and yellow ones of a sparry nature, are termed *A.* It is used for small statues, lamps, vases, and other ornaments. The finest is found near Volterra, in Tuscany. It is also procured in great abundance on the shores of the British Channel, between Watchet and Minehead, where it is manufactured into toys and ornaments.

**A la Mode**, the French term for fashionable.

**Alarm-Bell**, or ALARUM, is a watch or clock that strikes at a particular hour. An ordinary clock strikes on a bell every half hour; and, by a small addition to the apparatus, it can be made to strike at any intermediate time, or to give a ringing succession of sounds loud enough to wake a sleeper. The alarm can be "set" beforehand, so as to act at the required time.

**Alaska**, an immense territory of the United States, extending from lat. 54° 40' N. up to the Glacial Ocean, and between 131° and 170° lon. W., including the greater part of the Aleutian Islands, and sold in 1868 by Russia to the United States

fur seal (Fig. 8), the sea-lion, the sea-otter, and the walrus. Whales, cod, herring, and halibut are abundant in the adjacent seas, and immense quantities of salmon are caught in the Alaskan rivers. The fur trade and the fisheries are the leading industries of *A.* The taking of fur seals, which is for the most part restricted to the Pribiloff Islands, is now regulated by act of Congress, the privilege being under rental to the "Alaska Commercial Co.," at \$55,000 per annum. In 1878 that Co. took the maximum number of 100,000 skins allowed by law, upon which the tax due the government was \$262,500 (besides the rental). The annual product of the fishery in salted codfish alone, is about 10,000,000 lbs. Timber is exported in limited quantities. Amicable relations have, generally, been sustained between the Indians and whites in *A.* Some outrages, however, occurred in the last months of 1878, and the collector of customs at Sitka—the only officer exercising some authority on the main-land—stated that bloody outbreaks might be apprehended at any time in consequence of the means now existing for producing intoxicating liquor, and from the lack of any organized government in the Territory.

**Alb**, or ALBA, a white surplice of muslin worn under the vestment by Catholic priests.

**Albany**, a city of the United States, cap. of the State of New York, at the head of sloop navigation and near the head of tide-water, on the W. bank of the Hudson River, lat. 42° 39' 3" N., lon. 73° 32' W., 145 m. N. of New York city, 164 m. W. of Boston, and 370 m. N.E. of Washington. It is a port of delivery for foreign merchandise, and an important mart or entrepôt for the products of the Western States passing through the canals, which have their terminus here. *A.* has a very extensive trade in grain, and its lumber market is perhaps the largest in the world; its manufactures are also very important and extensive. *A.* has 9 banks, 6 savings banks, 6 insurance companies, and about 15 periodicals. The steamboats plying on the Hudson River between New York and *A.* are among the largest that navigate any inland waters. Pop. 80,000.

**Albany and Susquehanna R.R.**,

runs from Albany to Binghamton, in New York State; distance, with branches, 17,695 m. Offices in New York. Organized April, 1851, and leased for 99 years from 1st March, 1870, by Delaware and Hudson Canal Co., for interest and dividends equal to 7% on \$7,000,000, the amount of stock and bonds then outstanding. *Financial Statement.* Cap. stock paid in, \$3,500,000;

Fig. 8. — FUR SEAL.

for \$7,500,000. The principal settlement is at Sitka, a town of about 500 inhabitants, situated in the easternmost part of Sitka Sound, on the W. shore of Baranoff Island, in lat. 57°. The natives of *A.* number about 50,000, consisting of Esquimaux and kindred tribes and Indians. The European pop. is not above 1,000. The climate is by no means so inhospitable as that of corresponding latitudes on the eastern coast of North America. At Sitka the mean annual temperature is 42.9 F., the lowest being 31.1, in Jan., and the highest 55.8, in Aug. The Aleutian Islands are wholly destitute of trees, but the interior of *A.* is well wooded, and dense forests of the Sitka spruce or white pine produce timber of great size and unsurpassed quality. On the coasts are found the

funded debt, \$6,045,000; total, \$9,545,000; cost of construction, \$7,374,745.28; equipment, \$1,698,692.97; real estate, \$845,028.30; other liabilities, \$373,461.55; total, \$9,918,461.55. *Funded Debt.* 1st mortgage issued 1863, payable 1888, \$1,000,000, 7% interest (Jan. and July); Albany City loan, issued 1865, payable 1895, \$1,000,000, interest 7% (May and Nov.); 2d mortgage issued 1865, payable 1885, \$2,000,000, interest 7% (April and Oct.); 3d mortgage issued 1869, payable 1881, interest 7% (May and Nov.); amount authorized, \$500,000. Amount outstanding, \$85,000. *Consolidated Mortgage* issued 1876, payable 1906, interest 7% (April and Oct.). Amount authorized, \$10,000,000. Amount outstanding, \$1,977,000. Net earnings for 1878, \$450,579.68.

**Albata**, *British plate* or *German silver*, a compound of tin, copper, and nickel, extensively used in England in the manufacture of a variety of articles which were formerly plated or made entirely of silver. *A.* goods do not look so well as those plated, when the latter are entirely new, but they possess superior durability. Birmingham and Sheffield are the principal seats of this manufacture.

**Albertite**, a highly bituminous mineral found in New Brunswick, which has proved valuable for making illuminating gas, and also for the manufacture of various liquid hydro-carbons and illuminating and lubricating oils, which are distilled from it.

**Album**, a book kept for the writings and inscriptions of friends; also a book for keeping photographs, etc.

**Albumen**, a constituent of the animal and vegetable fluids and solids, which enters into commerce in a dried state; chiefly the *A.* of the egg and of blood. The principal use of *A.* is in photography and calico-printing. *Imp. free.*

**Albumenized Paper**, paper prepared for printing photographs on; also an imitation of parchment, prepared for steeping paper in sulphuric acid.

**Alcarrazas**, the Spanish name for porous unglazed earthenware coolers.

**Alcohol**, [*Fr. alcohol* and *esprit de vin*; *Ger. weingeist*,] is a liquid which forms the intoxicating principle of fermented liquors. It is by the distillation of such liquors that ardent spirits are obtained, and they receive the names of brandy, rum, gin, whiskey, according to the nature of the substance employed, but in every case consist almost entirely of three ingredients, viz., alcohol, water, and a little oil or resin, to which they owe their flavor and color. When these liquids are redistilled, the first portion that comes over is a fine light, transparent fluid, known in commerce by the name of *rectified spirits*. When as highly rectified as possible, the sp. gr. of the liquid obtained does not appear to be less than 0.8200, and is generally more. *A.* cannot, by this process, be deprived of the whole of the water with which it is combined; but by redistillation with hot hydrochlorate of lime, it is procured of the sp. gr. of 0.7939 at 60° F. In this state it is the strongest that can at present be procured, and it is therefore called *pure* or *absolute A.* The *A.* of commerce, or *spirit of wine*, is never so strong as this; its sp. gr. is seldom under 0.8370. In this state it is fragrant, limpid, colorless, volatile, inflammable, and of a pungent, agreeable taste. It has never been frozen. At 173½° it boils. It combines with water in every degree; and the proportion of it present in common spirits is best judged of by their sp. gr., and is usually ascertained by a hydrometer. The sp. gr. of what is called pure *A.* being 0.7939 at 60° F., and that of water 1.000, it follows that the lighter a spirit is, the stronger it is. What in this country is called *proof spirits* is understood to be a mixture of equal bulks of *A.* and water. When spirits are weaker than this they are said to be *under proof*; when stronger, to be *above proof*: thus, "10 under proof" signifies that every 100 gallons of that spirit would require to have 10 gallons of water abstracted from it to bring it up to proof; and "10 over proof," that every 100 gallons contain too little water by 10 gallons. *A.* is extensively

used in the arts. It dissolves the resins, camphor, and the essential oils; and hence its uses in varnish-making, in pharmacy, and in perfumery; while its fluidity at the lowest temperatures—its antiseptic properties, and its purity and inflammability, render it applicable to a great variety of other purposes.

*The duty on imported A., brandy, and spirituous liquors generally is \$2 per proof gallon, the "proof spirit," under the law, being "that alcoholic liquor which contains one-half its volume of A. of a sp. gr. of 0.7939 at 60° F. No lower rate or amount of duty to be charged than that fixed for first proof, but to be increased in proportion for any greater strength and none under first proof to pay less than 50 per centum ad valorem. To ascertain the number of proof gallons contained in any quantity of liquor stronger than first proof, multiply the actual quantity in wine gallons by the percentage of A., and divide by 50. Thus, to find the duty on 20 gallons at 108°: 20 × 108 ÷ 50 = 21.60 gallons at \$2.00, or \$2.16 per gallon."*

**Alcoholmeter**, is a well-known instrument for ascertaining the strength of spirits. The *A.* invented by Pr. Fralle, of Berlin, known as *Fralle's A.*, and now made in New York, is the one in use in the United States custom-houses.

**Alcornorco Bark**, a bitter and astringent medical bark derived in Venezuela from the *Bowdichia virgiliodes*.

**Alder**, an aquatic tree (*Alnus glutinosa*), found in all the northern parts of the world. Its timber is reddish-yellow in color, and, being soft, works easily. It is much used for piles, pumps, and other under-ground purposes where it is kept constantly wet; and its stems, hollowed out, are among the best materials, next to metal, for water-pipes. The veiny knots are often cut into veneer. The bark is valuable for tanning; and the young shoots, when mixed with other ingredients, are used for dyeing. The alder rots when exposed to the weather, and when dry is subject to worms.

**Ale**. See BEER.

**Alençon Lace**. See BLONDE.

**Aleppo**, a fine city of Turkey in Asia, in N. Syria, 70 m. E. from the Mediterranean, lat. 36° 11' N., lon. 37° 10' E. It was, in the Middle Ages, the great emporium of trade between Europe and the East, and is still the great caravan-centre of traffic with Central Asia. The U. States and most of the European nations have consuls there. *Pop.* 120,000.

**Aleurometer**, an instrument for determining the quantity of gluten in flour.

**Alewife**, or **GASPERAU**, a fish of the herring family (*Alosa tyrannus*), caught in large numbers in the bays and rivers of New England. They are put up in barrels, and are the object of a large trade in Boston.

**Alexandria**, in Egypt. See EGYPT.

**Alexandria**, a city and port of Virginia, on the right bank of the Potomac, 7 m. below Washington, in lat. 38° N., lon. 77° 4' W. It is considerably elevated, ascending gradually from the river, which has here a depth of water sufficient for vessels of the largest class. *A.* has 113 vessels, tonnage 3,821. Its coastwise trade is important. *Pop.* 13,570.

**Alexandria and Fredericksburg R. R.**, runs from Long Bridge to Quantico, Virginia, 32.4 m. Offices at Philadelphia; chartered 1864; possession taken by mortgage trustees 1872; to be reorganized. Cap. stock, \$1,000,000; funded debt, first mortgage 7% gold bonds, dated 1866, payable 1896, \$1,000,000; floating debt, \$174,756.70, and trustees' debt for preservation of property, \$43,540.47; total liabilities, \$2,218,261.17. Cost

of road and equipment, \$2,165,247.06; balance, profit and loss, \$53,014.11. Total resources, \$2,218,261.17. Net earnings for 1877, \$18,449.96.

**Alfa Fibre**, is the fibre of the *Macrochloa tenacissima*, and is the most important of the vegetable products of Algeria. It grows spontaneously over vast tracts of country where cultivation of any description is impossible, and covers 10,000,000 acres, from which a quantity of paper-making material may be collected, equal to the three-fourths of all the rags sold and used throughout the world. The exportation of *A.*, in 1878, exceeded 80,000 tons. *Imp.* free.

**Agarovilla**, the agglutinated seeds and husks of the legumes of a Chilian tree (*Ceratonia siliqua*). It contains much tannin, and is said to possess about four times the powers of good oak bark. It has been occasionally imported in mass.

**Algarrobo**. See CAROB BEANS.

**Algeria**, the largest and most important of the colonial possessions of France, extends about 500 m. along the N. shore of Africa, from about 8° 30' E. to 1° 30' W. It is bounded on that side by the Mediterranean, E. by Tunis, S. by the Sahara or Great Desert, and W. by Morocco. Its area embraces 258,306 sq. m., being about one-sixth larger than France. There are 3 provinces—Algiers, Constantine, and Oran—which are subdivided into 12 departments. At the head of the colony is a governor-general. The country is traversed by branches of the great mountain-chain of Atlas, and in general is well watered and highly fertile. There are 5,139,136 acres of land under cultivation, of which 8 % are cultivated by the European colonists, and 92 % by the natives. The total imports amount annually to about \$40,000,000; exports, \$30,000,000. *Pop.* 5,000,000, about half of which consist of wandering Arab tribes.

**Algiers**, the principal city and port, rises in the form of an amphitheatre, near the middle of the coast, 36° 48' N., 3° 4' E. It is defended on the sea-side by very strong batteries. The harbor, a work of immense labor, is formed by two projecting moles, and is about 15 feet deep; but it is unsafe, and vessels lying along it must be strongly fastened by cables. The principal intercourse of Algiers is with France, Italy, England, and Spain. Exports: oil, wax, hides, skins, corn, fruit, wool, rags, cotton, iron ore, Esparto grass or alfa, etc. *Pop.* 58,816. The other chief ports are Oran, Bona, and Mostaganem.—The principal inland towns are Constantine and Philippeville. The money, weights, and measures of France are in general use among the settled population in the towns.

**Alicante**. See SPAIN.

**Alien**, a foreigner or person not naturalized, not a citizen of the U. States. For commercial purposes generally, a foreigner enjoys the same protection and privileges as a natural-born citizen merchant. He is not, however, permitted to own vessels sailing under the national flag, and he cannot act as a merchant-appraiser in cases of dispute between the custom-house officers and merchants as to the value of imported merchandise.

**Aliment**, any substance which may be used as food.

**Alizarine**, a fine red volatile coloring-matter, in the form of crystals, found in madder, and which yields the Turkey-red dye.

**Alkalies**, a class of chemical bodies characterized generally by their peculiar hot, bitter, and caustic taste; by their changing the colors of vegetable blues to green, and yellows to brown; and by their neutralizing acids, and forming with them the class of compounds called salts. The principal *A.* are ammonia, potash, and soda; an account of which, and such others as possess commercial interest, will be given under their proper heads.

The value of any *A.* is determined by an *alkalimeter*, a graduated instrument which shows the quantity of acid neutralized by a given weight of the sample, and hence the amount of pure *A.* contained in it.

**Alkanet**, [*Sp.* *Arkanela*; *Fr.* *Orcanette*; *Ger.* *Orkanetz-wurzel*,] is the root of a species of bugloss (*Anchusa tinctoria*), a native of the warmer parts of Europe. It is of a dark-red color, and white within, and imparts an elegant tint to alcohol, wax, and to all unctuous substances. The coloring matter is confined to the bark, and the small roots are preferred, as these have most bark in proportion to their bulk. The best *A.* is imported from Montpellier in France, and from the Levant. *Imp.* free.

**Alkermes**. See KERMES.

**Alkool**, a black dye, a preparation of antimony, used by females in Eastern countries to tinge their eyelids. See HENNA.

**Allege**, the French term for a tender or lighter for a ship.

**Allegheny Valley R.R.**, runs from Pittsburgh to Oil City, Pa., 132 m.; from Red Bank, a point on its own line, to Driftwood, a point on the Phila. & Erie R.R., 110 m.; and branches, 17 m.; total, 259 m. This Co., located at Pittsburgh, Pa., was chartered in 1851. *Financial Statement*: 1st mortgage River Division, \$4,000,000, payable 1896, interest 7.03 % (Jan. and July); 1st mortgage Eastern Extension, \$10,000,000, payable 1920, interest 7 % (April and Oct.); 2d mortgage Eastern Extension, \$3,200,000, payable \$100,000 per year, interest 5 % (Jan. and July); Income bonds, \$6,200,400, payable 1894, interest 7 % (April and Oct.). Net earnings for 1878, \$915,726.57.

**Alligation**, in *Commercial Arithmetic*, is a formula for ascertaining the proportion of constituents or ingredients in a mixture.

1. To find what quantity of any number of ingredients, whose rates are given, will compose a mixture of a given rate. *Rule*.—1. Write down the rates of the ingredients under each other. 2. Connect by a curved line the rate of each ingredient, which is less than that of the mixture, with one or any number of those that are greater, and each greater rate with one or any number of those that are less. 3. Put the difference between the mixture rate, and that of each of the ingredients, opposite the contrary rate with which it is linked. 4. Then if only one difference stand against any rate, it will be the quantity belonging to that rate; but if there be several, their sum will be the quantity.

*Example I.* Wine at 90 cts. per gallon is to be mixed with wine at 60 cts. per gallon; required the proportions so as to sell the mixture at 70 cts. per gallon.

70 { 90 : : : : 10 at 90 cts. per gal.  
60 : : : : 20 " 60 "

That is, the wine at 90 cts. per gal. must be to that at 60 cts. in the proportion of 1 to 2.

*Example II.* What quantity of spirits at \$1.70, \$1.80, and \$2.20 per gallon, must be taken, so as that the mixture may be worth \$2.00 per gallon.

2.00 { 1.70 : : : : 20 at \$1.70 per gal.  
2.20 : 30 + 20 = 50 " 2.20 "  
1.80 : : : : 20 " 1.80 "

*Ans.* 2 gal. at \$1.70; 5 at \$2.20; and 2 at \$1.80.

II. When the whole composition is limited to a certain quantity. *Rule*.—Find an answer as

before, by linking; then, as the sum of the quantities, or differences thus determined, is to the given quantity, so is each ingredient found by linking to the required quantity of each.

III. When one of the ingredients is limited to a certain quantity. *Rule*.—Take the difference between each price and the mean rate as before; then, as the difference of that ingredient whose quantity is given is to the rest of the differences respectively, so is the quantity given to the several quantities required.

In the same manner, questions of this kind may be worked where several of the ingredients are limited to certain quantities, by finding first for one limit, and then for another. In general, however, cases in alligation are best solved by an analytical process, as they form what are called *indeterminate* or *unlimited* problems, from their admitting of a variety of answers. See AVERAGE.

**Alligator Leather**, the New York name for the tanned and prepared skins of the alligator, which come from Texas. They are mottled like tortoise-shell, are as pliable as calf-skin, and are used for boots, etc.

**Allotment Ticket**, an order for periodical payment of a portion of a seaman's wages to some second party during his absence at sea.

**Allowances**. See TARE.

**Alloy**, is a term applied to a mixture of any two metals; but sometimes it is applied only to the baser or inferior of the two, such as copper in standard gold and silver; while if mercury be one of the two, the mixture is more usually called an *amalgam*. Some metals are too brittle, some too soft, to be of much use in their pure or simple state; but there are scores of combinations of them, two and two, which prevent various serviceable qualities; and all such combinations form *A*. Sometimes three or even four metals form an *A*.—In *type-metal*, the qualities of a soft, malleable metal (lead), and of a hard, brittle metal (antimony), are combined to produce a useful *A*. that will possess properties depending on the proportions of the ingredients. The various *A*. of lead and tin, such as *printer*, differ in quality from the same cause. Copper and tin produce *bell-metal*, *bronze*, *gun-metal*, and *speculum-metal*; and it is noteworthy what great differences are observable in these *A*., according to the proportions between the two components, all other conditions being the same. The change even goes to that extent that an *A*. becomes harder in proportion to the increase in the *softer* of the two metals. That *A*. are chemical combinations, and not merely mechanical mixtures, is shown by the fact that their sp. gr. is seldom a mean between those of the components; and that they are more fusible, or melt at a lower heat, than the most fusible of the two components. The principal *A*. will be found noticed under their proper names, and some others under the names of the simple metals. See also ASSAY.

**Allspice**, or PIMENTO, [Fr. and Ger. *piment*; It. *pepe garofanato*,] is a small, dry, reddish-brown berry, the fruit of *Myrtus Pimenta*, common on the N. side of Jamaica, whence it is called Jamaica pepper. It is named *A*. from its taste and flavor (qualities which reside chiefly in the cortical part of the berry), being supposed to resemble that of a mixture of cloves, cinnamon, and nutmegs. The berries are gathered before they are ripe, and dried in the sun; the smallest and most fragrant being preferred. The produce of the Pimento crop,

though sometimes very abundant, is variable; and there is seldom a plentiful harvest above once in five years. A corresponding fluctuation occurs in the annual importations from the West Indies, whence it comes packed either in bags or hogsheds. The Pimento tree is also cultivated in some parts of the Southern States. Duty on import, 10 cts. (ground) and 5 cts. (unground) per lb.

**Almacen**, the Spanish name for a warehouse or store-room.

**Almandine**, a name for the carbuncle or precious garnet.

**Almonds**, [Du. *amandalen*; Fr. *amandes*; Ger. *mandeln*; It. *mandole*; Port. *amendoas*; Sp. *almendias*,] the kernel of the fruit of the almond-

Fig. 9. — ALMOND BLOSSOMS.

tree (*Amygdalis communis*), which tree, nearly resembling the peach both in leaves and blossoms (Fig. 9), is a native of Syria and Barbary, but now naturalized in the south of Europe. *A*. are of an oblong compressed shape, nutty taste, and are covered with a thick brown skin. There are two permanently distinct varieties,—the *sweet* and the *bitter*; but many subvarieties are distinguished in the places of growth. It is said that the eye can discover no difference between the sweet and bitter *A*., nor between the trees which produce them. *A*. are now little used in medicine; the sweet are a common article of the dessert; the bitter are used chiefly in cooking to give a flavor to other articles, and by perfumers in the preparation of the *paste of A.*, *milk of A.*, etc. Both become rancid by keeping. They are gathered in August and September, but are not generally shipped till the middle of October. They are imported into this country chiefly from Valencia, Alicante, and Malaga, in Spain; small quantities, besides, are brought from France, Portugal, and Italy. Bitter *A*. are obtained almost wholly from Barbary. The best sweet are the *Jordan* variety, brought from Malaga; they are longer, flatter, less pointed at one end, and less round at the other, and have a paler cuticle than the other kinds. The sweet *A*. are imported in mats, casks, and boxes;

the bitter usually in boxes. The annual imports into the U. States are from 2,000,000 to 3,000,000 lbs. *Imp.* duty (unshelled) 6 cts., (shelled) 10 cts. per lb.

*Oil of A.* is a fat or greasy substance expressed from sweet and bitter *A.*; sp. gr. 0.915. It is pale yellow, but becomes colorless when long exposed to light. It soon grows rancid, especially if in contact with oxygen. It is imported from England. The essential bitter oil is used in perfumery; the sweet oil is largely used in soap-making, etc. Average cost (duty paid) in New York: (sweet) 50 cts., (bitter) \$5.75 per lb. *Imp.* free.

**Almude**, a variable measure for liquids in several countries. In Portugal, the Lisbon *A.* = 3.7 gallons, and the Oporto *A.* = 5.6 gallons. In Turkey and Egypt, the *almud* = 1.151 gallon.

**Aloe Fibre**, is the very valuable fibre of aloe, a genus of succulent plants growing in warm countries. It is made into ropes, cables, fishing-lines, etc., and is extensively exported from Algiers.

Fig. 10. — LIGN-ALOE.

**Aloes**, [Fr. *aloès*; Ger., It., Sp., *aloe*,] a bitter resinous juice, extracted from the leaves of a succulent plant of the genus *Aloe*. It is used as a common purgative medicine. Three kinds are known to druggists, namely, — 1. *Socotrine*, from the island of Socotra, is sometimes imported in chests from the Levant; it is the purest, though seldom to be found genuine in this country; the *A.* imported from the Cape Colony through England is sometimes designated by the same name, but it is much inferior in quality; 2d. *Hepatic*, or liver-colored *A.*, is imported chiefly from Bombay in gourds; a darker kind is brought from Barbadoes; 3d. *Caballine*, known by its rank smell, is used only for horses. These varieties of *A.* are said to differ only in purity, and it is probable that they may be obtained, in some instances, from different species of the same plant. *Socotrine A.* is said to be obtained by only draining the leaves,

after being cut at their base; *hepatic A.*, by boiling or slight pressure; and *horse A.* seems to be a coarse preparation from the dregs of the last. Those of best quality are glossy, not very black, but brown; when rubbed or cut, of a yellow color; compact, but easy to break; easily soluble; of an unpleasant peculiar smell, and an extremely bitter taste. *Imp.* free.

**Aloe-Wood**, **AGALLOCHUM WOOD**, **EAGLE-WOOD**, or **CALAMBAK**, [Fr. *bois d'aloès*; Ger. *aloeholz*,] is procured from the interior part of the trunk of a large tree, the *Lign-Aloe* (Fig. 10), (*Aquilaria Malaccensis*, and *Alseodaphne agallochum*), growing in some parts of Assam, Cochinchina, and China. It is of a dark color, and is saturated with a peculiar aromatic resinous matter, which is highly esteemed by Eastern nations. This substance is said to be the produce of disease, as the sound wood is white and inodorous. It is used as a stimulating medicine, as well as an ingredient in incense.

**Alpaca**, the name of a species of Peruvian sheep (Fig. 11), smaller in size, but closely allied to the llama, and, like it, used in Peru to carry burdens. From its wool is manufactured, sometimes with cotton or silk warp, a plain woven stuff, used for dresses, umbrellas, etc. Nine-tenths of the *A.* wool is black, the rest brown or grizzled. The staple is ordinary 6 inches in length, of a singularly soft and silky quality, and when carefully managed loses nothing of its gloss in dyeing and finishing. It is dyed in the piece, and may be obtained in all colors. It was first manufactured at Bradford, England, which is still the chief place of manuf., but it is also manufactured in France, in Germany, and in the U. States. The wool is chiefly imported from Lima and Buenos Ayres. For import duty, see **WOOL** and **WOOLLENS**.

**Alpargata**, a light kind of sandal or shoe, made of rushes (*Microchloa tenacissima*), worn by the Valencian peasantry.

**Alqueire**, or **ALQUIERE**, a Portuguese dry measure. The *A.* of Lisbon = 0.36 bushel. The *A.* of Rio Janeiro = 1 bushel.

**Altimeter**. See **QUADRANT**.

**Altometer**. See **THEODOLITE**.

**Alto-Relievo**, sculptured works in high relief.

**Alum**, [Ger. *alaun*; Du. *aluin*; Fr. *alun*; It. *allume*; Sp. *allumbre*; Lat. *alumen*,] a salt of great importance in the arts, consisting of a ternary compound of *alumina* or pure argillaceous earth, potass, and sulphuric acid. *A.* is sometimes found native; but by far the greater part of that which is met with in commerce is artificially prepared. It is brittle, colorless, inodorous, and has a sweetish astringent taste. Sp. gr. 1.73. The best *A.* is the Roman, or that which is manufactured near Civita Vecchia. It is in irregular octahedral, crystalline masses, about the size of a walnut, and is opaque, being covered on the surface with a farinaceous efflorescence. The *Levant*, or *Roch A.*, is in fragments about the size of the former, but in which the crystalline form is more obscure; it is externally of a dirty rose color, and internally exhibits the same tinge, but clearer. It is usually shipped from Smyrna; but it was anciently made at Roccha, or Edessa, in Syria, and hence its name *Roch A.* English *A.* is in large, irregular semitransparent, colorless masses, having a glassy fracture, not efflorescent, and considerably harder than the others. It is very inferior to either the Ro-

man or Roch *A.* The principal use of *A.* is in the art of dyeing, as a mordant for fixing and giving permanency to colors which otherwise would not adhere at all, or but for a very short time; but it is also used for a great variety of other purposes. *Imp. duty*, 60 cts. per 100 lbs.

**Alumina**, is an oxide of the metal aluminium, and is the basis of nearly all sorts of clay; it occurs naturally in felspar and many other rocks, and can be obtained chemically from alum. When pure, *A.* is a white powder, soft to the touch, insipid, insoluble in water and in most acids, very hard in its small particles, so purely white as to form a good basis for paints and colors, attracts moisture strongly, becomes plastic when mixed with water (this is a characteristic of the clay series generally), gives the crimson tint to the colors called lakes, and forms a fine blue color in combination with cobalt. The gems sapphire, oriental ruby, and topaz are nearly pure *A.* in a crystalline state. In almost all clay, silica is present with *A.* in various proportions. The most useful salt of *A.* is the sulphate, for which see **ALUM**.

**Aluminium**, is a metal first isolated from alumina, in 1845, by Wöhler. In 1854 Deville devised a mode of obtaining it sufficiently cheaply to bring it within the range of manufacturers, and other chemists have introduced improvements which gradually have lowered the price of the metal in the market, though there is little probability that it will ever be cheap. Before the improved processes were introduced, *A.* sold for as much as gold, weight for weight; from which standard the price has lessened to about \$1 per oz.; but even at this last price it is nearly as dear as silver, and therefore only suited for special purposes. When prepared in any of the numerous ways now adopted, *A.* is a white metal, something like zinc in color and hardness; it is only one-fourth as heavy as silver; it is very sonorous, and seems likely to be useful for musical instruments; in elasticity and tenacity it about equals silver; it can be beaten out, either hot or cold, into leaves as thin even as  $\frac{1}{1000}$ ; it is easily drawn out into wire; it can readily be polished by burnishing; and varied by a beautiful alternation of burnished and dead surface; it undergoes no sensible alteration in air or in oxygen, even at a high temperature. Then, again, *A.* melts at a lower temperature than silver, and is on that account preferable for some manufacturing purposes; it flows easily into moulds, whether of metal or sand; if soiled by dust, it can be cleaned with India-rubber or soap and water; if made greasy, with benzine; it can be soldered with an alloy of zinc, copper, and *A.*, having 80 or 90 per cent. of the first-named metal; it forms alloys with iron, zinc, nickel, copper, and silver. The various properties of *A.* have already brought it into use for a number of purposes. It is used for bracelets, combs, pen-holders, pins, spoons, forks, drinking-vessels, shirt-studs, statuettes, etc. Its rank may be now said to be midway between the precious and the common metals. The mutual relations of *A.* and copper

give origin to a remarkable alloy. Each gives hardness to the other; and the compound, of a golden color, takes a fine polish. The nearest approach to the appearance of real gold, by a compound in which no gold exists, is made by copper alloyed by 5 or 10 per cent. of *A.*, deep and pale gold colors having their respective ratios. This alloy, under the names of *A. bronze* and *A. gold*, seems likely to have an important future before it. An alloy of 90 copper and 10 *A.* possesses remarkable malleability and strength.

**Amadou**. See **AGARIC**.

**Amalgam**, is a compound of mercury with some other metal. Many such *A.* may be easily formed; and they are for the most part either soft or easily crumbled. With lead, mercury forms an *A.* useful in silvering the inside of glass globes; with gold, an *A.* which assists in the process of watch-gilding or metal-gilding; with tin, an *A.* which constitutes the metallic back of a looking-glass or mirror, and also an *A.* which facilitates the deposition of a thin, brilliant coating of tin on the surface of iron, steel, and copper, called *cold*

Fig. 11. — ALPACA.

*tinning*; with zinc, an *A.* useful as a protection for the bottoms of iron ships; with palladium, an *A.* employed somewhat in the same way as that of zinc; with zinc and tin together, an *A.* useful for coating electric machines.

**Amalgamation**, is strictly any mode of causing mercury to combine with other metals to form the amalgams above noticed; but technically it usually means the separation of silver or gold from the ores in which these precious metals are usually found, mercury being the agent or instrument. As regards silver, for instance: sulphuret or other ore of silver is washed, ground, mixed with common salt, roasted, ground again, and mixed with mercury and iron. Various other substances being driven off, the silver and mercury unite; and the mercury is finally driven off by distillation, leaving the silver isolated. A process nearly similar is employed for gold.

**Amande**, the French name for Almond; *aman-*

*des cassées* being shelled almonds, and *amandes en coques*, unshelled.

**Amazon Stone**, a crystallized variety of felspar, of a beautiful apple-green color, found in South America near the river Amazon, and in the Ural mountains.

**Amber**, [Ger. *Bernstein*; Du. *Barnsteen*; Fr. *ambre jaune*; It. *Ambra gialla*; Lat. *succinum electrum*,] a brittle, light, hard substance, usually nearly transparent, sometimes nearly colorless, but commonly yellow, or even deep brown. It has considerable lustre. Sp. gr. 1.065. It is found in beds of lignite, in nodules or rounded masses, varying from the size of coarse sand to that of a man's hand. It is tasteless, without smell, except when pounded or heated, when it emits a fragrant odor. It is highly electric. *A.* is undoubtedly of vegetable origin, and, as is clear from the insects, etc., often preserved in it, was originally exuded in a fluid state from some extinct species of pine. *A.* is found in various countries, more particularly on the Adriatic and Sicilian shores, and in Prussia, near the sea-coast, between Memel and Dantzic, where there are regular mines of it. In the U. States, it is found, in small quantities, principally at Amboy (New Jersey), and at Gayhead and Cape Sable (Maryland). *A.* is sometimes adulterated with copal and other resins, which are detected by their different appearance, and by not exhaling the proper odor when burned. *A.* is used for ornamental purposes in the manufacture of necklaces, mouth-pieces for cigars and smoking-pipes, etc. It is also used in the manufacture of various kinds of varnish, dissolved with drying linseed-oil, asphaltum, and resin; it is used as a coachmaker's varnish, and the spirit varnishes, which are prepared from the solution of amber in alcohol, or ether, are used for photographic purposes. The principal market for *A.* is Constantinople. The straw-yellow, slightly clouded, translucent variety is the rarest, and most esteemed by the Orientals. In other countries, the orange-yellow, transparent variety is preferred. *Imp.* (not manufactured) free. See SUCCINIC ACID.

**Ambergris**, [Fr. *ambregris*; Ger. *ambra*; Sp. and Port. *ambargris*; It. *ambraçani*,] a substance found principally in warm climates, floating on the sea, or thrown on the shores; it is said to be a morbid product of the spermaceti whale. It is generally procured in small fragments, but sometimes in masses weighing upwards of 100 lbs. When good, it is solid, opaque, of a bright gray color, which is darkest externally, and intermixed with yellow or reddish streaks. It has a fragrant and peculiar odor when heated and rubbed. Sp. gr. about 0.914. The best comes from Madagascar, Surinam, and Java. It is used as a perfume, and possesses the remarkable power of increasing the odor of other perfumes. It usually sells in New York at about \$20 per oz. This high price leads to frequent adulteration of the commodity. *Imp.* free.

**Amboyna**. See MOLUCCAS.

**Amboyna**, or LINGOA WOOD, a fancy wood of various colors, and having the shades generally small. It is much used in cabinet-work, and is imported from Ceram and Amboyna, in logs of about 2 feet wide.

**Ambrette**, a French name for musk seed.

**Ambulance**, a travelling medical carriage for transporting invalids or wounded persons.

**American Leather**, a kind of varnished or enamelled cloth, prepared in imitation of leather

for covering chairs, sofas, writing-tables, etc. It is chiefly manufactured in Newark, New Jersey.

**American Red-Root**, is the *Ceanothus Americanus*. The root is used to dye wood a cinnamon color, and the leaves are known as New Jersey tea.

**American Tea**, the leaves of a species of Camellia, which grows on the Bald Eagle mountain, in Pennsylvania.

**Amethyst**, [Fr. *amethyste*; Ger. *amethyst*; It. *amatista*; Sp. and Port. *ametisto*,] a precious stone of a purplish-violet color and great brilliancy. It is of two kinds, the *oriental* and *common*. Of these, the *oriental*, which is a species of sapphire, is by far the most valuable. The *common* or *occidental A.* is merely a colored variety of quartz, or rock crystal, and is in beauty, lustre, and hardness, much inferior to the *oriental A.* It occurs crystallized, in rounded pieces, and in massive portions; but its primary form, like that of quartz, is a slightly obtuse rhomboid. It is most valuable when large, high colored, and without flaws. It is found in India, Germany, Sweden, and Spain, but is chiefly imported into this country from Brazil. *Imp.* duty (unset) 10 per cent., (set) 25 per cent. See SAPPHIRE.

**Amianthus**. See ASBESTOS.

**Amidon**, the French name for starch.

**Ammonia**, *Volatile Alkali*, or *Spirits of Hartshorn*, a pungent volatile substance, of great importance and extensive use, which is formed during the putrefactive fermentation of animal matter. When pure, it is a gaseous body, composed of 3 equivalents of hydrogen and 1 of nitrogen; sp. gr. 0.590; but in medicine and the arts, it is generally used in solution in water, or in combination with other substances. *Imp.* duty, 20 per cent.—*Liquid A.* or *Hartshorn*, is an aqueous solution of *A.*, prepared either by pressing the gas as it is found directly into water, or by distillation from sal-ammoniac, burnt-bone, and water. In the former case the sp. gr. is 0.880, in the latter 0.954. It is limpid, colorless, very volatile, has a pungent smell and a caustic taste; and is one of the most useful stimulants. *Imp.* duty (as medicine), 40 per cent.; (crude, or gum ammonia) free.—*Acetate of A.*, or *Spirit of Mindereus*, is prepared by adding sesqui-carbonate of *A.* to dilute acetic acid. It has a sweetish bitter taste, and is employed externally as a refrigerant, and internally as a diaphoretic. *Imp.* duty, 25 cts. per lb.—*Carbonates of A.* The *Carbonate of A.* may be obtained by uniting 1 vol. of carbonic acid gas with 2 vols. of ammoniacal gas. It is a dry, white, volatile powder, and is used as a stimulant in a preparation called *Spirit of Sal Volatile*. The *Sesqui-carbonate of A.* is obtained by sublimation from a mixture of hydrochlorate or sulphate of *A.* and chalk, and usually occurs in cakes, broken out of the subliming vessel. When fresh, it is of a crystalline texture, semi-transparent, and hard, odor pungent, and taste penetrating. It is extensively used in chemical preparation. In medicine it is employed as a stimulant, and is usually called *smelling-salts*. It is also used instead of yeast, in making some kinds of bread. *Imp.* duty, 20 per cent.—*Hydrochlorate (Muriate) of A.*, or *Sal-ammoniac*, [Fr. *sel ammoniac*; Ger. *salmiak*,] was originally procured from Egypt, where it was made from the soot of camel's dung. It is now, however, prepared in abundance in this country, by decomposition of the ammoniacal fluid given off during the prepara-

tion of coal-gas; also, by a complicated process, from bones and other refuse of animal substances containing its ingredients. It is likewise found native at Etna and Vesuvius, in some of the Tuscan lakes, in Persia, etc. As generally obtained, it is in large cakes of a semi-circular form, translucent and colorless, with a sharp saline taste, but no smell. Sal-ammoniac is extensively employed in the arts. It is used in preparing aqua regia, in soldering some of the metals, in tinning iron and copper, in the preparation of dyes, etc., also in various chemical manufactures. *Imp. duty, 10 per cent.*

**Ammoniacum**, or *Gum Ammoniac*, [Fr. *Gomme Ammoniaque*; Ger. *Ammoniak*,] a gum resin, procured, according to some authorities, from the plant *Heracleum gummiferum*, but by others referred to the *Ferula Orientalis*. It has rather a heavy smell, and a bitter-sweet taste. It is in agglutinated masses of tears, or in separate dry drops, of a yellowish-white color. Sp. gr. 1.207. That which is decidedly guttiform, of a clear and deep buff color externally, pale within, and free from impurities, is most esteemed. It is produced in Persia, Abyssinia, and other places, but is imported into this country from England. It is used in medicine as a stimulant; and in the arts, to form the *diamond cement* employed to join pieces of broken glass or porcelain. *Imp. free.*

**Ammunition**, a general term in commerce for certain military stores, such as powder, shot, artillery and small-arm projectiles with their cartridges and the percussion-caps, friction-primers, etc., by means of which they are fired; also war-rockets and hand-grenades. For artillery, when the projectiles, their cartridges, primers, etc., are packed in the same box, it is designated in the U. States service as *fixed ammunition*; this is the description furnished for field and siege artillery. *A.* for small-arms is known in the U. States service as *small-arm cartridges*. In these the bullet and cartridge are invariably put up together in boxes of 1,000, except some descriptions of patented cartridges, which are put up in boxes containing 600 or 1,200, and repeating-cartridges, in which the box is made to contain a multiple of the number which fills the breech-chamber.—*Knight.*

**Amontillado**, a dry kind of sherry of a light color, much used to reduce the color of other sherries when too high.

Fig. 12. — AMPUTATING SAWS.  
(Copied from Kulb's.)

**Amortization**, the redemption by a sinking-fund.

**Amoy.** See CHINA.

**Amputating Knife and Saw.** The *A.* knife,

used for making the incisions in amputations, has a long, narrow blade. The *A.* saws, which are of sizes from 4 to 14 inches in length, are modifications of the *tenon*, *frame*, *joint*, and *crown* saws (see Fig. 12). The *Hey's* saws, used in making eusections, and in removing carious bones from deep-seated places, have edges more or less curved, and the smallest of these dwindle down to a nearly circular plate of steel less than an inch in diameter, serrated round the edge, except where a slender shank terminating in a wooden handle is riveted to the edge of the saw-plate.—*Knight.*

Fig. 13.—ANCHOR.

*a* to *b*, shank; *b* to *c*, square; *d* to *e*, arm; *f* to *g*, palm, fluke, or kevel; *h* to *i*, point, pee, or bill; *j* to *k*, blade; *M* to *N*, crown; *o*, ring; *p*, stock; *d*, throat or crutch.

**Amsterdam.** See HOLLAND.

**Amulets**, are articles of various kinds, sold as imaginary charms, to ward off evil from the wearer.

**Ana**, an East Indian name for the 16th part of anything, as the link of a measuring chain; the 16th of the quota, a land measure, or 7½ sq. yards.

**Anacahuite-Wood**, the wood of a Mexican tree, *Cordia boissieri*, introduced into commerce as a reputed remedy for consumption.

**Anæsthetic Apparatus.** See INHALERS.

**Anastatic Printing**, a mode of reproducing engravings and printed matter by saturating the print or drawing with an acid; it is then transferred on a plate of metal, from which copies are printed in a manner similar to lithography.

**Anatto**, same as ANNOTTO, q. v.

**Anchois**, the French spelling for anchovy and anchovies.

**Anchor**, [Fr. *ancre*; Ger. *anker*; It. *ancora*; Sp. *ancla*,] a heavy hooked iron instrument for fixing a vessel in a harbor or road. Large ships carry 4 principal *A.*, the *sheet*, *best bower*, *small bower*, and *spare A.*; and two small ones besides, for particular purposes, namely, the *stream* and *kedg*. The weight of the largest *A.* is about 1 cwt. for each twenty tons measurement, or 0.0025 of the tonnage of the vessel. An *A.* (Fig. 13) consists of two arms terminating in broad expansions termed flukes, and attached to a long shank, to which is fixed a stock of wood or iron at right angles to the arms, to insure the perpendicularity

of the flukes when the *A.* is on the bottom, in order that they may take firm hold of the ground. *A.* require to be made of the very best and toughest wrought-iron. They are made by welding together a lagot of bars under a steam- or trip-hammer, the smaller and more difficult portions being shaped and rounded off, and the whole *A.* finished up by hand. The form of the *A.* remained almost unchanged from a very early period until the second part of this century, when more complex methods of fabricating have been partially introduced; but an *A.* differing little from the old-fashioned type, excepting that even the very largest sizes have iron hooks, is still in use in the navy and merchant service of the U. States. Small *A.*, termed *grapnels*, and having 4 or more arms, are used for boats. The *mushroom A.*, so called from its shape, is much employed in the

and entrails separated, the bodies are salted and packed in small barrels, in which, if the air is excluded, they will keep for a considerable time. Genuine anchovies are small and firm, round-backed, fibre red, with skin of a silvery white. Those that are dark-brown without, with flabby, pale-colored flesh, and tapering much towards the tail, are commonly *sardines*, an inferior species, frequently substituted for, or mixed with, the true kind. They are prepared as a delicacy, and are used in the manufacture of *A. sauce*. They are mostly imported into this country from Italy.

*Customary tare*, in barrels of 16 lbs., 6 lbs. each. *Imp. duty* (preserved in oil, or otherwise), 50 per cent.

**Andazé**, a Turkish cloth measure = 27 inches.

**Anderson, Lebanon, and St. Louis R.R.**, (in progress,) to run from Anderson to Montezuma, Ind., 100 m. Office at Anderson. *Financial*

*Statement* 31 Dec., 1877: Cap. stock authorized, \$2,000,000; paid in, \$1,000,000. Funded debt authorized, 1st mortgage bonds dated 1 Nov., 1875, bearing 7 % interest, payable May and Nov., principal payable 1905, at the rate of \$15,000 per mile. Cost of construction to date, \$1,000,000; estimated cost to completion, \$2,500,000.

**Anemometer**, [from Gr. *anemos*, wind; *metreo*, to measure,] an instrument or machine to measure the wind, its *direction* and *force*. Three descriptions of *A.* are usually employed—1. Dr. Whewell's; 2. Mr. Follett Osler's; 3. Dr. Robinson's.

**Anemoscope**, a weather-vane and register to indicate the changes of the wind and weather.

**Angelica**, [Fr. *angélique*; Ger. *angelika*,] a large umbelliferous plant (*Angelica archangelica*), cultivated in gardens, all parts of which have a fragrant, aromatic smell, and a pleasant bitter taste (Fig. 14). The tender stems, stalks, and the midribs of the leaves are made, with sugar, into a sweetmeat (candied *A.*). The dried *A.* root is imported, free from duty, from Hamburg in casks, and is used by rectifiers and compounders in the preparation of gin, and as an aromatic flavoring for "bitters."

**Angle-Bars**, pieces of iron for forming the edges of iron safes, bridges, and ships, or to be riveted to the corners of iron boilers, tanks, etc., to connect the side plates.

**Angola**, a light and fashionable cloth, made from the Angora goat's wool, which is also made into plush, and from its repelling heat is used for cloaks and overcoats.

**Angora Wool**, is the long, silky hair of a breed of goats raised in large numbers at Angora in Asiatic Turkey, and successfully introduced into the U. States. Large quantities of this hair are exported from Smyrna and Constantinople, and manufactured into shawls, camlets, and fine cloth, etc. In France, this article is also now applied to the manufacture of a new kind of lace, which is more brilliant than that made from silk, and which in a great measure supersedes the costly fabrics of Valenciennes and Chantilly. See **ANGOLA** and **MOHAIR**.

**Angostura**, or **CUSPARIA BARK**, is a valuable tonic, obtained from the stem and branches of a

Fig. 14. — ANGELICA.

East Indies by the native vessels called grabs. — *A.* are manuf. in Pennsylvania, Maryland, and other places in the U. States; they are also imported from England. When imported to be used for the equipment of a vessel, they are liable to duty. *Imp. duty*, 2½ cts. per lb.

**Anchorage**, a duty paid for the liberty of anchoring in a port. It means also a ship's anchoring ground.

**Anchovy**, [Fr. *anchois*; It. *acciuga*,] is a small fish (*Engraulis encrasicolus*), about the size of the finger, of a bluish-brown color on the back, and silvery white on the belly. It abounds in the Mediterranean, particularly off Gorgona, near Leghorn, where it is taken in May, June, and July. It is also found on the coasts of France and Portugal. After being caught, and the heads

species of *Galipea*, the former being in flat and the latter in quilled pieces. It breaks with a short and resinous fracture, is covered with an ash-colored epidermis, is internally smooth, and of a dull brownish-yellow color. Its odor is rather nauseous and fishy, and it has a strong, bitter flavor, accompanied by a peculiar and somewhat aromatic pungency. It is found in the warmer parts of South America, especially in the neighborhood of Angostura, in Venezuela. *Imp. free.*

A spurious and poisonous bark is sometimes met with under the name of *A.* This is more intensely bitter, and in shorter and less regular pieces than the genuine; internally, it is nearly black, and externally, covered with a rough, rust-colored epidermis.

**Angostura Bitters.** See BITTERS.

**Anil**, the Spanish name for Indigo.

**Aniline.** See ANILINE VIOLET.

**Aniline**, [Fr.; Ger. *Das Anilin*], is a colorless, oily, and highly poisonous liquid, having a faint vinous odor, and an aromatic burning taste. Sp. gr. 1.002. It dissolves in all proportions in ether, alcohol, and in fixed and volatile oils. When exposed to the air, it acquires a yellow or red color, which is always noticed in commercial aniline oil. It forms a numerous class of salts, most of which crystallize readily. It was discovered in 1826 by Unverdorben, as a product of the distillation of indigo, and was named from Anil, the name of the American species of the indigo plant (*Indigofera*). It is generally obtained from the basic oil of coal-tar. The beautiful blue color which it strikes with a solution of bleaching powder is sufficient for its recognition. It has met with an important application in the arts, in the production of beautiful dye colors, which are very intense, a few pounds' weight of the dye being capable of coloring some miles of fabric. *A.* colors are used for the production of brilliant tints on cotton, wool, and silk; also for ink, for coloring leather, soaps, candles, ivory, horn, etc. Their high cost is counterbalanced by the brilliancy of their tints and the simplicity of dyeing. Unfortunately, the speedy alteration by light of nearly all the *A.* colors will probably check their use in art.

***A. Black.*** is obtained by dissolving a salt of *A.* in water, then adding chlorate of potash and sulphide of copper, or sulphate of iron. This color, however, can scarcely be said to have been satisfactorily produced. All the *A.* blacks are liable to turn green by exposure.

***A. Blue and Green.*** The coloring-matter known as *Bleu de Paris* and *Bleu de Lyon* is obtained by heating a salt of rosaniline for several hours with an excess of *A.* The beautiful indigo-blue color *Azurine* is produced by the mixture of *A.* with chlorate of potassium, to which a quantity of hydrochloric acid has been added. This and other *A.* blues possess the property of acquiring, under the influence of acids, a green tint called *Emeraldine*.

***A. Red.*** This color, discovered by Dr. Hoffman in 1858, is generally produced by the combination of arsenic acid with a slight excess of *A.* New processes, however, have been introduced for the production of *A.* reds without the use of arsenic. All the red derivatives of *A.* are composed essentially of rosaniline salts (see ROSANILINE). The red known as *fuchine*, consists chiefly of hydrochlorate of rosaniline. The *Azaline*, or *A. red* prepared by nitric acid, is principally nitrate of rosaniline. The salts of rosaniline, which are chiefly employed for dyeing silk and wool, are the acetate, the hydrochlorate, and the nitrate, and their application is simple in the extreme. The silk is dyed by passing it through a cold aqueous solution of the salt: for the dyeing of the wool the solution is heated to 50° or 60°. Rosaniline is fixed by silk and wool with so great force and rapidity, that it is necessary in dyeing to take particular precaution, and to operate with solutions that are at first comparatively weak, and are only gradually strengthened, to prevent the dyeing being unequal, and the portion first immersed in the bath being more strongly colored than those afterwards introduced. Cotton, at the contrary, does not prevent any attraction for *A.* colors generally. Their fixation on cotton can, therefore, only be effected by first heating the cotton with some animal mordant, or with tannic acid.

***A. Violet.*** The names of *Aniline*, *Indisine*, *Mauve*, *Phenamine*, *Rosolane*, *Tyroline*, *Violet Imperial*, *Violine*, etc., have been given to the varieties of this color, which was first obtained in the crystalline condition in 1860 by M. Scheurer-Kestner. *A. violet* resists the action of light to a very considerable extent, though inferior in this respect to either madder, cochineal, or indigo. To dye silk, an alcoholic solution of the violet purple is diluted with eight times its volume of hot water previously acidulated with tartaric acid. This liquid is poured into the dyeing-bath of cold water slightly acidulated. Through this the silk is passed until the required shade is obtained. The dyeing of wool is conducted at a temperature of 50° to 60° C., the dye-bath consisting simply of a dilute aqueous solution of coloring-matter, without any acid.

***A. Yellow*, or *Chrysaniline*,** is obtained by submitting for some time the residue from which the *A. red* (rosaniline) has been extracted to a current of steam, when a quantity of the base passes into solution. Addition of nitric acid to this solution precipitates the chrysaniline in the form of a difficultly soluble nitrate. Chrysaniline and its salts dye silks and wools a splendid golden-yellow color.

**Animal Charcoal**, principally carbonized bone, used by sugar-refiners and by iron-makers in blistering steel. When obtained cheap, it forms a valuable fertilizer for land. *Imp. free.*

**Animal Fat**, is the name given in commerce principally to tallow and lard; but the name is also applied to horse grease, bear's grease, and blubber.

**Animal Jelly.** See GELATINE.

**Animal Manures.** See MANURES.

**Animé**, or **ANIMI**, is a resin of a brown yellow color, transparent and brittle. It exudes from the Courbaril, a large South American tree which is a species of *hymenæa*. It occurs in pieces of various sizes, and it often contains so many insects belonging to living species, as to have merited its name, as being animated. It contains about a fifth of 1 per cent. of a volatile oil, which gives it an agreeable odor. Sp. gr. 1.054 to 1.057. It is extensively used by varnish-makers, who fuse it at a pretty high heat, and in this state combine it with their oils or other varnishes. It is also employed, on account of its agreeable smell when burning, in the manufacture of pastilles. *Imp. free.*

**Aniseed**, [Fr. and Ger. *anis*], is the fruit or seed of an umbelliferous plant (*Pimpinella anisum*) largely cultivated in Malta, Spain, and Germany (Fig. 15). It has an aromatic smell and a warm sweetish taste. The small compact seed imported from Spain is usually preferred to the lighter and larger kind, which is the growth of Germany and England. It is used in medicine and confectionery.

**Oil of *A.***, is a volatile fluid obtained from the seeds by distillation; it concretes at about 35° F., which is its leading character. It is used in cordials, and from it are prepared the spirit of anise (*spiritus anisi*) and anise water (*aqua anisi*). The *oleum bulianum*, or the oil of star anise (*illicium anisatum*), has the color and taste of the oil of anise; but it preserves its fluidity at 35° F. It is sometimes fraudulently substituted for *oleum anisi*.

**Anisette**, a French liquor obtained by distilling aniseed, fennel, and coriander-seed with brandy, and sweetening the product. The *A. de Bordeaux*, when genuine, is a delicious and very stomachic drink. *Imp. \$2 per gal.*

**Anker**, a liquid measure in various places. The English *A.* contains 10 wine galls., or 8½ imp. galls. The Scottish *A.* of 20 Scottish pints equals about 7½ imp. galls. In Copenhagen the *A.* contains about 8½ imp. galls.; in Amsterdam, Riga, and Penau, 8½; in Revel, 9½; and in Rostock, nearly 8 imp. galls.

**Anna.** Same as *Ana* (q. v.).

**Annealing**, [Fr. *le recuit*; Ger. *das anlassen*.] is a process by which glass is rendered less fran-

gible; and metals which have become brittle, either in consequence of fusion or long-continued hammering, are again rendered malleable. When a glass vessel is allowed to cool immediately after being made, it will, if a small splinter of flint, or an angular fragment of quartz, be dropped gently into it, make it fly to pieces with great violence. This extreme fragility is prevented by *A.*, or placing the vessels in a hot oven, when they take several hours, or even some days, to cool. When metals have been extended to a certain degree under the hammer, they become brittle, and incapable of being farther extended without cracking. In this case the workman restores their malleability, sometimes by *A.*, or, in other cases, by heating them red-hot, and allowing them to cool slowly. Cast-iron is now rendered malleable without subjecting it to the action of puddling. The process is somewhat similar to that employed in annealing glass. The metal is kept imbedded in ground charcoal for several hours at a high temperature, and then allowed to cool slowly. In this manner vessels are made of cast-iron which

flour, salt, and soap, for weight; and turmeric or ferruginous earth, for color. *Imp. free.*

**Annuity**, is a periodical payment of money, amounting to a certain annual sum, and continuing either a certain number of years, as 10, 20, or 100, or for an uncertain period, to be determined by a particular event, as the death of the annuitant, or that of the party liable to pay the *A.*, or of some other person, or indefinitely; and these last are called *perpetual annuities*. When the possession of an *A.* is not to be entered upon until the expiration of a certain period, it is called a *reversionary*, or *deferred A.* When an *A.* is dependent upon the existence of a life or lives, it is called *life A.* As an *A.* is usually raised by the present payment of a certain sum, as a consideration whereby the party making the payment, or some other person named by him, becomes entitled to an annual, semi-annual, quarterly, or other periodical payment of a certain sum, for a stipulated number of years, or for a period to be determined by the happening of a certain event. The rules and principles by which this present value is to be

computed have been the subject of much scientific investigation. The present value of a perpetual *A.* is evidently a sum of money that will yield an interest equal to the *A.*, and payable at the same periods. The present value of an *A.*, for a limited period, is a sum which, if put at interest, will, at the end of that period, give an amount equal to the sum of all the payments of the *A.* and interest; and, accordingly, if it be proposed to invest a certain sum of money in the purchase of an *A.*, for a given number of years, the comparative value of the two may be precisely estimated, the rate of interest being given. But annuities for uncertain periods, and particularly life annuities, are more frequent, and the value of the *A.* is computed according to the probable duration of the life by which it is limited. Many such annuities are granted for public services by acts of Congress of the U. States, and, as these do not arise from a specific contract, and are not usually subjects of purchase, their precise value is not often a subject of investigation. But life annuities are often created by contract, whereby a private party—more usually a life insurance company—agrees, for a certain

Fig. 15.—ANISE (*Pimpinella anisum*).

can sustain considerable violence without being broken.

**Annihilator.** See FIRE-ANNIHILATOR.

**Annotto**, or **ARNOTTO**, [Ger. *orlean*; It. and Por. *oriana*; Fr. *rocou*.] is a reddish dye, the inspissated extract from the pellicles of the seeds of the *Bixa orellana*, found in the East and West Indies, but chiefly imported to this country from Brazil. It is used by dyers for giving more or less of an orange cast to the simple yellows, as an ingredient in varnishes, and for coloring cheese and butter. *A.* is moderately hard, of a brown color on the outside and a dull red within. There are two kinds. *Flag or cake A.*, in cakes of 2 or 3 lbs. weight each, is generally enveloped in large flag-leaves. *Roll A.*, a more concentrated extract, is brought in small rolls of a few ozs. weight, and contains a larger proportion of coloring matter than the former. This is the kind used chiefly in dairies. It is often adulterated with wheat or rye-

sum advanced by the purchaser, to pay a certain sum annually to the person advancing the money, or some other annuitants named by him, during the life of the annuitant; or the *A.* is granted to the annuitant, his heirs and assigns, during the life of some other person, or during two or more joint lives, or during the life of the longest liver or survivor among a number of persons named in the agreement whereby the *A.* is raised. Such annuities are usually made transferable, and are sold and purchased in the market as a species of public stocks.—When an *A.* is created by a contract with a private party or company, its object usually is to give the use, during his life, not only of the income of his capital, but of the capital itself. If a person, having a certain capital, and intending to spend this capital and the income of it during his own life, and leave no part to his heirs, could know precisely how long he should live, he might loan this capital at a cer-

tain rate during his life, and, by taking every year, besides the interest, a certain amount of the capital, he might secure the same annual amount for his support during his life, in such manner that he should have, the same sum to spend every year, and consume precisely his whole capital during his life. But, since he does not know how long he has to live, he agrees with a party or company to take the risk of the duration of his life, and to pay him a certain *A.* during his life, in exchange for the capital which he proposes to invest in this way. The probable duration of his life, therefore,

becomes a subject of computation; and, for the purpose of making this calculation, tables of longevity are made, by noting the proportions of deaths, at certain ages, in the same country or district. See *INTEREST, LIFE INSURANCE, and MORTALITY* (tables of).

The following tables show the cost of an *A.* of \$100, and the amount of *A.* which a deposit of \$1000 will purchase in the best life insurance companies of New York, the rates charged by them being usually those found in the columns marked five per cent.

**Annul**, to cancel, or render void, as an agreement, proposition, or entry.

**Annunciator**. See *ELECTRIC BELLS*.

**Anodynes**, are medicines which relieve pain

and procure sleep, such as opium, morphine, the anæsthetics, etc.

**Anthal**, a Hungarian wine measure = 11½ imp. gallon.

**Anthracite**, is an important fossil fuel, the hardest variety of stone coal, consisting, when pure, almost exclusively of carbon. It has a conchoidal fracture, a black color, and an imperfectly metallic lustre, from which it is sometimes called *glance coal*. It burns slowly, with intense heat, without smoke, and with little flame. *A.* is formed from softer and more bituminous coals by the action of subterranean heat, which has driven off most of their volatile matter. The composition of *A.* is the same as that of coke formed artificially from bituminous coal, and it is more dense than coke only because it has been heated under greater pressure. The coal of the Lehigh basin is most baked, and contains the least amount of volatile matter—3 to 7 per cent.; the Scranton coal, from 9 to 12 per cent.; the semi-bituminous coal of Blossburg and Broad Top, from 17 to 25 per cent.; the bituminous coal of Western Penn., from 30 to 50 per cent. In Rhode Island, a small basin of carboniferous rocks has been still more thoroughly calcined, and the coal is partially converted into graphite (graphitic *A.*). The density and great heating of *A.* make it the best of all fuels for metallurgic purposes, while its freedom from smoke specially commends it for combustion in cities. For the generation of steam, *A.* has no superiority over the best bituminous and semi-bituminous coals; and as a household fuel, cannel is preferred for open fires for its cheerful flame and the facility with which it is kindled; but the steadiness, cleanliness, and economy of an *A.* fire will always make it the staple fuel of communities which can obtain it.

*A.* occurs and is largely mined in Wales, Ireland, and other parts of Europe, but the most extensive and productive beds of *A.* are those of Penn. These form several attached basins lying between the folds of the Allegheny Mountains. Their aggregate area is only about 500 sq. m., but from their proximity to the chief centres of population and manufacture, they have had a most important effect on the development of the industry and wealth of America. — *Am. Ency.*

**Antiar**, a poison obtained in Java from the acrid juice of the upas-tree, *Antiaris toxicaria*.

**Antigua**. See WEST INDIES.

**Anti-Macassar**, an open-worked napkin or loose fancy covering, to preserve a chair or couch.

**Antimonial Wine**, a medical preparation of tartar-emetic.

**Antimony**, [Fr. *antimoine*; Ger. *spiesglanz*; Mal. *soormah*,] a metal extensively used in medicine; and in the arts employed in the composition of printing-types, music-plates, etc. The metallic ore of commerce consists of sulphur and other impurities combined with the pure metal. This ore is found abundantly at Rosenau, in Hungary, and in other parts of Europe, but is imported into this country chiefly from the Malayan Archipelago. It is generally of a lead-gray color, possessing considerable splendor, and is met with compact,—in acicular crystals,—and in rhombic prisms of considerable size, and variously modified. *Crude A.* is the name given in commerce to the sulphuret of the metal, after being separated from the impurities of the ore, by fusion and a species of filtration. It is usually in the form of loaves, of a dark-gray color, the goodness of which is estimated from their compactness and weight, the largeness and distinctness of the striae, and from their being entirely vaporizable by heat.

*Regulus of A.*, the pure metal after being separated from the sulphur, is commonly of a dusky-white color, very brittle, and of a scaly texture. Sp. gr. about 6·8. Imp. duty, 10 per cent.

**Antimony Yellow**, a preparation of antimony of a durable color, used in enamel and porcelain painting.

**Antiquarian**, a large kind of drawing-paper, measuring 56 by 58 inches.

**Antiques**. See VIRTU.

**Antiseptic**, any substance which prevents decomposition, as glycerine, charcoal, chloride of lime, etc.

**Antwerp**. See BELGIUM.

**Anvil**, as one of the requisites of the smithy, is in itself nothing more than a piece of iron, fitted to receive heavy blows without being either broken or dislodged. Practically, it exhibits very varied forms. Some are made of cast-iron, subject to a few finishing processes. Others are made of wrought-iron, several pieces being welded together at a white heat, and forged into form by blows from sledge-hammers. The best are faced with steel, hammered or welded when the steel is not quite so highly heated as the iron. The protuberant pieces of an *A.*—the chisel-socket, the beak or conical end, etc.—are usually welded on. Small *A.*, for delicate works, are polished with emery and crocus. *A.* are placed sometimes upon solid timber, sometimes embedded in stone. Those underneath steam-hammers are placed upon huge masses of foundation of enormous strength, otherwise the machine would soon beat itself into disorder. A steam-hammer at the Essen steel-works, in Prussia, works upon an *A.* weighing 105 tons. *A.*, ranging in weight from 28 lbs. to 6 cwt., are extensively manuf. in Pennsylvania, New Jersey, Massachusetts, Connecticut, and other parts of the U. States. They are, however, still largely imported from England, where the principal manuf. are at Birmingham, Dudley, and Sheffield. Imp. duty, 2½ cts. per lb.

**Apiary**, a place for keeping bees.

**Apothecaries' Weight**, the weight by which drugs are dispensed, differing only from the common troy weight in its subdivision. The ounce is divided into 8 drachms, 24 scruples, or 480 grains.

**Apparel**, in the official returns of imports numerous small articles of dress are grouped under this name; but in trade the term is usually applied to ready-made clothing and millinery. *A.* is also the name frequently given to the furniture of a ship, consisting of the sails, rigging, anchors, etc.

**Apple**, a well-known fruit, the numerous varieties of which are obtained by grafting on the *Pyrus malus*. About 1,000 varieties are cultivated in the U. States, and form an important article of commerce. In 1878, the exports of green or ripe *A.*, chiefly to England and Canada, amounted to 279,447 bushels, valued at \$386,261, and the exports of dried *A.*, chiefly to Germany and Canada, amounted to 4,188,173 lbs., valued at \$260,085.

**Apple-Brandy**, **APPLE-JACK**, **APPLE-WHISKEY**, a liquid distilled from cider.

**Appliqué Lace**, a name given to lace when the patterns have been cut out and sewn on a foundation of net; by this means the same patterns may be transferred from a veil to a scarf or lappet, and they will wear out several foundations.

**Appraisement**, or APPRAISAL, is the term applied to the valuation of foreign merchandise on

its arrival at any port in the U. States, by customs-house officers called appraisers.

*Regulations.*—1. No merchandise liable to be inspected or appraised is delivered from the custody of the officers of the customs, until the same has been inspected or appraised, or until the packages are found correctly and fairly invoiced and put up, and so reported to the collector. The collector may, however, at the request of the owner, importer, consignee, or agent, take bonds, with approved security, in double the estimated value of such merchandise, conditioned that it shall be delivered to the order of the collector, at any time within ten days after the package sent to the public stores has been appraised, and reported to the collector. If, in the meantime, any package is opened, without the consent of the collector or surveyor given in writing, or if the package is not delivered to the order of the collector, according to the condition of the bond, the bond is, in either case, forfeited.

2. The collector designates on the invoice at least one package of every invoice, and one package at least of every ten packages of merchandise, to be opened, examined, and appraised, and orders the package so designated to the public stores for examination; and if any package is found by the appraisers to contain any article not specified in the invoice, and a majority of them is of opinion that such article was omitted in the invoice with fraudulent intent on the part of the shipper, owner, or agent, the contents of the entire package in which the article may be is liable to seizure and forfeiture, on conviction thereof before any court of competent jurisdiction; but if the appraisers are of opinion that no such fraudulent intent existed, then the value of such article is added to the entry, and the duties thereon paid accordingly, and the same is delivered to the importer, agent, or consignee.

3. It is the duty of every appraiser of the U. States, by all reasonable ways and means in his power, to ascertain, estimate, and appraise the true and actual market-value and wholesale price, any invoice or affidavit thereto to the contrary notwithstanding, of the merchandise, at the time of exportation, and in the principal markets of the country whence the same has been imported into the U. States, and the number of such yards, parcels, or quantities, and such actual market-value or wholesale price of every of them, as the case may be.

4. When the duty upon any imports is subject to be levied upon the true market-value of such imports in the principal markets of the country from whence the importation has been made, or at the port of exportation, the duty is estimated and collected upon the value on the day of actual shipment, whenever a bill of lading must be presented showing the date of shipment. If the value is \$100, or above, the bill of lading must be certified by a certificate of the U. States consul.

5. When an ad valorem rate of duty is imposed on any imported merchandise, or when the duty imposed is regulated by, or directed to be estimated or based upon, the value of the square yard, or of any specific quantity or parcel of such merchandise, the appraisement is made on the actual market-value, or wholesale price thereof, at the period of the exportation to the U. States, in the principal markets of the country from which the same has been imported, and the value such appraised is considered the value upon which duty must be assessed.

6. In determining the dutiable value of merchandise, are added to the cost, or to the actual wholesale price or general market-value, the cost of transportation, shipment, and transshipment, with all the expenses included, from the place of growth, production, or manufacture, whether by land or water, to the vessel in which shipment is made to the U. States; the value of the sack, box, or covering of any kind in which such merchandise is contained; commission at the usual rates, but in no case less than  $2\frac{1}{2}$  per centum; and brokerage, export duty, and all other actual or usual charges for putting up, preparing, and packing for transportation or shipment. All charges of a general character incurred in the purchase of a general invoice, are distributed pro rata among all parts of such invoice; and every part thereof charged with duties based on value, is advanced according to its proportion.

7. When the actual value to be appraised, estimated, as ascertained as hereinbefore stated, exceeds by ten per centum or more the invoice value, then, in addition to the duty imposed by law on the same, there is levied and collected on such merchandise twenty per centum of the duty imposed on the same, when fairly invoiced.

8. When merchandise of the same material or description, but of different values, is invoiced at an average price, and not otherwise provided for, the duty is assessed upon the whole invoice at the rate to which the highest valued goods in such invoice are subject.

9. If, on the opening of any package, a deficiency of any article is found, on examination by the appraisers, the same must be certified to the collector on the invoice, and an allowance for the same is made in estimating the duties.

10. In respect to articles that have been damaged during the voyage, the appraisers must ascertain and certify to what rate or percentage the damage is to be deducted from the original amount, subject to a duty ad valorem, or from the

actual or original number, weight, or measure, on which specific duties would have been computed.

11. If the importer is dissatisfied with the appraisement, he may give notice to the collector, in writing, of such dissatisfaction; on the receipt of which the collector selects an experienced merchant to be associated with one of the general appraisers, to re-examine and appraise the goods. If they disagree, the collector decides between them; and the appraisement thus determined is final, and deemed to be the true value on which the duties are to be levied.

12. Any person who wilfully and corruptly swears falsely on an examination before any appraiser, or collector and naval officer, is deemed guilty of perjury; and if he is the owner, importer, or consignee, the merchandise is forfeited.

**Apprentice**, is an individual (generally under the age of twenty-one) who is subjected to an engagement to serve for a stipulated period under the practice of some trade or profession, in matters referring thereto, on condition of receiving instruction in return.

*In the U. States*, every male infant, and every unmarried female under the age of 18 years, with the consent of the persons or officers hereinafter mentioned, may, of his or her own free will, bind himself, or herself, in writing, to serve as clerk, apprentice, or servant, in any profession, trade, or employment; if a male, until the age of 21 years; and if female, until the age of 18 years, or for any shorter time: such binding will be as valid and effectual as if the infant were of full age at the time of making the engagement.—Such consent must be given by the father of the infant. If he be dead, or be not in a legal capacity to give his consent, by the mother. If the mother be dead, or be not in a legal capacity to give consent, or refuse, by the guardian of such infant duly appointed.—Such consent must be signified in writing, by the person entitled to give the same, by a certificate at the end of, or indorsed upon, the indenture.—The executors of any last will of a father, who shall be directed in such will to bring up his child to some trade or calling, may bind such child to service, in like manner as the father might have done. The county superintendents of the poor may, in like manner, bind out any child, under the ages above specified, who shall be sent to a county poor-house, to be clerk, apprentice, or servant. The overseers of the poor of any town or city possess the like power in such town or city, with the consent, in writing, of any two justices of the peace of the town, or of the mayor, recorder, and alderman of any city, or of any two of them.—The age of every infant bound as aforesaid must be inserted in the indenture, and will be taken as being the true age without further proof thereof; and public officers who act in such cases should inform themselves fully of the infant's age. Every sum of money paid, or agreed for, in relation to the binding out of any clerk, or apprentice, must also be inserted in the indenture.—Whenever any child is bound out by the county superintendents, or the overseers of the poor, the person to whom the infant may be bound must enter into an agreement, to be inserted in the indentures, that he will cause such child to be instructed to read and write (if a male, to be also instructed in the general rules of arithmetic), and that he will give such apprentice, at the expiration of his or her service, a new Bible. The counterpart of any indentures executed by the county superintendents must be deposited in the office of the clerk of their county; the overseers of the poor will deposit it in the clerk's office of their city or town.—No indenture, or contract, for the service of any apprentice, is valid, as against the person whose

services may be claimed, unless made in the manner above prescribed.—The master is entitled to all the earnings of the apprentice.—A guardian is liable, although the apprentice has gone off and left his master.—An apprentice is not assignable, although the assignment would be valid as a covenant for the services of the apprentice.—An apprentice cannot recover of an assignee, or an implied promise, where service has been voluntarily rendered.—The laws of this country recognize no general authority in a father to dispose of his children, except for some specific and temporary purpose, such as apprenticeships during the father's life, or guardianships after his death.—If any person lawfully bound to service, as above mentioned, wilfully absent himself without leave, he must serve double the time of such absence, unless he shall otherwise make satisfaction, but

be well founded, they must either commit the apprentice to solitary confinement in the common jail of the county, for a term not exceeding one month, then to be employed at hard labor; or discharge the offending apprentice from his service, and the master from his obligations; or in case of ill usage by the master, discharge the apprentice from his obligation of service.—The above statutory provisions in relation to apprentices willfully absenting themselves, refusing to serve, or being guilty of any misdemeanor or ill behavior; and masters guilty of ill usage, etc., do not extend to such cases where the master or mistress has received, or is entitled to, any sum of money as a compensation for instruction.—In cases where money has been paid, or agreed to be paid, any justice of the peace of the county, or any mayor, recorder, or alderman of the city in which the

apprentice resides, has the power of inquiring into all disputes in relation thereto, and of making such order and direction as the equity of the case may require. If the difficulty cannot be reconciled, the master or the apprentice may be recognized, in such sureties as the officer will approve, for his appearance at the next Court of Sessions, and such Court, on hearing the parties, may either discharge the apprentice from service, or order the sum of money to be paid, or to be refunded; or, if not paid, discharge the same, and direct the securities to be cancelled; or punish the apprentice by fine, or imprisonment, or both, as for a misdemeanor.—*J. S. Jenkins.*

**Apricot**, is the fruit of *Prunus Armeniaca*, a native of Armenia, extensively cultivated in Europe. It is nearly related to the plum. It ripens earlier than the peach, which it resembles in some respects. The color of the *A.* is mostly yellow, with a red, brown, or yellow cheek on the side which is most exposed to the sun. It is propagated by budding on plum, peach, or wild cherry stocks. The *A.* is of inconsiderable commercial importance in America.

**Apron**, a lady's or workman's covering for the person; the sill of a window; a platform raised at the entrance of a dock; a false or inner stem above the foremost part of the keel.

**Aps**, a common name for the wood of the white poplar (*Populus alba*), extensively used for toys and common turnery purposes.

**Aqua Fortis**, an old term for dilute nitric acid.

**Aqua Marine**. See **BERYL**.

**Aqua Regia**. See **CHLORINE**.

**Aquarium**, or **VIVARIUM**, is a tank or vessel (Fig. 16), in which living specimens of aquatic animals and plants are maintained. When an *A.* is provided with plants and animals in proper proportion, both will be easily kept healthy; the plants, under the action of light, consuming the carbonic acid gas given forth by the animals, and consequently restoring to the air, or water in which they live, the oxygen necessary for the maintenance of animal life. It is, however, necessary, for maintaining the uniform composition of the air in the water, to add certain animals which feed on

Fig. 16. — AQUARIUM.

such additional term of service cannot extend beyond three years next after the expiration of the original term.—If any person refuses to serve, any justice of the peace of the county, or the mayor, recorder, or any alderman of the city where he shall reside, has the power to commit him to jail.—If any apprentice is guilty of any misdemeanor or ill behavior; or if any master be guilty of any cruelty, misusage, or refusal of any necessary provisions or clothing, or of a violation of the terms of the indenture, complaint may be made to any two justices of the peace of the county, or to the mayor, recorder, and alderman of the city, or any two of them, who will summon the parties before them and examine into the grounds of complaint; and if the same prove to

decomposing animal matter; such are the various species of molluscous animals, as the snail, etc. In some cases, when the supply is continuous, the fresh water maintains a healthy condition; and the same effect is obtained by a succession of bubbles of air introduced into, and ascending through, the water, to maintain the natural equilibrium destroyed by the animals breathing therein. Agitation of the water produces the same results more or less perfectly, but the effect is not so pleasing unless it is introduced with scenic devices or machines, such as paddles, self-acting fountains, etc.

**Aquatint**, a style of engraving, or rather etching on copper, by which an effect is produced similar to that of a drawing in Indian ink. It is now almost out of use.

**Aqua Vitæ**, [Fr. *eau de vie*,] a term absurdly applied to ardent spirits.

**Arabia**, an extensive region of Asia, extending from lat. 12° to 34° N. and lon. 33° to 60° E. It is bounded N. by Turkey in Asia; W. by the Red Sea and the Isthmus of Suez; S. by the Indian Ocean; and E. by the Persian Gulf. Area, 1,200,000 sq. m. *A.* is subject to a great variety of rulers, and its pop., vaguely estimated at 10,000,000, is composed partly of the commercial inhabitants of the coast, who form a regular society, and partly of *Bedouins* or pastoral Arabs, who live in tents, and subsist by their flocks, or by the plunder of passing caravans. *A.* is proverbially an arid country. Scarcely a single river exists; and almost the whole of the interior is occupied with sandy deserts—diversified only by a few oases or spots of fertility. Some of the districts of the coast, however, particularly Zemen, are fertile and beautiful. The *Hejaz*, or Sheriffat of Mecca, comprising the N. and W. part, bordering on the Red Sea, is the holy land of the Mohammedans, on account of its containing Mecca, the native town of Mohammed, and Medina, the city where he is interred. The chief products are coffee, which is grown in Yemen, at Bulgosa, near Beit-el-Fakih, gum-arabic, dates, pomegranates, figs, oranges, opobalsam, and a variety of odoriferous plants. Senna and the cotton-tree are also cultivated in Yemen; and indigo is cultivated about Zebir. There are no mines of the precious metals. *A.* has long been celebrated for its horses; the best are bred in the desert bordering on Syria. The native measures cannot be stated with accuracy. The Egyptian measures, weights, and moneys are now much used. The principal seaports are JIDDAH, MOCHIA, and MUSCAT, q. v. See also CARAVAN.

**Arabic Gum**. See GUM-ARABIC.

**Arachis Oil**. See NUT OIL.

**Aragu**, crude stick-lac taken from the tree.

**Arbitration**, is a contract by which two or more parties engaged in a dispute agree, by an instrument called a submission, to leave the decision to a third party, called an arbiter or arbitrator. The submission is generally in the form of mutual bonds, binding each to obey the award under penalties. In contracts of partnership, it is usual, in many places, to insert conditions of *A.* which have the effect of preventing one member from resorting to a law-suit, unless a reference has proved ineffectual, or the others have refused to accede to it. The proper subjects of *A.* are those questions as to fact, which are generally referred to a jury—a liquid debt specified and defined by deed is

therefore not a proper subject. Where there is more than one arbiter, there is generally authority to choose an umpire if they cannot come to a decision—and this last must be selected by voluntary choice, not by lot. The object of *A.* is a final determination, and so a restriction is void. Upon proving the submission and the award, by the affidavit of the subscribing witness, or by the affidavit of the arbiters, within one year after making such award, the court (which must be designated in such submission) shall, by rule, in open court, confirm the award made in pursuance thereof, unless the same be vacated or modified, or a decision thereon be postponed. The courts exercise considerable discretion in overlooking minute deficiencies, and allowing the evident meaning and intention of the various parties to be put in practice; and though an award be void as to some portion of it, yet, if it be specific in assigning to the parties the rights which the arbiters intended to bestow on them, it will be good as to the remainder. When a time is limited for making an award it cannot be protracted, except by prolongation consented to by parties, or permitted by rule of court. The courts will not relieve a person who has voluntarily submitted his case to an arbiter from the consequences of the decision, unless on grounds of corruption, partiality, or mistake.

**Arbitration of Exchange**, is the deduction of a proportional or arbitrated rate of exchange between two places through an intermediate place, in order to ascertain the most advantageous method of drawing or remitting. See EXCHANGE.

**Arbois**. See VIN DE PAILLE.

**Arbor**, a term used by watch-makers and others for an axis or spindle.

**Archangel**. See RUSSIA.

**Archil**. See ORCHIL.

**Archim**, or *PIK*, the Turkish ell = 30 inches.

**Ardel**, an Egyptian weight = 226 lbs.

**Ardent Spirits**, alcoholic liquors.

**Ardoise**, the French name for slate.

**Are**, the unit of the French measures of surface, equal to 100 sq. metres = 119.6 sq. yards.—*Centare*, equal to 1 sq. metre = 1.550 sq. inches.—*Heclare*, equal to 10,000 sq. metres = 2.471 acres.

**Areca Nut**. See BETEL-NUT.

**Areometer**. See HYDROMETER.

**Argand Lamp**, a burner or lamp in common use, with a circular wick to admit a double current of air.

**Argent**, the French name for silver metal and for coined money.

**Argentan**. See GERMAN SILVER.

**Argentiferous**, containing or yielding silver.

**Argentine**, a white metal coated with silver.

**Argentine Confederation**, [Sp. *Confederacion Argentina*,] a group of States of South America, lying between lat. 22° and 41° S., and lon. 57° and 70° W., formerly part of the Spanish viceroyalty of Buenos Ayres. Their constitution, which bears date May 15, 1853, is similar to that of the U. States, and the president is elected for 6 years by representatives of the 14 provinces. Area, 515,700 sq. m.; pop. 1,736,922.

The chain of the Andes runs along the whole western boundary, and the country for several hundred miles to the E. of this chain, is generally mountainous. The territory E. of the river Parana is waving, well watered, and fertile; but the district between that river and the mountains, extending from N. to S. through the whole length of the country, consists of extensive plains. In the N. these plains are in many parts liable to be overflowed; in the S. they are called *pampa*, and are remarkably dry, and destitute of trees. The country

is chiefly celebrated for the countless herds of wild cattle and horses, which roam in the vast natural pastures of the plains, and whose hides and tallow at present constitute the chief source of wealth. The land in the vicinity of the towns is generally cultivated, producing wheat, Indian corn, and barley, together with the sugar-cane, orange, cocoa, fig, olive, and vine. The public debt, amounting to \$62,301,795, is for the most part in the hands of English bankers. The public revenue assigned to the central government is derived almost entirely from custom duties, which are very heavy. The public expenditures invariably exceed, at times very largely, the annual revenue. The *A. C.* has 991 m. of R.R. opened for traffic, and 311 m. in construction. The various lines are mainly constructed at the expense of the State.

The external commerce of the country is conducted entirely at the city of *Buenos Ayres*, the cap. of the republic, which is the outlet for the produce not only of the whole valley of the river *La Plata*, but also of large districts of Peru and Chili. It is a fine, healthy town, situated in lat.  $34^{\circ} 36'$  S., lon.  $58^{\circ} 24'$  W., on the right bank of the estuary of the river *La Plata*, and 150 n. from the ocean, almost facing Montevideo, which stands on the opposite bank of the river. Pop. 180,000. The river is here 35 m. broad, but so shallow in most parts that large vessels have to unload by means of lighters in the outer roads, distant 8 m. from the port; while small vessels cannot approach nearer than the inner roads, distant about 2 m. Even open boats cannot be brought close to the beach, and have to land, at no little risk, goods and passengers in rudely constructed carts. In 1877, the exports, made up to the amount of more than one-half by wool and tallow, amounted to \$46,535,700. The imports, which in 1873 amounted to \$7,065,195, had fallen, in 1877, to \$34,910,290, the decrease being gradual. The foreign trade is chiefly with England and France, but the trade with the U. States is rapidly increasing. In 1873 it was as follows: Exports, \$1,049,367, consisting chiefly of sheep's and alpaca wool, and hides and skins; imports, \$2,013,587, chiefly made up by household furniture, boards, tobacco, cotton manufactures, spirits, starch, lard, petroleum, paper, perfumery, etc. During the same year, 41 American vessels (tonnage 20,940) entered the port, and 59 vessels (tonnage 30,945) sailed from it.—*Weights and Measures*, same as Spain.—*Money*. The silver *peso fuerte*, or silver dollar of 100 centesimos = \$0.965. The circulating medium is chiefly composed of government paper money, called *peso*, which, by its overissue, has depreciated the value of the dollar to about 50 cents.

**Argol**, a common name for crude tartar, in the state in which it is taken from the inside of wine vats. See **TARTAR**.

**Arica**. See **PERU**.

**Arindi**, an East Indian agent or broker.

**Aristolochia**, or **SNAKE-ROOT**, [*F. serpentina*; Ger. *Virginische schlangennurzel*,] the dried root of the *A. serpentaria*, or Virginian snake-root. It consists of a short stock or head, with numerous rootlets three inches or more in length, thready, interlaced, and brittle; skin greenish-yellow or brown, and pith iron-colored. In odor and taste it resembles valerian and camphor. The root is all used, but the rootlets are more powerful than the solid part. It is employed in medicine, and its action is similar to that of camphor. *A.* is exported to Europe from Virginia and the Carolinas.

**Arizona**, a Western territory of the U. States, bounded on the W. by the Rio Colorado, on the E. by lon.  $109^{\circ}$  W. to the parallel of lat.  $32^{\circ} 40'$ , and thence N. W. to the Colorado River; on the S. by Sonora, on the boundary line between the U. States and Mexico, N. by the territory of Utah; area, 113,916 sq. m. The general surface is considerably elevated above the sea-level, and consists of wide plateaus, occasionally crossed by ranges of high mountains, and diversified by towering isolated peaks. Climate eminently salubrious throughout the year. The Little Colorado, Bill William's Fork, and Gila rivers, drain the whole territory. There is a considerable amount of land capable of irrigation, immense areas of grazing land, and abundance of mineral wealth. Gold, silver, iron, tin, gypsum, nickel, platinum, and copper. Cap. Tucson, in the valley of the Sta. Cruz. Other important places are Arizona City, Florence, Phoenix, Prescott, and Wickenburg. Pop. 9,658.

**Arkansas**, a South-western State of the U.

States, bounded N. by Missouri, E. by the Missouri River, S. by Louisiana and Texas, and W. by Texas and Indian Territory. It lies between  $33^{\circ}$  and  $36^{\circ} 30'$  N. lat., and between  $89^{\circ} 45'$  and  $74^{\circ} 40'$  W. lon. Area, 52,198 sq. m., or 33,406,720 acres, on which only about 2,000,000

Fig. 17.—SEAL OF ARKANSAS.

acres consist of improved land. The eastern portion of *A.*, for a breadth of from 30 to 100 m. from the Mississippi, is a low marshy plain, abounding in lagoons, and for the most part subject to the annual overflow of the Mississippi, and its tributaries. Toward the centre of the State, the land rises into hills, enlarging into the Ozark Mountains, the highest elevation of which is not over 2,000 feet. Besides the Arkansas River, that passes wholly through the State from W. to E., and the Mississippi, which receives all its waters, *A.* is drained in the N. E. by the White River and the St. Francis; in the S. W. by Red River; and in the S. by the Washita. The climate is moist and unhealthy in the E. part of the State, especially along the Arkansas River, but in the middle and W. parts it is comparatively salubrious. The soil is exceedingly fertile on the borders of the rivers, but as it recedes from them it becomes poorer, and barren in some of the more elevated parts. The staple products are cotton, Indian corn, and live-stock. *A.* has not engaged in manufactures to any considerable extent. Its principal towns are Little Rock (the cap.), Helena, Arkansas Post, Pine Bluff, and Fort Smith. Pop. 484,471.

**Arkansas Central R.R.**, in progress, to run from Helena to Little Rock, Arkansas, a distance of 114 miles, with branches 264 miles. Offices at Helena. This Co. was formed by the consolidation of the Arkansas Midland and the Little Rock and Helena; it received State aid to the extent of \$15,000 per m., 30 year 6% bonds, and county subsidies to the extent of \$700,000 or \$800,000 in bonds. The State also made a grant of 200,000 acres of land. Defaulted 1 Jan., 1874, in hands of receiver March, 1876, and sold in foreclosure 22 July, 1877. No reorganization yet effected. *Financial Statement* before sale: Cap. stock authorized, \$2,500,000; funded debt, 1st mortgage 8% gold bonds, dated 1 July, 1871, and due in 20 years (guaranteed by State), \$720,000, and 2d mortgage 7% gold bonds, dated 1 April, 1873, and due in 20 years, \$700,000.

**Arkansas Valley R.R.**, runs from Kit Carson to Puebla, Col., a distance of 140 m., of which 75.5 m. only are in operation. It was chart. in 1872, and sold under foreclosure 8 May, 1878, to purchasing committee for bondholders. *Financial Statement*: Cap. stock authorized, \$3,000,000; paid in, \$1,520,000; funded debt (\$20,000 per m.), \$1,125,000. Total stock and bonds, \$2,645,000. Funded debt, 1st mortgage bonds, dated 1 April, 1873, payable 1903, interest 7% (April and Nov.). Offices at St. Louis, Mo. Net earnings, \$9,640.88.

**Armateur**, the French name for a shipowner, or one who fits out a ship for a voyage.

**Armenian Bole**, a soft earth of a bright red

color, found in some parts of Europe, and also in India, where it is used in medicine, and also in native painting and gilding. It is imported from England as a dentifrice, and as a pigment. *Imp.* duty, 50 per cent.

**Armenian Stone.** See LAPIS-LAZULI.

**Armor**, a general term for defensive weapons and clothing. The *Imp.* duty on ancient armors, or modern imitations of the same, is 35 per cent.

**Arms and Ammunition.** See GUN, GUN-POWDER, etc.

**Armures**, are woollen, worsted, or other fabrics so woven as to produce on the surface a diagonal or other ridge.

**Arnica**, an herbaceous plant, *A. montana*, also called leopard's bane. The root, leaves, and flowers are poisonous when swallowed, and are even irritant to the skin, but are administered as a stimulant in paralytic affections, fevers, and other diseases. They are also applied with benefit for bruises. They contain a volatile oil, a resin, and the alkaloid *arnicine*.

**Arnotto.** See ANNOTTO.

**Aromatics**, are substances possessing a fragrant aroma, and usually a warm pungent taste. They are mostly obtained by distillation from flowers, leaves, roots, etc. They are largely used in the manuf. of cosmetics and other articles for the toilet; also in medicine.

**Aromatic Vinegar**, is nothing but ordinary vinegar, flavored and scented with certain essential oils, such as those of cloves, lavender, and rosemary.

**Arrack**, a common East Indian name for spirituous liquors of all kinds. *A.* was formerly prepared in considerable quantity at Goa, but the principal seats of manufacture at present are the islands of Java and Ceylon. In the former, it is commonly termed *kneip*, and is made from a mixture of 62 parts molasses, 35 parts rice, and 3 parts of the sweet juice called palm-wine or toddy, extracted from the flowers of different species of palm-trees. In the latter, it is entirely distilled from cocoa-nut tree toddy. Ceylon *A.* is reckoned superior to that of Java. In India, it is prepared from the flowers of the *Bassia longifolia*, the *Mah-wah* tree, and the *Bassia latifolia*. In Turkey, it is distilled from the skins of grapes, and flavored with aniseed. *A.* is mostly imported into the U. States from Batavia, by way of Holland.

**Arroba**, a Spanish and Portuguese weight; also a Spanish measure of capacity. It varies in different places. The *A. weight*, Spanish standard = 25·36 lbs. avoirdupois; Alicante, 27·38 do.; Valencia, 28·25 do.; Arragon, 27·76 do.; Portugal, 32·38 do.; Argentine Rep., Bolivia, Costa Rica, Guatemala, Honduras, Mexico, Nicaragua, Paraguay, Peru, San Domingo, San Salvador, Uruguay, Venezuela, 25·36 do.; Brazil, 32·38 do.—The *A. measure of capacity*—Spanish standard for wine = 3·54 imp. galls., and for oil = 2·78 do. In all the above-named South American republics, it is equal to the Spanish standard.

**Arrowroot**, a farinaceous substance procured in various parts of America, the West Indies, and Ceylon, from the root of the *Maranta arundinacea*; and in India, from the tubers of the *Corchorus augustifolia*. It is prepared in nearly the same manner as starch; and when good, should be free from all musty flavor, white, insipid, and form a consistent jelly when dissolved in 8 parts of boiling water. It retains its nourishing property unimpaired for

many years. *A.* forms a common article of food for children and invalids. It is now largely manufactured in Florida, but the best is imported from Bermuda, and commands in New York an average price of 40 cts. per lb. It is frequently adulterated with potato starch, and great care is necessary in purchasing it. *Imp.* duty, 30 per cent.

**Arrow-Ties**, are the iron fastener or buckle, and the hoop-iron used instead of rope in baling cotton.

**Arsenic**, [Fr. *arsenic*; Ger. *arsenik*,] an exceedingly brittle metal of a strong metallic lustre, and white color, running into steel-gray. Sp. gr. 5·9. This substance, however, being very soft, is of little value, and is not used in the arts. The *A.* of commerce is the *white oxide* of that metal, or more correctly *arsenious acid*, a compound which is obtained chiefly in Bohemia and Saxony, in roasting the cobalt ores for making zaffre, and also by sublimation from arsenical pyrites. It is brittle, white, faintly sweetish in taste, more or less translucent, and is generally met with in cakes, or their fragments, retaining the shape of the subliming vessel; sometimes it has a yellow or reddish tinge, owing to the presence of iron, sulphur, and other impurities; from these it is freed for pharmaceutical use by resublimation, when it is often obtained in vitreous transparent cakes, which, however, soon grow opaque and crumble. Sp. gr. 3·72. In the shops it is commonly offered for sale in the form of a fine smooth powder, which is liable to adulteration with chalk and gypsum; but the fraud is easily detected by exposing the suspected substance to heat, when the pure acid is entirely sublimed, and the additions remain. Arsenious acid, though one of the most virulent poisons, is used in medicine. It is also employed as an ingredient in the *Scheel's Green* and other dyes, in the manufacture of flint-glass, etc. *Imp.* (*A.* and crude arsenious acid) free. *A.* forms with sulphur, two compounds, which are known in commerce under the names of **REALGAR** and **ORPIMENT**, q. v.

**Arsenic-Weight**, the Dutch apothecaries' weight, the pound of which is equal to  $\frac{3}{4}$  of a pound avoirdupois, and, like it, subdivided into 16 ozs.

**Arsheen**, a Russian cloth measure = 28 inches, or 0·71 French metre.

**Artata**, a Persian measure of capacity = 1·809 bushel.

**Artesian Well**, a well sunk to a great depth by boring, to reach the spring and insure a continuous supply of pure water, or to sink surface refuse.

**Artichoke**, [Fr. *artichaut*,] an esculent vegetable (*Cynara scolymus*), having large perennial roots and annual stems, bearing large round heads. Each of these is composed of numerous oval calycinal scales, inclosing the florets, sitting on a broad fleshy receptacle; this and the fleshy bases of the scales, the only eatable parts of the plant, are gathered before the expansion of the flowers. The *A.* is not cultivated in this country, but preserved *A.* are occasionally imported from France.

**Jerusalem Artichokes** are the tubers of the *Helianthus tuberosus*, a kind of sunflower. This name is due to its strange resemblance in taste to the real *A.* They also form occasionally an article of importation, either in the tuber or in oil.

**Artificial Flowers.** See FLOWERS, ARTIFICIAL.

**Artificial Limbs.** See LIMBS, ARTIFICIAL.  
**Arzeneiwaaren**, the German name for drugs or medical preparations.

**Asarabaca**, [Fr. *assaret*; Ger. *haselkraut*,] the root and leaves of the *Asarum Europæum*, a perennial plant, indigenous in W. Europe, but generally imported from the Levant. It contains a camphor-like principle, and a bitter essence which is combined with gallic acid. It is used in veterinary medicine, and also as an ingredient in most of the cephalic snuffs.

**Asbestos**, AMIANTHUS, or MOUNTAIN FLAX, [Lat. *amianthus asbestinum*; Ger. *asbert*; Fr. *ami-anthe*; Sp. *asbesto*, *alumbre de pluma*; Port. *asbestos*; It. *asbesto*,] a mineral (Fig. 18), of which there are several varieties, all more or less fibrous, flexible, and elastic, some very compact, and capable of being reduced to impalpable fibre. It is in-consumable by a high degree of heat, and in antiquity the art was discovered of drawing the fibres into threads, and then weaving them into cloth. In the Tarentaise of Savoy, a variety of *A.* exists, of which the threads are entirely separated, and of a brilliant whiteness, and capable of being elongated to upwards of ten times their original length. Cloths and even lace have been prepared from the

used for roofing, steam-pipe and boiler coverings, fire-proof sheathings, coatings, cements, paints, etc.

**Ash**, [Fr. *frêne*,] a tree of which there are many varieties. (Fig. 19.) The white ash (*Fraxinus Americana*), which abounds in the forests of the Northern States and in Canada, and the common ash (*F. excelsior*) of Europe, are very useful on account of their rapid growth, and the excellence of their hard, tough wood. The timber of the white ash is largely used for agricultural implements. It is also esteemed for the purposes of the coachmaker, cooper, and turner; and for ladders, poles, and other purposes which require strength, elasticity, and comparative lightness; while the underwood is excellent for hoops, rods, etc. It is, however, quite unsuitable for building purposes, as it neither stands moisture nor the weather.

**Ashes**, the saline and earthy particles of burnt substances. See BARILLA, KELP, POTASH, etc.

**Ashlar**, a name given to rough stones; and to freestones when they are first taken out of the quarry. The term is also applied to a facing made of nicely squared stones; the subordinate terms being *tooled*, *polished*, or *rustic*, according to the mode in which the surface is treated. See MASONRY.

**Ashore**. A ship is said to be *A.* when she has run upon the ground, or on the sea-coast, either by accident or design.

**Ashrafi**, or ASHRUFI, an East Indian coin, the gold mohur, worth 16 rupees, or \$8.

**Ashtabula, Youngstown, and Pittsburgh R.R.**, runs from Youngstown to Ashtabula Harbor, O., a distance of 62.6 m. Offices at Ashtabula. Organized 11th Feb., 1870. Leased from its opening (May, 1873) to the Pennsylvania Co. *Financial Statement*: Share capital paid in, \$1,817,880; funded debt, \$2,000,000; other liabilities, \$197,085.36; cost of R.R., appurtenances, and docks, \$3,782,225.37. Other assets, \$48,739.50; balance debt of income account, \$184,000.48; bonds, 1st mortgage, \$1,500,000, due 1901, interest 7% (April and Oct.); 2d mortgage income, \$500,000, due 1894, interest 7% (Jan. and July). Net earnings for 1877, \$77,330.76.

**Asparagus**, [Fr. *asperge*,] a well-known esculent vegetable (*A. officinalis*), having a perennial root and annual stalks. The stems are cut for use when only a few inches above ground. This highly esteemed vegetable is extensively cultivated in most of the States.

**Asphaltum**, a species of bitumen produced by the decomposition of vegetable matter. It is solid, brittle, of a black color, vitreous lustre, and conchoidal fracture. It melts easily, and is very inflammable—burning, when pure, without leaving ashes. Sp. gr. from 1 to 1.5. It abounds on the shores and surface of the Dead Sea, in Barbadoes, and in Trinidad, where it fills a basin of 3 m. of circumference, and of a thickness unknown. A gentle heat renders it ductile, and when used with grease or common pitch, it is used for coating the bottoms of ships, and is said to protect them from the teredo of the West Indies seas. Trinidad *A.* is imported to a considerable extent into the U. States, where it is used in the fabrication of vari-

FIG. 18. — ASBESTOS.  
 (From an Italian specimen weighing 114 lbs.)

*A.* derived from this locality. Paper has also been made of it. The varieties of *A.* are twisted *A.*, which is of a dirty gray or whitish-yellow color, and sometimes exists in thick spongy pieces, being then vulgarly called *fossil flesh*; sometimes it resembles, and is called, *fossil cork*; occasionally, when of a hard, membranous character, is called *fossil leather*; and the thinner and more flexible kinds of the same character are termed *fossil paper*. The woody *A.* is of a reddish-brown color, and resembles splinters of wood. *A.* is used to a considerable extent for burning in gas-stoves; incombustible paper has been made from it. *A.* is found in Piedmont, Savoy, Salzburg, the Tyrol, Dauphiné, Hungary, Silesia, Corsica, Cape of Good Hope, N. of Scotland, and Siberia. An ordinary quality of but little value is found at Staten Island, near New York. *A.* of various grades is also found abundantly in other parts of the U. States. *Imp.* free; when manufactured, duty 25 per cent. Several patents have been granted to Mr. H. W. Johns, of New York, who is the original inventor of nearly all the practical applications of *A.*, and has made its valuable properties known in all parts of the civilized world. *A.* is now extensively

ous road and roof coverings, and for other kindred purposes.—*A. rock* is a bituminous limestone found at Seyssel and at Val-de-Travers. It contains about 85 per cent. of carbonate of lime, and 15 per cent. of bitumen. Sp. gr. 2.4. Though easily scratched with the finger-nail, it is difficult to break up with the hammer, showing malleable properties under the blows. It is superior for every purpose to the Trinidad *A.*—Bituminous mastic, sometimes called *asphaltic mastic* or *asphaltic cement*, is generally composed of mineral tar and some calcareous, silicious, or earthy substances in powder. *Imp. duty* on *A.*, 25 per cent.

Fig. 19.—FLOWERING ASH (*Frazinus ornus*).

**Aspic**, a name for the oil of spike obtained from *Lavendula spica*.

**Aspinwall**. See COLOMBIA (UNITED STATES OF).

**Ass**, a domestic quadruped (Fig. 20) resembling the horse, but much inferior to that animal, both in beauty and utility. The ass has nearly the same mouth-marks as the horse, takes from 2 to 3 years in growing, and lives from 25 to 30. It is less subject to disease than the other, and, being content with scanty and coarse fare, is employed in England, Germany, France, etc., by poor people in drawing small carts and in carrying burdens; the female is, besides, valued for her milk. The abject condition of this creature in northern climes is in part owing to its never being the subject of attention. In Eastern countries, particularly in Arabia, where the breed is not only carefully tended, but frequently improved by inter-course with the fleet and fiery onager (or wild ass), it is an animal of great strength and considerable beauty.

**Assafœtida**, [Fr., It., and Por., *assafetida*; Ger. *stinkender asand*; Ar. *hilleet*; Per. *ungoozeh*,] a medicinal gum-resin, composed of the juice of the roots of the *ferula assafetida*, a large umbelliferous plant growing in the prov. of Khorassan and Laristan, in Persia. In its recent state it is white and semi-fluid, but by exposure to the sun it gradually hardens, and assumes a reddish color. In trade it is met with in large, irregular agglutinated masses of a waxy consistence, having a motley appearance owing to the mixture of white drops with others of a violet, red, and brown tint. It has a nauseous alliaceous smell, and a bitterish acrid taste. Those masses are to be selected which

are clear, of a pale reddish color, and variegated with a number of elegant white drops or tears. An inferior kind, full of sand and very fetid, is said to be a compound of garlic, sagapenum, turpentine, and a little of the real gum. *A.* loses some of its smell and strength by keeping; it should, therefore, be preserved in bladders shut up in tin boxes, and kept apart. It is imported in mats, casks, and cans, from England, which country receives it from India, whence it is exported from Persia. The Treasury regulations of the U. States require it to contain 50 per cent. of its peculiar bitter resin, and 3 per cent. of volatile oil. *Imp. duty*, 20 per cent.

**Assault**, an attempt or offer, with force and violence, to do a corporeal hurt to another; as by striking at him, with or without a weapon. Assault does not always necessarily imply a hitting or blow; because, in trespass for assault and battery, a man may be found guilty of the assault, and acquitted of the battery. But every battery includes an assault. If a person in anger lift up or stretch forth his arm, and offer to strike another, or menace any one with any staff or weapon, it is an assault in law; and if a man threaten to beat another person, or lie in wait to do it, if the other is hindered in his business, and receive loss thereby, an action lies for the injury. Any injury, however small, actually done to the person of a man, in an angry or rude manner, is a battery.

**Assay** or **Assaying** [Fr. *cupellation*; Ger. *abtreiben der capelle*], is a mode of ascertaining what proportion of gold or silver there is in an alloy of those metals. When an alloy of (say) silver is melted, the inferior metals become oxidized, and can be removed as a kind of scale. The assay, or cupel furnace, is a small upright stove, having within it a wagon-like earthen vessel called a *muffle*, closed at all parts except one end, and a few slits in the top and side. Small crucibles called *cupels* are placed in the muffle, which shield them from contact with the fuel in the furnace. The cupels are small cups, made of some substance that will not be acted upon by the fused oxides, while their texture is sufficiently porous to let the oxides penetrate. The silver alloy and a bit of pure lead, both accurately weighed, are put into a cupel at a full red heat. A litharge, or oxide of lead, gradually forms, and is absorbed by the substance of the cupel carrying down with it the copper or other base metal of the alloy, while the remainder of the lead goes off in fume. When this process is carefully conducted, the button or globule of silver becomes absolutely pure. The cupel is taken out of the muffle and gradually cooled. The globule is weighed, and the difference between it and the weight of the original silver put in represents the weight of inferior metal with which the latter was alloyed. The proportion of alloy found in the silver is denoted by decimals. Thus, absolutely pure silver being reckoned at 1,000, any alloy of silver is reckoned at some lower figure; such as standard silver, which is said to be 925, there being 925 of silver and 75 of copper in 1,000 of standard silver. Gold is more difficult to assay than silver, because there is usually some silver as well as copper in the alloy. A special process, called *parting* or *quartation*, is often needed in addition to the cupellation. A *touchstone* is sometimes used, to furnish a rough guess at the composition of a gold alloy. (See TOUCHSTONE.) Besides the mode of assay-

ing by cupellation, there is what is called the *humid* way. A solution of chloride of sodium, in which the exact proportion of salt to water is ascertained, is employed as a means of determining the proportion in which silver and copper exist in any alloy.

**Assets**, [*Fr. actif*.] designate property presumed to be set apart to meet any obligation; thus the acceptor of a bill is said to have assets of the drawer in his hands. It is also commonly used in trade to designate the stock, cash, and all available property of a merchant, in contradistinction to his *liabilities* or obligations.

**Assignee**, a person to whom an involved, insolvent, or embarrassed debtor transfers and commits his property and estate for the benefit of his creditors. An *A.* is clothed with the powers and responsibilities of a trustee; he is liable only for want of ordinary skill and care. See **INSOLVENT LAWS**.

**Assignment**, an instrument in writing by which a merchant whose affairs are involved, or who is embarrassed or becomes insolvent, transfers his property and effects to a responsible party, called *assignee*, in trust for his creditors. See **INSOLVENT LAWS**.

**Assignor**, one who makes an assignment.

**Assizement**, a legalized inspection of weights and measures, and of the quality of commodities, etc.

**Ass-Load**, the pack-load for an ass; the average weight of which, in South America, is 170 lbs.

**Association**, a union of persons for some common object; a joint-stock company.

**Assortment**, a selection or variety of goods, samples, etc., of the same class or kind, but varying in quality, color, form, or price.

**Assurance**. See **LIFE INSURANCE**.

**Asteria**, a species of star sapphire, exhibiting six milk-white rays, radiating from the centre of an hexagonal prism.

**Astrakan**, is the wool or fur of a peculiar kind of sheep raised in Bokhara, Asia. This fine wool is the object of a considerable trade at Astrakan, in Russia, whence its commercial name.

**Asumbra**, a liquid measure in Paraguay = 4 gallons.

**Atchison and Nebraska R.R.**, runs from Atchison, Kans., to Lincoln, Neb., a distance of 148.89 m. Office in Boston, Mass. Founded in 1870, the Co. was reorganized in 1878. Under new organization, *Financial Statement* will be: Cap. stock (for 70 % of old bonds), \$2,625,000, and (for 50 % of unpaid coupons) \$712,500; total, \$3,337,500, and funded debt (for 30 % of old bonds), 1st mortgage 7 % 30 year bonds dated 1 March, 1878, \$1,125,000. Total liabilities, \$4,462,500. Net earnings for 1878, \$95,645.87.

**Atchison, Topeka, and Santa Fe R.R.**, runs from Atchison, Kans., to Colorado State line, a distance of 471 m. This Co. was organized in March, 1863, and operates six other Cos. under lease, which have a total length of 749 m.—Total distance run over by this Co., 1,220 m. The Co. has besides leased the New Mexico and S. Pacific R.R. (in course of construction) from the S. branch Pueblo road at Trinidad to Albuquerque, a distance of 248 m. Transfer office, Boston, Mass. *Financial Statement*, 1877: Funded debt, 1st mortgage bonds issued 1869, \$15,000 per m. authorized; \$7,041,000 outstanding, payable 1899, interest 7 % (Jan. and July). Land grant bonds issued 1870,

authorized \$7,500 per m.; outstanding, \$3,366,000, payable 1900, interest 7 % (April and Oct.). Consolidated bonds issued 1873; amount authorized, \$7,500 per m.; amount outstanding, \$3,349,000, payable 1903; interest 7 % (April and Oct.). Land income mortgage issued Jan. 1, 1878; amount authorized, \$480,000; payable 5-20's, interest 8 % (Jan. and July). Pottawattomie land mortgage bonds issued 1869; amount authorized, \$800,000; amount outstanding, \$439,000, payable 1 Nov., 1879; interest 7 % (May and Nov.). By an act approved 3d March, 1863, Congress granted 10 sections of land per m. The estimated quantity within the limit is 2,932,784 acres, of which 2,474,686 acres had been certified to the Co. to 30 June, 1877. Sales to Dec. 31, 1877: 643,598 acres had been sold, at the average price of \$4.98. Net earnings for 1877, \$1,356,421.69.

**Atelier**, a French workshop, sculptor's studio, or building dock.

**Athens**. See **GREECE**.

**Athol Brose**, strong whiskey in which honey has been intimately dissolved by careful trituration, used as a morning dram in some parts of Scotland.

**Atlanta and Charlotte Air-Line R.R.**, runs from Atlanta, Ga., to Charlotte, N. C., a distance of 269 miles. This Co., whose offices are in Atlanta, Ga., was formed in Feb., 1877, by the bondholders on the sale of the road under foreclosure in Dec., 1876. *Statement of Funded Debt*: 1st mortgage preference bonds, dated 1877, \$500,000, due 1897; interest 7 % (April and Oct.). 1st mortgage bonds dated 19 May, 1877, \$4,250,000, due 1907; interest 7 % (Jan. and July). Net earnings for 1877, \$60,389.90.

**Atlantic and Great Western R.R.**, runs from Salamanca, N. Y., to Dayton, O., a distance of 387.50 m.; branches and leased lines, 158.68 m.; total, 546.18 m. This Co., whose offices are at Meadville, Pa., was organized in 1871, and placed in the hands of a receiver 10 Dec., 1874, by whom it has since been operated. *Financial Statement*: Cap. stock authorized, \$50,000,000; funded debt, \$68,994,811.28; floating debt, \$6,475,126.80; total stock, bonds, and debt, \$110,147,742.18. Funded debt in detail: 1st mortgage bonds, \$14,922,200, payable 1902; int. 7 % (Jan. and July); 2d mortgage, \$10,173,679.69, payable 1902; int. 7 % (March and Sept.); 3d mortgage, \$28,784,000, payable 1902; int. 7 % (May and Nov.); Ohio 1st mortgage, \$2,416,300, payable 1876; int. 7 % (April and Oct.). Reorganization stock, etc., \$661,131.59; leased line trust, payable 1902, \$5,323,000; int. 7 % (Jan. and July); leased line trust, payable 1903, \$2,907,000; int. 7 % (Jan. and July); Western Extension certificates, July, 1876, \$2,059,000; Western Extension bonds, \$1,748,500. Net earnings for 1877, \$968,917.36.

**Atlantic and Gulf R.R.**, runs from Savannah to Bainbridge, Ga., a distance of 237 m., with branches 110.17 m.; total, 350.17 m.; and has its offices in Savannah. Default was made on the consolidated bond coupons, due 1 Jan., 1877, and two receivers were appointed in March following. Int. is still paid on the 1st mortgage sectional bonds. *Financial Statement*, Dec., 1876: Cap. stock, \$3,693,700; 7 % guarantee stock, \$782,976.69; funded debt, \$3,566,500; bills payable, \$126,268.35; traffic earnings (1876), \$959,377.94; current accounts, \$245,492.57; total, \$9,374,315.59. Net earnings for 1876, \$352,913.29.

**Atlantic and North Carolina R.R.**, runs from Goldsboro' to Morehead, N. C., a distance of 95 m. This Co., whose offices are at New Bern, N. C., was chartered in 1853, and opened in 1858. About one-half the cap. stock is held by the State of N. C. *Financial Statement*: Cap. stock, \$1,600,000; and funded debt, 1st mortgage 8% bonds, dated 1868, payable 1888, \$200,000.

**Atlantic and St. Lawrence R.R.**, runs from Portland, Me., to Island Pond, Vt., a distance of 149.5 m., with a branch from Lewiston to Auburn, 5.5 m.; total length, 155 m. Chartered in 1845, and leased, in 1853, to the Grand Trunk R.R. of Canada for the interest on the outstanding bonds and 6% annual dividend on capital stock. Office in Portland, Me. *Financial Statement*: Cap. stock, \$5,000,000; funded debt, \$3,484; total stock, bonds, and debts, \$8,484,000.

**Atlantic and West Point R.R.**, runs from East Point to West Point, Ga., a distance of 80.74 m. Offices at Atlanta, Ga. Chartered as Atlanta and La Grange R.R. Co. in Dec., 1847. *Financial Statement*: Cap. stock, \$1,232,200. Debenture bonds, \$83,000. Net earnings for 1878, \$13,435.40.

**Atlantic, Mississippi, and Ohio R.R.**, runs from Norfolk, Va., to Bristol, Tenn., a distance of 408 m., with branches 428 m. This Co., located at Lynchburg, Va., was organized in 1870 by the consolidation of the Norfolk and Petersburg, the South Side, and the Virginia and Tennessee R.R. The State of Virginia holds a controlling interest in all these lines. Under the act of consolidation they were sold to the A. M. and O. R.R. Co. for \$4,000,000, secured by a 2d mortgage on the whole property, the 1st mortgage thereon never to exceed \$15,000,000; these bonds to receive no interest before July, 1880, and from that date 6% per annum. Final payment to be made in annual instalments of \$500,000 each; the first payment during 1885. In 1876 the property passed into the hands of receivers. Cap. stock, \$6,921,900. Average rate of interest on funded debt, 7.06%. Net earnings for 1877, \$600,633.09.

**Atlas**, a large kind of paper 34 by 26 inches; a rich Indian embroidered satin; also a collection of maps in one volume.

**Atmometer**, an evaporometer, or instrument to measure vaporous exhalations.

**Atropia**, a formidable alkali obtained from the deadly nightshade.

**Attachment**, is a process by which a person may be apprehended, or a property seized, by virtue of a writ or order issued by a court or judge under authority of law. In respect to property the term is usually applied to seizure on mesne process. In some of the States, a plaintiff can, at the commencement of any action to recover money, attach the property of the defendant; but the more usual rule is that there can be no seizure of property, except in specified cases, till the rights of the parties have been settled by judgment of the court. The exceptions are chiefly when the defendant is a non-resident or a fraudulent debtor, or is attempting to conceal or remove his property for the purpose of defrauding or delaying his creditors. An A. is said to be foreign when a creditor attaches property belonging to his debtor in the hands of a third person, or a debt due to such debtor by a third person. The laws of each State on A. of property will be found noticed under the heading **INSOLVENCY**.

**Attar of Roses**. See **ROSES (OIL OF)**.

**Attestation**, the legal act of witnessing a deed by affixing one's signature thereto.

**Attire**, articles of clothing or dress.

**Attorney**, a representative or deputy, one holding a power or authority to act for another. (See **POWER OF ATTORNEY**.) An A. at law is an officer of a court, who is authorized by the laws and rules of the court to prosecute or defend a claim or suit, without any special written authority for the purpose. An A. at law has authority, for and in the name of his principal, to do any acts necessary for conducting a suit, and his employer is bound by his acts.

**Aubergine**, the French name for egg-plant.

**Au Besoin**, [Fr., in case of need.] "*Au besoin chez Messieurs — à —*," "In case of need, apply to Messrs. — at —," is a phrase used in the superscription of a bill of exchange, pointing out the person to whom application may be made for payment in case of failure or refusal of the drawee to pay.

**Aubusson**, a town of France, celebrated for its manuf. of carpets, known as *Aubusson carpets*, and made in the style of the *Louises of France*.

**Auctioneer**, is a person whose business is to sell the goods of others by public outcry, vendue, or auction. He is the agent of both parties, the seller and the buyer. It is his duty, previously to the commencement of every sale, to state the conditions under which the goods are offered; to receive the respective biddings, and to declare the termination of the sale. For these purposes he commonly makes use of a hammer, upon the falling of which the biddings are closed. In most of the States, an A. is required to have a license to sell, and in the State of New York he is required to give bonds to the amount of \$10,000, conditioned for the faithful performance of the duties of his office, to render a semi-annual account of all goods sold or struck off, and to pay on the amount of these sales the duties chargeable according to law, as follows: On all wines and spirits, foreign or domestic, 1 per cent.; on all goods and effects imported from any place beyond the Cape of Good Hope, 50 cents; and on all other goods and effects which are the production of any foreign country, 75 cents. Articles of the growth, produce, or manuf. of the U. States, except distilled spirits, are exempt from auction duties. Goods and chattels, otherwise liable to such duty, are exempt from the same, if sold under any judgment of any court of law or equity; if they belong to the estate of a deceased person, and are sold by a person duly authorized; if they be the effects of a bankrupt or insolvent, and be sold by his assignees; or if they be goods damaged at sea, and are sold within 20 days after being landed, for the profit of the owners or insurers. An A. is bound to observe strictly his instructions, and to act in good faith to the owner of the goods; he is not at liberty to misrepresent to the bidders or purchasers; he is liable for loss by negligence; and he cannot purchase the property he is employed to sell. An A. has a lien for his commissions, and can sue the buyer for his purchase-money. In the State of New York, no A. can demand or receive a higher compensation for his services than a commission of 2½ per cent. on the amount of any sale made by him, unless in pursuance of a previous agreement in writing. In the city of New York, all goods, wares, and merchandise, and every species of property, except ships, vessels, real or

leasehold estate, exposed for sale at auction, and struck off by the A. to the previous owner, or to any person bidding in his behalf, or to any fictitious person, or in any other manner than as an actual sale and purchase, are subject, each and every time they are so struck off, to a duty of 5 per cent. Any person offending against this provision is liable to a fine not exceeding \$100, and imprisonment not exceeding one month.

**Audit**, a regular examination of books, vouchers, or accounts by one or more qualified parties.

**Auditor**, one who inspects or examines and certifies accounts; an accountant.

**Aufgedinge**, the money premium received with an apprentice in Germany.

**Auger**, a very useful tool for boring holes, is one of a class which all workers in wood are well acquainted with. Some have upright handles, some transverse; some have plain stems, some hollow, some screwed; and the mode of working, by to-and-fro twisting movement or by screwing, depends on these forms. The *auger*, *brad-awl*, *gouge-bit*, *centre-bit*, *gimlet*, and *screw-auger* are familiar examples of these hole-boring tools.

**Augsburg**. See BAVARIA.

**Aurantia Wine**, a wine made in India and Sardinia from the China orange, *Citrus aurantium*.

**Auriferous**, containing or yielding gold.

**Aurist**, an ear-doctor, one who attends to the cure of disorders of the ears.

**Australia**. See NEW SOUTH WALES, QUEENSLAND, SOUTH AUSTRALIA, TASMANIA, VICTORIA, WESTERN AUSTRALIA.

**Austria-Hungary**, a European Empire, extending from 45° to 51° N. lat., and from 8° 35' to 26° 35' E. lon., is bounded N. by Prussia and Russian Poland, E. by Russia and Turkey, S. by Turkey, the Adriatic Sea, and Italy, and W. by Switzerland and Bavaria. It forms a bipartite State, consisting of a German, or *Cisleithan* monarchy, and a Magyar, or *Transleithan* kingdom, the former officially designated as Austria, and the latter as Hungary. Each of the two countries has its own parliament, ministers, and government, while the connecting ties between them consist in the person of the hereditary sovereign, in a common army, navy, and diplomacy, and in a controlling body known as the Delegations. The public debt of the whole empire—exclusive of the special debt of Hungary, in 1878—was \$1,631,685,040. Besides, the floating debt was estimated at \$220,904,205. The total annual interest on the debt amounted to \$56,648,040. The private debt of Hungary was \$177,000,000. In recent years the published accounts of A. show invariably a declining revenue with growing expenses. The monarchy is subdivided as follows:

I. AUSTRIAN EMPIRE.	Sq. m.	Population.
Lower Austria.....	7,655	1,990,708
Upper Austria.....	44,633	736,557
Salzburg.....	2,767	153,159
Styria.....	8,671	1,137,990
Carinthia.....	4,006	337,694
Carniola.....	3,857	466,334
Coast Land.....	3,085	600,525
Tyrol and Vorarlberg.....	11,325	885,789
Bohemia.....	20,064	5,140,544
Moravia.....	8,585	2,017,274
Silesia.....	1,988	513,352
Galicia.....	30,313	5,444,689
Bukovina.....	4,036	513,404
Dalmatia.....	4,940	456,961
Total, Austrian Empire.....	115,925	20,394,980

II. KINGDOM OF HUNGARY.		Sq. m.	Population.
Hungary, including the Banat .....	87,043	11,530,397	
Croatia and Slavonia.....	16,773	1,846,150	
Transylvania.....	21,215	2,115,024	
Town of Fiume.....	8	17,844	
Total, Hungary..	124,438	16,509,455	
Total, Austro-Hungarian Monarchy..	240,943	35,904,435	

The country is generally mountainous; large plains, however, occur, chiefly in Hungary and Galicia. Three climatic belts are distinguished, viz.: 1. the N. belt, from the N. frontier to N. lat. 49°, producing grain and flax; 2. the Central belt, between N. lat. 49°-46°, yielding wine, fruit, and the cereals; and 3. the S. belt, between N. lat. 46°-45°, furnishing, besides the above, semi-tropical fruits. The mean temperature varies between 39°-56° F. The soil, though of endless variety, is in general fertile; but in agriculture, A. is still behind other European States. The mines of gold and silver in Hungary and Transylvania, and of quicksilver at Idria in Carniola, are the richest in Europe; lead and copper are produced in considerable quantities; the supply of iron is almost inexhaustible; and indeed nearly every metal is found, except platinum. Salt, vitriol, alum, soda, sulphur, and saltpetre are found in great quantities. Scarcely a province is deficient in coal. Marble and a variety of precious stones also occur. The produce of the vine is a source of considerable wealth, and a large quantity is exported; the finest is the celebrated Tokay, made at Zemplin, in Hungary. Tobacco, hops, hemp, flax, and potash are produced in sufficient quantity to afford a surplus for exportation.

The manufacturing interests of A. have largely increased since 1860, when freedom of trade was established throughout the empire; they embrace textile goods, iron-ware, silk, leather, paper, chemicals, beer, liquors, tobacco, etc.

The most important river is the Danube, which, with its tributaries, pervades the whole empire, crossing, however, its eastern boundary at about 500 m. from the sea. Its navigation is throughout rather difficult, owing to shoals and rapids. In 1878 the whole empire had 10,138 m. of railroads open for traffic, and 2,633 in construction. Its commercial marine consisted of 7,538 vessels, 330,298 tonnage, of which 98 were steamers. Nearly two-thirds of the commerce of A., both as regards imports and exports, is carried on with Germany. Its next important market is Turkey. The commercial intercourse of A. with the U. States is comparatively small; and it appears in the official returns even smaller than it is in reality, owing to the geographical position of the empire, which necessitates the transit of many Austrian and American goods through other countries, as the exports and imports of which they come to figure. The value of direct exports to the U. States in 1878 was only \$272,250, while the imports reached \$2,827,581, consisting chiefly of mineral oil, grain, tobacco, tallow, etc.

There are 9 towns with over 50,000 inhabitants, viz.:—In Austria proper, Vienna (the cap.), 1,001,999; Prague, 189,949; Trieste, 109,324; Lemberg, 87,109; Gratz, 81,119; and Brinn, 73,771;—and in Hungary, Buda-Pesth, 270,474; Szegedin, (almost entirely destroyed, with enormous loss of life, by the overflow of the Theiss, in March 1879,) 70,179; and Maria-Theresiopel, 56,323. The chief ports are Trieste, Fiume, Korigno, Capo d'Istria, and Pola, in Illyria; and Ragusa, Cattian, Zara, Sebenico, and Spalatro, in Dalmatia. The foreign trade is, however, almost wholly engrossed by Trieste.

**Trieste** is situated in 45° 39' N. and 13° 46' E., at the N. E. extremity of the Adriatic. Pop. 109,324. It has a commodious harbor, and being a free port, and almost the only outlet for the South of Germany, Illyria, and parts of the Slavonian provinces, its commerce is very extensive, and the U. States have there a general consuls. Here is established (since 1833) the *Gesellschaft des Oesterrichisch-Ungarischen Lloyd*, which owns a fleet of 65 steamers, of 15,260 horsepower, and absorbs the greatest part of the trade of A. with the East, through the Suez Canal, being subsidized by the Imperial government. The Bank of Austria has a branch at Trieste. In 1875, Trieste received 6 American vessels, tonnage 3,806, while 16 vessels, tonnage, 8,225, cleared the port.

The *Austrian National Bank* was founded in 1815, and is the only State Bank of A. Though connected with the government, it is under the management of a body of directors; and its accounts are published periodically. Its functions are chiefly those of issuing paper, discounting commercial bills, and developing certain kinds of public works. It has the sole right of issuing notes. It appears that the chief danger that the bank runs is that consequent upon advances to government, which are made, as might be expected, profusely in times of pressure, which advances are accompanied with a large increase in the issue of paper. The bank allows no interest on deposits.

**Money**.—The *Florin*, or *Gulden*, of 100 *neu-kreuzer* = 48½ cts. The *Golden Crown* of 8 florins = \$3.88.

The legal standard in the empire is silver, and the florin, divided into 100 *neu-kreuzer*, the unit of money. Practically, the chief medium of exchange is a paper currency, consisting of bank-notes of all denominations, from 1,000 florins down to 1 florin, convertible only at a large discount into gold.

*Bills* upon Vienna are generally drawn in effective, and generally the particular coin in which they are to be paid is specified. Usance is 14 days after acceptance; 3 days of grace are allowed, except when drawn at less than 7 days' sight or date.

*Weights and Measures*.—The *Centner* (100 *Pfund*) = 123½ lbs. avoirdupois. The *Eimer* = 14.94 wine gallons. The *Joch* = 1.43 acre. The *Metze* = 1.7 imperial bushel. The *Klafter* = 67 cubic feet. The *Meile* (24,000 Austrian feet) = 8;29 yards, or about 4¾ m.

**Autographic Press**, a portable printing machine for taking copies of a writing or drawing, transferred from paper to a lithographic stone.

**Automaton**, is a self-moving machine. In many engines, and machinery, *automatic action* is the name given to a self-regulating apparatus; and speaking in a general way, whenever a process hitherto performed by hand is brought within the power of a machine, the apparatus becomes automatic in this particular instance. A watch or clock is an *A.* when wound up. It is in this sense that the word *A.* is generally used—action begun and maintained as soon as a train of wheels is set in motion by winding up. Wonderful examples of ingenuity in this form have been produced, in no other way useful than as showing what men can do if they try.

**Autophon**, a barrel-organ, the tunes of which are produced by means of perforated sheets of mill-board.

**Ava**, a long measure in Cadiz, the 16th part of the vara—rather more than two inches.

**Aval**, [Fr.] the signing of a draft, note, or bill of exchange; a French declaration of responsibility or guarantee for its payment.

**Avena-Root**, the root of the herb bennet, *Geum urbanum*, which, possessing astringent and aromatic properties, has been used in medicine, and is also said to impart a pleasant clove-like flavor to wine and beer.

**Aventurine**, a yellow or reddish-brown variety of quartz speckled with gold spots, found in Siberia, Bohemia, France, Spain, and India, and used in jewelry. Beautiful imitations of this mineral are now made by fusing sand, carbonate of soda, carbonate of lime, and bichromate of potash.

**Avellana**, the Spanish name for the filbert.

**Average**, in *Arithmetic*, is the mean of two or more quantities, formed by adding them together, and dividing by the number of quantities. Thus, 4 is the *A.* of 2 and 6, and 5 is the *A.* of 2, 6, and 7. The *A.* most commonly required in trades are those of prices. Ex.: What is the *A.* price per quarter of 300 quarters rice at \$15 per quarter, 260 quarters at \$13.50, and 270 quarters at \$12.50?

300 quarters at \$15.00 =	\$4,500
250   "   "   13.50 =	3,375
450   "   "   12.50 =	5,625
1,000	\$13,500

*Ans.* \$13.50 per quarter.

In calculations of this kind, it must be remembered that the *A.* of a set of averages is not the *A.* of the whole, unless there are equal numbers of quantities in each set averaged. See **ALLIGATION**, and **EQUATION OF PAYMENTS**.

**Average**, in the law of shipping, is generally applied to the loss occasioned by any sacrifice made to insure the safety of a ship and cargo, and being a loss which underwriters have to replace, it constitutes part of the law of insurance. There are, technically speaking, two sorts of *A.*, *general A.*, and *single or particular A.* The latter is an unmeaning term, used merely in contradistinction

to the other; to express those losses arising from the danger of the sea and otherwise, which are not made up by any contribution, but fall on the possessor of the article lost, or on those who may be responsible for its safety. The system of general *A.* is in full practice over all the commercial world. The circumstance under which the provisions of this law can be had recourse to is, when a vessel and the crew, passengers, and cargo, are in such imminent danger as to render it necessary to make a sacrifice of a part, for the preservation of the whole. The simplest case is that of throwing goods overboard (jettison) to lighten the ship. Here cargo is sacrificed, and the other proprietors of cargo, along with the ship-owners, bear a share of the loss, according to their respective interests. In another instance, it may be necessary to cut away a mast, or slip an anchor. Here the sacrifice is against the ship-owners, and the other parties interested must share the loss with them. It is of no moment how light and valuable may be the goods thrown overboard, or how much the reverse those saved. Goods stowed on deck are presumed to be an incumbrance, and so not suitable subjects of *A.* A loss effected by inherent defect, or by sea-risk, cannot be considered *A.*; there must be an intention to sacrifice; and that intention must have been with the view of preserving the remaining property embarked in the adventure. It is held, that when a vessel having sustained an injury has to put into a port for repairs, the expense of putting into port and remaining there, is to be considered *A.* loss, if the act was necessary for the safety of all concerned, but that the expense of the repairs (unless in so far as they may be solely necessary for the preservation of the cargo) falls on the ship-owner. Property injured in the making of the sacrifice—such as a part of the ship cut away to facilitate the throwing overboard of goods—constitutes *A.* An accurate statement of the circumstances under which a jettison, or other loss on which *A.* is claimed, should be entered in the log, and immediately on arrival, the master should draw up a narrative of the circumstances, and make affidavit to them, along with his crew, that there may be no ground to presume that goods have been removed since arrival. The adjustment is generally made thus: the owners contribute according to the net value of ship and freight at the port of delivery, after deducting expenses. But ship's provisions, wearing apparel, and seamen's wages, do not contribute. If the vessel has had to put back to the port of lading, the cargo is taken at invoice price; otherwise, the cargo is valued at the price it would bring at the port of destination, deducting freight and charges. Ship's furniture is rated at the cost of removal, with a deduction of one-third. The value of what is lost being thus estimated, is added to the value of what is saved, and the whole being divided according to the respective interests of the parties, the loss which each has to suffer is a sum bearing the same proportion to his share of the whole sum divided, which the loss sustained bears to the whole sum.

**Average-Stater**, one whose business is to compute averages.

**Averuncator**, an instrument for pruning young trees.

**Aviary**, an enclosure for keeping and rearing birds, made of wire-netting or wooden framework.

**Avignon Berries**, or PERSIAN BERRIES, the

small yellow dyeing berries of commerce, the produce of the buckthorn, *Rhamnus amagdalinus*, which grow in South France, and are also imported from Persia.

**Avocado Pear**, the pulpy fruit of *Persea gratissima*, highly esteemed as a vegetable in tropical countries; oil has been made from it.

**Avoine**, the French name for oats.

**Avoidupois**, the name given to the common system of weights, by which are weighed all commodities except medicines, the precious metals, and gems. A pound *A.* contains 7,000 gr.; an ounce is equal to 437½ gr. A cubic foot of water weighs 997.17 oz. *A.*

TABLE OF AVOIDUPOIS.

27 $\frac{1}{2}$ grains	= 1 dram.....dr.
16 drams	= 1 ounce.....oz.
16 ounces	= 1 pound.....lb.
25 pounds	= 1 quarter.....qr.
4 quarters	= 1 hundredweight, <i>cwt.</i>
20 hundredweight	= 1 ton.....ton.

**Awa**, the Japanese name for Indian corn.

**Award**, the decision given by an arbitrator; the amount of salvage or other sum granted by a competent court.

**Awl**, a shoemaker's and saddler's piercing tool. Steel bars drawn to the square of  $\frac{1}{8}$  of an inch or less are imported from Sheffield, and extensively manuf. into awls in Rhode Island.

**Awning**, the trade name for a kind of ticking manufacture for awnings.

**Awnings**, a canvas canopy or covering fixed to keep off the sun in boats or ships, and also to

Fig. 21.—AWNING.

shade store-fronts. The ordinary mode of supporting a roll of canvas, by means of rafters resting against the building and upon posts at the curb, need hardly be described. The canvas is tacked to a roller, and is furled by means of a running rope, being protected, when furled, by a pent-roof on the wall of the building. In Fig. 21, the lower edge of the *A.* is attached to the boards, which are secured to the side extension. The extensors are made in toggle-sections, operating as lazy tongs. The upper edge of the *A.* is coiled on a roller operated by a cord; it is held by a pawl, to keep the canvas stretched. The spiral spring acts to keep the arm extended. So far as ingen-

uity has been exercised upon this subject, it has generally been upon modes of lowering and winding, having especial reference to shading side-walks and show-windows. Some devices, however, have been intended for window-shades, and are modified in shape and mode of operation to suit their location.

**Axayacatl**, the eggs of a species of fly deposited on rush mats, and sold as caviare in Mexico.

**Axe**, an iron instrument generally used with both hands in hewing timber and chopping wood. It consists of a head with an arching edge, and a handle. There are several forms of *A.*, the two principal being the *broad A.*, for hewing, and the *narrow A.*, for cutting and rough-hewing. The *hatchet* is a smaller form of the *A.*, and is used with one hand. *A.* are now manuf. at very reduced prices in the U. States, principally at Cohoes, N. Y., Collinsville, Conn., etc. *Axe-handles*, usually made of the wood of the white hickory, and sold by the dozen, are also extensively manuf. in the Northern and Western States.

**Axe-Stone**. See **JADE**.

**Axle**, in wheel-work, is the shaft or pole on which the wheel turns. In strictness, it is the same thing as axis; but the *axle* and *axle-tree* of a wheeled vehicle are rather elaborate contrivances to insure the smooth rolling of the wheel along the road, and the avoidance of heat at the rolling surface.

**Axminster Carpet**, an imitation Turkey carpet, noted for its thick and soft pile; the worsted being thrown entirely to the surface, instead of appearing on both sides. These carpets are woven in one piece, usually 27 inches wide.

**Axonge**. See **LARD**.

**Ayr-Stone**. See **SNAKE-STONE**.

**Azaleine**. See **ANILINE (RED)**.

**Azimuth**, a nautical instrument for finding the sun's magnetical azimuth.

**Azores**, or **WESTERN ISLANDS**, are situated in the Atlantic, between lat. 37° and 40° N., and lon. 27° and 32° W., about 795 m. W. of Portugal, to whom they belong. They consist of 3 groups, viz.: 1. St. Michael's and St. Mary; 2. Terceira, Fayal, Pico, St. George, and Graciosa; 3. Flores and Corvo, exclusive of several islets. *Pop.* 252,480. The seat of government is Angra, in the island of Terceira. *Pop.* 20,000.

These islands are of volcanic origin, and are in general mountainous. The climate is mild and pure, and the soil highly fertile, most of the islands abounding in vineyards, orange and lemon orchards, and pastures. The growth of wine is considerable. It is produced mostly in Pico, but is known as *Fayal wine*, from being shipped from the latter. From 8,000 to 10,000 pipes are exported in favorable seasons to America and the West Indies. Large quantities of fruit are exported to England. The imports from America are boards, staves, lumber, fish, pitch, tar, mineral oil, wheat, tobacco, etc. The principal shipping towns are Ponta del Gado in St. Michael's, Angra in Terceira, and Fayal in the island of the same name; but there is no good port, and as none of the anchorages afford shelter, ships are often obliged, by violent winds, to put to sea at a very short notice. The commerce of the U. States with the *A.* for the year 1878 (including Madeira and the Cape Verde Islands), was as follows: Imports, \$73,076; exports, \$645,108. Ships entered, 30; tonnage, 9,492; ships cleared, 45; tonnage, 14,178.

**Azure**, a pale but clear and brilliant blue color.

**Azure-Stone**. See **LAPIS-LAZULI**.

**Azurine**. See **ANILINE (BLUE AND GREEN)**.

## B

**Bablah**, **BABULA**, or **NEB-NEB**, is the rind of the fruit of the *Mimosa cineraria*. It contains a considerable portion of gallic acid; also tannin, a red coloring matter, and an azotized substance. It is imported from the East Indies and from Senegal, as a substitute for the more expensive astringent dye-stuffs, and for communicating shades of drab to cotton.

**Babouche**, a Turkish slipper.

**Back**, a large vat or cask used in breweries and distilleries to hold beer, spirits, or water, of from 300 to 500 gallons capacity. They have been made so large as to hold 1200 barrels. In many breweries, a back is simply a very large flat tub used to cool wort.

**Backgammon-Board**, a board or table with two divisions or folding leaves to hold the men, dice, and boxes used for playing the game of backgammon on certain black and white spaces called points. It is generally made to imitate the exterior of a bound book.

**Backing**, in bookbinding, preparing the back of a book for gluing, etc., for receiving the cover or case.

**Back-Rag**, a Dutch wine.

**Backs**, the thickest and stoutest tanned hides, used chiefly for sole leathers.

**Backwardation**, an English stock-exchange term for an allowance made for carrying over stock, shares, etc., to the next account-day, instead of settling or delivering at once.

**Back-Woodsman**, a settler in the uncleared districts of North America.

**Bacon**. See **HAM**.

**Badana**, the Spanish name for a dressed sheep's skin.

**Baden**, a Grand-duchy of Germany, situated on the right bank of the Rhine, between lat. 47° and 50° N. and lon. 7° and 10° E. Area, 5,851 sq. m. Pop. 1,507,179. Principal cities: Mannheim, pop. 46,452; Karlsruhe, the capital, 42,895; and Pforzheim, a manufacturing place, 23,692.

*Baden* has been called the "Eden of Germany," for although nearly one-half of its surface is occupied by the mountainous districts of the Black Forest and the Odenwald, it possesses a soil favorable for the growth of corn, wine, and fruit, and abounds in magnificent woods and navigable streams, while the proportion of waste land to the whole soil is less than six acres in every thousand. Agriculture is the chief occupation of the people. Grain, tobacco, hemp of a very fine description, and flax are extensively cultivated. The average product of the vine, which is chiefly grown on the high lands skirting the valleys of the Rhine and Main, and Lake Constance, is estimated at about 4,000,000 gallons. The chief mineral productions are silver, cobalt, copper, iron, manganese, salt, coal, alum, vitriol, and sulphur. The most extensive manufacture is perhaps that of the madding and coarse descriptions of linen; the chief others are woollens, cottons, silks, watches, jewelry, paper, and wooden-ware, clocks, and straw hats, for the production of which the Black Forest has been long celebrated. Baden is advantageously situated for trade from its position on the Rhine, Main, Neckar, and other streams, which, besides securing for it an outlet for its own productions in the Empire, and in Switzerland, have rendered it a country of extensive transit. — *Finances*: The public debt is divided into two parts, the first called the general debt, amounting in 1878 to 85,269,414 marks, or \$21,317,350; and the second the railway debt, amounting to 251,330,028 marks, or \$62,832,506. Nearly the whole of the debt bears interest at the rate of five per cent. — *Measures, Weights, and Money*, see **GERMANY**.

**Badger**, a carnivorous quadruped (*Meles vulgaria*), approaching the bear in character (Fig. 22). It is about the size of a fox, is found in

Europe and in some parts of the U. States, and is hunted by night, chiefly for its hair, which is made into shaving- and paint-brushes. Its skin dressed with the hair on is sometimes used for trunks, and the hide makes good pistol furniture. — The name *B.* is also applied to a ticket poster, one entitled to wear a badge; and to a licensed carrier.

**Badiane**. See **STAR-ANISE**.

**Badigeon**, the French name for whitewash; also a composition of saw-dust and glue, used by joiners to fill up chinks in wood; a colorless substance or thick mortar for hiding defects in stone work.

**Baetas**, a plain, unchecked woollen stuff, manufactured in Spain and Portugal.

**Bag**, a canvas sack or enclosed wrapper intended to contain grain or any other description of dry merchandise. There is no certain defined quantity that a bag shall commercially hold, the weight necessarily varying with the contents, which range from 1 to 2½ cwt. Grain-bags of American manuf., which are hired out for a voyage to Europe, and returned empty, or which are exported empty, and afterwards imported filled with grain, are admitted free of duty. See **BALE** and **SACK**.

**Bagatelle-Board**, a cloth-covered board pierced with 21 holes, for playing a game with a set of 9 ivory balls.

**Bagazo**, the mass or refuse of grapes, sugar-canes, etc., after they have been pressed.

**Baggage**. See **PASSENGER**.

**Bagging**, a coarse kind of stuff, made of hemp,

Fig. 22. — BADGER.

jute, old ropes, cotton, etc., and used as a wrapper for wool, cotton, coffee, grain, and other articles. It was chiefly imported from Dundee, but is now extensively manuf. in the U. States. The *B.* made of hemp is known as Kentucky *B.* Imp. duty, 40 per cent. See **GUNNY-CLOTH**.

**Bagpipe**, a musical instrument of very ancient origin, consisting (Fig. 23) of two parts, viz.: a leathern bag and three pipes. The bag of the Irish pipes is inflated by a bellows, that of the Scotch pipes by the mouth; and each is compressed with the arm, so as to sound the pipes.

**Bahama Islands**. See **WEST INDIES**.

**Bahama Sponge**, a coarse kind of sponge, fished up about the Bahama Islands, used for common purposes.

**Bahia**. See **BRAZIL**.

**Babut** [Fr.], a coffer or large chest in the Renaissance style.

**Baies**, the French name for berries.

**Bail**, one who stands bondsman or security for the appearance of another in a court of law under certain penalties.

**Baillieur de Fonds**, in France, one who furnishes capital for a business; a silent partner.

**Bailment**. This term, peculiar to English law, not generally used in America, is applied to a delivery of goods by a party called *bailor* to another party called *bailee*, on a condition, expressed or implied, that they shall be restored by the bailee to the bailor, or according to his discretion, as soon as the purpose for which they have been bailed shall be answered. It embraces a variety of contracts, which, when they have relation to commerce, will be found treated under their respective designations.

**Bait**, food for horse, hence the term "livery and bait stables." More generally, a bit of food or other substance put on a hook to entice fish.

**Bait-Mill**, a machine used by fishermen for cutting mackerel or salted herrings into small pieces for bait. It consists of an oblong wooden box, standing on one end, containing a roller armed with knives, which is turned by a crank on the outside.

Fig. 23.—BAGPIPE.

**Baize**, a coarse, open woolen fabric, having a long nap, and sometimes friezed on one side. It is imported from Rochdale, England; also manu. in the U. States.

**Baking-Powders**, are preparations of chemical salts, soda, phosphates, etc., used as substitutes for yeast in making bread.

**Balachong**, a preparation consisting of small fish with prawns and shrimps, first fermented and then dried. It is esteemed a great delicacy by the Malays and Chinese, with whom it forms

an article of extensive commerce.

**Balance**, in *Book-keeping*, the sum of money which must be added to one or the other side of an account, in order that the debits and credits may be *balanced*, or of equal amount.

*B.*, or *Beam and Scales*, is a well-known instrument used for weighing commodities. In manu., delicacy of weighing is seldom so much needed as in science. An ounce of pins, a pound of silk, a ton of iron, may be weighed with sufficient accuracy for commercial purposes by the common *B.* or pair of scales. Generally, a *B.* (Fig. 24) has two scales or pans, in one of which weights are placed to counterbalance the commodity placed in the other; and all *delicate B.* are of this form, such as those which will turn with *one-millionth* part of a load. In all such *B.* the pivots are exquisitely constructed, very often steel knife-edges resting on agate. Common scales have a single scale-pan, with a movable weighted lever as a counterbalance. Other forms of *B.* are noticed under SPRING-BALANCE, STEELYARD, and WEIGHING MACHINE.

**Balance-Book**, is a book in which the adjusted accounts of debtors and creditors have been posted from the ledger.

**Balance of Trade**, is the difference between the commercial exports and imports of any country. A State is said to have a *favorable B.* when the exports exceed the imports, and an *unfavorable B.* in the contrary case; it being supposed that such balances could not be cancelled, except by the remittance of an equivalent amount of gold and silver, and that the money thus remitted is the measure of the gain or loss derived by the State from foreign trade. In order chiefly to bring about the desirable result of a favorable balance, restrictions and prohibitions were for many years imposed in England, France, and other European countries on the importation of nearly all commodities except bullion, while on the other hand bounties were granted on exportations. The selfish principle that what is gained by one nation is lost by another, has been abandoned by England and France, but is still to this day the doctrine of American protectionists. It is obvious that the wealth of States and of individuals consists not in money alone, but in the abundance of their whole dispensable products; that gold and silver are commodities subject to the same general rules in their transmission, as sugar, tobacco, or any other commodities, namely, sent from where they are of lower to where they are of higher

Fig. 24.—BALANCE.

value, and never exported except for the purpose of importing some more valuable article in return; that in the case of what is called an unfavorable balance, bullion is not exported unless it be at the time the cheapest exportable commodity; and that in point of fact its exportation (except from mining-places), as well as its importation, can take place only to a limited extent. If bullion is largely exported, it will become scarce, and of course dear, in the exporting country; the money value of other commodities will in proportionate degree fall; and they will become preferable objects of remittance and exportation until bullion is again reimported. In a similar manner, if, by the operation of a favorable balance, bullion is imported in greater quantity than is necessary to supply the wants of the country, its value will become depreciated in relation to other commodities, and it will be again re-exported. The domestic exports of the U. States for the year 1878 amounted to \$722,811,815, while for the same year the imports were only \$466,872,846; America had therefore a very *favorable* balance of trade. But if we come to analyze the exports, we find that

about \$600,000,000 consisted of natural products of the country, as cotton, bread-stuffs, mineral oil, tobacco, precious metals, etc., leaving a comparatively small balance for manufactured goods, while the considerable diminution on imports is certainly in part attributable to the high rate of protectionist duties, which in many cases amount to total prohibition, and year by year discourage European manufacturers from dealing with America. See PROTECTION AND FREE TRADE.

**Balance-Sheet**, is a statement of a trader's position or pecuniary affairs, showing the balances of property and debts, profits and losses.

**Balancing-Books**, in *Book-keeping*, the closing or adjusting of each personal or general account in the ledger, and clearing up a trader's or banker's books.

**Balas Ruby**, a lapidary's term for the rose-red varieties of spinel.

**Bale**, a package or bundle of goods in a cloth or skin cover, and corded for transportation; a package of merchandise of variable dimensions. Cotton, wool, and various other articles are shipped in *B.* The established *B.* of cotton in Alabama, Louisiana, and Mississippi is 500 lbs.; in Georgia, 375 lbs.; and in South Carolina, 362½ lbs.; in Egypt, 228 lbs.; Surat, 382 lbs.; Bengal, 300 lbs.; Brazil, 162 lbs. Practically, however, in packing cotton, these weights are only approximate. The average weight of the *B.* of all kinds of cotton arriving at Liverpool is about 400 lbs.—*McElrath*.

**Baleen**. See WHALEBONE.

**Baleinier**, the French name for a whaler.

**Bale-Lashings**, packing-cordage, usually sold in lengths of 17 fathoms. Hoop-iron, now generally used for cotton *B.*, is imported in lengths of about 12 feet.

**Baling-Paper**, a stout wrapping- or packing-paper for parcels.

**Balize**, or **BALISE**, is a timber frame or pole raised on a bank as a landmark; a buoy, or sea-beacon.

**Balk**, in the timber trade, a log of squared timber which varies in length from 20 to 90 feet, and from 8 to 30 inches in square.

**Ball**, a shot; a round plaything; a printer's inking-pad, etc.

**Ballast**, [Du. and Ger. *ballast*; Fr. *lest*; It. *savorra*; Sp. *lastre*; Por. *lastro*,] is sand, iron, or any other heavy material employed for sinking a vessel to a proper depth in the water, and to give it a just counterpoise against the action of the wind on the sails. In ballasting a vessel, the centre of gravity should be placed neither too high nor too low. When too much heavy *B.* is deposited in the bottom of the hold, the vessel will be too *stiff*; she will roll violently, and besides having her sailing qualities impaired, will be in danger in bad weather of being dismasted. When, on the contrary, there is too little *B.*, or this is so disposed as to raise the centre of gravity too high, the vessel will be too *crank*, and equal danger will arise. The art of ballasting, however, is to be acquired rather from experience than specific rules, as the quantity required by different vessels of the same tonnage varies according to their shape or *build*.

Vessels in *B.*, i. e., having no goods on board other than the stores and other articles requisite for the ship, crew, and passengers, are exempt from the payment of certain port-charges which are levied upon vessels having cargoes; many formalities at the custom-house are likewise dispensed with in favor of such vessels.

**Ballast-Engine**, a steam-engine for dredging

up shingle in a river, or drawing gravel or earth on a railroad.

**Ballasting**, a term for gravel, stone, clay, or other material applied to the covering of roads generally, but to the metalling or bottoming of railroads in particular.

**Balling-Furnace**, an oven in which iron is heated to a welding heat.

**Ballistic-Pendulum**, a mechanical contrivance for ascertaining the strength of gunpowder, by computing the velocity of a cannon-ball, which is made to strike a revolving or swinging beam.

**Ball Leathers**, the outer skin-covering of the pads nailed to the ball-stocks used by printers for inking type.

**Balloon**, [Fr. and Ger. *ballon*,] a machine made of silk, inflated with coal-gas for aërostation (Fig. 25). The ascent of a *B.* in the air is simple enough in principle. If the capacity of a hollow globe of silk is 10,000 cubic feet, and if 10,000 cubic feet of atmospheric air weigh more than the same quantity of gas or of heated air, *plus* the apparatus, then the *B.* and its appendages will ascend. The time has not yet arrived when the *B.* can be ranked among the aids to locomotion; for, although movement can be easily obtained, the maintenance of a particular direction still baffles the aeronaut.

**Balm**. See BALSAM and MELISSA.

**Balmorals**, [so called from the country residence of Queen Victoria in Scotland,] a heavy and bright colored skirting of woollen or worsted, wholly made of wool or mixed with cotton, imitating the skirt worn by the Swiss peasants, and largely manuf. in the U. States. *Imp.* duty, 35 per cent., besides a duty of 20 cents per lb. when value is not over 40 cents per lb.; 30 cents when value is from 41 to 60; 40 cents when value is from 61 to 80; and 50 cents when value is above 80 cents. *B.* manuf. in whole or in part, pay 50 cents per lb. and 40 per cent.

**Balot**, [Fr. *ballot*,] a small bundle or package.

**Balsa**, a raft or float of skins, used principally on the Pacific coasts of S. America, for landing goods through a heavy surf.

**Balsam**, [Fr. *baume*; Ger. *balsam*,] a name ap-

Fig. 25. — BALLOON.

plied to various medicinal resinous juices obtained from trees; but the term is strictly applicable only to such as contain benzoic acid, along with a volatile oil and resin; and of these true *B.*, there appears to be only five, namely, *B.* of Peru, *B.* of Tolu, Benzoin, Storax, and Liquid Amber. There are besides the *B.*, or Balm of Gilead or Opopalsam, Copaiba, and others which contain no benzoic acid, but are turpentine containing a volatile oil and resin.

*B. of Peru* is procured from a tropical American tree (*Myrciophylon Peruviferum*). It occurs in two states; the white and the black. The former, which results from spontaneous exudation, or incisions made in the bark, is very rare. The black or common *B.* is said to be procured by boiling the bark and branches of the tree. It is a fluid, having the consistence of syrup, a brown color, fragrant aromatic smell, and a pungent bitterish flavor. Sp. gr. 1.15. It is commonly imported in tin flasks. Average price in New York, \$1.20 per lb. Imp. free. Both the white and black *B.* are extensively adulterated, chiefly with copaiba, turpentine, or volatile oils.

*B. of Tolu*, or *Dry White B.*, is said to flow from incisions in the same tree; and when fresh is of the consistence of a strong turpentine. It becomes tenacious with age, and in cold weather may be broken, but melts again in summer. It is a brownish-yellow or reddish-brown friable substance, of a pleasant smell like benzoin, and a weak, aromatic, somewhat acid taste. Largely used in pharmacy and perfumery. Its adulteration with turpentine or resin is known by its odor when thrown on hot coals. It is imported in jars or tin cases. Average price in New York, \$1.00 per lb. Imp. free.

**Baltimore**, a magnificent city of the U. States, the commercial metropolis of the State of Maryland, and one of the three great seaports of the East, lies in lat. 39° 17' N., lon. 76° 38' W., on the Patapsco River, 18 m. (to the wharves) from its entrance into the Chesapeake Bay. The bay is sufficiently roomy, and of a depth to accommodate the largest ships, and the channels in the river, which are being continually improved, have been dredged to 24 feet, and a width varying from 250 to 400 feet. "Situated at the most northerly navigable extremity of the Chesapeake Bay, into which a number of rivers discharge themselves, passing through in their progress the most fertile districts of Virginia and Maryland, the city of *B.* is most favorably placed. Within the bay she has water communication by canal with New York and Philadelphia; with Washington by the Potomac River, and thence by the Chesapeake and Ohio Canal with Cumberland, the colliery district of the State. With Richmond, Petersburg, and Lynchburg, the James River affords means of communication, and with Norfolk the broad waters of the bay. Along these coasts and water-sheds, thousands of acres of well-tilled farms and numberless thriving villages are situated, dispatching the best qualities of grain grown upon the continent to her wharves, to the extent, at times, of 100,000 bushels in a day, in almost numberless craft—steamers, schooners, and sloops—in exchange for supplies carried upon return voyages. The position of *B.* at the head of the Chesapeake, brings it much nearer to the interior of the country than the other large cities of the Atlantic coast. The advantages of this are two-fold: First, conveying freight further by water causes a corresponding reduction in the cost of transportation; and secondly, its proximity to the coal region, and direct communication with them, enables steamers to take in coal at about \$2.50 per ton less than they could do at New York, giving a direct saving of \$2,000 upon the 800 tons consumed by steamers in each voyage across the Atlantic. With these advantages in point of location, *B.* is naturally becoming an outlet for the productions of the great West, as well as the interior, at the same time

being a natural distributing point to the same sections of the country. *B.* is the seaport terminus for three lines of railroad. These are the *B.* and Ohio, Northern Central, and *B.* and Potomac, all of which run to important sections of the country. Steamers ply between *B.* and Boston, New York, Philadelphia, Richmond, Norfolk, Wilmington, and New Berne, N. C., Charleston, Savannah, Key West, New Orleans, Havana, Galveston, etc. *B.* has also great European steamship facilities. From the large and commodious piers of the Baltimore and Ohio Railroad Co., at Locust Point, the *Allen line* dispatches six large steamers a month to Liverpool, the *North German Lloyds* two regularly per month to Bremen, the West India and Pacific S. S. Co. one a month to Liverpool and another to Havre, and on March 1, 1879, the *N. C. Railway Co.* started a weekly line to Liverpool. Two lines of Spanish steamers send out about four boats per month, and numerous steamers of no particular lines send out full cargoes. In addition there are now building six iron steamers to run between *B.* and Barrow, England, which are chiefly designed for the live-stock trade, and will be operated in connection with the traffic of the *B.* and Ohio R.R. Co. In 1878 the marine of *B.* consisted of 1,776 vessels—tonnage 129,936-67. During the same year 1,074 foreign ships, 334 American ships engaged in the foreign trade, and 113 foreign ocean steamers, having an aggregate tonnage of 1,227,131, entered the port, which was 8.25 per cent. of the total tonnage entered at American seaports from foreign countries. The exports were \$19,512,468 (4.57 per cent. of total imports of the U. States) in 1870, and \$16,938,628 (3.81 per cent. of total imports) in 1878. The exports were \$14,330,248 (2.97 per cent. of total exports of the U. States) in 1870, and \$45,492,527 (6.54 per cent. of total exports) in 1878. *B.* has 14 national banks, with an aggregate capital of \$10,418,985, and there are besides several important private banking-houses. The rapid increase of its commerce may be inferred from the following review of her leading products, exports, and imports in 1878. Pop. about 325,000.

**Canned Oysters, Fruits, and Vegetables.** *B.* is the great oyster mart of the world (see OYSTERS, under which head is given a synopsis of that important branch of the *B.* trade). There are 41 large establishments exclusively engaged in packing, and perhaps 100 small ones which are chiefly employed in opening oysters for home and near-by consumption. About 10,000 men are employed in packing and handling. As an exhibit of the amount done, 50,000 cans of raw oysters are put up daily by a single house, and 30,000 cans of cooked by another. The principal markets for foreign trade are in England, Australia, S. America, and the West Indies.—When the canning of oysters is finished, each year, that of fruit and vegetables begin. From 4 to 5 millions of cans of peaches, tomatoes, and corn; from 8 to 10 millions of fruits; and from 6 to 10 millions of cans of vegetables are packed annually. These canned fruits and vegetables are sent to all parts of the U. States, and are exported to all sections of the civilized world. The Hindoo, Chinese, Japanese, and all European markets, are largely supplied with canned goods from the packing-houses in *B.*

**Coal.** The inexhaustible supplies of bituminous coal furnished from the Cumberland coal region, the superior quality of the article, the gas-coal from W. Virginia, and the anthracite coal brought to the city from the coal regions of Pennsylvania, all point to *B.* as the centre for that trade. In 1870 coal was seldom shipped from *B.* to any foreign port except to Aspinwall. Since that time Cumberland coal has grown rapidly into favor, and about 40,000 tons were exported in 1878.

**Coffee.** *B.* stands only second to New York for the coffee trade. Its imports from Brazil, in 1878, amounted to 481,184 bags, and the average monthly sales to 40,912 bags.

**Cotton.** The foreign export of raw cotton, in 1878, was 83,295 bales, against 37,067 bales in 1877. There are 17 mills engaged in the manu. of cotton (shirtings, sheetings, and cotton duck), and 80 per cent. of all the cotton duck pro-

duced on the earth is made by these mills. An extensive trade is done with foreign countries by the *B. manuf.*, who have generally agents in England, France, and Germany.

*Flour.* *B.* is one of the greatest flour markets in the world. The flour manuf. in this city from the high grade and fancy Maryland and Virginia wheat, is of well-known superior quality, and wherever introduced maintains its reputation. A very high grade of "strong flour" is manuf. with great care for shipment to Brazil and other S. American countries. This flour is capable of standing long voyages to the tropics. In 1878, *B.* received 1,594,113 bbls., against 1,322,709 bbls. in 1877. The export trade for the years 1876-1878 was as follows:

Destination.	1878.	1877.	1876.
Great Britain.....bbls.	100,353	39,158	51,032

Totals.....	590,150	369,519	426,094

*Grain.* The completion of the *B.* and Ohio R.R., the extension of its western connections, and the facilities granted by the Pennsylvania R.R., have caused a large increase of the long-famed grain trade of *B.* The comparative receipts of grain for three years were as follows:

	1878.	1877.	1876.
Wheat.....bbls.	22,017,120	7,331,540	3,945,247

*Live-Stock.* The cattle-market of *B.* has long been famous. The market is furnished from Virginia, W. Virginia, Pennsylvania, Tennessee, Kentucky, Missouri, Illinois, Texas, N. Carolina, Indiana, and Ohio. The aggregate receipts of beef-cattle for 1878 (including only cattle offered for sale at the stock-yards) were 117,675, on which foreign export took 2,989 head, the beginning of a large trade anticipated. Total receipts of live hogs for 1878 were 360,514 head, being 40,855 more than 1877, and 113,052 more than 1876.

*Lumber.* This trade is very extensive. Altogether about 35 large houses are engaged in the lumber business, with an immense aggregate capital, and the machinery used in the trade is of the most highly improved character. About 50 millions of feet of yellow pine are used annually in making packing-boxes only. The export trade in 1878 was 2,818,052 feet, against 2,607,000 in 1877.

*Metals and Machinery.* *B.* is surrounded by iron-ore beds, and though the iron trade has declined during the last few years, mining is still carried on to some extent even within the city limits. For many years the largest iron plates rolled in America were made at the Abbott Iron Works of *B.* There is one railroad iron mill capable of turning out over 40,000 tons finished rails yearly. There is also large business done in the manuf. of marine and stationary steam-engines, water-wheels, mill-gearing, shafting, pulleys, stoves, hollow-ware, iron work for buildings, plumbers' iron and brass goods, agricultural implements, car-wheels, etc. The copper industry stands at least equal to any on the Atlantic coast.

*Petroleum.* *B.* is the nearest seaport to the oil regions, and has exceptional facilities for refining petroleum. There are 7 large refineries, besides 2 for gasoline and 2 for paraffine. The aggregate receipts of refined and crude oils in 1878 were 879,605 bbls., against 1,094,952 bbls. in 1877. The total exports during the same year were 37,717,056 gallons.

*Provisions.* Large quantities of provisions from the West to foreign ports are shipped at *B.*, and the preparation and exportation of lard has become one of the most important departments of commerce. There are 6 large establishments engaged in refining lard for export, besides numerous small ones for home trade. The *B.* refined lard is of very high standard, and is celebrated everywhere. The exports of provisions from *B.* in 1878 (and totals for preceding years) were as follows:

To	Lard. lbs.	Bacon. lbs.	Pork. bbls.	Beef. bbls.
Great Britain.....	3,880,370	11,683,437		375

Totals 1875.....	8,520,000	1,130,210	17,864	3,127

*Shoe and Leather.* This branch of *B.* industry is of considerable and daily-increasing importance. In 1870, the *B. Shoe and Leather Board of Trade* was established. In 1878, there was exported to England and Germany about 15,000 sides of oak-tanned leather. The amount of oak and hemlock leather received during the same year was 650,000 sides, value \$3,250,000; the light stock, calf-skins, upper and finished stock of all kinds, \$2,500,000; green, salted and dry flint hides, 375,000, valued at \$1,875,000. The estimate value of all business made in hides, leather, and skins of all descriptions in 1878 was \$3,375,000. There are 29 firms engaged in the manuf. of boots and shoes, employing about 4,000 operatives. The sales for 1878 were as follows: Wholesalers and retailers, \$8,600,000; manufacturers, \$6,000,000; rubber boots and shoes, \$1,000,000; auction sales, \$1,000,000; hides and leather, \$5,000,000; making a total of \$21,000,000.

*Sugar.* The total imports and consumption at *B.* for years 1874-1878 were as follows:

Year.	Imports.	Consumption.
1878.....tons.	23,303	22,787

**Baltimore and Ohio R.R.** (offices at Baltimore). This Co., one of the most important, best managed, and most successful in the world, was first chartered in 1827. Its main line, from Baltimore, Md., to Wheeling, Va., a distance of 379 m., was completed in 1853. On Jan. 1, 1879, the Co., with all its branches and leased lines, had in operation 1,499.75 miles of road. The *B.* and *O. R.R.*, having now a continuous line of railway from Baltimore to Chicago, and connecting with all the great railroads which pass through States bordering on the Mississippi, is enabled to compete with the great lines of New York and Boston for a share in the transportation of grain and other products of the North-western States. It has at Baltimore spacious and substantial warehouses and grain-elevators; and in its great workshops at Mount Clare, on the western suburbs of Baltimore, are manufactured all the varieties of work required by the necessities of a mammoth railway. On Sept. 30, 1878, the financial status of the Co. was as follows:

LIABILITIES.	
Stock.....	\$13,677,730.00
Preferred stock (dividends limits at 6 per cent.).....	4,599,578.72
Surplus fund (invested cap. derived from net earnings).....	37,111,919.29
On loan 1850-1880, int. 6 per cent. (Jan. and July).....	579,500.00
On loan 1853-1885, int. 6 per cent. (April and Oct.).....	1,710,000.00
On Baltimore city loan, 1855-1890, int. 6 per cent. (Jan., April, July, Oct.).....	2,938,091.09
On Sterling loan 1870-1895, int. 6 per cent. (March and Sept.).....	3,017,697.00

*Rolling stock* on main line and branches: Locomotive engines, 560; cars in passenger trains, 553, and in freight trains 12,072; total, 12,625.

*Net earnings* for 1878, \$5,995,978.63.

*Dividends* paid on cap. stock: Nov. 15, 1877, 3 per cent.; May 15, 1878, 4 per cent.

**Baltimore and Potomac R.R.**, extends from Baltimore to Pope's Creek, Md., a distance of 73.1 m., with branch from Bowie station to Washington City, 17.1 m.; total, 90.2 m. Office in Baltimore. This road, partly opened in 1872 and completed in 1873, forms, in connection with the Northern Central R.R. of Baltimore, a continuation of the Pennsylvania R.R. system to the Southern R.R., through Washington. The first mortgage bonds of this Co. are jointly guaranteed by the Pennsylvania R.R. and the Northern Central R.R., and its capital stock mostly owned by these companies. *Financial Statement*, 31st Dec. 1878: Funded debt, 1st mortgage main line bonds, issued 1871, \$3,000,000, payable 1911, interest 6% (April and Oct.); 1st mortgage tunnel bonds, issued 1871, \$1,500,000, payable 1911, interest 6% (Jan. and July); 2d mortgage income bonds, issued 1875, \$2,000,000, payable 1915, interest 6% (Jan. and July). Net earnings, 1878, \$92,890.26. Payments, interest on bonds, and others, \$275,171.76. Balance deficit, \$182,260.65.

**Bamboo**, a gigantic plant of the reed or grass kind, which grows luxuriantly in the tropical parts of America and Asia. It shoots up with great rapidity, and varies in height from 15 to nearly 100 feet. When full grown its general appearance is that of a straight rod with a number of stiff branches shooting at right angles from the main stem. It is of almost universal use, and is probably the most valuable boon conferred by Nature upon the inhabitants of warm climates. The young shoots of the plant are eaten as asparagus; when older, a fluid affording an agreeable beverage is secreted in the hollow joints; and the leaves and seed are used in medicine. It is largely imported into this country, where it is used for a variety of purposes, as walking-sticks, umbrella-sticks, chair-seats, wicker-work, tobacco-pipes, etc. *Imp.* free; when manuf., 35 per cent.

**Ban**, the Spanish name for a kind of fine muslin.

**Banana**, the fruit of the *Musa paradisiaca*, a valuable plant common in tropical countries. It very closely resembles the plantain, but is generally shorter and rounder, with a pulp softer and of a more delicate taste. It grows in clusters, and

the bunches vary in size, containing from 8 to 100 *B.*, and weighing from 4 to 40 lbs.

The *B.* and plantain are to the inhabitants of the torrid zone what maize is to this country, wheat to Europe, and rice to India and China. There is perhaps no other plant in the globe which, in so small a space of ground, can produce so great an amount of nutriment. The produce of the *B.* is said to be to that of wheat as 133:1, and to that of potatoes as 44:1. Numerous preparations are made of this fruit, both before and after its maturity. When fully ripe, it is exposed to the sun, and preserved like figs, forming an agreeable and wholesome food; while meal or flour is obtained from it by being cut into slices, dried, and pounded. The clusters are imported to the Northern States from the West Indies and Florida, in the green state, but the fruit rapidly ripens and decays. *Imp.* duty, 10 per cent.

**Banasta**, in Spain, a large basket made of twigs or latiss.

**Bancal**, an Indian weight of about 17 drachms avoirdupois; also the Spanish name for a thrown or twisted carpet.

**Banca-Tin**. See **TIN**.

**Banco**, an Italian word signifying bank, used at Hamburg and other places as a prefix to paper money, and also for sums inscribed in the books of the bank opposite the names of those who have deposited money or specie there. Banco is worth on an average 23 per cent. more than ordinary currency; but the premium necessarily varies with the nature of the security.

**Band**, a tie; a waist-girdle; an ornament; a body of musicians; a weight used on some parts of the coast of W. Africa for weighing gold-dust, equal to about 2 ozs. Troy.

**Bandage**, a ligature; a linen roll or other support or protection for the limbs, sold by chemists and surgical instrument makers.

**Bandal**, or **BANDLE**, a linear or cloth measure used in the S. and W. parts of Ireland, which is rather more than half a yard.

**Bandala**. See **MANILLA HEMP**.

**Bandana**, a kind of handkerchief with white figures or spots upon a red or dark ground, manuf. in England and Scotland, where the original Indian pattern has been much improved. To produce the figures or spots, holes of the proper size and shape are pierced in two metal plates, one affixed to the upper and the other to the lower part of a press. The cloth, previously dyed Turkey-red or some other color, is folded into 12, 16, or 20 thicknesses, placed in a compact pile between the two plates, and heavily pressed by them. A liquid solution of chlorine is made to flow over the upper plate; it passes into all the holes; finds its way through all the thicknesses of cloth; then escapes through the sides in the lower plate, and during the brief passage it extracts all the color. The pressure is so great (300 tons) that, under the influence of the skilful arrangement adopted, none of the liquid deviates sideways to act upon the other parts of the cloth. This is a variety of the *discharge* style adopted by calico-printers.

**Bandbox**, a thin box of slight wood, papered, chiefly used by milliners. Large quantities of them are annually made in New York and Philadelphia.

**Bandeau** [Fr.], a fillet, wreath, or veil; a lady's ornament for the head.

**Bandoline**, is an adhesive gum, made from Iceland moss, or from quince-seeds, steeped and boiled, and perfumed with essences. It is used by ladies for fixing or smoothing the hair.

**Bangkok**. See **SIAM**.

**Bangor and Piscataquis R.R.**, runs from Oldtown, Me., to Blanchard, Me., a distance of

62.5 m. Office at Bangor, Me. It was chartered in 1861, and opened to its present terminus in 1875. *Financial Statement:* Cap. stock, \$357,148.50, of which \$200,000 is held by the city of Bangor in exchange for bonds, and for which it has a mortgage on the road. Funded debt, city of Bangor bonds, as follows: \$600,000 issued 1869, interest 6%; \$322,000 issued 1871, interest 7%; \$99,000 issued 1874, interest 7%; \$101,000 issued 1876, interest 7%,—all payable 1 April, 1899. Net earnings for 1877, \$24,834.79.

**Banister-Brush**, a domestic sweeping-brush for the stairs.

**Banjo**, a favorite musical instrument of the colored people in America. It has a head and a neck like the guitar, a body like a tambourine, and five strings, which are played with the fingers and hand.

**Bank**, a term sometimes applied to a depository for money, but most commonly to an establishment for dealing in money capital. The proprietor or manager of such an establishment is called a *banker*. See **BANKING**.

**Bank-Fishery**, the cod-fishery on the banks of Newfoundland.

**Bank-Hours**, the time within which money is paid or received at a banking-house, more usually between ten and three.

**Banking**, is a term generally used to express the rules and principles by which the operations of a bank or banking-house are, or should be, regulated, as well as these operations themselves. The issue of paper-money in the form of notes payable to the bearer on demand is, in reference to the public, perhaps the most important of the functions of a bank. This privilege is restricted in America to the NATIONAL BANKS, under which head is explained in this work the whole system of banking of the U. States. In each State of Europe it is granted to one public bank, which—Great Britain excepted—is generally more or less connected with the government. These public banks are noticed under the names of the countries to which they belong. The present article, therefore, is limited to general considerations on the principal purposes of both national banks and private banking-houses, namely, to receive deposits, to facilitate remittances, and to make loans.

*Deposits.*—The banks first instituted in Europe after the revival of commerce were established for the purpose of receiving deposits. The lodgements consisted of coin of full weight, or an equivalent amount of bullion; and the credits raised in the bank-books for such deposits were transferred in payment of debts from one account to another by means of drafts or checks; the coin or bullion being seldom or never withdrawn, except when required for exportation. No interest was allowed on the deposits; and the advantages derived from such banks consisted in the safe custody of the precious metals, in the facility and despatch given to cash transactions by the transfer system, and in the certainty afforded that these transactions would be adjusted in currency of a determinate and invariable standard, instead of the light and debased coins then in circulation. The receiving of deposits is now invariably conjoined with other departments of banking business, and the general condition of the circulating medium renders bullion lodgements unnecessary. Deposit banking, as thus modified, still furnishes to the public the advantages of secure custody

for their money, with the facility, despatch, and economy of the transfer system; besides which, interest, varying from 2 to 3 per cent., is frequently allowed by private bankers on the sums in their hands, from the readiness with which they can be reinvested by the banks in securities yielding a higher rate. Deposits are of two kinds: *Dead accounts*, in which money is invested for the purposes of security and interest without being operated upon; and *Drawing accounts*, called also *Running, Operating, or Current accounts*, in which there is a perpetual paying in and drawing out by checks or otherwise, according to the circumstances or necessities of the depositor, interest being sometimes allowed on the daily balances in the hands of the bank.

*Remittances* were, in ancient times, effected by sending a messenger with the coin, and in the middle ages by means of bills of exchange. The latter still form the chief vehicle for foreign remittances. A common form of effecting an inland remittance is that of *Letter of Credit*, which authorizes the bank's correspondent to repay the money deposited with them to the party named in the letter; the use of the money during the intervening period, and sometimes a small commission, forming the remuneration of the bank. The transmission of money from one part of the country to another is now in great part effected in this country by the Express companies, and for small remittances, by Post-Office orders.

*Loans* may be classed under three heads: 1st, Discounts; 2d, Cash credits; 3d, Overdrafts on current accounts:

1. *Discounts.*—The form in which loans are chiefly made by bankers is on the security of bills of exchange or notes, which are well adapted for their purposes, as having only a short time to run before they fall due, the advanced capital soon returns, while, being transferable, they can, if necessary, be rediscounted. The advance is made to the full amount of the bill under deduction of interest, or, as it is loosely termed, *discount*, for the time which the bill has to run; a commission is also sometimes charged, varying from one-eighth to one per cent.

"The bills presented to a bank for discount may generally be divided into the following classes:

"1. Bills drawn by producers or manufacturers upon wholesale dealers.

"2. Bills drawn by wholesale dealers upon retail dealers.

"3. Bills drawn by retail dealers upon consumers.

"4. Bills not arising out of trade, but yet drawn against value, as rents, etc.

"Kites or accommodation bills.

"The first two classes of bills are the best, and are fair legitimate bills for bankers to discount. The third class does not generally meet with the same favor. They are for comparatively small amounts, and are drawn by shopkeepers and tradesmen upon their customers. To discount these bills freely would encourage extravagance in the acceptors; and ultimately prove injurious to the drawers. When a man gives notes or accepts bills to his butcher, baker, or tailor, he may fairly be suspected of living beyond his income. Solvent and regular people pay their tradesmen's accounts with ready money. The fourth class of bills, though sometimes proper, ought not to be too much encouraged. Persons out of trade have no business with bills. The last class of bills should almost always be rejected. To an experienced banker, who knows the parties, the discovery of accommodation bills is by no means difficult. They are usually drawn for even amounts, and for the longest term that the bank will discount, and are presented for discount soon after they are drawn. The parties are often relatives, friends, or parties who, from their avocations, can have no dealings with each other. The length of the period which bills have to run is also matter of consideration. The principal advantages to a bank of short dated bills compared with long dated bills are the following:—There is more safety in discounting short bills, because the parties may fail before the long ones fall

due; the commission (where this is charged) will be more in the course of a year upon any given amount of capital employed in discounting a succession of short bills than in discounting long bills; long dated bills lock up the funds of a bank, so that they cannot be discounted with safety but from the bank's own capital; for if a bank employs its deposits, or its circulation, in discounting long dated bills, and payment of the notes or deposits should be demanded, the long dated bills could not be rediscounted, and the bank must stop; long bills may encourage speculation; as persons may purchase large quantities of commodities in the expectation that the price will advance before the long bills which he accepts in payment shall fall due; while if the bills are of short date, this will be prevented." (GILBART'S *History and Principles of Banking*.)

Besides discounting bills, the banks render important services in attending to their due negotiation; it being customary for merchants and other people to send all the bills and drafts payable to them to their bankers, who become responsible for their regular presentation for payment, and for their noting if not paid.

2. A cash-credit is an undertaking on the part of a bank to advance to an individual such sums of money as he may from time to time require, not exceeding on the whole a certain definite amount, for repayment of which he enters into a bond with securities. Cash-credits are granted not only upon personal security, but also upon the security of stock in the public funds, or in railroad companies, also occasionally of lands or houses. To those requiring temporary advances of money, cash-credits possess the following advantages over discounts: the party can repay any part of the sum drawn at pleasure, and interest is charged only for the money actually employed; he has also the power of drawing, whenever he pleases, to the full amount of his credit; whereas, in the case of discounting bills, he must make a new application to the bank for each bill. To the bank the comparative advantage of a cash-credit in respect to bills, consists chiefly in its connecting the party more intimately with the bank; in the summary mode in which the bond may be recovered from the party or his securities; while to a bank issuing notes, the frequent operations under the credit give activity to its circulation. On the other hand, their comparative disadvantage to a bank is as follows: cash-credits, when once granted, cannot be called up, but bills of exchange soon fall due, and you can refuse to discount again. If you discount bills of exchange, they can be rediscounted to supply the bank with funds, if necessary, but advances on cash-credits cannot be replaced. In case of a panic or a run upon the bank, the persons having cash-credits might have occasion to draw upon the bank, and the notes would immediately be returned upon the bank, for payment in gold; but you could refuse to discount bills of exchange until the run was over.

3. Overdrafts on current or deposit accounts are similar in character to the drafts under a cash-credit, with this difference, that in a current account the party overdraws on his own individual security, and that on each occasion he has to obtain the permission of the bank.

In advancing money, whether by discounting bills of exchange or otherwise, a bank receives only the market rate of interest. But as this is a return which may be obtained for money without incurring the expense of an establishment for the purpose, it is obvious that no one would invest capital in the business of banking when it is to be confined to the loan department alone. The main object of the banker, however, is to procure, and

employ on an advantageous footing, the money of other people, and his profits are nearly in proportion to the extent to which he can accomplish that object. The trading capital of a bank consists of — 1st, the capital contributed by the partners; 2d, the money lodged in deposits; and, 3d, the money deposited for the purpose of remittance; to which has to be added, in the case of banks of issue, 4th, the amount of notes in circulation. These means are employed in — 1st, discounting bills of exchange; 2d, advances on cash-credits, or overdrawn accounts; and, 3d, investments in the funds and other good securities. The surplus of the former upon the latter forms the *reserve* kept by the bank to meet current demands. The amount of reserve necessary in ordinary circumstances is to be estimated from experience, and the transactions and position of the bank; but as unforeseen events may occur which may render the bank liable to be called upon for the whole or a considerable portion of its liabilities, whether in the shape of deposits or notes in circulation, it is of consequence that the amount of trading capital arising from these sources should be invested in securities which shall rapidly revolve, and be at all times convertible. The securities which best fulfil these requisites are bills of exchange, and stock in the public funds, on which a bank can easily extend or diminish its advances in proportion to the capital which it may have to employ; increasing them when the deposits and circulation are increasing, and diminishing them when these are diminishing; while in anticipation of a run, the bills may be converted into money by being rediscounted, and the stock sold. Investments and securities not readily convertible cannot be made with safety except out of the capital belonging to the bank itself. See EXCHANGE, MONEY, NATIONAL BANKS, etc.

**Bank-Note**, or **BANK-BILL**, a promissory note for money to be paid on demand by a banking company. In the U. States, every National bank may issue circulating notes to the maximum value of 90 per cent. of their capital. These notes are printed and delivered by the public treasury on deposit of corresponding bonds. The notes issued by a National Bank are current in all parts of the country. There are still in circulation notes of \$1 and \$2, but the printing of these notes was discontinued on Nov. 1, 1878, in accordance with section 5,175 of the revised statutes, which provides "that after specie payments are resumed, no association shall be furnished with notes of a less denomination than five dollars." On Nov. 1, 1878, there were in the U. States 2,053 National Banks. Their aggregate capital was \$473,590,426; outstanding circulation, \$322,460,715; bonds on deposit, \$349,408,900.

**Bankrupt and Bankruptcy.** A bankrupt, in English law, is a person who, either from the want of sufficient property, or from the difficulty of presently converting what he possesses into money, is unable to meet those demands of his creditors which the law gives them the power of instantly enforcing, and who has committed some act indicative of the situation in which he is placed. It is in the latter particular that a bankrupt differs from one who is insolvent. A man may, were his affairs examined, be found unable to pay his debts; but if his creditors are either ignorant of the circumstance, or, knowing it, trust to the return of prosperity, no one is injured, no

one's claim is resisted, and there is no necessity of applying the sweeping remedy of the bankrupt law. But when by resisting or evading the demands of creditors, a man has distinctly shown to the world that he has not wherewithal to meet the just demands on him, it has been deemed, in certain cases, necessary for a special law to step in and lay its hand upon the property of every description belonging to the debtor, in order that particular creditors may not, through an expeditious adoption of the ordinary remedies of the law, sweep away the whole in full payment of their debts, and thus acquire an advantage over less fortunate creditors beyond the just reward of their activity. To accomplish this end, a bankruptcy code appoints all the property of every description belonging to a debtor to be placed in the hands of trustees, to be by them converted into cash, and then to be distributed among the ordinary creditors in proportion to the amount of their respective debts. It is a principle of the commercial bankruptcy law of England, that after a certain time has been allowed for all the resources of the bankrupt to be investigated, and his property realized for behoof of his creditors, if he has conducted himself with candor and integrity, he is protected from their further prosecution, and left free to recommence the pursuit of wealth, untrammelled by any obligation to them previous to his bankruptcy.

In the American law the distinction between a bankrupt and an insolvent was never generally regarded, and was expressly abrogated by the act of Congress, Aug. 19, 1841. In 1867, however, Congress, acting under the authority of the Constitution, which authorizes it "to establish uniform laws on the subject of bankruptcies throughout the U. States," enacted a general bankrupt law; but that law was repealed in 1878, and every State is now again governed by its own laws on insolvency, assignments for the benefit of creditors, exemptions of property from liability for debts, and attachments of property upon mesne process. These different laws will be found briefly examined under the heading **INSOLVENCY**.

**Bank-Stock**, is the paid-up capital of any bank, usually divided into shares of a certain amount. These shares may generally be transferred by assignment.

**Banqueroutier**, the French term for a bankrupt.

**Banquier**, the French term for a banker.

**Bantam-Work**, gaudily varnished japanned work.

**Banyan**, a Hindoo merchant or trader; a confidential cashier and broker for a mercantile firm.

**Bar**, in navigation, an obstruction at the entrance of a harbor or river. Sometimes in bar-harbors vessels have to wait for the rise of tide before they can enter or quit the port. In commerce, the term is applied to any piece of metal having much greater length than diameter. *Bar-iron* is iron shaped into bars, and fitted for all sorts of iron work.

**Barb**, an Arab horse. — Part of a fish-hook.

**Barbadoes**. See **WEST INDIES**.

**Barbadoes-Tar**, a species of petroleum or bituminous oil, obtained in Barbadoes, which possesses some medical properties, as an external and internal application.

**Barberry**, a shrubby ornamental plant (*Ber-*

*beris vulgaris*), a native of Europe and America. Its berries are of an oval shape, and, when ripe, generally of a bright red color. They are very acid, and not fit to be eaten raw; but when boiled with sugar, they form a most refreshing preserve. The bark and stem are very astringent, and yield a bright yellow dye.

**Barbotine**, an East Indian vegetable produce, the chief constituents of which are wax, gum, and bitter extract; also a name for worm-seed.

**Barcelona**. See **SPAIN**.

**Barchet**, a term used in Germany for a piece of stuff of 22 to 24 ells. The *B.* is the 45th part of the fardel.

**Bare**. When an article of merchandise is scarce, or is not in demand at a certain place, the market at that place is said to be *bare*.

**Barège**, a thin material used for ladies' dresses. It was originally a woollen fabric manufactured at Barèges, in France. It is now commonly made of cotton and wool, and the best is woven with a warp of silk.

**Bare-Pump**, a suction-pump for drawing liquids from a cask.

**Bargain**, an acknowledged agreement or verbal contract; a sale or purchase. By usage this word used alone has come to be taken for such transactions as are favorable to the buyer, as "I bought it at a *bargain*;" otherwise the term is qualified, as "*a bad bargain*."

**Barge**, a flat-bottomed boat, of which there are several kinds; they are mostly used on navigable rivers, for transferring heavy merchandise from ships to wharves, or from one quay to another.

**Barile**, the Italian cask as a liquid measure, varying in different localities. At Ancona the *B.* is 11'349; at Cerigo, for oil, 14'0298; at Florence, 9'6338, and for wine, 12'0442; at Genoa, 19'6086 for wine, and 17'083 for oil; at Leghorn, 12'041 for wine, and 11 gallons for spirits; at Naples the *B.* is 11'573; at Palermo, 9'436. In Trieste the Austrian *B.* is 144½ gallons.

**Barilla**, or **SODA ASH**, [*Fr. barille*; *Ger. barilla*; *It. barriglia*; *Sp. barrilla*.] an impure carbonate of soda, obtained by lixiviating the ashes of seaweeds. It is brought to us from Sicily and Spain (the best from Alicante) in hard, porous masses. The best quality is of a bluish-gray color. The value of *B.* depends upon its purity. It usually contains from 16 to 24 per cent. of pure carbonate of soda, and occasionally 30 per cent. It is particularly used in the manufacture of soap and glass, and in bleaching; but it is much less used than formerly, on account of the cheapness with which soda is obtained from common salt. Average price in New York (in bbl.), 2 cts. per lb. *Imp. free*.

**Bark**, the outer covering of trees. Many barks enter largely into commerce for various economical and manu. purposes. They are described in this work under their respective heads. In navigation, see **SHIP**.

**Barkers**, **PETER FUNKS**, **TOUTERS**, or **CAPPERS**, are fellows employed at mock-auctions to induce purchasers to enter the sale-room.

**Barking**, a technical name for coloring or tanning sails, nets, cordages, etc.

**Barley**, [*Fr. orge*; *Ger. gerste*; *It. orzo*; *Sp. cebada*.] a well-known species of grain (*Hordeum*), extensively raised in the Middle and Northern States and in Europe. Its varieties are distinguished either from the number of rows of grain

in the ears, or from the time of sowing them into winter *B.* and spring *B.* The principal consumption of *B.*, chiefly in America, is for malting. It is also valuable for culinary purposes, especially for thickening broths, soups, and puddings, after it has undergone the process of pearling. This is done by machinery, which removes the husk for *pot*, and a portion of the kernel for *pearl B.*, leaving the remainder smooth and round like shot. The average yield of *B.* in the U. States is about 30 bushels to the acre, and the weight 48 lbs. per bushel. The average crops of *B.* for the last seven years were as follows: acres, 1,477,809; bushels, 31,814,724; value, \$25,082,158; value per acre, \$16.97. In 1878 the exports (chiefly to England and Ireland) were 3,921,501 bushels; value, \$2,565,736.

**Barm.** See YEAST.

**Barn,** a farm-building used for storehouse or granary.

**Barnacles,** a twitching instrument used by farriers, etc., to hold by the nose horses that are troublesome.

**Barometer,** a pneumatic instrument for measuring the weight of the atmosphere, or of its pressure on the surface of the globe, and thus indicates the state of the weather. The dial *B.*, whose only use is to indicate good and bad weather, is so called because it is provided with a dial on which moves a long needle (Fig. 26), which is put in motion by the mercury of the instrument itself. To the axis of the needle is fixed a pulley, *O*, on which is rolled a thread which bears at one of its ends a weight, *P*, and at the other a little heavier weight, floating on the mercury of the small branch of the *B.* If the atmospheric pressure increases, the level falls in the small branch, and the float follows it, drawing the

Fig. 26.—BAROMETER.

pulley and needle from left to right. The contrary motion takes place when the pressure diminishes, because the mercury rises in the small branch, and with it the float. The result is that the needle stops on the words *variable*, *rain*, *fair weather*, etc., when the *B.* assumes corresponding heights, provided the instrument be well regulated, which is seldom the case.

**Barouche,** a four-wheeled pleasure carriage, with falling top and seats.

**Barque.** See SHIP.

**Barracan,** a thick, coarse camlet of wool or

mixed material, used for cloaks or outer garments, and chiefly made in France.

**Barral**, the Spanish name for a large bottle, capable of holding an arroba or 4 gallons.

**Barratry**, is any fraudulent or other unlawful act committed by the master or mariners of a ship, without consent of the owner, and tending to his injury, as running away with the ship, wilfully carrying her out of the course of the voyage prescribed by the owners, sinking or deserting her, embezzling the cargo, smuggling, or any other offence, whereby the ship or cargo may be subjected to arrest, detention, loss, or forfeiture. By the laws of the U. States, acts of *B.* committed by "any captain or mariner, or any ship or vessel" are punishable by death. *B.* is one of the losses covered by insurance, and the owner may thus protect himself against the act of the master and sailors appointed by himself. It is the duty of the owner to prevent, as far as he may, the misconduct of the master; and if the former appear to have acted with gross negligence, the underwriter is not liable.

**Barrel**, a round wooden vessel or cask, made of staves and heading, having more length than breadth, bulging in the middle, and bound with hoops. It forms a variable measure of capacity for handling dry goods and liquids; a *B.* of wheat flour being 196 lbs.; of lime, 320 lbs.; of fish, 220 lbs.; of beef or pork, 200 lbs.; of wine and brandy (U. States and England), 31½ gallons; of oil (at Cincinnati), 43 gallons; of honey (at Havana), 6 gallons.—The *B.* of a pump is the hollow cylinder in which the piston moves.—The *B.* of a wheel is the cylindrical axle round which the piston moves.—*B. bulk*, in shipping phraseology, is a measure of capacity for freight, equal to 5 cubic feet; 8 *B. bulk*, or 40 cubic feet, making one ton of measurement.

**Barrel**, or SPRING-BOX, [Fr. *barillet*; Ger. *Das federhaus*,] the small cylinder of a watch, about which the spring is coiled (Fig. 27).

**Barrique**, [Fr.] a large cask or hogshead, of variable capacity, ranging, according to the commodity, from 40 to 83 gallons.

**Barrow**, a tray or light carriage of several kinds, there being hand-*B.* for two persons, wheel-*B.*, load-*B.*, *B.* for wheeling sacks, and porters' *B.* or trucks. See WHEEL-BARROW.

**Barsac Wine.** See SAUTERNE.

**Bar-Shoe**, a particular kind of horse-shoe, made to protect the tender frog of a horse from injury.

**Barter**, an exchange of commodities; a rude mode of trade which, since the general diffusion of coined money and the precious metals, is almost obsolete, except in a few uncivilized countries.

*B.*, in *Commercial Arithmetic*, is an application of the rule of proportion to the exchange of one commodity, of which both the rate and quantity are fixed, for another, of which either the rate or the quantity are alone fixed. As the value of the goods exchanged are equal, it is obvious that the product of the quantities multiplied into their respective rates will be also equal. Hence the following Rule: Multiply the given quantity and rate of the one commodity, and the product, divided by the rate of the other commodity, gives the quantity sought; or, divided by the quantity, gives the rate.

**Bar-Wood**, a red dye-wood, the produce of *Baphia nitida*, a small quantity of which is imported from Angola, in Western Africa.

**Barytes**, an earthy mineral, which is found both massive and crystallized in England, Bohemia, etc. Sp. gr. 4.5. The white sulphate of *B.*, or heavy-spar, being very heavy, and costing only

before grinding about \$5 in England, is largely imported for adulterating white-lead. It is also employed in the manuf. of jasper-ware, in producing opaque white patterns as a colored ground, and in making a pigment called *permanent white*. The *nitrate* of *B.* are used in pyrotechny for producing a green flame; and the *carbonate* of *B.* in the manuf. of plate-glass, in color-making, etc. Nearly all these salts are virulent poisons. *Imp. duty*,  $\frac{1}{2}$  ct. per lb. for carbonate and sulphate; 20 per cent. for nitrate.

Fig. 27. — BARREL OF A WATCH-SPRING.  
A, barrel; B, chain; C, fusee.

**Baryton**, BARYTONE, a stringed instrument of music; a kind of bass-viol.

**Bas**, the French name for hose or stockings.

**Basalt**, a black and very hard stone of volcanic origin, used for the assaying of gold and silver.

**Basane**, the French name for tanned sheep-skin, used for bookbinding.

**Basil Oil**, an aromatic ethereal oil, obtained from the root of the pot-herb basil (*Ocimum basilicum*).

**Basin**, a bowl of various size and material for containing fluids; a wet dock, or harbor-inclosure for ships; the French name for dimity, a white cotton stuff mostly striped.

**Basket** [Fr. *panier* and *corbeille*; Ger. *körbe*; It. *paniere*; Por. and Sp. *canastas*], a well-known vessel of various form and size, made of flexible materials lapped or interwoven, and used for the stowage or conveyance of merchandise, fruit, vegetables, etc. Of late years much ingenuity has been exercised in this country in devising forms of *B.* for the carriage of fruit to market in packages of size proportioned to the character of the fruit. Osiers, splints, veneers, and paper have been employed. Some of these *B.* are made frustum-shaped, so as to pack in nests for return; others have been made folding or collapsible; others of so cheap material and workmanship as to be sold with the fruit. *Imp. duty*, 35 per cent. The finer kinds of *B.* are made by hand, but the commoner kinds are now generally made by machinery. A basket-making machine, for which there are many American patents, substantially consists (Fig. 28) of a circular wooden bottom-piece with radially projecting basket-strips, attached to the end of a rotating shaft; during the rotation of the bottom and radial strips, a filling-carrying device having a vibratory motion passes over and under the radial strips, and leaves the filling carried by it, and this filling is laid in compactly by reed-like pieces.

**Bason**, in hat-making, a triangular metallic plate upon which a covering of fur is laid and felted to make a conical napping or *pull-over* for a hat-body.

**Bass Fibre**. See PIASSARA.

**Bass or Bast Mats**, a matting made in Russia from the thin layers of the inner bark of the lime-tree, used by gardeners for binding or covering plants, and also for baling and packing purposes. A full-sized Russian bast-mat weighs about 5 lbs. when new and quite dry; it is 7 feet long and 4 feet broad. They are largely imported in bales. *Imp. duty*, 20 per cent.

**Basset-Horn**, a musical wind instrument resembling the clarinet in tone and manipulation, but larger. It is seldom employed in the orchestra.

**Bassette**, a small bass-viol.

**Bass-Horn**, a musical wind instrument of deeper tone than the bassoon.

**Bassoon**, a musical wind instrument made of wood, and capable of being divided near

the middle, so that the two parts may be of more convenient length for carriage. The *B.* has a reed and curved mouth-piece, and is played by means of keys and finger-holes like the clarinet, to which it forms the bass.

**Basso-Relievo or Low-Relief**, is the slight projection of a sculptured object from the plane surface, as in the case of the figures on medals, coins, friezes, etc.

**Bass-Viol, or Violoncello**, a stringed musical instrument resembling a violin, but larger, and having a graver tone. It is held in an upright position when played, the butt-end resting on the floor.

Fig. 28. — BASKET-MAKING MACHINE.

**Bass-Wood**, a name given to the American linden-tree, *Filia Americana*. The wood is soft, easily worked, and is used for the panels of carriage-bodies, seats of chairs, the fans of fanning-mills, etc. It is also made into pulp, and then used as a material for paper-making. See BAST.

**Bast**, rope, cord, and matting made from the bass or linden tree; also a name for the bark or tough fibres of the flax and hemp plants. See BASS.

**Bastimento**, the Italian name for a ship.

**Bat**, a name for the tical of silver in the East, weighing 235 grains; also a club or striking instrument.

**Batavia**. See JAVA.

**Batch**, the quantity of bread baked at one time.

**Bateau-a-Vapeur**, the French name for a steamboat and steamship.

**Bathing-Machine**, a portable shed or room on wheels placed upon the sea-beach for the convenience of bathers.

**Batiste**, the French name for cambric or lawn, the finest kind of linen, named after Batiste, who first made it at Cambray.

**Batman**. See MAUND.

**Batta**, a term used in India to denote a percentage, or allowance. Thus, the Sicca rupee is said to bear a *batta* of 16 per cent. against the current rupee, as 100 Sicca rupees = 116 current rupees.

**Batten**, in weaving, an instrument for striking the weft home. — Also a piece of fir or pine timber used for floors, and as a ground for laths, not exceeding 7 in. in breadth, about 2½ in. thick, and 6

W. of Germany, and, next to Prussia, the most important member of the German Empire. *Area*, 29,292 sq. m. *Pop.* 5,022,390. It is subdivided into 8 provinces. — Capital, Munich [Ger. *München*]; *pop.* 193,024. The government is a limited monarchy, with chambers of councillors and deputies, regulated by a deed of constitution of May 26, 1818.

*B.* consists of two parts, separated by Hesse-Darmstadt, Baden, and Wurtemberg. The larger or eastern portion, lying bet. lat. 47° 20' and 50° 41' N., and lon. 9° and 13° 48' E., comprehends 7 of the 8 provinces. This country is mountainous and woody towards the south, and contains a number of lakes and marshes. To the northward are rich and extensive plains until we reach the Danube, beyond which it is again mountainous and woody. The division called Rhenish *B.* is a small but densely inhabited country, extending from lat. 48° 57' to 49° 50' N., and from lon. 7° 6' to 8° 31' E. *B.* is essentially an agricultural country, and its soil is in general fertile. Wheat, rye, barley, and oats are the chief objects of culture; next to which are vine and hop plant; considerable attention is likewise given to flax, hemp, fruit, liquorice, and madder. The chief mineral products are iron, coal, and salt; but quicksilver, gold, silver, cobalt, and some other metals are likewise found. Manufacturing industry is mostly diffused over a number of small dealers. The principal article is linen; the others are woollens, worsted hose, cottons, hardware, arms, beer, toys, leather, paper, glass, porcelain, and straw-plaiting.

The internal commerce of *B.* is chiefly conducted by the Danube in one direction, and the Rhine in the other. Exports:—Grain, salt, timber, potash, fruit, liquorice-root, seed, hops, cattle, sheep, swine, flax, yarn, coarse linens, glass, leather, Nuremberg wares, beer, etc. *B.*, for an inland country, is favorably situated for commerce; it has good lines of railroads, and is the channel of a considerable transit trade between the other German States and Switzerland, Austria, and Italy.

The chief commercial and manufacturing cities besides Munich, are Augsburg, *pop.* 57,210; Nuremberg [Ger. Nürnberg], *pop.* 91,017; and Ratisbon, *pop.* 35,000. Augsburg formerly occupied the place now held by Frankfurt as the chief money-market of Central Germany; and banking and exchange operations are still one of its principal sources of wealth; it also carries on an extensive transit trade, is noted as a wine depot, and has extensive printing, engraving, and bookbinding establishments. *Measures, Weights, Money* are those of the German Empire.

**Banking**.—The usance for bills on Augsburg is 15 days' sight; half usance, 8 days. Bill transactions are settled weekly on Wednesday, and those which fall due on that day are not payable till the Wednesday following. Bills have thus from 1 to 8 days' grace; but those drawn *à vista* (at sight), must be paid within 24 hours after being presented. There is at Munich a banking Co. which issues notes, discounts bills, and lends money on mortgage; it is sanctioned by government, but the latter is not responsible for its engagements.

**Finances**.—The public revenue is about \$53,000,000, and the expenditures nearly the same. The debt of the kingdom in 1878 was \$27,147,305. This considerable debt was created in part by the deficits of former years, and in part by the construction of public works, especially railroads. The greater number of the railroads in *B.*, constructed at a cost of \$62,500,000, are the property of the State.

**Bawla**, matting for thatch made of the leaves of the cocoa-nut in the Pacific Islands.

**Bawsin**, leather made from sheep's skin.

**Bay**, a horse of a bright-red brown, inclining to a chestnut color. — The laurel-tree (*Laurus nobilis*), a native of the south of Europe and of Asia. It attains a height of 20 to 30 feet. The leaves are smooth, evergreen, lanceolate, and wavy at the margin; and afford, when bruised or burnt, a grateful aroma, which occasions their employment for culinary purposes. But the part chiefly valued is the fruit or berry, which is small, ovate, dark, purple-colored, aromatic, and bitter. It has long been used in medicine as a stimulant and carminative. The husks of the berries contain a great quantity of volatile oil; and the kernels furnish by expression a flat greenish oil, which is much employed in embrocation. *Bay-berries* and oil are imported from Trieste, Italy, and Spain. *Imp. duty*: on bay-berries, free; on fixed or ex-

Fig. 29. — BAY-TREE, OR LAUREL.

or more feet in length. *B.-ends* are pieces under 6 feet in length.

**Battery**. See GALVANIC BATTERY.

**Batting**, cotton in sheets prepared for interlinings, bed-covers, etc.

**Battledore**, a rack; a child's plaything for keeping up a shuttlecock; an instrument for striking a tennis-ball.

**Batts**, carded cotton prepared in sheets and sold as batting.

**Baudruche**, the French name for gold-beaters' skin.

**Bauge**, a drugget made in France with thread upon thick and coarse wool.

**Bausch**, BUSCH, a German term in the paper trade for 181 sheets of paper.

**Bavaria**, [Ger. *Bayern*,] a kingdom in the S.

pressed oil, 20 cents per lb.; on essential oil, \$17.50 per lb.

**Bayberry Tallow**, a fragrant green wax, from which candles have been made. It is found attached to the berries of the Candleberry, Bayberry, or Wax Myrtle (*Myrica cerifera*), a small shrub of North America.

**Bayonet**, a pointed spear, an offensive weapon made to fix on the barrel of a musket.

**Bay Rum**, BAY WATER, a spirituous perfume like Eau de Cologne, made in the West Indies from the leaves of a species of bayberry (*Myrica acris*) distilled in Jamaica or Santa Croix rum. The Bay rum extensively used by barbers as a wash for the head is generally a fictitious article, consisting of some drops of the essential oil extracted from the leaf with distilled spirits. *Imp. duty*, as alcohol; when under 54° strength, \$1 per gallon, 1st proof, and in proportion for any greater strength; on essence or oil, 50 cents per oz.

**Bay Rush**, a plant common in the Bahama Islands, which furnishes much farina, that can be made into bread.

**Bay-Salt**, salt made in the salinas, or natural ponds, by evaporation from sea-water exposed to the sun.

**Bay-Wood**, a name for the inferior variety of mahogany growing along the Bay of Honduras.

**Bazaar** [Per. *a market*]. In Oriental countries this term is used to distinguish those parts of towns which are exclusively appropriated to trade. The principle of the *B.* is association for facility of reference; all the shops of a city are placed together; and the different trades and occupations are severally collected in different parts of the *B.*, instead of being indiscriminately mingled as in our streets. Thus the saddlers are found to occupy one passage, the pipe-makers another, and so on. The great bazaars consist of a connected series of these passages, or lanes, vaulted with high brick roofs, surmounted by domes which admit a subdued daylight; and those of superior description are sometimes decorated with paintings. The passages are composed of a series of recesses or stalls, the floor of which is raised from 4 to 3 feet above the ground. These recesses, which are entirely open in front, are scarcely more than closets; but in the most respectable parts there is generally a door in the back-wall which leads to another apartment that answers the purpose of a store-room. The front part is the shop, on the floor of which the merchant sits with his goods so placed that he has seldom to rise, which, if he is a Turk, he rarely does without manifest reluctance. Long bargaining is common, and an apparent indifference is exhibited both by buyer and seller; the latter, as he sits smoking his pipe, being indeed the personification of luxurious repose. Not only trades, but handicraft employments are carried on in the *B.* The stocks of the individual dealers are seldom of much value, but an improving effect is produced by the exhibition of the whole in a connected form, whence arises the splendid appearance of the oriental *B.* Business commences and terminates with daylight, and none of the shopkeepers or artisans reside in them. Wholesale dealers have no open shops in the *B.*, but they have warehouses in them, or in their vicinity. In America and Europe the name *B.* is chiefly applied to a fancy repository.

**Bazaar - Maund, Bazaar - Weight.** See MAUND.

**Bellium**, a gum-resin of a brownish-red color. It burns with a balsamic odor, and resembles myrrh in taste, smell, and medical properties. The Indian *B.*, which is the best, is obtained from the *Balsamodendron Mukul*; the African *B.*, which has a feeble odor and bitter taste, is obtained from *Hendelotia Africana*. *Imp. free.*

**Beacon**, a signal, a buoy, or light for the guidance of mariners.

**Beading**, is an artificial property given to spirits, of beading on the surface, or hanging in pearly drops on the sides of the glass containing it.

**Bead-Plane**, a moulding plane of semi-cylindrical contour.

**Bead-Proof**, the standard strength among distillers for alcoholic liquors, when tested by the glass bubbles or hollow beads used as floats, but which are now superseded by more accurate meters.

**Beads**, are small perforated globes or balls of glass, ebony, coral, amber, etc., which range from seed beads to a very large size. They are used as ornaments for the person, and form a large article of commerce with Eastern countries, Africa, and North American Indians. They are also employed by Roman Catholics for the purpose of counting a series of prayers called the *Rosary*. Glass *B.* are made in large quantities at Murano, near Venice. *Imp. duty* on *B.* and *B.* ornaments (except amber, which is free), 50 per cent.

**Beaker**, a jug with a spout. — A glass vessel in the shape of a goblet used in chemistry.

**Beak-Irons**, instruments for working sheet-metal.

**Beam**, a large piece of timber used as a support for flooring in a house, or for the decks of a ship. — The horizontal bar or support of iron or other metal, from the ends of which the scales of a balance are suspended. — That part of a steam-engine to which the piston is attached — In weaving, a wooden cylinder on which the web is wound. — The width of a ship from side to side.

**Beam and Scales.** See BALANCE.

**Beam-Compass**, an extending instrument for drawing circles or axes of very large radius.

**Beam-Filling**, that portion of a vessel's cargo which is stowed between the beams.

**Beam-Timber**, the hard, fine-grained wood of the beam-tree (*Pyrus aria*), used in Europe for cog-wheels, etc.

**Beans**, [Fr. *fèves*; Ger. *bohnen*; It. *fave*; Port. *faras*; Sp. *habas*,] a well-known pulse (*Vicia faba*), of which there are one or two varieties cultivated for culinary purposes in gardens, and in a more extensive scale in fields, for horse provender and cattle feeding. A bushel of *B.* must weigh 62 lbs. *B.* are largely exported from the U. States. *Imp. duty*, 10 per cent; as seed, 20 per cent.

**Beans and Nuts**, a trade term for a kind of small coal.

**Bean-Sowing Machine**, a drill for planting beans in rows.

**Bear**. There are several species of this well-known quadruped; the most important, however, are the brown and black *B.*, *Ursus arctos* and *Americanus*, and the polar or white *B.*, *Ursus maritimus*. The *B.* is an object of commercial utility for menageries and zoological collections, and also for its skin and grease. The flesh of the black *B.* is extremely delicate, the hams in particular being

much esteemed. — A stock-exchange term for a jobber or dealer who, having sold stock or shares which he does not possess, is anxious that such securities should decline in value, so that he may be enabled to buy at a profit. The term is said to derive its origin from the story of the man who sold the bear-skin before he had killed the bear.

**Bearberry**, a dwarf branching shrub, *Arctostaphylos alpina*. The leaves, imported from England, are used in medicine.

**Bearer**, one who presents a check, draft, or other order for the payment of money. If a check, bill, or note be made payable to bearer, it will pass by delivery only, without indorsement; and whoever fairly acquires a right to it, may maintain an action against the drawer or acceptor.

**Bear's Grease**, the grease or oil obtained from the fatty parts of the black or white bear, and made into a pomatum, used for promoting the growth of the hair.

**Bear-Skins**, the skins of the various species of bear, which are much prized for robes, hearthrugs, and sleigh coverings. Bear-skin is also the trade name of a kind of heavy cloth with a long nap.

**Beaters**, the striking parts of thrashing or other machines or mills.

**Beaujolais Wine**. See BURGUNDY WINES.

**Beaver**, a small rodent animal (*Castor fiber*, Fig. 30), once abundant in all the northern parts of America, but now found only on the Upper Mis-

Fig. 30. — BEAVER.

souri and the unsettled parts of the Canadas. The *B.* is characterized by industry, ingenuity, and instinctive skill in building dams and bridges. Its body, about 2 feet long, is covered with a thick, glossy fur, of a most commonly chestnut-brown color, which is used for making hats and caps. The *B.* furnishes also a peculiar odoriferous secretion termed *Castoreum*.

**Beaver-Cloth**, a species of heavy felted wool-lens, chiefly used for overcoats, made in England, Germany, France, and the U. States.

**Beaverterteen**, a kind of fustian, made of coarse twilled cotton, which is shorn after dyeing.

**Becket**, a sea term for a piece of rope.

**Beck-Iron**, a piece of metal bent at right angles for the purpose of securing wood firmly on the bench while planing.

**Bed-Clothes**, the blankets, sheets, and quilts spread upon a bed.

**Bedding**, the furniture and appurtenances for a sleeping-couch.

**Bedding Plants**, young plants from a nursery, fit to be transplanted into beds.

**Bed-Spread**, a coverlet or counterpane.

**Bedstead**, a framework of wood or metal, to support a bed. *B.* bear various names, according to shape and size, and are largely manuf. for home use.

**Bed-Ticking**, a stout material of cotton or linen, for making bed-cases to hold feathers, flocks, etc.

**Beech** [Fr. *hêtre*]. The common *B.* of Europe (*Fagus sylvatica*) and the red *B.* of North America (*F. ferruginea*) are very beautiful forest trees, growing to the height of about 100 feet (Fig. 31). The fruit is a triangular nut, called *beech-mast*, which is edible, valuable as food for swine, and yields a large proportion of a bland fixed oil which is used as food and burned in lamps. The wood is of close texture, though not so strong as the grained timbers against a cross strain. When exposed to alternate drought and moisture it soon decays, but lasts long when kept constantly wet. It is used for machinery, furniture-work, presses, stocks and handles of tools; also for keels of ships, and for planking in parts kept constantly under water. It is, however, little used in building, and though easily turned, it is not adapted for hollow vessels, as it is apt to split when quickly dried after being wet.

**Beef**, the flesh of oxen and cows, fit for food, which is either used fresh or cured. Salted *B.* of commerce is classed into mess, prime, mess extra, India, India mess. It is usually quoted in the U. States under the general head of "Provisions," and is packed in barrels containing 200 lbs.—For many years there has been a search for new outlets to American meat-products. Shipments of cured and pickled *B.* have largely augmented in bulk and value; but growers and shippers have not been satisfied, craving the higher prices of prime fresh *B.*, or the saving of heavy transportation bills by the processes of concentration. Numerous patents have been granted for extract of *B.*, or other cooked and canned products convenient for safe and cheap shipment. The results have not been altogether satisfactory, as the profits only warranted the use of cheap beefs of Texas. Enterprising shippers believed

it possible to send abroad the best American corn-fed *B.*, by the use of refrigerating processes, in the fastest steam-ships, and present it in the principal markets of Great Britain in perfect soundness of condition, in competition on its own merits with English *B.* of famous repute. The first shipment of fresh *B.* was made to England by Mr. Timothy C. Eastman, of New York, in Oct., 1875, and with such success as to command a constant extension of this newly-developed business, in which New York, Philadelphia, and other cities, are now engaged. English authority makes the statement that most of the live-stock from the U. States is superior in quality and condition to that imported from Holland and other parts of the Continent, and that there is a juiciness and flavor about the *B.*, and an equal distribution of fat and lean, that are not wholly attainable except through the American system of full grazing. It hardly seems probable that any other country can successfully compete with the cheap and luxurious pasturage of the U. States in a degree sufficient to interfere with

the new-established meat-trade, which is a very prominent feature in the meat-distribution of this country. Its extension must depend upon the continuance of a difference between American and English prices sufficient to constitute a satisfactory margin for expenses and profits. One condition needing amendment is evidently the weight of our beeves. Were there a larger proportion of heavy, fully-fattened animals, the price realized would be increased above the advance of cost. Feeders have their share in this work, and must coöperate with shippers if they would develop a permanent and profitable industry. The competition will tend to advance home-prices in proportion to the comparative magnitude of the shipments. Such advance would tend to limit the growth of the trade, even to the destruction of the business, if the margin should be reduced below expense of shipment. A more scientific course of feeding, the exercise of skill and the practice of economy in all the methods of management and feeding, become, therefore, essential elements of growth and success in transatlantic shipments of American *B.* In 1878 the exports of fresh *B.* (all to Great Britain — less 487,090 lbs. first shipment to France) amounted to 54,046,771 lbs., value \$5,009,856. The exports of salted or cured *B.* for the same year, to almost every country in the world, amounted to 38,831,379 lbs.; value, \$2,973,234.

**Beef-Wood, SWAMP OAK, or BOTANY BAY OAK**, the produce of a species of *Cusuarina*, which grows in Australia, is a hard, close-grained, reddish wood, variegated with dark and white streaks. It is exported to England, where it is used for ornamental work.

**Bee-Hive**, a straw basket, glass case, or other enclosure set apart for bees to carry on their industrial operations in.

**Beer.** [Ger. *bier*; Fr. *bière*.] (*Drinks.*) A fermented liquor made from malted grain. In Europe, most commonly of barley; in America, from wheat; and in India from rice. Hops and other bitter substances are added to improve the flavor and to impart their peculiar properties to the liquor. The drink in some of its varieties appears to be of great antiquity, and was probably discovered by the Egyptians. In 1878 the exports of *B.* from the U. States (mostly to Canada, Mexico, Brazil, U. S. of Colombia, etc.) amounted to \$147,197, while the imports (mostly from Great Britain and Germany) amounted to \$592,707. *Imp. duty*: in bottles (duty on bottles included), 35 cts. per gal.; otherwise than in bottles, 20 cts. per gal.

The manuf. of *B.* from barley is divided into two distinct processes — *malting* and *brewing*. Malting consists of four successive operations: steeping, couching, and flooring, which have for object the germination of barley; and kiln-drying, which consists in drying the germinated barley in a large and heated room called *kiln*. Barley is then malt. The appearance of the malt, and the color of the *B.* made from it, depend upon the temperature of the kiln. At between 90° and 100° F. pale malt results; at 120°–125°, amber malt; 150°–170°, brown malt for porter and stout; 300°–400°, black malt used for coloring porter. The object of changing the barley to malt is to render its constituents soluble, and bring them into a condition suitable for fermentation. Brewing consists in crushing the malt, and placing it in a mash-tub with warm water. Here the starch of the malt is transformed into dextrose and glucose, which, with the soluble albuminous and saline constituents, are taken into solution by the water. The infusion obtained is called *wort*. The wort is then boiled with hops, cooled, fermented, cleansed, and then transferred to store-casks, where a slow fermentation occurs, the *B.* develops its fined qualities, and is finished for use. The composition of the water used in brewing is supposed to exert an

important influence on the success of the process. *Ale* is prepared from pale malt, and the active fermentation is checked while there still remains a considerable quantity of sugar unchanged. *Pale ale* is made from malt dried in the sun or by steam. It is not allowed to rise above 72° during the fermentation. The formation of acetic acid is thus prevented, and the unpleasant flavor due to the solution of the yeast by the alcohol is avoided. *Scotch ale* is a sweet strong ale. *Small beer* is a weak liquor made by using little malt, or by mashing with fresh water the malt residuum left after the wort for ale or porter has been drawn off. *Porter* is a dark-colored *B.* made from a mixture of pale, amber, brown, and black malt. *Stout* is strong porter. *Berlin white beer* (*weiss beer*) is prepared by quick fermentation from a mixture of 1 part of barley malt and 5 parts of wheat malt, with half a pound of hops per bushel. The *Lager B.* of the U. States is the *B.* of Bavaria; it owes its name (from *lager*, a "storehouse") to the fact that it is stored in cool cellars or vaults for several months before it is used, and its remarkable keeping qualities and highly-prized properties to the peculiar kind of fermentation by which it is produced. There are three varieties of this *B.*: *Lager*, or summer *B.*, which is not ready for use in less than from 4 to 6 months; *Schenk*, winter or present-use *B.*, ready in 4 to 6 weeks; *Bock B.*, which is an extra

Fig. 31.—BEECH-TREE.

strong *B.*, made in small quantity and served to customers in the spring, during the interval between the giving out of the *schenk B.* and the tapping of the *lager*. It requires 2 months for its preparation.

*Chica*, or maize *B.*, was used by the S. American Indians before the Spanish conquest. *Bourza*, or millet *B.*, is made by the Crim Tartars. *Quass*, or rye *B.*, is a sharp, acid beverage prized by the Russians. *Koumiss*, or milk *B.*, is prepared by the Tartars from mare's milk, which they dilute and ferment. *B.* is a nourishing drink from the gum, sugar, and starch it holds in solution; its stimulant and tonic properties are due to the alcohol and the bitter principle of the hops. The proportion of alcohol per cent. varies from 8.88 to 4.20.

Within the last twenty years, the brewing of *lager B.* has become one of the most important industries of the U. States, and is only prevented from becoming a very large article of export to S. America by the high duties imposed there on U. States products, in retaliation for the prohibitive duties of the latter country on imports. In

the city of N. York alone, the official returns of *B.* sold by N. York brewers, in the year ending May, 1878, amounted to 1,184,557 bbls. There are, according to the latest returns, in the U. States at present in active operation 2,600 breweries, producing annually for sale and consumption, in round figures, 285,000,000 bbls. of *B.*, and the capital invested in breweries and malt-houses is estimated at \$102,900,790.—See BREWER.

**Beeswax**, a substance obtained from the honey-comb after the expression of the honey, used for making candles, sealing-wax, polishing furniture, etc. Two kinds occur in commerce, the yellow and the white or bleached—the last one generally adulterated with spermaceti. *B.* is largely produced in N. Carolina and some of the Western States; it is also extensively imported from British Gambia (Africa), Cuba, and the East Indies. *Imp. duty*, 20 per cent.

**Beetle**, a heavy wooden hammer or mallet for driving piles, palisades, etc.: when used by paviors it is called a *rammer*.

**Beetle Shirtings**, are cotton goods finished to imitate linen shirtings.

**Beet-Root Sugar**. The beet is a biennial plant, *Beta vulgaris*, distinguished by its large succulent root (Fig. 32). Of this species the two principal varieties are,—the red *B.*, which is cultivated in our gardens for the table; and the white *B.*, extensively used in France and other parts of Europe for the manuf. of sugar.

Fig. 32.—BEET-ROOT.

Sugar is derived from the juice of the beet-root by operations nearly the same as those by which cane-sugar is made; when refined, it is undistinguishable from the cane-sugar. Five tons of clean roots yield about 4½ cwt. of coarse sugar, which give about 160 lbs. of double-refined, and 60 lbs. of inferior lump-sugar; the remainder is molasses. In 1873, the production of *B.* sugar in Europe was as follows: France, 400,000 tons; Germany, 260,000; Austria, 205,000; Russia, 150,000; Belgium, 80,000; Holland, etc., 35,000;—total, 1,130,000 tons.

The belief that the *B.* would be made to yield in the U. States, sugar of good quality, in sufficient abundance, and at a sufficiently low cost to take the place eventually of the imported sugars produced from the tropical cane, has not been yet realized; although no pains have been spared to insure success, and large sums have been expended by capitalists in the equipment of factories, etc., at different points in the country, notably at Chatsworth, Ill., in Sauk County, Wisconsin, and in California.

**Beeves**, a common name for oxen or slaughtered cattle.

**Begass**, the stalk of the sugar-cane after the juice has been expressed, which is used for fuel and manure.

**Beggud**, the East Indian name for tin-foil, usually shipped in packages of 200 leaves (100 corges).

**Belgium**, a western kingdom of Europe, between lat. 49° 27' and 51° 31' N., and lon. 2° 27' and 6° E., bounded N. by Holland, E. by Germany, S. by France, and W. by the German Ocean. Government is a constitutional monarchy, with a senate and house of representatives; the members

of both chambers being elected by those citizens who pay not less than \$8.60 annually of direct taxes. About 58 per cent. of the inhabitants are Flemish, the rest Walloon and French, with 39,000 Germans in Luxembourg. The capital, Brussels, one of the most splendid cities in Europe, has 376,965 inhabitants. There are, besides, 3 cities with a pop. of above 100,000 inhabitants, namely, Antwerp, 145,101; Ghent, 130,092; and Liege, 115,956. *B.* is divided into 9 prov., the area and pop. of which were as follows on Jan. 1, 1879:

Provinces.	Area in Sq. Miles.	Population.
Antwerp (Anvers).....	1,093	522,735
Brabant.....	1,268	942,247
Flanders { West.....	1,249	691,190
East.....	1,158	863,696
Hainault.....	1,437	949,346
Liege.....	1,117	635,076
Limboung.....	931	204,619
Luxemburg.....	1,706	208,339
Namur.....	1,414	319,386
Total.....	11,373	5,336,634

The coast-line of *B.* is about 46 m. in length, and presents a uniform succession of low dunes or sandhills. The country is in general level, except in the prov. of Liege and Namur, where the surface becomes irregular, and in some parts hilly. The soil of the flat country is in most parts light and sandy; but is rendered exceedingly fertile by the constant application of manure, to obtain which the attention of the cultivator is especially directed to the rearing of cattle. The climate is temperate and healthful; and the common objects of culture are wheat, rye, barley, oats, buckwheat, potatoes, turnips, hemp, flax, beet, hops, and chicory, with artificial grasses. A variety of fruits are also grown, and some tobacco. About nine-elevenths of the country are under cultivation, and of the remainder, the greater part is occupied by forests, towns, roads, canals, and railroads, which cannot be deemed unproductive. *B.* is the most densely populated country in Europe.

The mineral productions are numerous and abundant, particularly in the S. and E. portions of the kingdom, comprehending Hainault, Namur, Luxembourg, and Liege; and the working of mines constitutes a valuable branch of the national industry. Of the mineral products, the first in point of importance is coal, of which, in 1878, there were produced 15,162,715 tons. The three great centres of the coal-mines are Mons, Charleroy, and Liege. Iron mines are numerous, especially in the district between the Sambre and the Meuse; and in 1878, the quantity of prepared ore worked up was 3,612,000 tons. Lead is found in Liege, Namur, etc.; copper in Hainault and Liege; zinc in Namur and Hainault; besides which the mineral products of the S. and E. prov. embrace manganese, calamine, sulphur, and alum, also various kinds of stone, slate, marble, and clay fitted for the manuf. of porcelain.

*B.* excels in almost all branches of industry. One of the most important of its manufs. is that of woollen cloths (particularly black cloth), the chief seats of which are at Verviers, Liege, and Dalhem; carpets are made at Tournay; linens at Ghent, St. Nicolas, Termonde, Courtray, etc. The cotton manuf. employs about 150,000 hands; Ghent, St. Nicolas, Antwerp, and Mechlin contain the principal factories. There are important manuf. of silk in Antwerp, Siene, Uccle near Brussels, etc. The lace of Brussels and Mechlin has long been celebrated; the ribbons of every kind are made in large quantities at Antwerp, Tournay, and Ypres. The melting and manuf. of iron, copper, and tin is carried on extensively from the abundance of these metals and of coal, and charcoal from the forests. The principal groups of forges are between the Meuse and the Sambre, at Charleroy, and on the banks of the Meuse, extending from its entrance into Belgium to the limits of Namur and Liege. The iron manuf. comprehend steam-engines, cannon, and firearms, all made on a great scale in Liege; and cutlery and iron utensils in various localities. The chief other manuf. are those of hosiery, employing about 75,000 persons, mostly in the arrondissement of Tournay; porcelain at Sept-Fontaines, Brussels, Ardennes, and Tournay; glass at Namur, Liege, Val-St.-Lambert, and Charleroy; beet-root sugar and refining at Ghent; besides beer, leather, salt, paper, hats, and a great variety of other articles.

The internal commerce of *B.* is facilitated by magnificent rivers, particularly the Meuse and the Scheldt. There are also numerous canals; among them, the Great Northern Canal, from Neuss on the Rhine (in Prussia) by Venloo on the

Meuse to Antwerp, and with which communicate, by means of the Scheldt, the Lievre and Bruges canals; the Ostend and Dunkirk canals, reaching the sea at different points; the Brussels canal, and the Louvain canal. There is besides a dense network of railroads, the length of lines open to traffic in 1878 being 2,264 miles. The total length of telegraph lines in 1877 was 3,098 miles, and the length of wires, 13,189 miles.

The foreign trade of *B.* is officially divided into "general commerce," including the sum total of all international mercantile intercourse, direct as well as transit, and "special commerce," comprising such imports as are consumed within and such exports as have been produced in the country. The value of the general commerce in 1876 was represented by \$491,336,600 of imports, and by \$433,568,600 of exports. The special commerce was as follows:—Imports for home consumption, \$291,675,000; exports of home produce, \$224,736,400. France heads the list of importing countries in the special commerce of *B.*, followed, in order of importance, by Great Britain, Holland, Germany, Russia, and the U. States. In the export market of Belgian produce France likewise takes the first place, followed by Great Britain, Holland, Germany, and the U. States. The international commerce of the kingdom is almost entirely carried on by foreigners, chiefly under the British flag. The commercial marine, on the decline for a number of years, consisted in 1878 of 57 vessels, of an aggregate burthen of 45,322 tons, inclusive of 24 steamers of a total burthen of 30,397 tons.

The commercial intercourse of *B.* with the U. States in 1878 was as follows:—Exports, \$3,982,842, principally consisting of chemicals, \$112,356; paper materials, \$264,289; furs, \$133,674; glass, \$1,400,220; pig-iron, \$243,619; brown sugar, \$129,117; wines, \$160,591; cloths and cassimeres, \$201,406. Imports, \$22,388,075, principally consisting of cattle, \$67,850; wheat, Indian corn, rye, etc., \$6,205,259; cotton, \$1,557,189; leather, \$291,111; mineral oils, \$5,265,589; bacon and hams, \$4,013,423; lard, \$2,463,499; turpentine, \$196,800; tallow, \$114,304; tobacco (leaf), \$1,061,355; wood (boards, deals, etc.), \$108,321.—32 American vessels (tonnage 29,506) entered Antwerp; and 25 American vessels (tonnage 23,893), of which 13 were in ballast, cleared that port.

*B.* communicates with the sea at Antwerp, Ostend, and Nieuport, by the canal of Bruges to Oostburg, by the canal of Dunkirk to Furnes, by the canal of Ghent to Terneusen, by the canal of Termonde to Hulst, by the Scheldt from Flushing to Antwerp, by the same river and the canal of Willebroeck from Brussels to Antwerp, and by the canal of Louvain and the Scheldt from Louvain to Antwerp. But the only seaports of any consideration are Antwerp and Ostend.

**Antwerp**, a strongly fortified and magnificent town, is situated in 51° 14' N. and 4° 22' E., on low ground, on the right bank of the Scheldt, where the river makes a considerable bend. It is about 45 m. from the mouth of the Scheldt, reckoning from Flushing, where vessels bound for Antwerp must take a Dutch pilot as far as Lillo. The river at Antwerp is about 400 yards broad, and large vessels may sail up to the quay, and into a large basin; the depth of low water in front of the city being from 32 to 42 feet. Its commerce is considerable, and about 2,000 vessels annually enter its port. It connects directly with New York by the Red Star and White Cross lines of steamers. *Pop.* 145,101.

**Ostende**, a fortified seaport of West Flanders, is situated in 51° 10' N. and 2° 54' E. It possesses great facilities for carrying on trade with the interior by means of railroads and canals. The town is almost surrounded by two of the largest of these, particularly that leading to Bruges, into which ships of great tonnage may enter with the tide. *Pop.* 16,735.

**Money, Weights, and Measures.** are those of France. The usage of bills from London or Paris is 1 month's date. No days of grace are allowed.

**Finances.** The public income and expenditures of *B.* in recent years have mostly been balanced, with an occasional surplus. For the year 1877, the revenue amounted to \$50,809,150 and expenditures to \$49,288,500. On Jan. 1st, 1878, the total amount of the national debt was \$184,900,800, on which \$57,000,000 represent the share which *B.* had to take in the national liabilities of Holland, after separating from that kingdom. Almost the entire remainder of the debt of *B.* was raised for or devoted to works of public utility, particularly the constructing of State railroads.

**Bank of Belgium.** The National Bank of Belgium is modelled on that of the Bank of France. Its capital consists of 25,000 shares each of 1,000 francs; it issues paper payable on sight and to bearer to the amount of 20, 50, 100, 500, and 1,000 francs; but without permission from government cannot increase its issues beyond three times its metallic reserve. This bank pays large dividends to holders of its stock.

**Bell**, a sonorous instrument, constructed of hollow metal, for calling attention in a house, or for ringing chimes and striking the hours and quarters, etc., or in churches and public buildings. Small *B.* are cast in sand, large *B.* in loam. *Imp. duty:* (church *B.*) 35 per cent.; (silver, German silver, or gold *B.*) 40 per cent.; (copper *B.*) 45 per cent.

**Belladonna**, the deadly nightshade (*Atropa belladonna*), an herbaceous plant of Europe, all the parts of which are narcotic and poisonous. The extract of *B.* is used in medicine. The root and leaves are imported, free of duty.

**Belleville and Southern Illinois R.R.**, runs from Belleville (12 m. S. E. of St. Louis) to Duquoin, Ill., 56.4 m. Offices, Belleville, Ill. This line was opened in 1861, and is leased and operated by the S. L., A. and T. H. R.R. Co., who furnish the rolling-stock for a rental of 40% of gross earnings up to \$7,000 per m.; 30% on all exceeding and up to \$14,000 per m. Cap. stock, \$1,680,000. Bonded debt (secured by 1st mortgage and guaranteed by lessees), dated 1 Oct., 1866, payable in 30 years, \$1,100,000, interest 8% (April and Oct.). Rental recd. for 1878, \$98,351.99.

**Bell Metal**, an alloyed metal usually in the proportion of 78 parts of copper and 22 parts of tin. *Imp. free.*

**Bellows**, an instrument for increasing the activity and heat of a fire. The familiar *B.*, with two flat boards hinged at one end, elastic leather sides, a valve in the bottom board to admit air, and a nozzle to expel it, have been known in Europe for two or three centuries. Patent *B.* have a revolving handle, which permits a continuous blast to be maintained. See **BLAST, BLOWING-MACHINES, FORGE, VENTILATION.**

**Belt**, an article of dress of various materials; thus there are sword-belts, waist-belts, cross-belts, ladies' belts, etc.—A band, usually of leather, India-rubber, or gutta-percha, which, by wheels and pulleys, connects the different rotatory parts of machinery, transmitting power with less noise and friction than accompanies the employment of toothed gearing.

**Belting**, the material for the fabrication of machinery belts; also machinery belts taken collectively.

**Belvidere, Delaware, and Flemington R.R.**, from Trenton to Manunka Chunk, N. J. This line, whose offices are in Trenton, N. J., 67.82 m., with branches, 15.37 m.; total, 83.19 m., is the property of two Co.'s, the Belvidere Delaware R.R., opened in 1853, and the Flemington R.R., opened 1854. They were leased in 1876 to the Pennsylvania R.R. Co., who operates them as the Belvidere Div. of the United R.R. of N. J. **Financial Statement:** Cap. stock (Bel., Del.), \$994,000; cap. stock (Flem.), \$150,000; funded debt (Bel., Del.), \$3,444,500; bills payable (Bel., Del.), \$171,702.27; funded debt (Flem.), \$250,000. To debit: Railroad (Bel., Del.), \$3,114,513.31; equipment (ditto), \$1,130,787.62; railroad and equipment (Flem.), \$290,653.87; balance, \$474,447.47. Funded debt of Bel., Del. R.R., 1st mortgage, 1852, \$1,000,000, payable 1877, interest 6% (June and Dec.); 2d mortgage, 1854, \$500,000, payable 1885, interest 6% (March and Sept.); 3d mortgage, 1857, \$750,000, payable 1887, interest 6% (Feb. and Aug.); consolidated mortgage, 1876, \$1,500,000, payable 1916, interest 7% (Jan. and July). Net earnings, 1877, \$122,631.52.

**Bend**, a name in the leather trade for a butt or rounded crop cut in two.—A mode of fastening a rope, of which there are several kinds, as the short *B.*, fisherman's *B.*, etc.

**Benedictine.** A French liqueur or cordial, distilled at Fecamp, in Normandy, and somewhat resembling Chartreuse, q. v.

**Bengal.** See **INDIA (BRITISH).**

**Bengal Light**, or **BLUE LIGHTS**, a species of fire-work, which, when ignited, throws out a remarkably brilliant and penetrating light. As it contains antimony, its fumes are poisonous; it cannot, therefore, be used with safety except in the open air. It is used on ships as night signals.

**Bengals**, a thin slight stuff made of silk and hair for women's apparel.

**Bengal Stripes**. See **GINGHAMS**.

**Benitier** [Fr.]. See **HOLY-WATER POT**.

**Benjamin**. See **BENZOIN**.

**Ben**, (*Oil of*), a fine colorless limpid oil obtained by expression from the decorticated seeds of the *Moringa pterygosperma*, a tree which grows in Egypt and Arabia. It is inodorous, and does not readily become rancid; hence its excellence for the manuf. of jasmine, tuberose, and other scented oils. It is also used in medicine; and by watchmakers for lubricating watch machinery. It is imported from France.

**Benzine**. See **BENZOLE**.

**Benzoin**, **BENJAMIN**, or **FRANKINCENSE**, an odoriferous gum-resin, obtained in Siam and the Eastern Archipelago, from *Styrax Benzoin* (Fig. 33).

Fig. 33.—*STYRAX BENZOIN*.

It occurs in large masses, is quite dry, and easily pulverizable, of a brownish-red color, spotted with clear red, and, in proportion to its fineness, has intermixed a large number of tears, resembling in size and form almonds, with an even fracture, having a greasy lustre, and translucent; while the mass is opaque, uneven in its fracture, and occasionally porous. Its taste is sweetish and resinous; its smell, especially when rubbed or kindled, pleasant and balsamic. Sp. gr. 1.068. The large masses, quite opaque, of a brownish or blackish color, and destitute of white grains, is called *B. in sorta*. It is used in medicine, in perfumery, to burn in censers in Roman Catholic churches, and to yield benzoic acid. Imp. free, but prohibited unless

it affords 80 per cent. of resin, or 12 per cent. of benzoic acid.

*Benzoic acid*, or *Flowers of Benzoïn*, occurs in white, needle-like prisms, of a flocculent appearance when in mass, with a soft, silky lustre; taste, at first sweetish, but afterwards pungent; odor peculiar, but highly characteristic; sp. gr. 0.657. It is completely soluble in alcohol. It is used in medicine and perfumery. Imp. duty, 10 per cent.

**Benzole**, **BENZINE**, **BENZOLINE**, a highly inflammable oil obtained from coal-naphtha, of great solvent powers, which is used by manufacturers of India-rubber and gutta-percha, by chemists for making oil of bitter almonds, for illuminating purposes (then often called *gasoline*), in the preparation of varnishes, for cleaning kid gloves, for extracting grease, paint, or tar from cloth, silk fabrics, and leather, and other purposes. Imp. duty, 40 cts. per gal.

**Berberine**, a little crystalline powder obtained from the root of *Berberis vulgaris*, used as a substitute for quinine, and for coloring cottons and silks.

**Bercheroot**, the Russian pound, 40 of which make a Russian pood.

**Bere**, **BIGG**, one of the kinds of six-rowed barley, grown in Scotland and other northern countries, valued for its hardy properties. It is used for the distillation of whiskey.

**Bergamot**, the fragrant fruit of the Bergamot orange-tree (*Citrus Bergamia*), from the rind of which an essential oil of delicious quality is obtained, both by pressure and distillation. This oil is limpid, fluid, and yellowish, with a smell resembling that of oranges. Sp. gr. 0.888. It is used as a perfume.

**Bergen**. See **Norway**.

**Berkowitz**, or **BERQUET**, a Russian weight = 360 lbs. avoirdupois.

**Berlin**. See **PRUSSIA**.

**Berlin Blue**, a blue mellic pigment; a fine variety of the Prussian blue. Imp. duty, 25 per cent.

**Berlin Gloves**, thread or cotton gloves for summer wear.

**Berlin Iron**, is iron which, from its perfect fluidity when melted, admits of being cast into the most delicate forms, such as lace-work, perforated fans, bracelets, etc.

**Berlin Wool**, the name given to various kinds of beautifully dyed, soft, elastic worsted yarns, used by ladies for knitting and tapestry-work.

**Berlin Work**, a species of embroidery in colored worsteds from designs produced by Berlin artists.

**Bermillians**, stout linens or fustian fabrics.

**Bermudas** (*The*). See **WEST INDIES**.

**Berries**, are soft and succulent fruits, having their seed lying loosely among pulp, many of which enter into commerce, as bay-berries, juniper-berries, etc. French and Persian berries, also called yellow berries, are the small dried fruit of *Rhamnus infectorius*, used for dyeing.

**Berry-Wax**, same as Bayberry-Wax, (q. v.).

**Bersimlich**, a kind of Greek silk used for sewing and embroidery.

**Berthage**, a charge made on a vessel for a position in dock or harbor.

**Beryl**, an ornamental stone, differing little from emerald, except in color. The emerald is green; all the varieties of other colors, tinged more or less yellow and blue, or altogether colorless, are beryls. Common form, the hexahedral prism; transparent, translucent, or opaque; lustre, vit-

reous; sp. gr. 2.75; localities, Brazil, Siberia, France, and the U. States. Such varieties of beryl as are clear, transparent, or exhibit brilliant shades of sky-blue, or mountain-green, are denominated by lapidaries *aqua-marine*, or precious beryl. They are principally brought from Brazil. They are also found at Royalston, Mass.

**Beahmet**, grapes made into a consistence resembling honey, a staple product of some of the mountainous districts of Asia Minor. It forms a great article of food among the Turks.

**Betel**, an East Indian plant (*Piper betel*), the leaf of which, mixed with the fruit of the Areca palm (*A. catechu*), commonly called betel, or pinang nut, forms a hot, acrid, and narcotic masticatory, known as *Pun* in India and the Malayan archipelago, where it forms nearly as extensive an article of commerce as tobacco in the West. All classes, male and female, chew it, and they allege that it strengthens the stomach, sweetens the breath, and preserves the teeth. It gives the lips, tongue, and teeth a reddish tinge which is esteemed ornamental.

**Beton** [Fr.], a kind of concrete or hydraulic cement, rendered more compact by being mixed with gravel, pebbles, etc., which is used in submarine works as a foundation for masonry. It is also called grubbstone mortar.

**Betterave**, the French name for the red beet.

**Betuline**, a colorless resin or gum extracted from birch bark.

**Beurre**, the French name for butter.

**Bevel**, to shape or smooth away to an angle.—

A carpenter's tool to strike angles with.

**Bevel Plumb-Rule**, a surveyor's instrument for adjusting the face of the slopes in embankments.

**Bevel-Wheel**, a wheel with teeth at an angle.

**Beverage**, a common name for any kind of drink.

**Beyrout**. See **TURKEY**.

**Bez**, a cloth of native cotton-twist of various lengths, made in Turkey.

**Bezoar**, a morbid concretion found in the stomachs of some ruminating animals, and possessing many fanciful medical properties. It has long fallen into medical disuse in Europe, but is still highly valued in the East.

**Bhand**, a Surat weight of 900 lbs.

**Bhang**, an intoxicating drug obtained in India from the *Cannabis sativa*, or hemp plant.

**Bicarbonate of Soda**. See **SODA**.

**Bice**, is the name of two blue and green pigments, which are native carbonates of copper, and are used by artists. Blue *B.* is sometimes called *mountain blue*, *Hamburg blue*, and *mineral blue*. Green *B.* has also the names of *Hungarian green*, *malachite green*, *emerald green*, and *mountain green*.

**Bichromate of Potash**. See **POTASH**.

**Bid**, an offer made, a price tendered for an article at an auction.

**Bidery-Ware**. [from Bider, a city in Hindostan,] the name given to certain ornamental articles made in India of an alloy consisting of copper, lead, tin, and zinc, inlaid with silver or gold, and polished. They are greatly admired for the elegance of their form, as well as for the gracefulness of the patterns with which their surface is engraved.

**Bigarreau**, a name for the white-heart cherry, derived from the French.

**Bigg**. See **BERE**.

**Bighera**, a name for thread lace in Italy.

**Bijou**, a gem, a small jewel.

**Bijouterie**, jewelry, trinkets, etc.

**Bijoutier**, the French name for jeweler.

**Bilan**, the French name for an account-book; a balance-sheet of debtor and creditor.

**Bilander**, **BYLANDEI**, a small coasting-vessel with two masts, resembling a tray.

**Bilge**, the swell or protuberant part of a cask.—The projecting parts of a ship's bottom, or floor on each side of the keel.

**Bill**, a formal statement or declaration in writing; an account rendered; an acceptance; an account presented for payment; the formal statement in detail of a purchase: when one merchant purchases a line of goods from another, he makes a *bill* with him; a promissory note, a foreign or inland bill of exchange, and the bank-notes or circulating issues of banks, are also called *bills*.—A term among letter-founders for a fount of type.

**Bill-Book**, a book in which entry is made of the particulars of bills and notes, in favor or against a person or firm.

**Bill-Broker**, one who deals in discounts.

**Bill-Head**, a printed form with name, address, or business, used for making out accounts from the books.

**Bill-Hook**, the name in the West Indies for a small curved hand-chopper, or reaper, for cutting sugar-canes, brushwood, etc.

**Billiard-Balls**, red and white globes of ivory with which the game of billiards is played.

**Billiard-Cloths**, green woollen broadcloth, manufactured to cover a billiard-table, which are piece dyed, and 72 to 81 in. wide.

**Billiard-Cue**, the rod or stick with which the billiard-balls are struck.

**Billiard-Table**, a table usually made of slate covered with a cloth, having padded cushions and sometimes netted bags at the corners, and used for playing the game of billiards, with ivory balls and a cue.

**Billion**, a term used to denote a thousand millions, or 1,000,000,000, according to the French method, used on the continent of Europe and in the U. States. The English use the same word to denote a million of millions, expressed by the figures 1,000,000,000,000.

**Bill of Entry**, a note of the particulars of goods entered at the custom-house, whether imported or intended for exportation. See **ENTRY**.

**Bill of Exchange**, is a written order directing one party to pay a sum of money to another—either the person who gives the order or some third person—at some day fixed or ascertainable. The individual who issues the order is called the *drawer*; the person to whom it is addressed is called the *drawee*, until he consents to honor the draft or obey the order, after which he is called the *acceptor*. The bill may be passed from hand to hand by delivery or endorsement, according to circumstances (see **ENDORSEMENT**), and in the latter case, the person who makes one is called the *endorser*, and the person who receives, the *endorsee*. He who is in the legal possession of the bill, and the obligation contained in it, is called the *holder* or *payee*. *B. of E.*, as one of the most prompt and powerful engines in conducting trade, are peculiarly privileged by the law, requiring few words and no solemnities of execution. There is no particular form for a *B. of E.* required by law, further than that the mandate to pay in

money be distinct, and the person who is to pay, the person who is to receive, and the time of payment shall be ascertainable beyond a doubt. A mere request to pay money is not a bill, for the drawee is presumed to be the drawer's debtor, and the bill must be an absolute assignment of the debt; nor is an acknowledgment of debt, or a promise to pay which is part of a bargain for the sale of goods. When a bill has all the apparent requisites, though an expression which takes it out of this sphere of document be fraudulently introduced to escape observation, it would appear that it will still be held a bill against the committer of the fault. This was held where the word "at" was introduced in very small letters within the tail of the S of Sir in the address to the drawee. An order to pay in anything other than cash is not a bill, as "in U. S. bonds," "in bank-notes," etc. The amount must be specific, and therefore the addition of the words "or whatever else may be due," would vitiate the bill. The money must be payable "at all events," and any condition which may affect the certainty of the declared intention of the parties to hold it an absolute order to pay at some time or other, will vitiate the bill, as, when A B agrees to pay when C D shall marry, or at a certain time if C D be alive then. From the time when a bill is drawn and delivered, it becomes, by the operation of the contract of mandate, a document of debt in favor of the payee, for he who in fulfillment of an obligation gives an order to another to pay, becomes himself responsible on that other not performing. If the drawee is not indebted to the drawer, or, as it is commonly termed, has "no effects," he will not be liable, even though he has accepted, to the drawer, but third parties who have received the paper for value, are not affected by the obligation between the original parties, otherwise than as they appear on the bill. (See ACCOMMODATION BILL.) A drawer generally appends his usual signature at the foot of the mandate. The acceptor to whom it is addressed generally signs below the drawer, either with or without the word "accepted" before his name. An endorser commonly puts his name on the back, with or without a direction to pay to a particular person. It is common practice to mention on the face of a bill that it is "for value received;" but this is not necessary, and in the general case value is presumed, and need not be proved by the party pleading it unless where a bill has been originally obtained through fraud, or in that of a bill which has been stolen. A person who delivers a blank bill, drawn or accepted, is liable for whatever sum may be filled in. Bills may be subscribed by procuration. Whoever takes such a bill, however, must assure himself of the procurator or agent's authority to grant it, for if he exceed his powers, the bill will not be effectual against his employer. A person who signs "per procuration" should mention that he does so, otherwise he will be personally liable.

**B. of E.** are divided into foreign and inland; the former is drawn in one country and payable in another, the latter is drawn and payable in the same country. In the U. States, a bill drawn in a State on a person resident in another, is considered an inland bill. In most essential points, the laws as to foreign and inland bills are analogous to each other. Foreign bills are generally drawn in several sets, or parts, transmitted by different

conveyances, in order that if any one or more should be lost, another may arrive safe for being presented. Each bears that it is payable on the others not being paid, as "pay this my second bill of exchange, first and third of the same tenor and date not being paid," etc. The drawee of a bill drawn in sets should only accept one of the sets, as it is held that if he accept one set, and afterwards pay another set, he will not be liberated from the claim of a *bond fide* holder of the accepted ones. The various parties upon a bill, besides the acceptor, endorsers, drawers, and others, become liable for its payment on failure of the acceptor. The acceptor's failure to pay is commonly said to be an act of *dishonor*. If the drawee refuse acceptance, this likewise is dishonor, and is held to be such a prospective refusal of payment as entitles the holder to claim immediately from the drawer, or, if there be an endorser, on that endorser, who has recourse on the drawer; but to entitle him thus to record on the original parties, there are obligations on the holder, without performing which he is held not to have duly negotiated. He must present the bill for acceptance and for payment on the proper occasions. (See PRESENTMENT.) He must give notice of non-acceptance or of non-payment; and usually he must have the bill protested. (See NOTICE, PROTEST.) To avoid expenses, in case the drawee refuse to accept, the drawer of a foreign bill may require the holder to apply to a third person named in the bill, which is usually made thus: "In case of need, apply to Messrs. — at —." The drawer may also add a direction, that in case the bill is dishonored, it shall be returned without protest, by subscribing the words, *return without protest*, or *retour sans protest*. When the drawer of the bill is debtor to the drawee, it is usual to insert in the bill these words: and *put it to my account*; but when the drawee or the person to whom it is directed is debtor to the drawer, then he inserts: and *put it to your account*; and when a third person is debtor to the drawee, it is sometimes expressed thus: and *put it to the account of A. B.* The foregoing forms, however, though in frequent use, are not necessary. See DAYS OF GRACE.

#### FORM OF INLAND BILL OF EXCHANGE.

\$100. New York, March 27th, 1879.  
Three months after date, pay to J. Hopecraft or order,  
ONE HUNDRED DOLLARS, for value received, and charge the same  
to account of  
To Robert Bruce & Co., Baltimore. WM. RUSSELL.

N. B. — This admits of the following variations, according to circumstances: Instead of "three months after date," it may be "at sight," or at such time "after sight," or at such a specified time, or "on demand," and the instruction to pay may be "to me or order."

#### FORM OF A FOREIGN BILL OF EXCHANGE.

Fr. 1,000. Chicago, March 27th, 1879.  
Sixty days after sight of this first of exchange (second and third unpaid), pay to the order of A. Vuillot, ONE THOUSAND FRANCS, value received, and charge to account, with or without advice of  
JOHN WILLIAMSON.

To E. W. Davies & Co., Paris.

N. B. — This form admits of the same variations as are exhibited in the above inland bill.

**Bill of Health.** See QUARANTINE.

**Bill of Lading**, is a certified document or receipt from the master or mate of a ship for goods shipped. It is a negotiable instrument. Several parts or copies are made out, one for the use of the master, the others for the shipper, who, by means of them, can give a title to the consignee

or other person for whom the goods are destined, to receive them. The following is an ordinary form of a bill of lading:

SHIPPED in good order and well-conditioned, by Robert Davidson & Co., in and upon the good ship called *Emma*, whereof Rudolph Thonitz is master for the present voyage, now lying at the port of Baltimore, and bound for London, fifty cases canned oysters, being marked and numbered as in the margin, and are to be delivered in the like good order and well-conditioned at the aforesaid port of London, the dangers of the sea only excepted, unto Mr. Henry Hoyd, or to his assigns, he or them paying freight for the said goods, at the rate of ——— per ton, with prime and average accustomed. In witness whereof, the master of the said ship hath affirmed to three bills of lading, all of this tenor and date, one of which bills being accomplished, the others to stand void.

Dated in Baltimore, the 27th day of March, 1879.

RUDOLPH THONITZ.

When the goods are put on board, a receipt is generally given by the master; this is afterwards exchanged by the holder for the bill of lading. The bill has two objects. It fixes the amount and condition of the goods received, and for which the master is responsible (see AFFREIGHTMENT), and conveys a title to demand delivery. It may, like a bill of exchange, be negotiated by simple endorsement and delivery, which will carry a right to the goods. No intimation to the shipmaster is necessary, he being bound to deliver to the holder.

**Bill of Parcels**, is an account of goods sold given by the seller to the purchaser. It usually contains the description, quantity, price, and amount of each article; with the statement of the place, date, and terms of credit.

**Bill of Sale**, a writing made by the seller of goods to the purchaser, by which the seller transfers and conveys away the right and interest he has in the goods therein named.

**Bill of Sight**, in England, a temporary form of entry at the custom-house, permitting goods, of which the consignee ignores the quantity and quality, to be provisionally landed for examination.

**Billon**, the French name for gold or silver alloyed with copper, and coined below the standard value.

**Bills Payable**, notes, bills and other written promises or engagements to pay, outstanding against an individual or firm.

**Bills Receivable**, the unpaid notes, bills, etc., claimable by an individual or firm.

**Billy**, a slubbing frame in a woollen factory, generally containing 60 spindles, when the cardings are joined, to make a continuous yarn, drawn out slightly twisted, and wound in bobbins.

**Bimbeloterie**, a French term for toys and playthings in various materials, children's hand-carriages, etc.

**Bind**, a term applied, in the fish trade, to 250 eels or ten strikes, each containing a quarter of a hundred.

**Binnacle**, the case in which the mariner's compass is secured on board ship, within sight of the helmsman or man at the wheel.

**Birambi**, the fruit of *Acerroha Bilimbi*, a shrub from Berbice, which makes an excellent pickle and a delicious preserve.

**Birch** [Fr. *bouleau*], a graceful forest tree, of which there are several species. The Norway *B.*, *Betula alba* (Fig. 34), furnishes an inferior timber used for common articles of furniture and in ship-building. The bark yields a yellow dye, and also an essential oil prepared and used in Russia, and which is said to impart the peculiar odor to Russian leather. The black *B.* of North America, *Betula lenta*, is a compact, handsome wood, but it soon

decays. It is used for flooring and keelsons, and is largely exported to England. The wood of several other species, found in the N. Eastern and Western States, is used for many economical purposes, as for herring-barrels and butter-tubs, turnery-ware, etc.

Fig. 34. — NORWAY BIRCH.

**Birch-Broom**, a common sweeping-broom made from the young shoots of twigs of the birch-tree.

**Birch-Wine**, a medicinal drink made from the sap of the birch-tree, which is said to possess antiscorbutic and diuretic properties.

**Bird-Call**, a kind of whistle.

**Bird-Fancier**, a dealer in cage-birds, pigeons, etc.

**Bird-Lime**, an adhesive, tenacious, vegetable product, obtained principally from the inner bark of the holly, the mistletoe, and the distaff thistle, by bruising, long boiling in water, and fermentation, the mash being again boiled in water and evaporated to a proper consistence. It is of a greenish color, odor resembling that of linseed-oil, and having a bitter taste. It is employed by the bird-catcher to entangle the feet of his prey at some selected spot; and in India it is used to destroy insects.

**Bird-Seed**, canary, hemp, millet, and other small seeds used for feeding cage-birds.

**Birds**. Singing and other birds, and land- and water-fowls, and stuffed birds, do not pay duty on importation into the U. States. If, however, they are imported in such quantities as to authorize the belief that they are intended for sale, the duty is 20 per cent.

**Bird's-Eye**, a fine kind of tobacco partly made from the stalks of the leaves of certain varieties of

*Nicotiana*.—Artificial glass eyes for stuffed birds. They are extensively manufactured.—A pattern consisting of small circular spots.

**Bird's-Eye Crape**, a thin material made for the East Indian markets.

**Bird's-Eye Diaper**, a kind of towelling.

**Bird's-Eye Maple**, an estimated variegated cabinet wood, arising from an accidental form in the arrangement of the fibre of the rock or sugar maple, *Acer saccharinum*, of America. Curled maple consists of undulations in the same wood.

**Bird's-Nest (Edible)**, the nest of the swallow, *Hirundo esculenta*, of the Malay Archipelago, a bird of the size of the common martin. It builds its nest of a gelatinous substance which it is said to derive from a sea-weed. This weed is swallowed and partly digested, and then disgorged and fashioned into a nest as large as a common coffee-cup. The taste of dishes prepared from these nests is said to be insipid, but the Chinese prize them, probably for their supposed tonic and aphrodisiac powers. They are said to be worth in China twice their weight in silver.

**Birds of Paradise**, a genus of birds (*Paradisea*) remarkable for the extreme elegance and richness of their feathers (Fig. 35), which are

Fig. 35.—BIRD OF PARADISE.

employed for the same purposes as the feathers of the ostrich. The skins and plumage of these birds are imported almost wholly from Batavia, and realize a high price. In preparing them for the market, the bird is disembowelled, smoked, and deprived of its legs. The true wings, which are not so brilliant as the other feathers, are also frequently removed.

**Birth**, or **BERTH**, a nautical term applied to the position in which a ship is moored or anchored, as a port birth, good birth, wide birth, etc.; also a small crib or cabin built up against the ship's side.

**Bisa**, a Burmese coin, worth about 27½ cts.

**Biscuit**, [Fr. *biscuit*; Ger. *zweiback*; It. *biscotto galetta*; Por. *biscoito*; Sp. *biscocho galetta*,] a kind of bread chiefly used by seamen, which is baked in the form of flat cakes in order to insure their being deprived of moisture, and so preserved from becoming mouldy during the continuance of long voyages. They are mostly made of pollard, or an inferior kind of flour; but there are some white varieties for cabin use, and a kind also called pilot *B*. The small American cracker is a superior kind of *B*. There are many fancy *B*. sold by pastry-cooks, such as captains', arrow-root, rice, wine *B*., etc.—A term given to white porcelain after it has been baked in the oven, and before it receives the glaze. From it are made groups of miniature statuary, which are baked two times, and are also called *B*.

**Bishop**, is a beverage composed of hot or cold burgundy, claret, or other red wine, poured upon

ripe bitter oranges, and then adding sugar and spices according to taste. It is drunk either hot or cold, and its quality depends entirely upon the excellence of the wine employed. In order to make bishop properly, the oranges ought to be well selected, and the white part between the peel and the pulp rejected. It is called *cardinal* when made with white wine; and *pope*, when made with tokay.

**Bismar**, a Danish weight = 13½ lbs.

**Bismuth**, [Fr. *bismuth*; Ger. *wismuth*,] a brittle yellowish-white metal, of a foliated texture, and peculiar odor and taste. Sp. gr. 9.83. In hardness it stands between copper and lead, is scarcely malleable, breaks under the hammer, and cannot be drawn into wire. *B*. is a very rare metal; it is principally obtained in a combined state, from the mines of Schneeberg, in Saxony. As met with in commerce, it is impure, generally containing iron and arsenic, and probably some other metals. Most metallic substances unite with *B*., and are rendered by it more fusible than before; hence it is used in making solder, printers' types, pewter, etc. As a medicine, *B*. acts as a tonic and anti-spasmodic. In the arts it is often called *tin glass*. The sub-nitrate of *B*. is a tasteless, heavy powder of pure white color, called *pearl white*, *pearl powder*, *blanc de fard*, etc.; it is used as a pigment and as a cosmetic, extensively used by ladies both on and off the stage. It is imported from France, and cost in average in New York, \$8 per lb. Imp. duty: (metal), free; (oxide), 20 per cent.; (sub-nitrate), 40 per cent.

**Bistort-Root**, is the root of *Polygona bistorta*, a powerful astringent.

**Bistouri**, a surgeon's incision knife, of which there are several forms.

**Bistre**, is a brown pigment useful for water-color drawings; it is made from the soot of various kinds of burnt wood.

**Bit**, a carpenter's boring instrument which fits into a stock or handle; a drill.—That part of a key which is fitted to the shank and in which the wards are cut.—The hammer used by masons for rough picking or dressing granite.—The iron mouth-piece of a bridle, of which there are several kinds, as snaffles, curbs, etc.—A small silver coin, formerly circulating to some extent in the West Indies, equal to two Spanish reals vellar, or 10 cts.

**Bittern**, the residual liquor after the separation of the salt from the water of a brine-spring, from which bromine is made.—A composition of *Cocculus Indicus*, quassia, liquorice, tobacco, and sulphate of iron, said to be used by brewers in adulterating beer.

**Bitters**, a stomachic drink for promoting digestion and improving the appetite, consisting of spirits in which wormwood, gentian, chamomile, angelica, bitter barks, or some other ingredients have been steeped. The best *B*. are those prepared in New York with Angostura bark. Imp. duty as ALCOHOL, q. v.

**Bitter Salt**, Epsom salts, the sulphate of magnesia.

**Bitter-Sweet**, is a wild hedge plant, *Solanum dulcamara*, which is a dangerous narcotic, but used medicinally with advantage.—A variety of apple.

**Bitterwood**, a tree of the West Indies, *Xylopia glabra*, all the parts of which are aromatic and intensely bitter.

**Bits**, are two strong but short pieces of timber

projecting vertically from the deck of a vessel, in the fore-part, close to either side, and strongly secured to the beams on which the deck-planks are laid. They are placed in pairs, and are principally used for fastening the cable when the ship is at anchor or moored alongside a quay. There are many kinds of *B.* used for different purposes in ship-building, and distinguished by various names.

**Bitumen**, or **MINERAL PITCH**, a solidified earth-oil, or naphtha, which constitutes the inflammable principle of coal. See **ASPHALTUM**.

**Bituminous Coal**. See **COAL**.

**Black**, the darkest of colors, produced by the total absorption of all the rays of light. It is the opposite of white. The principal substances sold and used as paints and dyes for producing black are vegetable blue-black, ivory-black, cork-black, lamp-black, black lead, Frankfort-black, aniline black, Spanish black, and Indian ink.

**Black Amber**, a German name for pitch-coal, which is found accompanying amber, and of which jet-like ornaments are manufactured.

**Black Ash**, an impure carbonate of soda, which, when refined, is called white ash. — The wood of *Fraxinus sambucifolia*.

**Black-Ball**, a blacking composition used for polishing shoes.

**Blackberry**, the fruit of the bramble, *Rubus fruticosus*. This fruit is not a berry, but a collection of drupes; it is edible and pleasant, and is used for pies and puddings, etc.

**Black Cattle**, is a name applied collectively to the large description of domestic animals, horses, bulls, oxen, cows, etc.

**Black-Chalk**, a kind of black clay, containing a large quantity of carbon, and found in several parts of Europe. It is also manuf. with ivory-black and fine clay. The fine sorts are made into artists' crayons, and used for drawing on paper.

**Black Cherry**, the wood of a lofty tree of N. America, the *Cerasus serotina*, which is extensively used in cabinet-work.

**Blackcock**, a kind of grouse, the *Tetrao tetrix*.

**Black Currants**. See **CURRENTS**.

**Black Draught**, a popular purgative medicine, composed of epsom salts, senna, liquorice, and aromatics.

**Black-Ebony**. See **EBONY**.

**Black-Flux**, a preparation of cream of tartar ignited in a close crucible; a carbonate of potash and charcoal.

**Blacking**, a polishing paste or liquid, the chief ingredients of which are powdered bone black, sperm or other oil, molasses, sour beer or vinegar, oil of vitriol, and copperas. It is used for blacking and polishing boots and shoes. The *Aeme blacking*, recently patented and made in Philadelphia, is said to give a beautiful polish without brushing, to retain its lustre for weeks and preserve the leather. Many thousands of tons of blacking are annually made in the States. *Imp. duty*, 30 per cent.

**Black Iron**, a name given to malleable iron, in contradistinction with that which is tinned, and called white-iron.

**Black Jack**, a drinking-cup of tin or leather. — A mining name for zinc blende or sulphide of zinc. — Caramel or burnt sugar, which is used to color spirits, vinegar, coffee, etc. — A trade name for adulterated butter.

**Black Japan**, a varnishing material made with tar and alcohol, or with lamp-black and

resin, used in house and carriage painting. It is a liquid of about the same consistency as varnish of a jet black color; it has no grains, as the mixture of a pigment and varnish, and its flowing qualities are excellent. It was formerly imported from England. It is now successfully manuf. in New York, where it is known as Valentine's Black Japan.

**Black-Lead**. See **PLUMBAGO**.

**Black Letter**, in printing, an old English or modern Gothic type.

**Black Oak**. See **QUERCITRON**.

**Black Plates**, a commercial name for thin sheets of iron prepared for coating with tin.

**Black Pudding**, [*Fr. boudin*], a kind of sausage, made of pig or sheep's blood, groats, suet, etc., enclosed in the dried intestines of swine and boiled. In America, they can be procured only in French shops.

**Blacks**, a name for ink used in copper-plate printing, prepared from the charred husks of the grape and residue of the wine-press.

**Black Salts**, a name for the ordinary potash in a crude and impure state.

**Blacksmith**, a worker in iron; one engaged in beating and shaping malleable iron.

**Black Spruce**. See **SPRUCE**.

**Black Strape**, a name for bad liquor and inferior wines.

**Black Tea**. See **TEA**.

**Black Tin**, tin ore, beaten into a black and fine powder like sand for smelting.

**Black Wad**, an ore of manganese, used as a dryer for painters' colors.

**Black Walnut**. See **WALNUT**.

**Bladder Green**, a pigment prepared from Persian berries.

**Bladders**, the urinary vessels of oxen, pigs, calves, and sheep, which are chemically prepared for holding lard, and other purposes. Quantities of *B.* are exported to England, packed in salt or pickle.

**Blade**, the flat, cutting part of a sword or knife, scissors, etc.

**Blades**, a commercial name for the four large shell plates on the sides, and the five large ones from the middle of the carapace of the sea-turtle: these yield the best tortoise-shell.

**Blanca**, a petty money of account in Malaga, 68 making one real villou = 5 cts.

**Blanc de Fard**. See **BISMUTH**.

**Blanchimeter**, an instrument for measuring the bleaching power of chloride of lime and potash.

**Blanching**, the process of whitening anything, such as removing the skin of almonds; covering iron plates with a solution of tin, etc.

**Blandurillo**, a fine, soft poinatum made in Spain.

**Blank - Books**, account-books, letter-books, pass-books or memoranda, made of ruled or unruled writing-paper, and bound with flexible or stiff covers. They are manufactured and sold by stationers.

**Blank Credit**, an authorized permission given to draw on an individual or firm to a certain amount.

**Blanketing**, a closely woven or felted woollen stuff used for printing-machines. *Imp. duty*, 20 cts. per lb. and 35 per cent.

**Blankets**, soft, loosely-woven stuff pieces, used for bed-covering or wrappers. The long staple is

the wool generally used. *B.* are made also of cotton warps and wool. They are woven in widths varying from 4 to 20 quarters, and in lengths of webs from 60 to 100 yards. They are usually sold by the pound. They are extensively manuf. in Yorkshire, England, in France, in Germany, and in the U. States. *Imp. duty* (value not over 40 cts. per lb.), 20 cts. per lb. and 35 per cent.; (over 40 cts. and not over 60 cts.) 35 cts. per lb. and 35 per cent.; (over 60 cts. and not over 80 cts.) 40 cts. per lb. and 35 per cent.; (over 80 cts. per lb.) 50 cts. per lb. and 35 per cent.

**Blanquette**, a delicate sort of French white wine. The best is the sparkling *B.*, made at Limoux, dept. Aude, from muskat grape.

**Blast**, air introduced into a furnace artificially.

**Blast-Furnace**, an enclosed fire-place where an extra degree of heat is generated by a powerful force-bellows.

**Blasting**, a speedy process for removing or detaching heavy masses of stone, earth, etc., by exploding charges of gunpowder, nitro-glycerine, or dynamite.

**Blasting-Powder**, a coarse kind of powder for mining and quarrying purposes.

**Blast-Pipe**, the tube in a locomotive, which carries off the waste steam, and produces a greater draught for the fire.

**Blast-Regulator**, a cylinder of iron for holding and conveying air to a blast-furnace.

**Blay Linens**, linens beetled in the manufacture, and slate colored.

**Blé**, the French name for wheat, but chiefly applied to wheat.

**Bleaching**, the chemical process of removing the color of cloth or vegetable substances. This important process, though applied also to flax and other fibrous materials, has received its chief development in connection with cotton. As a distinct branch of manuf., *B.* goes through three series of processes—the removal of dirty, greasy, resinous, and starchy particles; the removal of color, and the glossing and folding of the bleached cloth.—*Singering*. Woven cottons always exhibit a downy-surface of minute fibres when they leave the loom. In order to remove these fibres, the cloth is passed over a singering machine, which consists of a plate or cylinder of copper, kept nearly red-hot by gas-jets underneath. The pieces of cloth are tacked temporarily together, and wound in an enormous length upon a roller, from which the cloth travels over the singering cylinder, and is received upon another roller.—*Boiling*. The cloth is next boiled in a boiler called a *keir*, which is so constructed as to shower down a stream of liquid in the form of a spray on the cloth. The liquid is a hot solution of lime or some other alkaline agent, and the purpose of the boiling is to remove dirt and grease.—*Washing*. The washing-machine has a water-trough and two wooden squeezing-rollers. The cloth passes continuously through the water in the trough between the rollers, which revolve 100 times a minute, and squeeze the cloth as it passes. The machine has, in many establishments, superseded the *dash-wheel* formerly employed; some of them are so large that they will wash 12,000 yards per hour.—*Chemicking*. This, also called *scouring*, is a second washing with smaller rollers, and some kind of acid in the water. It is, in fact, the *bleaching* process; chlorine, developed from the chloride of lime steeped in the liquid, removes the colors from the

cloth.—*Squeezing*. After the cloth is thoroughly bleached, the greater part of the liquid is expelled from it by the squeezing-machine—one of the many varieties in which the cloth is passed between two smooth rollers, and pressed as it passes.

—*Drying*. The cloth passes over a series of steam-heated cylinders in the drying-machine, becoming quite dry before it leaves the last of them, although not smooth.—*Mangling*. If the cloth is to be printed—for printing muslins, chintzes, etc.—it goes to the print-works after drying; but if it is to be sold as calico or other white cloth, it requires a few finishing processes, of which mangling is one. The cloth passes through a cistern of water, and is then dragged between two rollers, which flatten and equalize the threads.—*Sarehing*. When flattened and equalized in surface, the cloth, wound upon a cylinder, passes through the starching-machine, which has a roller dipping into a trough of starch, and other rollers to press the superfluous starch out of the cloth. Flour paste, sometimes weighted with ground porcelain clay, and sometimes tinted with a little blue, is the composition here employed.—*Calendering*. It is not all white goods that require to have a gloss given to them; but when such is the case, the calendering or glazing machine is employed (see CALENDERING).

—*Making up*. Lastly (that is, unless the dyeing or printing is to be immediately done in the same establishment), the cloth is passed through a machine in which rollers are placed at definite distances apart, so as to form a self-measuring apparatus; and then the cloth is packed into bales or other parcels, according to the market to which it is to be sent. A moderate but efficient plant for an establishment adequate to bleaching 2,500 pieces of 20 yards each in a week, will cost about \$25,000. For other processes of bleaching, see CANDLES, PAPER, SILK, STRAW PLAIT, WOOL-LENS, etc.

**Bleaching Powder**, the name given to chloride of lime, which is the chief substance employed in bleaching. It is prepared by passing chlorine into chambers containing fresh-slaked lime in fine powder, by which the gas is copiously absorbed, with extrication of heat. It is a dry, white powder, possessing a faint odor of chlorine, and a strong, penetrating taste. When agitated with water, a portion is dissolved; and the solution, called *bleaching liquor*, contains both chlorine and lime. Its bleaching power, and consequently its commercial value, may be estimated by its action upon a solution of indigo of known strength. Chlorine of lime is also used for fumigation, from its possessing the property, when exposed to air, of checking contagion or destroying noxious effluvia. The chief seats of the manuf. are Glasgow (Scotland), and Newcastle-on-Tyne and Lancashire (England), from where enormous quantities are annually exported to the U. States, our imports for the year 1878 amounting to 49,285,054 lbs., valued \$598,813. *Imp. free*.—Some other bleaching powders, made of some of the magnesian salts, are coming to a certain extent into use.

**Bleak**. See PEARLS (ARTIFICIAL).

**Blende**, the Black Jack of miners, a native sulphuret of zinc, of little value, owing to the difficulty of extracting the metal from the ore.

**Bleu de Paris**, BLEU DE LYONS. See ANILINE (BLUE).

\* **Bley**, the German name for lead, *bleyglotte* being litharge, and *bleyweess* white lead.

**Blind**, a sun-screen or shade for a window, fitted within or without, and made of different kinds. A common inside window-*B.* is a plain hanging of union holland or linen; a wire *B.* is a short, transparent frame of woven wire, gauze, or perforated zinc, painted, which is either plain, or lettered and figured. Outside window-*B.* are known as Spanish, Florentine, Venetian, dwarf, spring-patent, or common roller. There are also spring-*B.* for store-fronts and sky-lights, and iron rolling *B.* for shop-windows.

**Blinkers**, are square pieces of leather fastened to the head-stall of a horse to make him look before him instead of aside.

**Blistering-Fly.** See CANTHARIDES.

**Blistering-Plaster**, a preparation of powdered cantharides upon adhesive plaster, to raise a blister on the skin.

**Blister Steel**, wrought-iron which has blisters on the surface, owing to the evolution of gas from the interior of the bar.

**Bloater**, a commercial name for a slightly-cured and smoked herring. *B.* are made into a paste for a breakfast relish.

**Block**, a shaped piece of wood containing a sheave traversing on a spindle for passing ropes through. Pulley-blocks for naval and shore use are made by means of a complicated system of machinery invented in England in 1808. Blocks of every description are extensively manuf. in the U. States, at Boston, Providence, and New York. The working of a triple block, in its simplest form, is illustrated in Fig. 36.—The wooden mould on which hats are formed.—A mass of buildings enclosed between four streets.

**Blockade**, the official closing of a port or coast during war, by guarding and watching it with vessels of war to prevent commercial intercourse. Due notice is always legally given by proclamation to the mercantile world of the commencement and raising of a blockade. To be sufficient, the *B.* must be effective and known. The government of the U. States has uniformly insisted that the *B.* should be made effective by the presence of a competent force stationed and present at or near the entrance of the port. A violation may be by going into the place blockaded, or by coming out

of it with a cargo laden after the commencement of the *B.* Also placing himself so near a blockaded port as to be in a condition to slip in without observation, is a violation of the *B.*, and raises the presumption of a criminal intent. When a ship has contracted guilt by breach of the *B.*, she may be taken at any time before the end of her voyage. When taken, the ship is confiscated; and the cargo is always, *prima facie*, implicated in the guilt of the owner or master of the ship; and the burden of rebutting the presumption that the vessel was going in for the benefit of the cargo, and with the direction of the owners, rests with them.

**Block Tin**, tin cast into blocks and ingots; tin ore which has been treated with copper and sulphuric acid, and is ready for smelting. A block of tin weighs from 375 to 400 lbs.

**Blonde**, a choice kind of silk lace. There are both black and white *B.*, which again are either real or in imitation. The best of the former are imported from France.

**Blood**, the fluid which circulates in the heart and blood-vessels of animals, which is used very largely in Europe, and to a small extent in the U. States, for many commercial purposes: it is stirred and run into casks for the use of sugar refiners; it is made into animal charcoal; coagulated, it is sold to calico-printers for dyeing Turkey-red, and is chemically prepared for printers' use. Albumen is made from blood. In some of the agricultural districts it is employed as a fertilizer of land.

**Blood-Stone**, a hard species of chalcedony, colored with numerous bright-red spots like drops of blood; it is called also heliotrope and oriental jasper, and is used for rings, etc. The best comes from India.—A species of hard hematite used as a burnisher in several trades.

**Bloom**, a name given to the yellowish fawn-colored deposit from the tanning liquor on the surface of the leather, and penetrating to a slight depth.—A technical term for a mass of iron taken out of the furnace to be hammered.

**Bloom Raisins**, a fine quality of sun-dried grapes.

**Blotting Book**, a book or pad with sheets of unsized paper for drying the ink on newly-written documents.

**Blotting-Paper**, unsized paper used for drying inked manuscripts. It is either white or colored, and some is specially prepared for chemical purposes.

**Blouse**, a sort of smock-frock or outer garment, worn by workmen in France, Belgium, etc.

**Blowing-Machine.** Besides the simple apparatus described under BELLOWS, many other forms of *B.-M.* have been devised. Vaughan's machine consists of two square boxes placed side by side, with a crank, a pipe, a piston, and other apparatus for producing a blast with the boxes alternately. In another arrangement, two vertical cylinders, with weighted pistons worked from the beam of a steam-engine, cause air to be driven from the first to the second, and then expelled with augmented force from the latter. In some of the *B.-M.* now made, the working of pistons by steam-power causes an immense quantity of air to be forced through tubes. See FORGE, HOT-BLAST, VENTILATING FAN, etc.

**Blow-Pipe**, [Fr. *chalumeau*; Ger. *löthrohr*.] a small pipe for directing a blast of air into a flame,

Fig. 36.—TRIPLE BLOCK.

to increase the intensity of the heat. It is variously formed, but has always a mouth-pipe to place between the lips. Much art is required to direct the blast of air from the lungs in a proper manner; but when well managed, this blast raises the temperature of a flame to a very high degree, thereby facilitating many of the processes in soldering jewelry, gold and silversmith's work, enamels, glass-blowing, etc. A still more intense heat is produced by the oxyhydrogen blow-pipe.

**Blow-Tubes**, in the glass manuf., hollow iron rods 5 or 6 feet long, with which the workmen gather up the fluid metal from the pots, to blow and form it into desired shape.

**Blubber**. See WHALE OIL.

**Blue**, the color of the sky. The principal *B.* pigments are: Ultramarine, Prussian *B.*, *B.* verditer, bice, cobalt *B.*, and iron *B.* The principal *B.* dyes are aniline *B.*, indigo, and Prussian *B.* Those and all other *B.* pigments and dyes are briefly noticed under their proper headings.

**Blue-Backs**, a name for the North American herring, *Chupea elongata*.

**Blue Clay**, a kind of clay formed of a very fine pulverized slate.

**Blue Copper**, an ore of copper, of an indigo-blue color.

**Blue Ink**. See INK.

**Blue-John**, a name, in England, for an esteemed variety of Derbyshire marble, which is worked up into vases and other ornaments.

**Blue Lead**. See GALENA.

**Blue Light**, a kind of firework or night-signal, which throws out a vivid light visible at a great distance.

**Blue Pill**, a medicinal preparation of mercury with confection of roses, liquorice root, and other substances.

**Blue Stone**, a common name for sulphate of copper.

**Blue Verditer**. See VERDITER.

**Blunk**, a Scotch name for heavy cotton cloth.

**Board**, a term in carpentry for all timber of any length or width, sawn into a less thickness than  $1\frac{1}{4}$  to  $1\frac{1}{2}$  inch; when above that thickness, it is called a plank.—A managing committee or body of directors.—The deck of a ship, as goods delivered *on board* a ship; to go *a board*, to enter a ship.

**Boarding-Officer**, a custom-house officer, whose duty is to go on board vessels on their arrival in port.

**Board of Trade**, in England, an official department branch of the government, having jurisdiction over the trade and navigation of the country. It consists of a President, and Vice-President, and the Board are termed the Lords Commissioners of the Privy Council of Trade.—In the U. States, a voluntary association of business men which, in most large towns, are organized to promote the financial and commercial interests of the place, and to consider such questions with regard to railroad and water communication, foreign commerce, banking, insurance, exchange, supply and demand, etc., as may from time to time demand their attention. See CHAMBER OF COMMERCE.

**Boat**, a small open or decked vessel, usually propelled by oars. There are numerous kinds of boats, the construction and names of which differ, according to the service required of them. See BARGE, CORACLE, CUTTER, GIG, JOLLY-BOAT,

LAUNCH, LONG-BOAT, PINNACLE, SKIFF, WAGER-BOAT, WHERRY, YAWL, etc.

**Boatswain**, in a merchant ship, a subordinate officer having charge of the sails and ropes and other gear.

**Bobbin**, a package or hank of Russian flax, made up according to quality in 6, 9, or 12 heads.—A wooden pin to wind thread on.—The brass reel or winder of a lace machine, with a narrow hollow surface for receiving the thread.

**Bobbin-Net**, a machine-made lace.

**Bobbin-Net Machine**, a very complicated piece of machinery for making lace net—the mere technical names of parts furnishing quite a long list: carriages, combs, bobbins, point-bars, needles, thread-beams, lace-beams, rollers, guide-bars, slit-plates, etc. In principle, the thread that makes the bobbin-net is supplied partly from bobbins, and partly from a warp. The bobbins are very peculiar, being delicately-shaped pieces of brass, so thin as to pass between the threads of a warp; there are more than 1,000 such bobbins in a large machine, and they swing in a peculiar pendulum-like manner, to and fro between the warp threads, in such a way as to twist the weft round the warp. The machine-net, like the pillow-lace, varies in the shape and size of the mesh, the thickness and compactness of the thread, and the degree of ornamentation applied to the ground. *Broad-net* is woven the whole width of the machine; *quillings*, or narrow strips, are made several at a time, side by side in the same machine. In *fancy-net* the pattern is often worked in with thicker gimp by the Jacquard machine; but sometimes the net is made plain, and the pattern afterwards put in by hand. *Lace-running* is the name given to this net-embroidering by hand. *Lace-mending* is a special kind of needle-work to restore broken or torn meshes.

**Bobstays**, the rope which confines the bowsprit of a ship to the stern.

**Bock Beer**. See BEER.

**Bocoya**, a cask in Cuba, containing 36 wine gallons. As a package for coffee, sugar, etc., the *B.* varies. The coffee cask is either great or small, the *B. grande* containing 40 arrobas, and the *B. pequeno* 28 arrobas. The sugar cask holds from 50 to 54 arrobas, and the cask for molasses, 110 gallons.

**Bodkin**, a printer's tool for picking letters out of a column or page in correcting.—A sharp-pointed steel instrument for piercing holes, used by bookbinders and others.—A large-eyed blunt-pointed threading-needle used by tailors and others.

**Bodle**, a small coin; a Scotch penny.

**Body**, thickness; a printer's term for the size of the shank of type.

**Body-Varnish**, a thick and quick drying copal varnish used for carriages and other objects requiring to be polished.

**Boiler**, in general terms, any closed metallic vessel, kept partly filled with water, with arrangements for imparting heat to the water by means of the combustion of fuel, the steam generated being confined in the vessel above the water until it is required for use, when it is drawn off through pipes. This metallic vessel, with its compartments and openings, takes the name of "boiler" in the shops where it is manufactured. But in many classes or forms of *B.* the steam-generating apparatus is not complete until the *B.* is set up in

brickwork, with an external furnace constructed for the combustion of the fuel, and external flues made for conducting the heated gases to the chimney along the sides of the boiler. In others the *B.* is ready for use as it comes from the manufacturer, having within its external shell all these necessary arrangements for combustion and draught.

Fig. 37. — LONGITUDINAL.

Fig. 38. — CROSS-SECTION.

**Legend:** Fig. 37 is the Longitudinal, and Fig. 38 the Cross-Section, of a French Steam-Engine Boiler.

**BB.** Generators, 2 in number; always full of water, and placed in the centre of the furnace to receive the full heat of the fire; *CCD*, jackets surrounding the generators and the lower parts of the boiler to retain the heat; *E*, float of alarm-whistle; *FF*, furnace; *F*, float to show the height of water in boiler; *K*, smoke-stack; *PQ*, cylindrical boiler connected with the generators by four tubes, and about half filled with water; *S*, safety-valve; *T*, man-hole; *M*, valve admitting steam to the engine; *N*, tube for the injection of water into the boiler; *s*, alarm-whistle which gives warning of water being too low in the boiler.

*B.* for steam-engines (Figs. 37 and 38) are made in many different forms—in cylindrical, globular, wagon-shaped, etc. They are mostly made of sheet-iron riveted, sometimes of copper, which is much dearer in the first instance, but more durable. Some are made with the fire inside, some at one end, while for rapid heating the surface is often exposed to a very large area of fire action. Locomotive *B.* have brass or copper tubes running from end to end, and well secured; the heated air is thus completely surrounded by water, which becomes thereby speedily raised to the boiling-point. Some *B.* have double internal flues, so adjusted that the heat in one shall assist the combustion of the fuel in the other furnace. The fierceness of the heat is kept up in some *B.* by a lofty chimney, in some by blast or blowing machines; while in the locomotive the waste steam is used to augment the draught up the short chimney or funnel. Most *B.* have several appendages belonging to them: a feed apparatus, to keep the *B.* supplied with water; a water-gauge, constructed in various ways, but always so as to show the height of the water in the *B.*; safety-valves, for admitting the air, and for giving the steam a self-acting power of escape when dangerously high; a man-hole to admit a workman to cleanse the interior, etc. The bursting of steam-*B.* depends on many circumstances besides bad workmanship and high pressure; it still remains a subject requiring very scientific investigation.

When a vessel containing water is heated, the temperature rises and vapor silently passes off from the surface; but at 212° F. (the barometric column standing at 30 inches at the sea-level) steam begins to be formed in bursts at the bottom, and rising through the liquid, throws it into commotion. If the steam is allowed freely to escape, the temperature of the

water rises no higher. The water is then said to *boil*, and the temperature at which it remains is its *boiling-point*. On the top of a mountain, where the air is rare, the boiling-point is below 212°; at the earth surface, if the vessel is closed in, and a partial vacuum is formed, the boiling-point is similarly less than 212°. In a deep mine, or in a closed vessel with the air condensed, it is higher than 212°. What is called "one atmosphere" is the ordinary average pressure of the air, equal to about 15 lbs. on the sq. in. If the pressure be increased by artificial means to two atmospheres, water does not boil till it reaches a temperature of 234°; four atmospheres, 254°, etc. Every liquid has its own special boiling-point. Salt water

has a higher boiling-point than fresh water. Oil of turpentine and sulphuric acid are examples of liquids having a higher boiling-point than water, other circumstances being equal; while the boiling-points of ethers and alcohols are lower.

**Boiler-Plates**, flat sheets of iron used for making boilers, tanks, bridges, vessels, etc.

**Boiling-Point**, the temperature at which the elastic force of the vapor of any liquid is equal to the pressure of the atmosphere.

**Bois**, the French name for wood. *Bois à bruler* is fire-wood; *bois de construction*, building timber; *bois de teinture*, dye-wood.

**Bois-Durci**, or *hardened wood*, is the French commercial name of a material consisting of the sawdust of hard wood reduced to a fine powder, mixed with blood and other ingredients, and pressed into moulds, producing beautiful articles of various kinds.

**Boisseau**, the old French bushel or decalitre, which, by the new measures of France, is 12½ litres, equal to 763 English inches, or rather more than a third of an English bushel. The *B.*, however, varied in different localities, and also according to the grain measured.

**Boissons**, the general French term for drinkables, as wine, spirits, beer, etc.

**Bokhara**, or **UZBEKISTAN**, a state of Central Asia, in Turkestan, having N. and W. Khiva and Russian Turkestan, E. the Bolor-Tagh, and S. Afghanistan and Persian Khorassan. Area, 76,300 sq. m. The Hindoo-Koosh chain of mts. extends along the S. confines, but the greater part of the surface is level, consisting mostly of dry wastes and sandy steppes, save along the Amoo Jihoon and Kohik rivers, where the soil is fertile and agricultural. The inhab. manuf. silk stuffs, arms,

etc., but their pursuits are almost wholly pastoral. *Pop.* 2,500,000.

*Bokhara*, cap. of the above State, *pop.* 120,000, is one of the most important commercial emporia in Central Asia. From it come most of the genuine fine camel's-hair shawls sold in Europe and America, and which are hence called *Bokhara shawls*.

**Bole**, is a sort of greasy, earthy, lightly lustrous mineral, found in various traps and basaltic rocks. Several kinds are prepared into red and yellow pigments, useful in many of the manuf. arts. The *Imp.* duty of the Armenian *B.*, which is used as a tooth-powder, is 50 per cent.

**Bolivia**, a republic of S. America, bounded N. and E. by Brazil, S. by the Argentine Republic and Chili, and W. by Peru and the Pacific Ocean, lat. between 9° 30' and 25° 40' S., lon. 58° and 71° W. *Area*, 842,729 sq. m. *Pop.* 1,987,352, more than half being Indians and mixed races. The executive power is vested in a president, elected for 4 years; while the legislative authority rests with a congress of two chambers, elected by universal suffrage.

*B.* presents very different conditions of surface, elevation, and climate. It is traversed by the Andes, particularly towards the W., while on the E. it stretches into plains, which are watered by the Beni, Mamore, and other rivers which unite to form the Madeira, the largest affluent of the Amazon, and the Pilcomayo, one of the chief branches of the La Plata. This region is fertile, but it is nearly covered with vast primeval forests. In the plains, the climate is hot and unhealthy, except in the elevated valley of the Desaguadero, where it is temperate, especially from May to November. Earthquakes are common on the coast. The *mineral* productions are gold, principally found on the E. declivity of the E. cordillera of the Andes; silver from the mines of Potosi, which, however, are now much less productive than formerly. Copper is procured at Corocoro, and other places; there are also lead, tin, salt, brimstone, and nitre. Among vegetable products, the cocoa of Apolobamba and Moxas is celebrated; the sugar-cane and tropical fruits flourish in profusion on the banks of the Beni; and the E. of the Andes abounds in cascarilla, indigo, cotton, rice, coffee, tobacco, cinchona, copaliba, sarsaparilla, gum-elastic, vanilla, and other valuable drugs and dye-woods. The *manuf.* principally consist of cottons and glass made at Oropesa; woollens at La Paz; and hats at St. Francisco de Atacama. The *commerce* is inconceivable, owing chiefly to the difficulties which have to be encountered in bringing the produce to market; the ports of the Pacific, which cannot be reached except by toilsome passage, being hardly available for the foreign trade. The country to Cobija, the only Bolivian port, is traversed by only one road, that from Oruro, and that is practicable only for mules and llamas. Cobija, though a free port, is therefore but little frequented; the Bolivians preferring to make their imports and exports in transit through the port of Arica in Peru, or by the recently opened route of the National Bolivian Navigation Co., up the Amazon River and its tributaries, through Brazil. The total imports of *B.*, in 1875, were about \$5,500,000, chiefly from England. The exports, comprising silver, Peruvian bark, cocoa and coffee, and copper, tin, and other ores, were about \$4,500,000. The U. States have almost no direct commercial intercourse with *B.*

Till within the last few years, the vast agricultural and mineral resources of the country were entirely dormant for want of means of communication; but more recently an attempt has been made to construct roads and railways. A line of railway connecting La Paz, cap. of the republic, with the port of Aygacha, on the Lake Titicaca, was opened for traffic in 1872, a second line from Autogagasta to Salar was completed in 1874, and several other lines are in course of construction.

*Money.* The *Peso*, or *Dollar*, of 100 *centimos*, is theoretically worth \$0.985, but, for a number of years, the coins issued from the Government mint of Potosi have been 25 per cent., and more, below the standard.

*Weights and Measures.* The *Libra* = 1.014 lbs. avoirdupois; *Quintal* = 101.44 lbs.; *Arroba* of 25 lbs. = 25.36 lbs.; *Arroba* of wine or spirits = 6.70 gal.; *Gallon* = 0.74 gal.; *Vara* = 0.927 yard; *Square Vara* = 0.859 sq. yard.

*Finances.* The public debt, consisting of an internal and foreign debt, amounted in 1876 to \$17,000,000. The foreign debt consists of a 6 per cent. loan of \$7,500,000, nominal cap. — issued at the price of 68 — contracted in England in 1872. It was raised with the object of constructing a line of railway to enable the National Bolivian Navigation Co. to open communication between *B.* and the Atlantic Ocean. This object, however, was not carried out, and the greater part of the proceeds remained in England to furnish means for lawsuits extending over years.

**Boll**, in England and Scotland, a measure for corn, is the half sack, equal to 140 lbs., and divided into 10 stones or pecks. The *B.* of pease and beans weighs 280 lbs.; of oats, 264 lbs.; of barley, about 320 lbs.

**Bollard**, a large post to secure hawsers to.

**Bologna Sausage**, an excellent kind of dried sausage made of bacon, veal, and pork fat, and manuf. in Bologna, Italy. *Imp.* free.

**Bolsa**, in Spain, the exchange or place of business for money-changers and dealers.

**Bolster**, a long pillow or cushion stuffed with flocks, hair, or feathers, etc. — A tool for punching holes, and making bolts.

**Bolt**, a compact parcel or roll of canvas containing about 40 yards, 24 in. in width, and weighing about 28 lbs.; a bolt of silk is a long narrow roll. — A fastening, an iron or brass bar for securing a door. — The apparatus used for separating the bran from the flour.

**Bolt-Boat**, a strongly built boat, fitted to encounter rough and stormy seas.

**Bolter**, the machinery of a flour-mill, set in motion for separating the flour from the bran.

**Bolting-Clothes**, wire, hair, and other sieves of different degrees of fineness, used by millers for dressing or sifting flour and meal.

**Bolt-Rope**, a rope sewed to the edges of sails to strengthen them and prevent their splitting.

**Bomb**, a cast-iron projectile or combustible shell. See *SHELL*.

**Bombay**. See *INDIA (BRITISH)*.

**Bombay Shell**, a name for the shell *Cassia rufa*, imported at Bombay from Zanzibar, and re-shipped to England and France for cutting cameos.

**Bombazet**, a woollen material of various colors, woven, plain, or twilled.

**Bombazine**, a dress material for ladies, made of silk and worsted, the warp being of the former, the weft of the latter. It was formerly largely made at Norwich, England, but has now gone out of fashion.

**Bon**, the French name for a debenture, bill, or bond.

**Bonanza**, the Spanish name for a dividend.

**Bonbonnière**, a French sweetmeat-box.

**Bonbons**, [Fr.] sugar-plums; small confections.

**Bond**, is a description of obligation which assumes a variety of forms, and is connected with many of the contracts separately considered in this work. A simple bond is an executed deed in writing, and under seal, whereby the *obligor* (or person bound) obliges himself, his heirs, executors, and administrators, to pay a certain sum of money, generally with interest, to another (the *obligee*) at a certain time, or under certain circumstances. It is usual to grant *B.* to pay a certain sum, provided a certain act is not performed; or, more properly speaking, to grant an obligation which shall be void if a particular act be performed. It is thus customary to take a *B.* for double the sum intended to be paid, with the expressed condition that if the obligor pays a smaller sum (the actual sum due), the *B.* is void, the penalty in a *B.* — it is to say the double sum mentioned — being inserted merely to secure the full debt, with interest and costs. An obligation by *B.* extinguishes the debt of the principal contract debt, but the *B.* of a surety will not extinguish the debt of the principal. It cannot be assigned so as to enable the assignee to pursue on it in his own name; but the

assignee sues in the name of the obligee, a power to that effect being inserted in the assignment.

#### 1. FORM OF COMMON BOND, WITH CONDITION.

Known all men by these presents: That I, A. B., of the town of —, in the county of —, and the State of —, am held and firmly bound unto C. D., of, etc., in the sum of one thousand dollars, lawful money of the United States, to be paid to the said C. D., his executors, administrators, or assigns; for which payment, well and truly to be made, I bind myself, my heirs, executors, and administrators, firmly by these presents.

Scaled with my seal. Dated the — day of —, one thousand eight hundred and —.

The condition of the above obligation is such, that if the above bounden A. B., his heirs, executors, or administrators, shall well and truly pay, or cause to be paid, unto the above named C. D., his executors, administrators, or assigns, the just and full sum of five hundred dollars, in five equal annual payments, from the date hereof, with annual interest, then the above obligation to be void; otherwise to remain in full force and virtue.

Scaled and delivered }  
in presence of

A. B. [L. S.]

G. H. }

#### 2. FORM OF BOND OF AN OFFICER OF A COMPANY OR BANK.

Known all men by these presents: That I, A. B., of, etc., am held and firmly bound unto the — Company [or bank], in the sum of one thousand dollars, lawful money of the United States, to be paid to the said — Company or assigns; for which payment, well and truly to be made, I bind myself, my heirs, executors, and administrators, firmly by these presents.

Scaled with my seal. Dated the — day of —, one thousand eight hundred and —.

Whereas the above bounden A. B. has been chosen and appointed cashier [or, teller; or, treasurer, as the case may be], of the — Company [or bank]; by reason whereof divers sums of money, goods and chattels, and other things, the property of the said company [or bank], will come into his hands: Now, therefore, the condition of the above obligation is such, that if the said A. B., his executors, or administrators, at the expiration of his said office, upon request to him or them made, shall make or give unto the said company [or bank], or their agent, or attorney, a just and true account of all such sum or sums of money, goods and chattels, and other things, as have come into his hands, charge, or possession, as cashier [or, teller; or, treasurer], as aforesaid, and shall and do pay and deliver over, to his successor in office, or any other person duly authorized to receive the same, all such balances, or sums of money, goods and chattels, and other things, which shall appear to be in his hands, and due by him to the said company [or bank]; and if the said A. B. shall well and truly, honestly and faithfully, in all things, serve the said Company [or bank], in the capacity of cashier [or, teller; or, treasurer], as aforesaid, during his continuance in office, then the above obligation to be void: else to remain in full force and virtue. Scaled, etc. [as in Form 1].

#### Bonded Goods. See WAREHOUSE.

**Bonded Storekeeper**, an officer of customs detailed to take charge of a warehouse, or store, where goods liable to customs duty are permitted to be lodged in bond without payment of the duty until they are removed or cleared.

**Bondsman**, one who is bound or gives security for the faithful performance of any contract or money payments, due from another. See BAIL.

**Bon du Tresor**, a French Treasury bond, or government security bearing a varying rate of interest.

**Bone-Ash**, calcined bones reduced to a powder, and used for cleaning articles of jewelry, for sugar-refining, for making cupels, etc.

**Bone-Black**, a name for animal charcoal, the carbonaceous substance which remains after the calcination of bones in close vessels.

**Bone-Dust**, ground bones used for manure.

**Bone-Earth**, the phosphate of lime, or residue of bones which have been calcined.

**Bones**, the solid supports forming the skeleton or frame-work of the bodies of animals. *B.* enter largely into commerce for manuf. purposes. They are susceptible of being worked up into many useful forms by the mechanical processes of sawing, turning, stamping, drilling, etc., to make buttons, knife-handles, combs, tooth-brushes, etc. They are

also employed for making gelatine, for the size used by dyers and finishers of fustians, velveteens, etc. When distilled in retorts, *B.* become decomposed, and their elements recombined to form *sal ammonia*, *lamp-black*, *animal charcoal*, *plate-powder*, and one of the constituents for tipping *lucifer matches*. The largest use of *B.*, however, is perhaps now in making manure. *B.* are becoming an important item of U. States exports. In 1878, 47,429 cwts. of *B.* and *B.* dust, valued \$78,989, and 2,738,784 lbs. of bone-black, ivory-black, and lamp-black, valued \$80,740, were exported, chiefly to England and Germany. *Imp. duty*: (not manuf.) free; (manuf.) 35 per cent.

**Bone-Waste**, the dust or refuse of bones, after the gelatine has been extracted by the bone-boilers, extensively used for manure in Europe.

**Bonification**, [Fr.] is an allowance made in form of a discount.

**Bonito**, the name of a fish, the *Thynnus pelamis*, the sun-dried flesh of which is a staple commodity in the Maldives. When properly cured, it is as hard as horn, and is cut for export into pieces of a few ounces' weight.

**Bonnet**, a lady's covering for the head, made of different materials, according to season and fashion.

**Bonnet-Box**, a kind of paper or thin wooden band-box.

**Bonnet-Frames**, are foundations for ladies' bonnets, shaped and ready to be covered and trimmed.

**Book**, a name applicable in a general sense to almost every literary composition, but usually confined to such compositions as are large enough to form a volume. Printed volumes are distinguished according to the number of leaves produced from one sheet of paper. *Folio* is the largest size, of which 2 leaves or 4 pages make a sheet; *Quarto*, or 4to, 4 leaves or 8 pages; *Octavo*, or 8vo, 8 leaves or 16 pages; *Duodecimo*, or 12mo, 12 leaves or 24 pages; *Octodecimo*, or 18mo, 18 leaves or 36 pages, and so on. These again differ according to the size and form of the sheet. Thus there are royal, demy, post, and crown octavos; and the same with the others.

The modern book trade dates from the discovery of the art of printing with movable types by John Gutenberg, of Mayence, in 1441. In 1471, the art was brought to London by William Caxton, a mercer, and from that time until 1600 the activity of the press was considerable; the works chiefly used being Bibles and works on divinity, translations of the classics, versions of French and Italian romances, and old chronicles. Few, however, but "clerks and noble gentlemen," could then use these works, as their expense and the imperfect state of education placed them beyond the reach of the people in general. In 1516, "Fitzherbert's Abridgment," a folio law-book, was sold for 40 shillings, a sum which at that time would have bought 3 oxen. The edition of a book at that time averaged about 200 copies. The stormy period from 1600 to the revolution in 1688 was, although the age of Shakespeare, Bacon, and Milton, upon the whole less favorable to the diffusion of knowledge; and the number of books issued, unconnected with religious or political controversy, was very small. The period from 1688 to the accession of George III. in 1760, was much more remarkable. Newspapers were established on a regular footing, both in London and the provinces:

in 1731 appeared the "Gentleman's Magazine," the first of that class of periodicals produced in England; and in 1749, the first review, "The Monthly," and other similar works soon followed. Publishers attained higher influence in society, and the trade of books went much more than formerly into regular commercial channels. The number of new ones printed during this period was, however, not large, as the publishers appear to have aimed less at novelty than at selling large impressions of a few standard works. Between 1700 and 1756, excluding pamphlets and tracts, only 5,280 new books appeared; or, on an average, 93 annually. The period from 1760 to 1800 is distinguished less for originality than for the increased diffusion of literature. Periodical works were multiplied, and the principle of "number books" was then first developed. Of the latter, one of the most successful was Smollett's "History of England," which sold to the extent of 20,000 copies. Towards the end of the century, the average number of new books published annually was about 370, exclusive of pamphlets. From 1800 to 1827, the average annual number of new books, exclusive of pamphlets, was about 588, showing a very considerable increase relatively to the preceding period. Notwithstanding this increase, little had been done for many years in economizing the mode of conveying knowledge, and the reading portion of the middle classes had little or no opportunity of gratifying their taste, except through the medium of circulating libraries and reading clubs. A large class of readers, however, had now arisen, for whom a new species of literature was to be provided. With the view of meeting the wants of this class, a number of enterprising publishers directed their attention to the issue of cheap editions of the great writers. The success which generally attended these operations gradually revolutionized the book-trade. The portly folios and quartos of former times gave place to octavos and duodecimos; and publishers found it their interest in bringing out works, even for the wealthiest, to place them at the same time within reach of the generality of the middle class, reimbursing themselves for the lower price charged by the large impression sold. This change has been gradually effected without producing, as many anticipated, any diminution of new works. On the contrary, there has been a considerable and constant increase; and the truth of the observation, "that the more people read, the more they will read," has been confirmed. The principal localities of the English book-trade are London, Edinburgh, Dublin, Glasgow, Oxford, and Cambridge. Of these, by far the most extensive is London, which may be regarded as the emporium of the whole kingdom, as the provincial publishers have all agents there, to whom a large proportion of their works are consigned as soon as printed.

*English Law.* Books first composed, or written, or printed in the United Kingdom, and printed or reprinted in any other country, are prohibited from being imported for sale, except books not reprinted in the United Kingdom within 20 years, or being parts of collections, the greater parts of which had been composed or written abroad. — Books first composed, or written, or printed and published in the United Kingdom, and reprinted in any other country or place, may not be entered to be warehoused. — The importation for private use of English books reprinted abroad is limited to a single copy for each party, accompanied by luggage.

In the U. States, the development of the book-trade has been for the most part within half a century. The oldest house in the trade is that of

Sower, Potts & Co., whose founder, Christopher Saur, Sr., made almanacs and German Bibles near Philadelphia, in 1740. In 1820 it was estimated (by S. G. Goodrich) that the book production of the U. States amounted to only \$2,500,000, of which not more than 30 per cent. were original American books; for 1830, \$3,000,000, 40 per cent. American; for 1840, \$5,500,000, or 12,000,000 volumes, 55 per cent. American; for 1850, \$12,500,000, 70 per cent. American; for 1856, \$16,000,000, 80 per cent. American. The book production of 1871 has been estimated at \$40,000,000. In 1878, 5,632 books were copyrighted, which is an increase of 1,156 on 1877. In the absence of internal taxation or other authoritative statistics, these estimates are of little value; but it is certain that the proportion of books of American origin has steadily increased. The American book-trade is divided into three classes, — publishers, jobbers, and retailers. The book-trade proper numbers probably not more than 3,000 stores, but there are, perhaps, 10,000 which sell books and periodicals in connection with other lines of trade. Of these, about 800 are publishers, to the extent of an occasional book, though nine-tenths of the trade is done by less than 50 publishers. Besides the publishers selling through the regular trade, there is a large class of *subscription publishers* who sell their books exclusively through agents, to whom a particular district is assigned. The educational publishers are a class by themselves, although most of the largest general houses have extensive educational departments in addition to their regular business. Other specialties, as medical and law publishing, are also chiefly carried on by special houses. The jobber is the middleman, who orders large supplies, often by the thousand copies, from the publishers, and distributes them among the retailers throughout the country. He differs from the European commissioner in buying the stock and making what profit he can, instead of filling orders on commission.

Many houses are at once publishers, jobbers, and general retailers; others publish and keep a retail store; many are jobbers and retailers together; while some confine themselves to publishing and selling their own books. A peculiar feature of the American book-trade is the *trade sale*, an auction held in New York each spring and fall, to which the publishers send quantities of their new publications, and of their standard books. These are sold to the highest bidder among the members of the jobbing and retail trade who come together at these times.

The common forms for American books are the 12mo for novels, books of poetry, etc.; the octavo for books of travel, treatises, etc.; and royal octavo for books of reference. A form called the *Little Classic*, a square 24mo, has lately become a favorite; and a still smaller class of books, under the title of *Vest Pocket* size, is a yet newer fashion. Tinted paper is frequently employed in preference to white. The paper, stereotype, and press-work of American books are generally above the average of similar publications in any country of Europe.

In 1878, the imports of books, pamphlets, engravings, and other publications (chiefly from England, Germany, and France) were \$1,870,580, against \$2,897,125 in 1873, which is a decrease of \$1,026,545. The exports of the same, to almost every civilized country, amounted in 1878 to \$586,355. — *Imp. duty.* Books printed more than 20 years before, or imported for the use of public institutions, or of schools, or the property, within certain limits, of persons arriving in the U. States, are admitted free of duty. Other books and periodicals are taxed 25 per cent.

*Postage.* Books are carried by post at 1 cent for 2 ozs.—See COPYRIGHT, PRINTING, etc.

**Bookbinders' Cloth**, colored cottons, enamelled or embossed, made in imitation of leather or morocco, and used instead of leather in binding books. It is imported from England. *Imp. duty*, 35 per cent.

**Bookbinding.** This useful and elegant art comprises a number of ingenious applications of leather, cloth, paper, and gold.—*Folding.* Supposing a book to be bound in leather in medium size, the first process is to fold the sheets of paper into pages, according to size of the book. There are certain marks put in by the printer, called *signatures*, to guide the folder. The folding is made on a flat table, by women, with the aid of a long paper-knife; practice enables them to do it with great exactness, and with a rapidity of 300 to 500 octavo sheets in an hour.—*Rolling.* The sheets require to be rolled or pressed to make them smooth and compact. This compression used to

Fig. 59.—SHERIDAN'S LEVER PAPER-CUTTER,  
With Hand or Automatic Clamp.

be done by beating them in small clusters at a time with a hammer of 12 lbs. or 14 lbs. weight; but it is now better effected by a *rolling-press*. This consists of two smooth horizontal iron rollers, placed a small distance apart. The process is completed in a shorter time, it compresses the sheets into a more compact mass, and makes them smoother than by hammering. Sometimes, however, the sheets are placed in an hydraulic press.—*Sewing.* The sheets forming one volume, brought together in a mass, are fixed in a *cutting-press*, and saw-cuts made across the back edge to receive the bands or cords to which the sheets are to be sewed, and which aid in fastening the covers. The sewing-press was then coming in use, but it has been recently superseded by an ingenious little machine of American invention, by which a bit of wire is driven through the sheets and clinched at one blow on the other side.—*Rounding.* The back edge of the book receives a coating of glue and canvas. Then, by a dexterous application of a hammer and the fingers, the back edge, while still moist with glue, is made round or convex, and the front edge hollow or concave; while a kind of groove or recess is made to receive the covers, one on each side.—*Edge-cutting.* The edges are then cut smooth by a cutting-tool called a *plough*, which bears some resemblance to a carpenter's plane. The squeezing of a press keeps the book together in a compact mass while this is being done. The concave edge is temporarily made flat during this cutting, but it springs back to its proper concavity afterwards.—*Binding.* The covers of books are mostly made of millboard, cut

to the proper sizes and shapes from large sheets. Holes are made through them, corresponding to the cords or strings; and the fastening of the covers to the book mostly depends on the cords, which are passed through the millboard and pasted.—*Covering.* The covering with leather next ensues. This is made by pasting the leather to the covers; but much delicate manipulation is needed to effect this neatly. The "hollow back" of a book is produced by the interposition of paper or cloth between the edge and the leather, in a way that enables the book to be opened without crinkling the back.—*Tooling and lettering.* Much of the adornment of a bound book is produced by tooling. Numerous tools are employed in a heated state, to be pressed heavily against the leather of the covers. If no gold is used, the tool produces a dark shining device, which is called *blind tooling*; but in *gold tooling* leaf-gold is applied before the tools are used. In this latter case the gold is fixed to the leather by a coating of gold size, and the surplus gold is easily wiped off after the tooling. In *blocking*, the tools are fixed into a frame to form a device for the whole cover of a book; and this is brought to bear by the force of a press; it receives the name of *gold blocking* or *blind blocking*, according as gold is or is not used. The lettering of a bound book is but one special example of gold tooling, the tool being supplied with types instead of with an ornamental device.—*Edge Gilding.* Edges of books are sometimes sprinkled with color; sometimes marbled with a peculiar kind of parti-colored device; sometimes coated with one particular color, highly glazed, like the red-edged Bibles and Prayer-books now much in fashion. The more elegant kinds are gilt. To do this, the top, bottom, and front edges are scraped smooth with a piece of steel; they are coated with a composition of red chalk and water; this is wet with white of egg and water; the leaf-gold is laid on; and soon afterwards it is brilliantly polished by rubbing with a burnisher of agate or blood-stone. Other kinds of bookbinding require modifications in many of these processes. A book in *cloth boards* does not receive so much pressing as one bound in leather. A boarded book usually has only two or three strips to which the sheets are sewed; a bound book has more; and sometimes there are strips of vellum or parchment instead of strings. In *India-rubber binding* there is usually no sewing, the back edges of the leaves being cemented together with liquid caoutchouc. Books in boards have seldom got the edges so completely cut as bound books. The cloth cover is attached to the boards to form a *case* before the latter is applied to a boarded book. Much of the cloth is woven and embossed expressly for bookbinders' use. The case is attached to the book mainly by pasting, and not by the aid of the strings or cords. The sprinkling of *roun* or *sheep-bound* school books is done in nearly the same way as that of the edges of leaves. In cloth binding, the cloth for each particular book is often passed between cylinders specially engraved with some particular device; in other cases, a heavy stamping-press imprints a particular device on the cover after the cloth has been pasted on the millboard. *Vellum* binding, for account-books, bears special relation to the substantial way in which the sheets are stitched to vellum bands, and the bands fastened to the covers or boards.

**Book-Case**, an article of furniture for a library or sitting-room, generally glazed to preserve the books from dust.

**Book-Debt**, a charge for goods supplied, or work and labor done, entered in the ledger of a trader, or professional man.

**Booked**, duly charged; entered in a book.

**Book-Keeper**, an accountant, or one who has charge of the books in a bank or business establishment.

**Book-Keeping**, is the art of registering mercantile transactions for reference, statement, and balance; all of which must be so clearly done that the true state of every part, and of the whole, may be easily and distinctly known. The only method of book-keeping founded upon general principles is the *Italian*, or, as it is generally called, the *double-entry system*, from its being based on the principle that every transaction in business is virtually a transfer between two accounts, and so must be entered to the debit of the one and the credit of the other. In the present article it is proposed to give—I. An outline of the ordinary procedure in recording the transactions of a general merchant;—II. Practical directions for stating the different accounts;—and, III. A short account of a *single-entry system* adapted for retail business; premising the following general rules:

Record nothing but facts.

Record facts under their date of occurrence.

Record them under their proper heads of account.

Facts of the same character are to be represented by addition; facts of different characters by opposition; but the result of two different species of facts is never to be represented by their difference.

I. *Outline of the ordinary procedure in recording the transactions of a general merchant.*

The double-entry system, according to the practice of most commercial establishments, comprehends three different kinds or classes of books:—1st, *Primary Records*, or Day-books, for each distinct branch of business—as Cash, Bills, Invoices Inward, Invoices Outward, Sales on Commission, and so on, according to the nature of the trade, and in each of which the transactions are stated circumstantially as they occur. 2d, *The Journal*, in which all the entries in the primary records are collected and digested monthly in a concise technical form, suited for their being readily transferred into the ledger. 3d, *The Ledger*, in which the results shown in the journal are arranged under their appropriate heads; and the periodical abstract of which, termed a *Balance Sheet*, exhibits in a succinct form the state of the merchant's affairs.

#### PRIMARY RECORDS.

**Cash Book.** This, though the most important of all, is in its form the most simple. On the left-hand page, or Dr. side, are entered in chronological order all the sums received; and on the right-hand, or Cr. side, in the same order, all the payments. As no money can be paid that has not been first received, it follows that the Dr. side of a cash-book can never amount to less than the Cr. side; the excess of the former above the latter, if any, must, when correctly kept, also correspond with the money in hand.

**Bill Books.** Bills are either *receivable* or *payable*; the former being one of the channels through

which debts due to the concern are collected, the latter one of the channels through which debts due by the concern are discharged. Each description has generally a book allotted to itself, both of which should contain spaces for all particulars inherent and relative to the bill.

The *Bills Receivable* book should contain appropriate spaces for the following particulars: No.—When received—On whose account—Cr. folio—From whom received—Drawer—Drawee—To order of—Where payable—Date—Term—When due—Sum—When and to whom paid away—Dr. folio.

The *Bills Payable* book should contain spaces under the following heads: No.—When accepted—On whose account—Dr. folio—Holder—Drawer—To order of—Where payable—Date of Bill—Term—When due—Sum—When and to whom paid—Cr. folio.

Both books, it will be observed, are furnished with columns for running numbers; which numbers are also written on the face of each bill respectively, and by this means it can be readily referred to and identified.

*Invoice Book Inwards*, or *Bought Book*, is a receptacle for bills of parcels, or accounts of goods purchased.—In some houses these accounts are copied at length in the order in which they are received; while others form this book of blue, or common blank paper, into which the original accounts are pasted.

*Invoice Book Outwards* is appropriated for an account of goods sold on credit at home, or exported abroad. This book being of great importance, should be kept with the utmost precision, and carefully verified before the sums are transferred to the journal and ledger. In extensive concerns, several books of this kind may be kept at the same time, the titles of which can be varied according to the nature of the business. Thus one may be appropriated for *Town department*, another for *Country department*, and a third for *Foreign department*.

*Sales Book*, or *Factory Book*, is generally appropriated to accounts of consignments. Each account commonly occupies two pages, a title being placed over both, stating the names of the goods, ship, and consignor. The left-hand page contains an account of the charges incurred, including brokerage and commission; the right-hand page contains an account of the quantity, price, and amount of the goods sold, with the buyer's name, and the time of payment. The difference between this amount, and the charges on the other side, is the net proceeds for which the consignor receives credit.

Other books may be kept according to the nature of the business; as a *Debentures Book*, *Insurance Book*, etc.; and the common practice, as already noticed, is to set apart books for each distinct department of business. In some houses, however, a *Waste Book*, or *Petty Journal*, is appropriated for such occasional transactions as do not fall under any of the preceding heads.

These exhaust the authorities from which it is usual to compile the journal. There are, however, a variety of other books, kept in every counting-house, which do not commonly form part of the materials for the journal, such as the *Warehouse Book*, *Letter Book*, *Account-Current Book*, *Account-Sales Book*, *Petty Cash Book*, and *Order Book*. The *Warehouse Book*, kept in a similar way to the *Sales Book*, contains accounts for each

parcel of goods belonging to the merchant's own stock, detailing the quantities received, their disposal, the charges incurred, and the quantities on hand. The use of the others is sufficiently pointed out by their names.

### JOURNAL.

The journal, as already stated, is a monthly synopsis of all the transactions collected from the primary records, and digested under their appropriate heads of Debtor and Creditor. It usually contains, 1st, A column for the day of the month; 2d, A column for the folio of the ledger where each account is posted; 3d, A space for narrative; and, 4th, Two money columns. The rules for distinguishing Dr. and Cr. are to be inferred from the nature of the transactions and the accounts in the ledger. In personal accounts nothing is plainer than who are Dr. and Cr.; in actual business this is not only understood but felt. The following are the most general rules that can be given:

Whatever is *Received*, or the *Receiver* is *Debtor*.

Whatever is *Delivered*, or the *Deliverer* is *Creditor*.

The journal begins with the inventory of stock. Thus, if the property or assets of the merchant consist of Cash, \$1,000; Bill No. 57, on P. Hill, due April 3, \$600; Merchandise, \$4,500; Debt due by Peter Gray, \$800; and his obligations or liabilities, Bill No. 80, to P. Yates, due Jan. 6, \$1,700; Debt due to Moses Ker, \$1,150, the journal entries will be in this form:

#### SUNDRIES DR. TO STOCK.

Cash.....	\$1,000
Bills receivable, No. 57, P. Hill, due April 3	600
Merchandise .....	4,500
Peter Gray.....	800
	<u>\$6,900</u>

#### STOCK DR. TO SUNDRIES.

To Bills payable, No. 80, P. Yates, due Jan. 6.....	\$1,700
To Moses Ker.....	1,150
	<u>\$2,850</u>

The primary records are journalized at the end of each month.

In journalizing the CASH BOOK, state

Cash Dr. to Sundries.....For all money received.  
Sundries Dr. to Cash.....For all money paid.

Specifying particulars, and classing items of the same kind together.

In journalizing the BILL BOOKS,

Bills Receivable Dr. to Sundries...For all bills received.

Sundries Dr. to Bills Payable.....For all bills accepted.

In journalizing the INVOICE BOOK INWARDS,

Goods Account Dr. to A. B. (the seller)...For amount of goods purchased.

In journalizing the INVOICE BOOK OUTWARDS,  
C. D. (the person on whose account the invoice is sent) Dr. to Sundries. To Goods...For amount of goods.

To Charges.....For Shipping and other charges.

To Commission...For the Agent's commission.

To Insurance.....For Premium of Insurance.

The case here supposed is that of a consignment to order. When the transaction is a direct sale, or Venture Outward, no commission is charged.

In journalizing the SALES BOOK,

Sundries Dr. to Sales on Commission.

E. F. (the Purchaser).....For sales on credit.

Cash.....For ready money sales.

Sales on Commission Dr. to Sundries.

To Charges.....For charges at landing, etc.

To Interest.....For interest (if charged on advances).

To Commission...For the Agent's commission.

To G. H. (the Consigner)...For net proceeds.

The journal for the month is then closed by a similar arrangement of the transactions contained in any other Record which the nature of the business may render necessary.

### LEDGER.

This book is divided into distinct accounts, corresponding to the different branches of the business, into which are posted monthly the results brought out in the journal. Each account is introduced by an appropriate title; and articles of opposite kinds which belong to the same account are placed on opposite pages. The left-hand page is called the *Debtor*, or *Dr.*, side of the account; and the right-hand page the *Creditor*, or *Cr.*, side. The difference between the sums of the Dr. and Cr. sides is called the *Balance*.

The accounts in the ledger may be divided into two great branches. The first forms the accounts of the whole property or capital, technically called *Stock*, and the second embraces the accounts of the component parts of property. Under the general head of *Stock Accounts* are comprehended *Profit and Loss* account, and its ramifications, *Commission*, *Interest*, and *Charges*; the object of these accounts being to collect together the individual augmentations and diminutions of capital, and to transfer the results in one general entry to *Stock*; and also *Private Account*, its use being to record all sums put into the business, or withdrawn, so as to keep them distinct from *Profit and Loss*, and to transfer the result in the same manner in one entry to *Stock*. The accounts of the component parts of property will depend upon the nature of the business; but in general point of view, the whole may be conveniently arranged as follows:

#### 1. WHOLE PROPERTY.

	Branches.	Ramifications.
Stock.....	Profit and loss.	Commission.
	Private account.	Interest.
		Charges.

#### 2. COMPONENT PARTS OF PROPERTY.

*Accounts of Money, Real Property, etc.*, viz., Cash, Bills Payable, Bills Receivable, Goods, Houses, Stocks, etc.

*Personal Accounts*, viz., Bank, Ordinary Debtors and Creditors.

As by the fundamental law of double entry every debit must have a corresponding and equivalent credit, and *vice versa*, it follows that the two sides of the ledger must, if correctly posted, be constantly in a state of equilibrium; it follows likewise, from the axiom that "the whole is equal to the sum of all its parts," that the balance of the stock account must equal the aggregate balance of all the other accounts. Hence arises the proof of double entry, which consists in abstracting the balances of all the accounts in the ledger, and verifying their accuracy by ascertaining how far the above requisites have been fulfilled. This operation, called *balancing the books*, is usually performed

at the close of the year; at which period, likewise, the gain or loss during the year is indicated by the credit or debit balance brought into "Stock Account" from "Profit and Loss," after transferring to the latter its branches, Commission, Interest, etc., and the differences between the debit and credit sides of the goods and property accounts, after crediting the balances of merchandise and property on hand at their market value. The whole debit and credit balances being then arranged in opposition to each other, will give a condensed view of the merchant's assets and liabilities, and of his capital stock in the following form:

## BALANCE ACCOUNT.

Cash .....	\$1,946	Bills Payable.....	\$4,500
Bills Receivable in hand.....	1,463	Debts Payable.....	7,500
Goods, do.....	6,500		
Real estate.....	4,800	Stock, or net capital.	\$12,000
Stocks.....	1,400		10,000
Debts Receivable.....	5,891		
	\$22,000		\$22,000

## II. Practical Directions for stating the different accounts, including Observations upon Joint Accounts.

**STOCK.**—This is in truth the account of the merchant himself, or the concern; and in commencing a new set of books, is debited with all the liabilities, and credited with all the assets. Thus the sums given above under the head *journal* will be entered in the ledger in this form:

Dr.	Stock.	Cr.
To Sundries.....\$2,850	By Sundries.....\$6,900	

—the excess of the credit above the debit side, \$4,050, being the net capital or stock in trade. If at next balance it shall be found that a profit of \$4,000 has been realized, while \$2,000 has been withdrawn for private expenses, *Stock* will fall to be credited "By 'Profit and Loss,' \$4,000," and debited "To 'A B's Private account,' \$2,000." After which the balance at Cr. of "Stock," or A B's net capital, will be \$6,050.

**PROFIT AND LOSS.**—During the course of the year, this account should be debited solely for actual losses, and credited by actual gains; leaving the balances of Commission, Interest, Charges Account, etc., to be transferred at the time fixed for balancing. Some houses amalgamate the whole of these accounts into one general Profit and Loss account; but this is objectionable, especially in large concerns, where it is of importance to preserve all the channels of gain and loss as distinct as possible. A better plan is to open a separate account for Profit, and another for Loss.

The balance arising on Profit and Loss account is transferred "To Stock," or "By Stock," according as the result is gain or loss.

**COMMISSION ACCOUNT** is credited for all commissions received for our trouble in transacting business for others. There are seldom any entries to the debit, as the charges for commission made by our agents properly belong to the Goods Account to which they have reference. It is closed by transferring the balance to "Profit and Loss."

**INTEREST ACCOUNT** contains on the Dr. side all sums paid or incurred for interest or discount; and on the Cr. all sums received or become due for the same. The difference, at balancing, is transferred to "Profit and Loss."

**CHARGES ACCOUNT** contains on the Dr. side all general expenses paid or incurred in the business, as rents, taxes, salaries, postages, and incidentals.

If any of these should be afterwards charged to some other account, the sums so charged are entered to the Cr. The balance is transferred to "Profit and Loss."

In some houses, separate accounts are kept for Export Charges, Charges on Sales, on Commission, etc., such accounts being dissected periodically, and credited by the different parties, or Adventures, for which the charges were incurred.

**PRIVATE ACCOUNT** contains on the Dr., money, or anything else withdrawn from the concern for private use. It seldom contains anything on the Cr. side. The balance is transferred to "Stock."

**CASH.**—Some houses post the ledger directly from the Cash Book, without any intermediate entry in the Journal beyond "Cash Dr. to Sundries" for the monthly amount of receipts; and "Sundries Dr. to Cash" for the monthly amount of payments; but the more general method in large concerns is that described above under the head "Journal." By both plans, the cash account in the Ledger is usually comprised in twelve lines on each side yearly.

The mode of stating the cash details is simple. When goods are sold for ready money, Dr. "Cash," Cr. "Goods," or account to which the goods belong. When cash is received for goods formerly sold on credit, Dr. "Cash," Cr. the purchaser. When goods are bought for ready money, Cr. "Cash," Dr. "Goods," or account to which the goods belong. When cash is paid for goods purchased on credit, Cr. "Cash," Dr. the seller. When money is received of one person for the use of another, or for his own use, Dr. "Cash," Cr. the person for whose use it is received. When money is paid to one person for the use of another, or for his own use, Dr. the person for whose use it is paid, Cr. "Cash." When money is lent, Cr. "Cash," Dr. the borrower. When money is borrowed, Dr. "Cash," Cr. the lender. When a note is paid, Cr. "Cash," Dr. "Bills Payable." When a bill is discounted, Dr. "Cash," and Cr. "Bills Receivable" for the total amount of the bill; and Cr. "Cash," and Dr. "Interest," for the discount.

**BILLS PAYABLE ACCOUNT** is credited with all bills accepted, and debited with those paid; the balance shows the amount of bills unpaid.

**BILLS RECEIVABLE.**—This account is debited with all bills received, and credited with those paid, discounted, or otherwise disposed of; the balance shows the bills remaining in hand.

In the *Renewal of Bills*,—1st, If the bill be in your own hands, make A B (the acceptor) Dr. to Sundries; viz. To "Bills Receivable," for the sum of the old bill; To "Interest," for interest for the time the bill is renewed added to the new bill; and then "Bills Receivable" Dr. to A B for the new bill. 2d, If the bill be discounted, or paid away, make A B Dr. to "Cash" when you pay his bill, and A B Dr. to "Interest" for interest; then "Bills Receivable" Dr. to A B for the new bill. If the new bill, however, be drawn for the same sum as the former, and the interest paid in cash, it is sufficient to enter "Cash" Dr. to "Interest" for the interest, without bringing it to A B's account.

In the *Protesting of Bills*,—1st, If the bill be in your own hands, make A B (on whose account it was received) Dr. to "Bills Receivable" for the bill, and A B Dr. to "Cash" or "Charges," for expenses of protest; 2d, If the bill be discounted or paid away, A B Dr. to "Cash," paid his bill with expenses.

**Accommodation Bills.**—When you receive another person's acceptance, or grant your own note and receive the proceeds, in either case merely for your own accommodation, enter "Bills Receivable" Dr. to "Bills Payable" for the bill (as you will have to provide for it when it falls due); and when discounted, "Cash" Dr. to "Bills Receivable," and when paid, "Bills Payable" Dr. to "Cash." When you grant your bill to another, merely for his accommodation, it is sufficient to note the particulars in a "Memorandum Book," or "Register Bill Book," and take an obligation from him that he is to provide for it when it becomes due. If he then be unable to pay the bill, enter A B Dr. to "Cash." Where, however, accommodation bill transactions between two parties are numerous, the best way is to open a separate account for them.

Merchants whose bill transactions are numerous, keep a *Register Bill Book*, in which all bills they receive, or become bound to pay, are entered in the order in which they fall due, to enable them to regulate their payments without embarrassment.

**GOODS ACCOUNT** commences on the Dr. side, with the balance of goods on hand. Goods bought are entered on the same side; and goods sold on the Cr. Charges laid out on goods are entered on the Dr. side, as also discounts allowed on goods sold; and on the Cr. side discounts received on goods purchased, as well as any other incidental advantage which arises from them. On closing the account, Cr. By "Balance" for value of goods on hand. If the Cr. side is then found to exceed the Dr. the account is to be debited, To "Profit and Loss" for gain; and, if the contrary, it is to be credited By "Profit and Loss" for loss. In some houses, separate accounts are opened in the ledger for each kind of goods; but perhaps the more general practice is to open only one general account, and leave the gain or loss upon the different parcels to be ascertained from the Warehouse Book.

**ACCOUNTS OF SHIPS, REAL ESTATE, etc.,** are debited with the cost and outlays, and credited with the freights, rents, and other receipts. The difference is transferred to "Profit and Loss," after crediting them "By Balance" for their value at the time of closing.

**PERSONAL ACCOUNTS** are debited to Goods, Cash, Charges for Commission, and for everything we give out; and credited for what we receive either in Goods, Cash, or Charges, etc. Where the transactions with a party are numerous, and of different kinds, several accounts may be opened; thus with A B you may open his "General Account," his "Accepting Account," his "Account of Consignments," etc., the balance of all, or any of these, being transferred at certain periods to his "Account Current."

**INSURANCE ACCOUNT** is stated in various ways, according to circumstances. In the books of a merchant, or person insured, it is debited to the Broker or Insurance Company, for the amount of

premium and policy, and credited by the Adventure or person for whose account it is effected; the Broker being debited for Returns, Averages, or Losses, to the accounts that were formerly charged with the premiums. Where, however, the merchant acts as his own broker, it will be convenient to open a separate set of Insurance books for the accounts of the different underwriters, etc., and to reserve his general ledger for an Insurance Account, and an account for himself as "Broker," both of which will be stated, as in the former case.

In the books of an Underwriter, "Insurance Account" is credited by the broker or party insured for the premium, etc.; and debited to the same accounts for Returns, Averages, or Losses; the difference being transferred at balancing to "Profit and Loss." On balancing, care must be taken to transfer the premiums on current risks to a "Suspense" or "Guarantee Account."

**DEBENTURE ACCOUNT** is debited to "Goods" for the drawbacks to be received on goods exported from our own stock, and credited by "Cash" when we receive the same; the balance shows the debentures outstanding.

**GOODS RECEIVED ON COMMISSION.**—Separate accounts are sometimes opened in the ledger for each consignment; but as this is done in the Sales or Factory Book, it is usual to confine the ledger accounts to two general ones, namely, "Sales on Commission," and "Charges on Sales on Commission." The first is credited by the accounts of the different purchasers for the gross sales; and debited (after each consignment is sold) to "Charges on Sales on Commission" for the amount of charges, to "Commission" for your commission, and to the consigner for the net proceeds; and the balance will consist of the gross proceeds of goods not yet accounted for by you. "Charges on Goods on Commission" is debited to "Cash," etc., for all charges, and credited as already stated: the balance will show the amount of advances remaining to be accounted for to you.

**ADVENTURES.**—In *Adventures Outward*, two accounts are generally opened with the foreign agent, "A B Account of Consignments" is debited with the cost of the goods, Insurance, and Charges; and credited by "A B Account-Current" for net proceeds; the difference being carried to Profit and Loss. The account-current is credited by remittances. In *Adventures Homeward*, the foreign agent's account is credited by "Goods," or as the case may be, for the amount of invoice and charges; and debited with remittances.

*Consignments* by you to parties in this country are stated in the same manner as in *Adventures Outward*.

*Joint Adventures* may be stated in various ways. If A and B ship goods conjointly to Liverpool, to the value of \$1,500, of which \$1,050 are from A and \$450 from B, and the net proceeds realized by Z be \$2,000, the accounts may be stated in this form in A's books, supposing him to be manager, and the profits divisible equally.

Dr. Adventure to Liverpool on Joint Acct. with B. Cr.		Dr. B. Cr.	
To Goods.....	\$1,050	To Adven., his one-half cost.....	\$805
To B.....	450	To Balance.....	645
To Insurance.....	60		\$1,450
To Charges.....	50		
	\$1,610		
To Profit and Loss.....	195		
	\$1,805		
		Dr. Z. Cr.	
		To Adven., etc.....	\$1,000
		To B.....	1,000
			\$2,000
		By Adven., etc.....	450
		By Z, his one-half net proceeds.....	1,000
			\$1,450
		By Balance .....	\$2,000

The balance of \$645 is paid to B, on the \$2,000 being remitted by Z. The adventure may also be stated by A as though it were his own entirely, giving credit to B for his goods, and half the profit.

**BRANCHES.**—Concerns which have branch establishments should open accounts with each precisely as if they were strangers.

**BAD DEBT ACCOUNT** is debited to "A B," for bad debts incurred, and credited by "Cash" for dividends, etc., and by "Profit and Loss" for the net loss sustained at the period when the debtor is discharged, or the recovery of his debt has become hopeless.

A preferable mode of disposing of bad debts is to open a *Guarantee Account*, and credit it at the period of balancing by "Profit and Loss" for the probable amount of loss by bad or doubtful debts. In this case, the debtor's own accounts are debited for dividends, etc., and afterwards by "Guarantee Account" for net loss. At each succeeding period of balance a new valuation of bad debts is to be made, and an additional sum credited to "Profit and Loss," if found requisite.

*Partnership Accounts* may be kept in the general ledger in six different ways, namely, three in which no entries are made until the partners advance their shares; and three in which entries are made previous to the shares being paid in: in the latter, an "Account Proper" being opened with each partner, for recording the sums drawn or paid in, distinct from the "Account in Company" for his share.

1. *Cash*, or the *Article* advanced, Dr. to *Stock*,  
—then  
*Stock Dr. to Sundries*.  
To each partner for his share.
2. *Sundries Drs. to the Partner*.  
For the articles paid in.
3. *Sundries Drs. to Stock in Company*.  
For the articles paid in, mentioning each partner's share.
4. *Stock Dr. to Sundries*.  
To each partner's *Account in Company*, for his proposed capital; then  
*Sundries Drs. to Stock*.  
Each partner's *Account Proper* for the same.
5. Each partner's *Account Proper* Dr. to each partner's *Account in Company*, for the capital to be advanced.
6. *Sundries Drs. to Stock in Company*.  
Each partner's *Account Proper* for the proposed capital; and

when the partners pay in their respective shares, the entry by all the three last is "Cash" or the *Article* advanced Dr. to partners' *Account Proper*. On balancing the books, if the business has been successful, and the profit is to be divided, enter "Profit and Loss" Dr. to each partner's *Account Proper*; but if there has been a loss, these entries are to be reversed. The balance of the *Account Proper* is then usually transferred to the *Account in Company* when the latter is kept separate, and it is not fixed that the capital shall remain permanent. In all cases, interest is to be charged on

the partners' accounts, in order to equalize their advances.

*Joint Capital* is debited at the outset to each of the partners for his capital; at balancing it is debited to "Interest" for the interest arising on the capital; to "Profit and Loss" for gain; and credited by each of the partners' accounts for the sums withdrawn. It is thus just the *Stock Account* of the General Ledger reversed.

*Interest* is credited by "Joint Capital" for the interest arising on it; and debited to the partners for their respective shares.

*Profit and Loss* is credited by "Joint Capital" for net gain; and debited to the partners' accounts for their respective shares.

*Partners' Accounts* are credited by "Joint Capital," "Interest," and "Profit and Loss," for their respective shares of capital, interest, and gain, and debited to "Joint Capital" for the sums withdrawn.

### III. Outline of a Single Entry System adapted for Retail business.

In the simple form given below, the only books employed are a *Cash Book*, a *Day Book*, and a *Ledger*, into which the two former are posted directly without the intervention of a *Journal*. The *Cash Book* differs from ordinary books of this kind in having an inner column on each side titled "Store." In the inner column on the Dr. side are entered the cash drawn for ready-money sales and discounts received; and in the Cr. inner column, ready-money purchases, discounts allowed or paid, and all charges of a general nature. The amount of each of the inner columns is transferred monthly to the outer, and then posted to "Store Account" in the *Ledger*. In the annexed form the ready-money sales are entered weekly, but in practice they should be entered daily unless a petty cash book is kept for that purpose; in which case they may be transferred when convenient. The *Day Book* forms a chronological record of all the other transactions; the purchases on credit are extended into the column titled "Store Dr.," the sales on credit to that entitled "Store Cr." and any other transactions which may occur are expressed in the journal form, and entered in an inner column. The two outer columns are summed up monthly, and their amounts posted to "Store Account," as before. The *Ledger* is extremely simple, and will be readily understood on inspection. The "Store Account" combines a goods and charges account; and at closing, the value of the goods at hand, as ascertained by inventory, is stated to the credit as a balance, and the excess of the credit above the debit side, being the profit realized, is transferred to "Stock Account." The period embraced by the transaction is one month, but the procedure is the same throughout the year. The operation of balancing is here for illustration performed at the end of the month, when closing stock entries are stated in the journal form at the end of the *Day Book*.

Dr.

## CASH BOOK.

**Book Muslin**, a thin kind of muslin, of which there are several kinds made, for dresses, curtains, etc., as saccharillo, tarlatan, leno, etc.

**Bookseller**, a dealer in books, who frequently combines the business of publisher and stationer. See **BOOK**.

**Book-Trade**. See **BOOK**.

**Boom**, a projecting spar in a ship run out amidship or fore and aft, as a jib-boom on the bowsprit, studding-sail boom to the yards, etc.—The hard straw of flax.

**Boomerang**, a peculiar-shaped native Australian missile which recoils when thrown.

**Boon**, is the central wood-like part of the flax-stem. Its binding mucilage being softened by fermentation in the operation of *retting*, the *B.* is partially removed in *grassing*, and together with the *shives* is afterwards completely eliminated from

the *hare* or fibre in the operations of *braking* and *scutching*.

**Boornous**, a woollen cloak with hood and without sleeves, worn by the Arabs.

**Boort**, or **BORT**, a trade-name for a kind of imperfectly crystallized diamonds which come from Brazil, and, after being broken and reduced to powder, are used as a material for polishing other stones. Their value in New York is about \$6 per carat.

**Boot**, [Fr. *botte*; Ger. *stiefel*,] a covering for the foot and lower part of the leg, usually made of leather. The manufacture of boots and shoes has undergone in our time remarkable changes, which have converted shoemaking from a domestic to a factory trade. In 1844, M. Lefèvre, of Paris, invented a machine for fastening the sole and the welt by brass screws, made out of a continuous length of wire; other inventions followed, and now

machinery is employed in nearly all the operations connected with the business, some of the finest kind of work being, however, still made by hand. These machines, several of which are examples of American ingenuity, are very numerous. A machine for *pegging* boots and shoes, instead of sewing them, cuts the wire into pegs, presses the sole firmly against an iron last, guides a peg against the sole, presses it through the leather with great force, and clinches it against the iron sole. The *clicking* machine greatly expedites the cutting out and binding of the linings; while another machine models the instep pieces. The *blocking* apparatus expedites the process of blocking the uppers. One machine will cut soles at the rate of 60 a minute; another will split leather into two thicknesses, instead of paring it away with a knife. The *Eureka heel-trimming machine*, patented in 1875 by J. K. Krieg & Co., of New York (Fig. 40), trims about 1,000 pairs a day, without damaging the finest upper, either leather or cloth.

Fig. 40. — EUREKA HEEL-TRIMMING MACHINE.

Other inventions, introduced with various degrees of success, relate to the ventilating of the sides of boots by means of small pieces of metal; the sewing with wire thread instead of hempen thread; the making of circular revolving heels; the introduction of an elastic waist between the sole and the heel, etc. Although mainly the occupation of a man, women have of late years been largely found in the boot and shoe manufacture, owing to the universal use of the sewing-machine, which can be applied to stiff leathers just as well as to the most delicate muslin. In many factories there are women who, by various ingenious machines, close the uppers, sew on the welts and insoles, "last" the boots at the rate of one hundred and fifty pairs per day, and tack on and stitch the soles. There are in England, Germany, and France, large establishments where ranges of sewing-machines are employed in boot- and shoe-making, but it is in this country that real factories for such work have been most extensively and successfully established, and the boot- and shoe-making business has become a very important

branch of American manufacture and exports. Boston is the chief mart, but large shipments are also made from Philadelphia, New York, and Baltimore. Boots are usually packed in cases containing 12 pairs, and shoes in cases containing either 60 or 120 pairs. Boot-making is not usually considered a healthy occupation. Factory work is for obvious reasons better than hand work in crowded rooms, where the want of ventilation, the sedentary occupation, and the constrained position tell hardly against a good many. The riveters are said to suffer from nervous affections, from the noise caused by the hammering; and the habit of putting the brass nails into the mouth tends to produce excoriations which are rather difficult to heal. The machinists suffer more in boot work than in ordinary sewing, owing to the heavy character of the double-action machine. Many of the workers on patent or enameled leather are liable to affections of the eyes, induced partly by the quantity of gas which is kept burning in the machinists' room. In 1878, the U. S. exports of boots and shoes, chiefly to Germany, England, Holland, Mexico, Cuba, and S. America, summed \$351,152. *Imp. duty*, 35 per cent.

**Boot- and Shoe-Lacings**, cotton or silk braid, with ends secured and covered with metal.

**Boot-Back**, the hinder leather of long boots, sold ready shaped for making up.

**Boot-Crimp**, in boot-making, a tool or a machine for giving the shape to the pieces of leather designed for boot-uppers, which is made by softening, straining the leather over a former, and rubbing down the parts, which would be *crimped* or rugged, if the material was not compacted at that point.

**Bootee**, a white, spotted East India muslin.

**Boot-Fronts**, the calf-skin leather fronts for long boots. They are imported — cut, shaped, and crimped — from France. *Imp. duty*, 35 per cent.

**Booth**, a large canvas tent or pavilion.

**Boot-Hooks**, holdfasts for drawing long boots on the feet, consisting essentially of a stout wire bent into a hooked form, and provided with a handle.

**Boot-Jack**, a contrivance for taking off long boots by a pressure at the heel.

**Boot-Rack**, a stand to place boots and shoes on.

**Boot-Shank Machine**, a boot-maker's tool for drawing the leather of the upper or boot-leg over the last into the hollow of the shank.

**Boot-Stretcher**, a contrivance for stretching the uppers of boots and shoes. It usually consists of a two-part last, horizontally divided, and provided with a wedge, and sometimes a screw, to expand them after they are inserted in the boot.

**Boot-Topping**, the process of scraping a vessel's bottom to clear it from accumulated weed, etc., and daubing it with tallow, or some other mixture.

**Boot-Tree**, an instrument for stretching the leg of a boot, consisting of two wooden blocks which together form the shape of the leg and foot, and which, after being introduced in the boot, are driven apart by a wedge.

**Boquin**, a coarse sort of Spanish baize.

**Boracic Acid**, occurs in small brilliant color-

less crystals, which have a greasy feel; it is inodorous, and possesses little taste. It is obtained artificially by the action of sulphuric acid upon borax; and in a natural state in the hot springs of Sasso, near Florence. It is used in the manuf. of borax, as a flux in metallurgic operations, in making enamel, etc. *Imp. free.*

**Borate of Lime**, a mineral containing about 50 per cent of boracic acid, imported from Peru for the manuf. of refined borax. *Imp. free.*

**Borax**, a salt procured in an impure state, called *tincal*, or *rough borax*, from a lake in Thibet, and exported by way of Calcutta. Tincal is imbedded in a kind of soapy matter; its crystals are soft and brittle, colorless, yellowish or greenish, sometimes nearly transparent, but more commonly opaque. When purified, it is called *B.*, or *borate of soda*, and occurs in rather large, white semi-transparent crystals, having a sweetish alkaline taste. *B.* is also prepared artificially in the U. States from boracic acid, soda, and borate of lime. This salt is employed in medicine, but it is chiefly used as a flux in the arts, as a constituent of the glazes in porcelain, and in the manuf. of glass. *Imp. duty* (crude, or tincal), free, (refined) 10 cts. per lb.

**Bordeaux.** See FRANCE.

**Bordeaux Wines.** See CLARET.

**Border**, a printers' type with an ornamental face, suitable for forming a part of a fancy border; ornamental work surrounding the text of a page. —The rim of a lock. —That part of cloth containing the selvage.

**Bore**, [*Fr. ame*; *Ger. bohrrloch*,] the hollow cavity of a cannon, barrel of fire-arm, steam-engine cylinder, pump-barrel, pipe, wind-instrument, etc. It is expressed in mechanics in inches of diameter; in cannon in inches of diameter, as 8-inch gun, or in the weights in pounds of solid round shot adapted thereto, as 8 dr. 12 oz. etc.; in small-arms, in hundredths of an inch decimally, thus: 44, 55, in which it is termed *caliber*; in sporting-rifles by the number of balls to the pound; in smooth-bore fowling-pieces by a trade number, as Nos. 9, 10, 11, etc. —The capacity of a boring-tool; as, the bore of an auger.

**Borecole**, a winter cabbage.

**Borer**, in coopering, a semi-conical tool used to enlarge bung-holes and give them a flare.

**Borilla**, a rich copper ore in dust.

**Boring-Machine**, the apparatus used in seeking for water in the soil. —A cutting or edged tool for smoothing the internal surface of cast-iron cylinders. —In a general sense, any machine by which holes are made by the revolution of the tool or of the object around the tool, including any boring-tool with the machinery for driving it, as an auger with its handle, etc. See DRILL.

**Borneo.** See MALAYAN ISLANDS.

**Bort.** See BOORT.

**Bosh**, stuff; a name in England for mixed or adulterated butter.

**Boss**, a stud or knob, a protuberant ornament on harness, etc. —A master who takes in work at his own house from a manufacturer, and employs others to execute it.

**Boston**, a great city and seaport of the U. States, capital of the State of Massachusetts, and the metropolis of New England, lies in lat. 42° 21' 24" N., lon. 71° 3' 58" W., and occupies a commanding position at the western extremity of Massachusetts Bay, on the Charles River, 44 m.

N. N. E. of Providence, and 232 m. N. E. of New York. *Pop.* in 1875 (State census), 341,919. The city includes, besides *B.* proper, South *B.*, East *B.*, Roxbury, Dorchester, Charlestown, West Roxbury, and Brighton. *B.* proper, or old *B.*, occupies a peninsula, joined to the main land on the south by a narrow strip of land known as the Neck, which was once overflowed by the tides, but has been raised and widened. The harbor is a spacious indentation of Massachusetts Bay, the mouth of which lies between Point Alderton on Nantasket and Shirley in Chelsea. It embraces about 75 sq. m., and includes several arms, such as Dorchester Bay, South *B.* Bay, and the embouchures of Charles, Mystic, and Neponset rivers. A part of Charles River is commonly known as the Back Bay. There are more than 50 islands or islets in the harbor. The main entrance to the harbor is between Castle and Governor's islands; it is very narrow, and is defended by Forts Independence and Warren. The harbor is open at all seasons, and its deep-water front can afford accommodations for the loading of a number of vessels without delay. It affords anchorage for 500 vessels of the largest class, and has 75 capacious docks which are the property of the port, and since their establishment, in the time of Queen Anne, the receipts from them have been applied to their perfection and increase. There are stationary elevators under which foreign steamers can be loaded. *B.* has a very extensive trade with the Southern States and with foreign countries. Great progress has been made of late in competing for the export trade, and the opening of the "Through Business" (see this word), which was first inaugurated in *B.*, has already acted very favorably on her shipping interests. The great centres for distribution for the Western crops of the U. States are now in Europe, and *B.* claims to be the shortest and cheapest line between producer and consumer, from Chicago and the great Northwest to England and the Continent. *B.* ranks next to New York in extent of imports, and third among the cities of the Union in the value of foreign commerce, New York being first and New Orleans second. Eight lines of railroad terminate in *B.*, viz., the Fitchburg, the Eastern, the *B.*, Lowell, and Nashua, the *B.* and Maine, the *B.* and Providence, the *B.*, Hartford, and Erie, the *B.* and Albany, and the Old Colony and Newport. By means of the Grand Junction railroad, the main line of the Boston and Albany is connected with the Fitchburg, Lowell, Eastern, and Boston and Maine railroads, and with the Grand Junction wharf at East Boston, which greatly facilitates the transfer of freight to and from vessels. There are numerous lines of steamers to the principal Eastern ports of the U. States and Canadas. In 1871 not a steamship cleared from *B.* for any foreign port. The Cunard steamers, then the only line touching *B.*, made a triangular passage, bringing freight and passengers and loading for the return trip partly in New York and partly in *B.* Now, 4 steamship lines — the Warren, Leyland, Cunard, and Sears lines — make direct connection between *B.* and Liverpool, and others are in contemplation for business between *B.* and British and European ports to which there are now but occasional steamers. In 1878 the total value of the commerce of *B.* was \$87,055,255, the imports being \$36,679,863 (a decrease of \$11,037,359 on 1877), domestic exports \$49,195,077, foreign exports \$1,180,315 (in-

crease on exports \$7,168,051); 607 American vessels, of 259,476 tons, and 1,502 foreign vessels, of 679,614 tons, entered the port; and 539 American vessels, of 206,096 tons, and 1,370 foreign vessels, of 581,609 tons, cleared the port; 55 American and 220 foreign ocean steamers entered, and 38 American and 180 foreign cleared; 779 steamers and 204 sailing-vessels entered on the coastwise trade, and 819 steamers and 537 sailing-vessels cleared. There were belonging to the port 893 vessels with an aggregate tonnage of 302,429, and 92 steamers with an aggregate tonnage of 23,699. In 1878 fourteen ships, barks, etc., and four steamers, with an aggregate tonnage of 8,156, were built in *B.*, and her immediate vicinity. — According to the latest returns of the industry of Massachusetts, the chief manuf. establishments of Boston were 49 cabinet-ware factories, 38 manuf. of machinery, 38 book-publishing houses, 89 printing establishments, 31 hat and cap factories, 30 bookbinderies, 29 manuf. of watches, 28 of cars, carriages, etc., 17 of pianos, 17 of upholstery, 12 brass and 7 type and stereotype foundries, 9 glass factories, 4 of organs, melodeons, and harmoniums, 4 of paper collars, 3 of sewing-machines, and 2 of chemicals. — *B.* has 61 National banks, with an aggregate cap. of \$54,675,000; and about 30 fire and marine insurance cos., besides life insurance cos., and those against accidents.

TABLE OF THE TRADE OF *B.* WITH FOREIGN COUNTRIES IN 1878.

	Imports.	Exports.
Argentine Republic.....	\$2,947,809	
Austria.....		\$107,248
Belgium.....	199,320	700,978
Brazil.....	542,026	31,686
Chili.....	311,945	1,014,349
China.....	123,715	
Denmark, etc.....		19,832
Danish West Indies.....	16,285	76,770
France.....	21,913	125,348
French West Indies.....	439,836	538,860

United States of Colombia.....	4,170	32,186
All other Countries in Africa.....	288,625	614,493

The leading articles of imports and exports in 1878 were as follows:

**Boots and Shoes:** The total shipments, 1,648,724 cases, against 1,758,025 cases in 1877, and 1,521,205 in 1876. **Butter and Cheese:** Exports, 26,500,000 lbs. butter and 138,500,000 lbs. cheese. **Cotton:** Imports, 354,423 bales, against 350,979 in 1877, and 308,327 in 1876; exports to foreign ports, 122,015 bales, against 88,548 in 1877, and 68,057 in 1876. **Cotton goods:** 21,111 packages, against 30,175 in 1877, and 36,169 in 1876. **Fish:** The fresh fish trade has assumed large proportions. 29 wholesale firms are engaged in the business, employing over a million dollars capital. During the past year they handled 883,383 lbs. salmon, 11,092,463 lbs. cod, 15,728,342 lbs.

haddock, 394,982 lbs. cusk, 688,718 lbs. hake, 577,465 lbs. pollock, 2,353,574 lbs. blue fish, 327,382 lbs. sword fish, 3,758,112 lbs. halibut, 3,736,076 lbs. mackerel, and 4,491,438 lbs. herring, besides numerous other varieties of less note, nearly all of which have been disposed of fresh, and distributed to all parts of the country. **Flour** (including corn-meal): Receipts, 1,888,395 bbls; exports, 474,439 bbls. **Grain:** The exports of corn and wheat in 1876-1878 were as follows:

	1876.	1877.	1878.
Corn.....bushels.	6,669,138	3,182,844	4,160,817
Wheat....."	3,888,609	1,612,814	112,915

**Hemp and Jute:** 14,216 bales were imported, against 47,447 in 1877, and 81,875 in 1872. The trade in Manila and Sisal hemp, Calcutta Jute, and Jute butts, was as follows:

	Imported.	Stock from 1877.	Consumed.
Manila hemp....bales	114,783	41,155	127,394
Sisal hemp....."	59,691	13,028	49,074
Calcutta Jute..."	45,181	16,280	39,093
Jute butts and rejections....."	191,227	21,267	183,627

**Hides:** the imports were 1,787,412 hides and 27,701 goat-skins. **Ice:** exports 53,180 tons. This trade, which is a *B.* invention, has considerably declined within a few years. **Iron:** foreign imports, 711,799 bars and 64,812 bundles. **Lead:** 45,268 pigs. **Leather:** exports, 1,287,745 sides. **Live Stock:** the total number of beasts reported at market were 188,385 cattle, 372,787 sheep, 15,874 veals, 509,884 fat hogs, and 548 pigs. The total shipments of live stock to Europe, which is a comparatively new business, were 34,658 cattle, 27,905 sheep, 13,680 hogs, and 207 horses. **Nails:** exports, 64,873 casks (range of price, \$2.20 to \$2.50). **Petroleum:** exports, 4,150,074 gallons. **Salt:** imports, 2,179,964 bushels. **Spirits:** imports (chiefly from England, Holland, and Belgium), 94,808 gallons; export of New England rum, 1,048,018 gallons. **Sumac:** imports, 37,819 bags. The trade was as follows:

	Rhds.	Bales & Cases.	Boxes & Kegs.
Imports.....	10,963	2,471	16,363
Exports.....	14,135	4,310	4,926

**Tin:** imports, 9,915 pigs, and 180,794 boxes tin plates. **Wine:** imports, 120,864 gallons (86% from England). **Wool:** receipts of domestic wool, 255,931 bags and bales; imports of foreign wool, 30,833 bales. The receipts of wool embrace about one-third the entire clip of the country, while the average weekly sales amount to about 1,000,000 lbs. The stock of domestic wool on hand in *B.* Jan. 1, 1879, was 13,990,201 lbs., against 12,647,480 in 1878. The stock of foreign wool on hand Jan. 1, 1879, was 2,989,800 lbs., against 2,847,800 in 1878. *B.* has also a considerable trade in dry-goods and clothing.

**How to Enter the Port, and Mooring.**—In coming from the Atlantic, a ship should bring the light-house to bear W. by N. to W.N.W., and run direct for it. The largest ships may pass it at within less than a cable's length. If there be no pilot on board, or the master be unacquainted with the harbor, or the wind be north-westerly, which is the most unfavorable for entering, she had better steer W. by S. for Nantucket Roads, where she may anchor and get a pilot. There is sufficient depth of water to enable the largest ships to come up to the town at all times of the tide. They usually moor alongside quays or wharves, where they lie in perfect safety.

**Pilotage.**—No particular place is specified at

which vessels must heave to for a pilot. But all vessels, with the exception of coasters under 200 tons, and American vessels laden with plaster of Paris from British America, if hailed by a pilot within about  $1\frac{1}{2}$  mile of the outer light, must take him on board under a penalty of \$50. If they have got within this distance before being hailed, the obligation to take a pilot on board ceases. This regulation has obviously been dictated by a wish to have the pilots constantly on the alert; it being supposed that masters not well acquainted with the bay will heave to to take one on board, though they have got within the free limits.

**Careening, Stores, etc.**—Boston is a very favorable place for careening and repairing ships. All kinds of supplies may be had of the best quality and at moderate prices.

Fig. 41.—FANEUIL HALL.  
(The Cradle of American Independence.)

**Boston and Albany R.R.**, from Boston, Mass., to Albany, N. Y., 201.65 m.; branches, 47.98 m.; leased lines, 72.11 m.; total, 321.74 m. Offices, Boston, Mass. This Co. was formed in 1867, by the consolidation of the Boston and Worcester, and Western (of Mass.) R.R. Co.'s, with all their branches and leased lines. *Financial Statement*: Cap. stock, \$20,000,000; funded debt, 7% bonds, \$5,000,000, payable 1892; and 6% bonds, \$2,000,000, payable 1895.

**Boston and Lowell R.R.**, runs from Boston to Lowell, Mass., 26.75 m.; branches, 19.21 m.; leased lines, 37.23 m.; total, 83.19 m. This Co., whose offices are in Boston, was organized in 1830, and in 1857 made a contract with Nashua and Lowell R.R. Co. for joint operation of roads and branches. This combination embraces six small R.R. in Mass., and three in N. H. Legislative authority has been obtained, in both these States, to consolidate all these lines into one corporation. *Financial Statement*: Cap. stock, \$3,250,000; funded debt, \$2,124,500; notes payable, \$107,000; contingent fund, \$491,776.24. Funded debt in detail: Bonds (unsecured) issued 1864, \$200,000, payable 1879, interest 6% (April and Oct.); issued 1872, \$999,500, payable 1892, interest 7% (April and Oct.); issued 1875, \$500,000, payable 1895, interest 7% (March and Sept.); issued 1876, \$425,000, payable 1896, interest 6% (Jan. and July).

**Boston and Maine R.R.**, runs from Boston,

Mass., to Portland, Me., 115.50 m.; branches, 11 m.; leased lines, 79.84 m.; total, 206.34 m. This Co., whose offices are in Boston, was formed in 1842 by the consolidation of the Boston and Portland R.R. Co., the Boston and Maine R.R. Co., and the Maine, New Hampshire, and Massachusetts R.R. The road was opened to Portland in 1873. *Financial Statement*, 30th Sept., 1877: Cap. stock, \$6,921,274.52; funded debt, \$3,500,000; notes payable, \$32,009.98; sundry accounts, \$46,233.17; profit and loss, \$1,433,148.70. Funded debt in detail: Bonds issued 1873, \$1,500,000, payable 1893, interest 7% (Jan. and July); bonds issued 1874, \$2,000,000, payable 1894, interest 7% (Jan. and July).

**Boston and New York Air-Line R.R.** This Co., with offices in New Haven, Conn., runs from New Haven to Willimantic, Conn., 54 m., 50 being owned by the Co., and leases the Colchester R.R., 3.59 m.; total, 57.59 m. *Financial Statement*: Cap. stock, preferred, \$2,225,000; Ditto, common and scrip, \$695,706.81; funded debt, \$488,000; sundry accounts, \$55,998.98; profits and loss, \$3,838,247.

**Boston and Providence R.R.**, runs from Boston, Mass., to Providence, R. I., 44 m.; branches, 18.54 m.; leased Attleboro Branch R.R., 4 m.; total, 66.54 m. This Co., whose offices are in Boston, was chartered in 1831 and completed in 1835. It bought in 1873 the Providence, Warren and Bristol R.R. in connection with the Fall River, Warren and Providence R.R., which latter it transferred to the Old Colony R. R. It also owns with the latter Co. the Union Freight Co. in Boston. *Financial Statement* 30th Sept., 1878: Cap. stock, \$4,000,000; funded debt, 7% bonds due 1893, \$500,000; notes payable, \$500,000; dividends, \$125,408; sundry accounts, \$51,934.73; profit and loss, \$363,127.39; net earnings for 1878, \$293,358.88.

**Boston, Clinton, Fitchburg and New Bedford R.R.**, from Fitchburg to New Bedford, Mass., 91.02 m.; branches, 34.31 m.; leased lines, 26.12 m.; total, 151.45 m. This Co., whose offices are in New Bedford, was organized in 1876 by the consolidation of the B., C. and F. and the N. B. R.R.'s. *Financial Statement*: Stock, \$2,583,500; funded debt, \$3,169,100; notes payable, \$2,355,576.62; sundry accounts, \$257,991.16; balance and outstanding bills, \$79,485.86. Funded debt in detail: Mortgages, \$171,500 payable 1881, interest 6% (Jan. and July); \$400,000 payable 1884, interest 6% (Jan. and July); \$547,600 payable 1889, interest 7% (Jan. and July); \$252,000 payable 1890, interest 7% (Jan. and July); \$400,000 payable 1894, interest 7% (Jan. and July); \$270,000 payable 1881, interest 8% (April and Oct.); \$250,000 payable 1882, interest 8% (April and Oct.); \$280,000 payable 1883, interest 8% (April and Oct.); \$100,000 payable 1885, interest 8% (Feb. and June); \$528,000 payable 1896, interest 7% (May and Nov.).

**Boston, Concord, Montreal, White Mountains, and Mt. Washington Branch R.R.**, runs from Concord to Groveton Junction, 146.17 m., with branch from Wing Road to Mount Washington, 20.39 m.; total, 166.56 m. Offices in Plymouth, N. H. This Co. was chartered in 1844; the White Mountains (N. H.) R.R. was consolidated with it in 1873. *Financial Statement*: Cap. stock, \$1,800,000; funded debt, \$2,528,000; unpaid coupons and dividends, \$19,487; profit and loss,

\$582,414; net earnings for year ending March 31, 1878, \$201,100.36.

**Botargo**, a sausage made on the shores of the Mediterranean and the Black Sea, of the roe of the mullet. The best come from Tunis and Alexandria.

**Botschka**, the butt or pipe of Russia; a liquid measure containing 40 vedros, and equal to rather more than 108½ gallons.

**Botta**, a very variable liquid measure in Italy, in some towns only 106 wine gallons; in others as much as 246 gallons.

**Botte**, the French name for a boot; a truss or bundle.

**Bottle**, [Fr. *bouteille*, *flacon*; Ger. *bouteillen*, *flasche*; It. *bottiglia*; Por. *botelha*; Sp. *botella*,] an earthenware or glass vessel of various sizes for holding liquor, too well known to require any description. Glass bottles come from Europe, principally from France and Germany, filled with wine or other liquid; they are also sometimes imported empty in hampers. The smallest description of glass bottles, called *vials*, and used by druggists, perfumers, etc., are extensively manufactured in the U. States. See GLASS.

*Imp. duty (plain), 35 per cent.; the same, filled with articles not otherwise provided for, 30 per cent.; (cut, engraved, painted, colored, stained, silvered, or gilded glass), 40 per cent.* "In all cases where glass bottles or jars containing imported merchandise are not specially provided for in the statute as such, the duty of 30 per cent. ad valorem imposed by Schedule B shall be exacted on such glass bottles or jars, independent of the rate of duty assessed on the contents, or the fact that the contents are free of duty."—(Decision of the Treasury Dep., March, 1879.)

**Bottled**, wine, beer, or other commercial liquor put up in bottles.

**Bottle-Glass**, the commonest kind of green glass.

**Bottle-Jack**, an old mechanical clock-work contrivance for roasting, the machinery of which being wound up, kept the suspended joint revolving before the fire.

**Bottle-Rack**, a wooden frame with open shelves to place bottles on to drain.

**Bottom**, a shipping term for that portion of a ship which is under water, or the ship itself, as "trade in foreign bottoms."

**Bottoming**. See BALLASTING.

**Bottomry and Respondentia**, a contract in the nature of a mortgage, by which the owner of a ship, or the master, as his agent, borrows money for the use of the ship, and for a specified voyage, or for a definite period, pledges the ship as a security for its repayment, with maritime or extraordinary interest on account of the marine risks to be borne by the lender; it being stipulated that if the ship be lost in the course of the specified voyage, or during the limited time, by any of the perils enumerated in the contract, the lender shall also lose his money. *B.* differs materially from an ordinary loan. Upon a simple loan the money is wholly at the risk of the borrower, and must be repaid at all events. But in *B.* the money, to the extent of the enumerated perils, is at the risk of the lender during the voyage on which it is loaned, or for the period specified. Upon an ordinary loan, only the usual legal rate of interest can be reserved; but upon *B.* and *respondentia* loans, any rate of interest, not grossly extortionate, which may be agreed upon, may be legally contracted for. When the loan is not made upon the ship, but on the goods laden on board and which are to be sold or exchanged in the course of the voyage, the borrower's personal responsibility is deemed the

principal security for the performance of the contract, which is therefore called *respondentia*. And in a loan upon *respondentia*, the lender must be paid his principal and interest though the ship perish, provided the goods are saved. In most other respects the contracts of *B.* and of *respondentia* stand substantially upon the same footing. *B.* bonds may be given by a master appointed by the charterers of the ship, by masters necessarily substituted or appointed abroad, or by the mate who has become master on the death of the appointed master. If the bond be executed by the master of the vessel, it will be upheld and enforced only upon proof that there was a necessity for the loan, and also for pledging the credit of the ship; as the authority of the master to borrow money on the credit of the vessel rests upon the necessity of the case, and only exists under such circumstances of necessity as would induce a prudent owner to hypothecate his ship to raise money for her use. If the master could have obtained the necessary supplies or funds on the personal credit of himself or of his owner, and this fact was known to the lender, the bond will be held invalid. And if the master borrows on *B.* without apparent necessity, or when the owner is known to be accessible enough to be consulted upon the emergency, the bond is void, and the lender can look only to the personal responsibility of the master.

The contract of bottomry is usually, in form a bond (termed a *B. bond*), conditioned for the repayment of the money lent, with the interest agreed upon, if the ship safely accomplishes the specified voyage, or completes in safety the period limited by the contract. Sometimes it is in that of a bill of sale, and sometimes in a different shape; but it should always specify the principal lent and the rate of maritime interest agreed upon; the names of the lender and borrower; the names of the vessel and of her master; the subject on which the loan is effected, whether of the ship alone, or of the ship and freight; whether the loan is for an entire or specific voyage or for a limited period, and for what voyage or for what space of time; the risks the lender is contented to bear; and the period of repayment. It is negotiable. In case a highly extortionate or wholly unjustifiable rate of interest be stipulated for in a *B. bond*, courts of admiralty will enforce the bond for only the amount fairly due, and will not allow the lender to recover an unconscionable rate of interest. But in mitigating an exorbitant rate of interest they will proceed with great caution. Not only the ship, her tackle, apparel, and furniture (and the freight, if specifically pledged), are liable for the debt in case the voyage or period is completed in safety, but the borrower is also, in that event, personally responsible. The borrower on *B.* is affected by the doctrines of seaworthiness and deviation; and if, before or after the risk on the *B. bond* has commenced, the voyage or adventure is voluntarily broken up by the borrower, in any manner whatsoever, whether by a voluntary abandonment of the voyage or adventure, or by a deviation or otherwise, the maritime risks terminate, and the bond becomes presently payable. But maritime interest is not recoverable if the risk has not commenced. The lien or privilege of a *B. bondholder*, like all other maritime liens, has, ordinarily, preference of all prior and subsequent common-law and statutory liens, and binds all prior interests centring in the ship. It holds good

(if reasonable diligence be exercised in enforcing it) as against subsequent purchasers and common-law incumbrancers; but the lien of a *B.* bond is not indelible, and, like other admiralty liens, may be lost by unreasonable delay in asserting it, if the rights of purchasers or incumbrancers have intervened. Between the holders of two *B.* bonds upon the same vessel in respect to different voyages, the latter one, as a general rule, is entitled to priority of payment out of the proceeds of the vessel.

Seamen have a lien, prior to that of the holder of the *B.* bond, for their wages for the voyage upon which the bottomry is founded, or any subsequent voyage; but the owners are also personally liable for such wages, and if the *B.* bondholder is compelled to discharge the seamen's lien, he has a resulting right to compensation over against the owners, and has been held to have a lien upon the proceeds of the ship for his reimbursement. But in England and America the established doctrine is that the owners are not personally liable, except to the extent of the fund pledged which has come into their hands. If the ship or cargo be lost, not by the enumerated perils of the sea, but by the fraud or fault of the borrower or master, the hypothecation bond is forfeited, and must be paid.

The risks assumed by the lender are usually such as are enumerated in the ordinary policies of marine insurance. If the ship be wholly lost in consequence of these risks, the lender, as before stated, loses his money.

It is usual in *B.* bonds to provide that, in case of damage to the ship (not amounting to a total loss) by any of the enumerated perils, the lender shall bear his proportion of the loss, viz., an amount which will bear the same proportion to the whole damage that the amount lent bears to the whole value of the vessel prior to the damage. Unless the bond contains an express stipulation to that effect, the lender is not entitled to take possession of the ship pledged, even when the debt becomes due; but he may enforce payment of the debt by a proceeding *in rem* against the ship; under which she may be arrested, and, in pursuance of a decree of the court, ultimately sold for the payment of the amount due. And this is the ordinary and appropriate remedy of the lender upon *B.*

**Boucaut**, the French name for a large cask or hoghead.

**Bouches-a-feu**, the French term for cannon or artillery; guns of all kinds.

**Bouchon**, the French name for a stopple or cork.

**Bought on Time**, said of a purchase to be paid at a stipulated time, as 1, 3, or 6 months. — *Bought to arrive*, applied to a purchase of goods on the sea, to be delivered on their arrival. — *Bought up*, said of any article of merchandise or produce, when a speculator buys up and clears the market of the article.

**Bougie**, a surgical slender, flexible tube, intended for introduction into passages obstructed by stricture or other disease. — The French name for a wax candle.

**Boulangier**, a baker in France; one who makes or sells bread.

**Bounty**, a premium or bonus paid by a government for encouraging some special pursuit; or to the producers, exporters, or importers of certain articles; or to those who employ ships in certain

trades — as the *B.* granted to vessels engaged in the cod and mackerel fisheries. See **DRAWBACK**.

**Bounty-Boats**, the boats engaged in fishing for cod off the coasts of Maine and Massachusetts.

**Bouquet**, [Fr.] a nosegay or a bunch of flowers; an agreeable flavor or perfume; the pleasant perfume and ethereal flavor of choice wine.

**Bourbon**, an island in the Indian Ocean, forming a French colony. It lies about 90 m. S. W. from Mauritius, and 440 m. E. from Madagascar. Area, 895 sq. m. Pop. 209,688. The chief port and town is St. Denis, situated on the N. side, in lat. 20° 51' 43" S., lon. 55° 30' 16" E. Pop. 20,000. It possesses no close harbor, but only an open and dangerous roadstead. A great part of the interior is a volcanic desert; but the districts on the coast are generally fertile. The climate, though humid, is pleasant and salubrious; hurricanes are, however, frequent and violent. The staple products for exportation are sugar, coffee, and cloves. Its principal commercial intercourse is with France.

**Bourbon Whiskey**. See **WHISKEY**.

**Bourgeois**, in printing, an intermediate-sized type between brevier and long primer, 102 lines occupying about a foot.

**Bourse**, the name given in France, and some other parts of Europe, to the money-market or stock-exchange, where the merchants, bankers, and agents *de change* meet to transact business.

**Bourza**. See **BET**.

**Boussole**, a French marine compass.

**Bovello**, a Persian coin, worth about \$3.62.

**Bow**, a bent piece of wood used for archery, made of lancewood or yew. — The sharp or rounded front part of a vessel. — A stick of an elastic wood, having elongated horsehairs stretched to a certain degree of tension along it for setting the strings of a violin or bass-viol in motion.

**Bowed-Cotton**, another name in Liverpool for Upland cotton.

**Bower-Anchor**, a working anchor, one to which the cable is bent; the most effective and reliable anchor of a ship.

**Bowie-Knife**, a large sharp knife, formerly often used as a dagger or offensive weapon in some parts of the U. States.

**Bowline-Knot**, a kind of fastening which forms a loop on a rope that will not slip.

**Bowls**, smooth, round, heavy, wooden balls, used for playing on a bowling-green.

**Bow-Strings**. See **CATGUT**.

**Box**, a receptacle of any kind, large or small, made of various materials, wood, paper, tin, mill-board, etc. Thus there are tea-chests, trunks, packing-cases, snuff-boxes, pill-boxes, lucifer match-boxes, etc. — A division of a printer's letter-case.

**Box-Coat**, in England, a thick overcoat for driving, sometimes with heavy capes to carry off the rain.

**Box-Iron**, a laundress's smoothing-iron, containing a heater in a case, differing in this respect from a flat-iron, which is itself heated.

**Box-Sugar**, the sugar known as clayed sugar, advanced beyond the muscavado, imported from Cuba in boxes containing about 450 lbs. These boxes, charged at from \$2.75 to \$3.25, are made of pine shooks, and shipped from New York to Cuba, where they cost only from \$1 to \$1.25.

**Box-Wood**, [Dutch *peulshout*; Fr. *bois*; Ger. *buchsbaumholz*; It. *bosso*, *bossolo*,] the very valuable wood of the box-tree, *Buxus sempervirens*,

common in the south of Europe and west of Asia. It is of a yellowish color, close-grained, very hard, and heavy; it cuts better than any other wood, is susceptible of a very fine polish, and is very durable. In consequence, it is much used by turners, and mathematical and musical instrument makers. It is too heavy for furniture. It is the only wood used by the engravers of wood-cuts for books; and provided due care be exercised, the number of impressions that may be taken from a box-wood cut is very great. In France, box-wood is extensively used for combs, button-moulds, etc.; and sometimes, it has been said, as a substitute for hops in the manuf. of beer. It is chiefly imported from Constantinople and Spain, and is sold by the pound. *Imp. free.* The American box-wood is the timber of the dog-wood tree, *Cornus florida*. It is also used by turners and wood-cutters, but does not replace advantageously the true box-wood.

**Boyn**, a cheese-vat.

**Braca**, a name for the fathom in Portugal; the land *B.* is about 2·39 yards, but the marine *B.* is only 1·80 yards.

**Brace**, a carpenter's tool for drilling and boring. — A rope attached to the yard of a ship for moving it. — A support or strengthener.

**Bracelet**, a lady's armlet of metal, ornamented shell, beads, etc.

**Braces**, articles of male attire worn across the shoulders to suspend the trousers.

**Bracket**, a curved or angular wooden or iron stay or support for shelves.

**Bradoon**, BRIDOOON, a kind of bit for horses.

**Brads**, small thin nails, with a very slight head, or a head projecting on one side. They are extensively manuf. at South Abington, Massachusetts.

**Brahmin's Beads**, a name given in India to the spherical corrugated seeds of species of *Elæocarpus*, which are used by the Brahmin priests; they are also made into necklaces, bracelets, etc., which are much admired, and fetch a high price when capped with silver.

**Braid**, a narrow plaited, twisted, or woven trimming, used to ornament garments.

**Braid-Comb**, a lady's back-comb for the hair.

**Brails**, ropes attached to the foot or lower corner of ships' sails, for hauling them up to the yards to facilitate furling them.

**Brake**, a machine attached to the wheels of heavy carriages and railroad-cars, which, when pressed against the wheels, retards or stops their motion by friction. There are numberless patents for machines or inventions for this purpose.

**Bran**, is the husk of ground wheat. Pure meal or flour has the bran entirely removed by the processes carried on in the flour-mill; but "seconds" or inferior qualities are a mixture of the two, especially exemplified in what is known as *brown bread*. *B.* is also used in dyeing and calico-printing; as a food for cattle and horses, etc.

**Branch**, the metal piece screwed on to the end of the hose of a fire-engine, carrying the jet at its termination.

**Brand**, an indelible mark made with a hot iron, called branding-iron, on a cask or case. The internal revenue law on official *B.*, stamps, or marks, is given under the head STAMPS.—A written, printed, or engraved trade-mark. See TRADE-MARK.

**Brandy**, [Fr. *eau de vie*; Ger. *brandewein*; It. *aguarzente*; Port. *aguardente*; Sp. *aguardiente*,] a spirituous and inflammable liquid, obtained by dis-

tillation from wine, and from the *marc*, or fermented residue of pressed grapes. Wines of all descriptions, but chiefly those that are strong and harsh (*poussés*), are used in the manufacture of *B.*—red wine for quantity, white for quality. The superior vintages, and those that have most flavor, make the worst *B.* Mark *B.* possesses a more acrid flavor than that obtained from wine. The quality of *B.* is of course dependent both on the material from which it is procured and the skill with which it is manufactured. It is naturally clear and colorless. The different shades of color which it has in commerce arise partly from the casks in which it is kept, but chiefly from the burnt sugar, saunders wood, and other coloring matter intentionally added to it by the dealers. It is said that the burnt sugar gives mellowness to the flavor of the liquor, and renders it more palatable. *B.* improves considerably with age in casks, but not in corked bottles. It is prepared in most of the wine countries of Europe; but the superiority of French *B.* is universally admitted. The latter is principally distilled at Bordeaux, Rochelle, Cognac, and in Poitou, Touraine, Anjou, Armagnac, and Languedoc. That of Cognac is in the highest estimation. *B.* from grapes is also distilled in considerable quantities in the U. States, chiefly in California, Illinois, Indiana, Missouri, and Ohio. American *B.* does not rival French *B.*, but its manufacture is rapidly improving in quality, chiefly in California. In 1878 the Internal Revenue tax was paid on 20,457,770 gallons, and 5,748 gallons were exported. The *B.* imported from France is known in the U. States as *Cognac* and *Rochelle*, and its market value depends less on its quality than on the popularity of the brand. This custom acts unfavorably on the importation of the finer brandies, as growers feel that superior quality cannot overcome the prejudice in favor of an established name, and consequently ship their finest products to markets where they will be judged on their merits. The French value of the new *B.* of commerce varies from 4 to 20 francs per gallon. *Imp. duty*—as alcohol. *Internal Revenue tax* on domestic *B.* made from grapes—as that upon other distilled spirits. See SPIRITS.

**Brass**, [Fr. *cuivre jaune*; Ger. *messing*; It. *ottone*; Sp. *laton*, *azofar*,] one of the most useful of all the factitious metals, is an alloy of copper and zinc in certain proportions. It is sometimes prepared by cementation of calamine, a native carbonate of zinc, with granulated copper; but more usually by combining the copper directly with metallic zinc in the proportions requisite for each particular kind of *B.* It is of a fine yellow color, susceptible of a high polish, and is little liable to rust. Sp. gr. 7·8 to 8·4. It is more fusible, sonorous, a worse conductor of heat, and harder than copper. *B.* is malleable when cold, unless the proportion of zinc be excessive; but when heated it becomes brittle. It may be readily turned upon the lathe; and, indeed, works more kindly than any other metal. There is a vast variety in the proportions of the different species of *B.* used in commerce; nor is it easy to determine whether the perfection of this alloy depends on any certain proportions of the two metals. In general, the extremes of the highest and lowest proportions of zinc are from 12 to 33 parts in the 100. The ductility of *B.* is not injured when the proportion of zinc is highest. This metal is much used in the escape-

ment-wheels and other nicer parts of watch-making; and bars of *B.*, very carefully made, command for this purpose a high price. The use of *B.* is of very considerable antiquity. Most of the ancient genuine relics are composed of various mixtures of *B.* with tin and other metals, and are rather to be denominated bronzes. The best proportion for *B.* guns is said to be 1,000 lbs. of copper, 990 lbs. of tin, and 600 lbs. of *B.*, in 11 or 12 cwt. of metal. The best *B.* guns are made of malleable metal, not of pure copper and zinc alone; but worse metals are used to make it run closer and sounder, as lead and pot-metal. The economical use of *B.* is very large. It is employed for a great variety of mechanical purposes, and in the fine arts, no metal having been found so available for these uses. It would be impossible in the compass of this article to refer to all the ends which this important metal fulfils. There are various kinds of *B.* known as pinchbeck, prince's metal, bath metal, red brass, Dutch gold, Muntz's yellow metal, and malleable brass; the difference depending on the various proportions of copper and zinc.

*B.* is sold in pigs, in sheets, in bars, and in wire. It is manuf. on a very large scale in Connecticut; also in Massachusetts, New York, Philadelphia, etc. In 1878 the U. States exports of *B.* (and manuf. of) amounted to \$583,451, while the imports of the same were only \$245,670. *Imp.* duty (in bars or pigs), 15 per cent.; in sheets, wire cloth, and *B.* manuf., 35 per cent.

**Brasseur**, the French name for a brewer.

**Brass Foil**. See DUTCH GOLD LEAF.

**Brass-Founder**, one who casts brass.

**Brass-Rule**, lengths of thin metal used by printers for cutting into sizes to separate advertisements and newspaper columns; also for page-rules and table-work in book-printing, etc.

**Brass-Wire**. See WIRE.

**Brauvín**, a spirit distilled in Sweden.

**Brawn**, the flesh of the hog, boned, rolled or collared, and sold fresh or pickled.

**Brayer**, a printer's wooden rubber, for spreading or diffusing ink on the block, now superseded by the inking-roller.

**Brazil**, one who works in brass and tin, etc.

**Brazil**, [Port. *Imperio do Brazil*.] a great country of South America, occupying nearly one-half of that continent, extending from lat. 4° 23' N. to 33° 41' S., and lon. 34° 40' to 73° 15' W. Its boundaries are: on the N. the United States of Colombia, Venezuela, and Guiana; N. E. and E., the Atlantic Ocean; and S. and W., Uruguay, Paraguay, the Argentine Confederation, Bolivia, Peru, and Ecuador. The government is a constitutional monarchy; the executive is vested in the monarch or emperor; the legislative body consists of a Senate chosen by the emperor, and a Chamber of Deputies elected by the people. The pop. of *B.* is made up of an agglomeration of many races. While *B.* remained a colony of Portugal, but few women accompanied the emigrants to S. America. The earliest settlers intermarried and mixed with Indian women; and afterwards an extensive intermixture of races occurred with the Africans who were brought for slavery. In the northern provinces the Indian element preponderates, while in Pernambuco, Bahia, Rio de Janeiro, and Minas the negroes are numerous. At the seaports, the chief part of the pop. is of European descent. Cap., Rio de Janeiro. A steamer of the U. S. and

*Brazil Mail S. S. Line* sails on the 5th of every month from New York, calling at St. Thomas, Pará, Pernambuco, Bahia and Rio de Janeiro. The rates of passage (cabin) are: from New York to St. Thomas, \$75; to Pará, \$130; to Pernambuco, \$150; to Bahia, \$160, and to Rio de Janeiro, \$175. The subjoined table gives the area and pop. of each of the 20 provinces of the empire, according to the official returns of the partial census of 1872, the 11 provinces in which actual enumeration was made being marked by an asterisk (\*), with the number of pop. of the other 9 provinces filled in after government estimates:

Provinces.	Area.	Pop.
Amazonas (*)	753,459	57,610
Pará	412,441	280,000
Maranhão	141,645	380,000
Piauí	81,776	219,000
Ceará (*)	50,290	721,686
Rio Grande do Norte (*)	20,120	253,979
Parahyba	20,341	365,000
Pernambuco (*)	46,255	841,539
Alagoas (*)	11,611	348,000
Sergipe	12,038	280,000
Bahia	204,794	1,400,000
Espírito Santo (*)	17,029	82,157
Rio de Janeiro	18,480	1,050,000
Santa Catharina (*)	18,323	159,802
Rio Grande do Sul	119,211	455,000
Minas Geraes	237,472	1,500,000
Matto Grosso (*)	668,625	60,417
Goyaz (*)	263,362	160,395
Paraná (*)	168,556	126,722
São Paulo (*)	96,537	857,334
Total	3,287,961	9,448,233
Wandering pop. of aborigines, about		1,000,000

*B.* has a coast-line of nearly 4,000 m., extremely varied in its aspect and formation. About one-half of the Brazilian territory is covered by highlands and mountains; but all of those are of insignificant proportions and elevation. Indeed, many rising grounds mapped and described as *sertas* have nothing of a mountainous character. The Amazon and Paraguay water-shed in the province of Matto Grosso, forming the W. limit of the Brazilian highlands, is simply a low swelling plateau on which the Tapajós, Xingú, Paraguay, and other rivers have their sources; and these are so near to each other, and the water-shed is so low, that canoes ascend the Tapajós from Santarem near its confluence with the Amazon, cross over, and descend the Paraguay to Villa Maria. The principal rivers are the Amazon, with its great affluents the Madeira, Tapajós, Xingú, Negro, the Tocantins or Pará, the Maranhão, the São Francisco, the Rio Grande do Sul, etc., along with the upper streams of the Paraná, Paraguay, and Uruguay. Nearly all the geological formations are represented in *B.*, and the mineral wealth of the country includes gold, silver, diamonds, and other precious stones, iron, and coal. This is the richest diamond-producing country in the world; the most noted mines are those of the Serra do Frio, and in 1862 other very wealthy deposits were found in the prov. Minas Geraes. The climate of *B.* varies, according to the local conditions of so extensive a country; in the plains it is hot but healthy, most of the European diseases being unknown, and yellow fever comparatively a stranger. The fertility of the soil is not surpassed by that of any other country in the world; but comparatively little attention is paid to agriculture, and the growth of vegetation is in many places so rank as seriously to impede the operations of husbandry. The soil of *B.* is as varied as its climate, being in some parts amazingly fertile, and bearing almost every known species of vegetable production; while in others it is dry, arid, and unfavorable to vegetation. As a rule, the lands surrounding the large and populous cities are exceedingly rich and productive. The immense plains of the interior are for the most part covered with primeval forests, offering inexhaustible quantities of timber adapted both for solid construction and for cabinet and ornamental works. The northern provs. produce cotton, sugar, rice, tobacco, tapioca, isinglass, caoutchouc, indigo, cacao, and a variety of drugs and dye-woods; the middle provs. coffee, sugar, tobacco, rosewood, rice, etc.; while in the southern prov. of Rio Grande, the hides and horns of the wild cattle form the chief source of wealth. A small quantity of wheat is raised in Rio Grande, which, in point of soil and climate is so well adapted for the productions of the temperate zone that it might not only supply all the rest of the empire with provisions, but have a considerable surplus for exportation to foreign countries. The Mandioca plant is common nearly all over the empire; the root ground into meal, forming a general article of food, while the plant itself produces tapioca, which

is largely exported. Indian corn, millet, and beans are also generally cultivated. Cotton is raised chiefly from lat. 15° S. to the equator; the best is that of Pernambuco; next, that of Maranhão; that of Bahia and Pará is inferior. Sugar is cultivated chiefly in the prov. of Bahia, but to a great extent likewise in the provs. of Rio de Janeiro and Pernambuco. Coffee forms the chief object of culture in the prov. of Rio de Janeiro, and adjacent provinces. Four-fifths of the coffee consumed in the U. States, and over half of all that is used in the world, is of Brazilian growth. Each tree is supposed to yield annually, on an average, two pounds of coffee; but some give as much as eight. Besides the provinces adjacent to Rio de Janeiro, the coffee plant flourishes in the shade of the Amazon forest, and with moderate care yields two annual crops; and the Ceará coffee, much esteemed, grows on the mountain slopes, at an elevation of from 2,000 to 3,000 feet above the sea. In the prov. of Pará, the coffee plant is seen growing on almost every roadside, thicket, or waste. The vine and the olive are cultivated to a limited extent in the southern provinces. — Sugar refining is carried on extensively, particularly in the great cane-growing provinces of Bahia and Pernambuco, where there are numbers of *engenhos* established on a grand scale, with the best modern machinery for water- or steam-power. Tobacco and cigars of a common class (*charutos*) are manufactured on a large scale in Bahia, Rio de Janeiro, and other places. A number of cotton-weaving factories have been established, and compete favorably with foreign manu. in the production of the coarser fabrics. Very good silks are made at Rio de Janeiro and elsewhere. There are also manu. of common and wall papers, soap, chemicals, braids, ribbons, bronzes, etc. — The principal exports from B., besides coffee, are cotton, sugar, cacao, hides, horns, tobacco, diamonds, India-rubber, etc. The principal imports are cotton and woollen fabrics, and wrought and unwrought iron from England; wines from Portugal, Spain, and France; cotton fabrics, agricultural implements, hardware, lard, flour, petroleum, biscuits, coal, ice, hams, boots and shoes, etc., from the U. States. The total value of the imports into B., in the five years from 1874 to 1878, averaged \$100,000,000, and the exports \$150,000,000. About one-third of the total imports come from Great Britain, nearly one-fourth from France, and the rest chiefly from the U. States, Argentine Confederation, Portugal, and Germany. About one-fourth of the exports go to Great Britain, above one-fourth to the U. States, the remainder being divided chiefly among France, the Argentine Confederation, Germany, and Portugal.

COMMERCE OF THE UNITED STATES WITH BRAZIL FROM 1869 TO 1878.

Years.	Exports to B.	Imports from B.	Total Imp. and Ex.
1869.....	\$6,069,079	\$24,912,450	\$30,981,529
1870.....	5,817,846	25,175,959	30,993,805
1871.....	6,089,154	30,560,648	36,649,802
1872.....	5,985,924	30,134,249	36,120,173
1873.....	7,199,922	38,558,028	45,757,950
1874.....	7,705,820	43,911,315	51,617,135
1875.....	7,745,359	42,033,446	49,778,805
1876.....	7,347,380	45,453,173	52,800,553
1877.....	7,582,813	43,498,041	51,080,854
1878.....	8,686,704	42,972,036	51,658,740
Total.....	\$70,230,001	\$367,208,945	\$437,438,946

The total imports and exports for 1878, representing 4.60 per cent. of the general foreign commerce of the U. States.

The principal articles exported to and imported from the U. States in 1878 were as follows: *Exports*: Medical books, \$196,786; chemicals, dyes, etc., \$6,615; cocoa, \$23,415; coffee, \$35,367,992; hair, \$34,309; hides, \$1,288,085; India-rubber, \$2,457,398; wood, \$88,061; fruits, \$27,643; brown sugar, \$3,165,384; wool, \$97,127. — *Imports*: Agricultural implements, \$23,420; beer, \$9,825; blacking, \$6,528; books, etc., \$8,265; biscuit and crackers, \$37,799; Indian corn, \$106,881; wheat, \$75,000; wheat flour, \$4,436,006; tallow, \$5,922; carriages, etc., \$15,210; railroad cars, \$340,458; clocks, \$22,436; coal, \$5,658; cotton (manuf.), \$523,332; drugs, etc., \$104,889; apples, \$11,400; glass and glassware, \$42,038; jewelry, \$11,026; railroad rails, \$95,020; car-wheels, \$10,171; steam-engine locomotives, \$296,173; machinery, \$139,056; nails, \$10,006; other manu. of iron, \$123,205; edge-tools, \$102,680; lamps, \$11,149; boots and shoes, \$11,816; rosin and turpentine, \$49,972; petroleum, \$655,797; paper and stationery, \$49,024; perfumery, \$28,569; printing-presses, \$11,239; lard, \$604,999; sewing-machines, \$21,814; soap, \$27,131; wood (boards, deals, joists, staves, etc.), \$191,507; household furniture, \$82,974. — The customs duties upon all articles manu. in the U. States are very heavy, averaging from 40 to 50 per cent.

In 1878, 161 American vessels (tonnage 60,002), 3 American steamers (tonnage 5,845), 371 foreign vessels, and 44 foreign steamers, engaged in the Brazilian trade, entered the American ports; and 216 American vessels (tonnage 79,997), 8 American steamers (tonnage 10,673), 149 foreign vessels (tonnage 45,210), and 8 foreign steamers (tonnage 7,527), cleared the American ports for Brazil.

*Considerations on the Trade of the U. States with B.*—We owe the following and most valuable information to Mr. Thomas Adamson, U. S. Consul-General at Rio de Janeiro. "If our merchants wish to sell goods in B., they should establish houses, learn the language of the country, acquaint themselves with the fancies and needs of the people, and import the kind of goods required here. There is business in the country on which many people have grown rich. We may have a full share of it if we work for it. One of the ways not to succeed is to make trial shipments, often consigning the goods to a house that deals in articles of an entirely different kind. This consular office is in very frequent receipt of letters requesting the name of some person or firm who deals in a certain line of goods, with a view to sending a consignment. John Smith writes to say he manufactures pocket-books, and wants to know the address of a dealer in the article. He is informed that Fulano & Co. are large dealers in such goods. He ships a case or two of his goods to Fulano & Co., who have on hand a large stock which they purchased, and they sell their own goods first. The shipper gets uneasy, urges speedy sales, the goods are sent to auction and the owner gets very small returns. One of the serious drawbacks to an extension of American trade in B. is the system of long credits which prevails, a system less injurious to the European than to the American merchant, because of the lower rate of interest on capital in the money markets of Europe. This system compels the importing merchant to do a kind of banking business in connection with his regular business, and obliges him to carry large amounts in non-negotiable paper, running from one to twelve months, with the privilege of extension at the will of the debtor. In Rio de Janeiro it is no unusual case for a commercial house to have from \$250,000 to \$500,000 constantly outstanding in such paper. Few American merchants would care to risk such long credits, especially when they consider the fluctuations in exchange and the small margin between the rate of interest which their money will command in B. and at home. At the present moment the credit system has so undermined the business of the empire that a commercial crisis might very easily be precipitated. Beginning with the importer, this perilous system extends to the smallest consumer, and so great has become the sum of outstanding credits that any sudden measure of reform, even of limited extent, could not fail to produce wide-spread distress, if not bankruptcy. It becomes therefore a question of importance to the American merchant whether he shall invest his capital largely in this country, entering into competition with the old houses on their own ground, or whether he shall be content with a less ambitious but much safer beginning, and steer clear of the great dangers which now beset his trade. It is certain that there is a considerable market in B. for many lines of American manufactures, and that a demand may be created for other goods, as yet novelties here, but the unfavorable state of business renders it advisable to limit all enterprises to a cash basis. This will, of necessity, prevent the rapid growth of our trade for a time, and until sounder methods of business have placed us on an even footing with our competitors.

"In view of the fact that the empire of B. produces but a small portion of many principal articles of food consumed by its people; that not only the products of other climates, but also those things produced within her own borders, such as rice, corn, and meats, enter largely into the list of her staple imports, the trade in food substances deserves the attention of our merchants who seek to establish business relations with the empire. Each prov. has some great source or sources of wealth, to the production of which everything is made subordinate. In the S. provinces these are animal products, hides, beef, horns, hair, etc. In San Paulo and Rio Janeiro, it is coffee; in Bahia, tobacco; in Pernambuco, sugar and cotton; in Pará, India-rubber, cacao, and Brazil-nuts. Everything else is discarded or neglected. While potatoes, rice, beans, onions, etc., may be easily produced, they are almost wholly imported from France, England, and Portugal. Indian corn, which grows well in the uplands, comes mainly from the U. States; and the principal meat food of the whole empire, jerked beef, which is so easily produced in the S. provinces, is imported from Uruguay and Buenos Ayres to the extent of fourteen-fifteenths of the whole consumption. Whether the state of affairs is favorable to the prosperity of B. is not a question within the scope of this article. It is sufficient for the merchant to know that it is favorable to a certain line of commercial enterprise.

"Those who intend to engage in this branch of trade should first make a careful study of the methods employed by our competitors in preparing and packing their goods for S. American markets. The labels, covers, and capsules on cans, jars, and packages of fruits, vegetables, oysters, etc., are important factors in all efforts to introduce these goods into the Brazilian market. Good taste should be displayed in all things. The Brazilians are great admirers of France, and are largely influenced by the preferences and prejudices of the French people. The means employed in the U. States are frequently insufficient for B. In this hot, moist climate, our ordinary food preparations spoil very quickly, and for that reason the greatest care is necessary both in preparation and packing.

"The greater part of the *flour* consumed in *B.* comes from the U. States, and for fifty years past it has been our chief article of export to that country. Our competitors are Austria and Uruguay, both of whom are slowly gaining at our expense. The Austrian flour is highly esteemed and commands about a dollar a barrel more than American. It is packed in smaller and stronger barrels than ours, but containing the same weight. Of American flour, Richmond brands are preferred in this market. Of late there has been much complaint of the bad condition in which American flour arrives. The barrels are said not to be as strong as formerly. To retain our past supremacy in this trade, the quality of the flour must be kept up to an uniformly high standard and more care exercised in packing and shipping.

"*Lard* comes almost wholly from the U. States, there being no competition worthy of mention. Great care should always be observed with its packing, so as to command the paying price.

"There is but a limited demand for *salted meats* here, and that principally among the shipping. In 1877 only 80 barrels were imported from the U. States.

"Thus far the American *cured ham* has had a very unfortunate reputation in this market. In nearly every case they have proved inferior to the English ham in quality, and therefore sell at a much lower price. They also lack keeping qualities in many cases, spoiling before they can be placed on the market. The English ham is preferred at a cost from 10 to 15 cents per pound over the American. The surfaces are carefully cleaned or pared, chaff is placed inside the canvas covering, and they are carefully packed in coarse dry salt in boxes or barrels. As it is a question of preparation, not of price, our shippers must make the necessary improvement in curing and packing before they can hope for success here. *Dried meats* of the finer kind are imported from Portugal, Italy, and France. *Jerked beef*, or 'carne secca,' as it is called here, comes almost entirely from the River Plate and Uruguay. During 1877 the receipts of that article at Rio de Janeiro were 33,294,400 kilos, or 73,401,533 pounds, of which only one-fifteenth were Brazilian. *Preserved meats*, in tin cans, are imported in moderate quantities from Great Britain and France, and are used almost exclusively by foreigners, or in small quantities by rich Brazilians. A limited quantity of American pressed corned beef is sold here.

"Of *fish*, dried, salted, or preserved by cooking in tin cans, excluding codfish, there were imported, in 1877, 30 kegs from the U. States; 5,834 boxes and kegs from France; 5,247 boxes and kegs from Portugal, and 314 packages from other countries. The greater part of codfish imported comes from British North America. The receipts during 1877 were 64,585 packages, of which 3,284 packages came from the U. States. There is considerable sale for Oregon salmon, and I believe there is a good opening for the sale of lake trout and white fish if properly pushed. It is said that much of the salmon sold in Brazil as British is really American, with the labels changed. American *oysters* are a staple article and command fair prices. This trade is capable of considerable expansion, and should be carried on directly between the two countries. If shippers would send really good goods and maintain a certain standard, there is every reason to believe a good business may be made." — (*Am. Mail and Export Journal*, March, 1879.)

**Seaports.** *B.* has 42 seaports, the principal of which, in their order from N. to S., are those of Pará, Maranhão, Parahyba, Pernambuco, Macaé, Aracajá, Bahia, Lihéas, Santa Cruz, Porto-Seguro, Victoria, Rio de Janeiro, Santos, Paranaguá, Santa-Catharina, and Rio-Grande-de-Sul. The most important of these are the following:

**Pará, or Belem**, cap. of prov. of Pará, is situated in lat. 1° 30' S., lon. 48° 22' 31" W., on the river Amazon, about 75 m. from its mouth, and 300 m. W. N. W. of Maranhão. It is one of the finest of Brazilian cities. The harbor is confined, and is said to be diminishing in depth; the approach from the ocean is also rather difficult, and it is always expedient to take on board a pilot at the mouth of the river. It is the chief shipping-port for the India-rubber, immense quantities of which are collected on the shores of the Amazon. The other principal articles of export are sugar, hides, sarsaparilla, annatto, and Brazil-nuts. Pop. 35,000.

**Maranhão, or São Luis**, is in lat. 2° 31' S., and lon. 44° 19' W. It lies on the island of that name, forming the S. E. side of the bay of Marcos. The harbor is good and safe, but the entrance is difficult. Pop. 45,000.

**Pernambuco, or Recife**, in lat. 8° 3' S., and lon. 34° 52' W., is the cap. of the prov. Pernambuco, and one of the most flourishing ports of *B.* It comprises 3 different towns, which are built on sand-banks surrounded by the sea, and connected by bridges. Exports cotton, sugar, tobacco, hides, etc. Pop. 116,672.

**Bahia, or São Salvador**, is situated in lat. 13° 1' S., and lon. 38° 32' W., on the capacious bay of All Saints (Bahia de Todos-os-Santos), 740 m. N. N. E. of Rio de Janeiro. It is the cap. of the prov. Bahia, and the second city and seaport of the empire, in importance and population. It has an excellent harbor, which receives vessels of the largest tonnage. It exports more sugar and tobacco than all the rest of *B.* Pop. 129,109.

**Rio de Janeiro**, or simply *Rio*, the cap. of the empire, and one of the most magnificent cities of the two continents of

America, is situated on the W. side of one of the finest bays in the world, 80 m. W. of Cape Frio, in lat. 22° 54' S., lon. 43° 7' 15" W. To the right on entering the bay is the fort of Santa Cruz, within hail of which all vessels going into the harbor are required to pass, in order to answer any questions that may be put to them. The harbor is one of the finest known, and indeed can scarcely be excelled for capaciousness, and the security which it affords to vessels of every description. The entrance into it from the sea does not exceed a mile from point to point, but widens afterwards to about 3 or 4 miles. Rio de Janeiro is the seat of more than one-half of the foreign commerce of *B.*, and it has likewise a very extensive inland trade, particularly with the prov. of Minas Geraes, Goyaz, and Matto Grosso. It is the key to the mining districts—furnishing all their supplies, and receiving all their produce for shipment or other disposal. It is the greatest mart for coffee in the world. Pop. 274,972.

**Santos** is in lat. 23° 55' S., lon. 46° 19' W., on the N. of the island of Engua Guacu. The port is large and commodious, and it has an active trade in sugar. Pop. 15,000.

**Railroads and Telegraphs.** *B.* possesses, in 1878, railroads of a total length of 1,438 m., opened for traffic. The principal lines are—the Pedro Segundo, 138 m.; the San Paulo, 85 m.; the Bahia, 75 m.; the Pernambuco, 76 m.; the Cantagalla, 21 m.; and the Maná, 15 m. There were railroads of an aggregate length of 800 m. in course of construction at the same date. A commencement has been made to establish a system of telegraphs. There were, in 1878, lines to the extent of 3,890 m.

**Finances.** In the budget for 1877, both the revenue and expenditure were calculated at 105,378,914 milreis, or \$31,689,455. The total debt of *B.*, home and foreign, amounted in 1878 to \$367,904,450. The annual charge of the State for sinking fund and interest was \$19,965,165, being more than a third of the national revenue. The whole of the foreign loans of *B.*, \$95,467,500, bearing 5 per cent. interest, were contracted through the banking-house of Rothschild & Co., and on the security of "all the resources of the empire." The internal debt, \$72,436,850, is chiefly represented by bonds, called *Ajotees*, inscribed to the holder, and the payment of its cap. and interest, which is provided for by an annual vote of Congress, is under the charge of the sinking-fund department (*Caixa da Amortizacao*), independent of the government. *B.* has besides a floating debt, estimated at \$255,000,000, consisting in great part of treasury bills.

**Banks in Rio de Janeiro.** The *Banco-do-Brazil*, founded in 1853 with a cap. of \$18,744,014, had the exclusive right to issue notes payable to bearer. This right was cancelled in 1866, with obligation to pay its notes in 21 years, at the rate of 5 per cent. per year, which rate was reduced in 1873 at 2½ per cent. — *Banco-Commercial-do-Rio-de-Janeiro*, founded in 1866 to receive deposits and make discounts. Cap. \$5,000,000, on which \$1,173,600 are paid. — *Banco Nacional*, founded in 1871. Cap. \$5,600,000, all paid. Deposits and discounts. — *Banco-Industrial-e-Mercantil*, authorized in 1872. Cap. \$11,200,000, on which \$2,840,000 are paid. Deposits, discounts, and credit. — *English-Bank-of-Rio-de-Janeiro*, has branches at Pernambuco and Santos. Cap. \$4,000,000, on which \$2,000,000 are paid. There are many other banks and institutions of credit.

**Money.** The *Milreis* or 1,000 Reis = \$0.52. The standard of value is the gold *Octava* of 22 carats, equal to 4 milreis. Gold and silver coins have almost disappeared in recent years in *B.*, and the only circulating medium is an inconvertible paper currency, consisting of treasury notes, called *redulas* of a milreis and upwards, depreciated in value—specie bearing a premium of 60 to 75 per cent.—together with copper and bronze coins.

**Weights and Measures.** The French metric system, which became compulsory in 1872, was adopted in 1862, and has been used since in all official departments. But the ancient weights and measures are still partially employed. They are:

The *Libra* = 1012 lbs. avoirdupois.  
The *Arroba* = 3238 " "  
The *Quintal* = 12954 " "  
The *Alquere* (of Rio) = 1 bushel.  
The *Oitava* = 5534 grains.

Besides the above, the weights and measures of Portugal are also in use in some parts of the empire.

**Brazilletto Wood**, is the wood of a small tree, *Cosculpinia Brasilensis*, which is much used for ornamental cabinet-work, and is peculiarly adapted for carriage-wheel spokes. It was formerly used as a dye, but Brazil-wood has superseded it. Imp. free.

**Brazilian Pebbles**, lenses for spectacles, ground from pure, transparent, colorless quartz, or rock-crystal. Imp. free.

**Brazilian Tea**, a substitute for tea, prepared from the leaves of *Stachy tarpheta mutabilis*, and also of *Lantaria pseudothea*.

**Brazil-Nuts**, [Fr. *noix péchurins*; Ger. *pechurinnüsse*; It. *noci gemelle*; Port. *pucharins*; Sp. *becuiba*,] the fruit of the *Juvia*, *Bertholletia excelsa*, a majestic tree growing to the height of 100 or 120 feet, abounding on the banks of the Orinoco, and in the northern parts of Brazil. The nuts (Fig. 43) are triangular, having a cuneiform appearance, with sutures at each of the angles; the shell is rough and hard, and of a brownish ash color. The kernel resembles that of an almond, but is larger, and tastes more like a common hazel-nut; it contains a great deal of oil that may be obtained by expression or otherwise. These nuts do not

Fig. 43. — BRAZIL-NUT,  
Showing fruit cut open, and a separate nut.

grow separately, or in clusters, but are contained, to the number of from 15 to 50 or more, in great ligneous pericarps or outer shells, generally of the size of a child's head. The outer shell is very hard and strong, so that it is rather difficult to get at the nuts, which are closely packed in cells inside. The natives are particularly fond of this fruit, which is also much esteemed in this country and in Europe. It is imported in considerable quantities, chiefly from Pará. *Imp. free.*

**Brazil-Wood**, [Fr. *bois de Brésil*; Ger. *Brasilienholz*; It. *legno del Brasileverzino*; Port. *pao Brasil*; Sp. *madera del Brasil*,] a valuable dye-wood, the product of a tree, *Cesalpinia echinata*, which grows in various tropical countries, but is found in greatest abundance, and of the best quality, in the province of Pernambuco in B., where it is known as *pao de Rainha*, or Queen's-wood. The tree commonly grows in dry places and amid rocks, and seldom exceeds thirty feet in height. The only valuable part is the heart, which, after being freed from the thick bark and white pith, is only about one-half of the bulk of the trunk. B. is ponderous and hard; and when first cut is of a pale red, but becomes darker by exposure to air. It is variegated with irregular black spots, has a sweetish taste when chewed, and gives out its color with water, a property by which it is distinguished from saunders-red or sandal. The thick and close-grained pieces are preferred. The wood is susceptible of a good polish, and is occasionally used by the turner and cabinet-maker, but it is chiefly employed as a red dye. It is, however, for many purposes, superseded by the aniline colors. Ground B. is sold in New York in bbls. of 130 lbs., at about 3½ cts. per lb. *Imp. free.*

**Brazing**, the operation of hard soldering brass and other metals by means of the blow-pipe.

**Bread**, [Fr. *pain*; Ger. *brot*,] consists of a paste or dough formed of the flour or meal of different sorts of grain mixed with water and baked. When stale dough or yeast is added to the fresh dough, to make it swell, it is said to be *leavened*; when nothing of this sort is added, it is said to be *unleavened*, and called *Loaf B.* Sea biscuit, oat cakes, barley bannocks, rye cakes, etc., are examples of unleavened B. *Loaf B.* is made by working the flour into dough or paste with water, yeast, and a little salt, allowing it to stand until a certain degree of fermentation takes place, and then baking it in an oven heated to about 488° F. During the fermentation a quantity of gas is formed, and as it is prevented from escaping by the toughness of the paste, and dilated by the heat of the oven, the B. is rendered light, porous, and soft. Many bakers add potatoes to the flour. This admixture neither injures the quality nor the wholesomeness of the B.; but adulterations which are not so innocent are sometimes had recourse to, for the purpose of concealing the taste of damaged flour or to make the B. white when formed of inferior flour. The use of alum is liable to this objection, as being positively injurious to health; it is employed to lighten the dough. — *Aerated B.* has no yeast or ferment in it; carbonic acid is *directly* applied, instead of resulting from fermentation. While the dough is being worked by steam-power in a strong iron globular vessel, carbonic acid is forced in. The result is, that when the loaf is baking, the gas expands, bursts in bubbles from the surface and makes the B. light and porous by forcing its way through the dough. Medical men give a high character to this bread for purity and salubrity, while the manufacturing processes are simple, rapid, and economical. Many forms of B. are baked in tins, to give definite shape to the loaves; but this does not alter the other characteristics of the B. — The species of B. in common use in a country depends partly on the taste of the inhabitants, but more on the sort of grain suitable for its soil. But the superiority of wheat and Indian corn to all other farinaceous plants in the manufacture of B. is so very great, that wherever they are easily and successfully cultivated they are used to the nearly total exclusion of most others. Where, however, the soil or climate is less favorable to their growth, rye, oats, etc., are used in their stead.

**Bread-Fruit**, the fruit of *Antocarpus incisa*, a tree of S. Asia, now naturalized in the West Indies. It is nearly spherical, is covered with a rough rind, weighs sometimes 4 pounds or more, contains a large portion of starch fecula, and is a principal part of the food of the natives of the South Sea Islands. When baked in an oven the pulp is white and mealy, very nutritive, and resembles wheaten bread.

**Bread-Platter**, a fancy wooden trencher for cutting bread on.

**Bread-Stuffs**, an American commercial term for grain and meal; the produce of food plants which enter into commerce. As used in official returns of the U. States, the word B. includes bread and biscuit, barley, Indian corn, Indian corn-meal, oats, rye, rye flour, wheat, wheat flour, all other small grain and pulse, farina, and all other preparations of B. used as food, such as arrowroot, macaroni, vermicelli, etc. The imports of B. in 1878 were \$8,514,005, while the exports reached \$181,777,841.

**Break**, or **Brake**, a drag put on the wheel of a coach or railroad-car to check its speed. There are many patents for *B.*, the most generally adopted on American railroads being the Westinghouse Air-break, and the Ames Vacuum-break. — The

Fig. 43. — BREAK.

The accompanying figure exhibits the simplest form of *B.*, to show its action on the wheels. *A B* is an iron rod so disposed that it can act on the lever *C D*, which is mobile round the axis *E*. The rod *A B* is articulated at *A* to an arm of the lever fixed to that axis; and when the rod is drawn from *A* towards *B*, the two pieces of wood are pressed against the wheels by the intermediary of two iron slunks, which are articulated to the two ends of the lever *C D*, and to these two pieces of wood.

fly-wheel of a carriage or machine. — A substantial frame-work carriage for breaking in young horses to harness. — *To break*, to stop business for cause of insolvency, to make bankrupt.

**Breakage**, an allowance usually made by the shipper or seller on certain class of cheap fragile goods. Actual *B.* is allowed in the assessment of duties on importations of every kind of liquors, when the importer declares his option at the time of the entry; otherwise he is entitled to the allowance fixed by law, which is 10 per cent. on malt liquors in bottles, and 5 per cent. on all other liquors in bottles.

**Breaker**, a small ship's or boat's cask for holding water.

**Breaker (Stone)**, is a machine for the breaking of stones, ores, and other hard substances into fragments of moderate size. It is used in the construction of roadways, in preparing concrete, in mining operations, and in crushing minerals for various purposes.

There are several machines patented for this object, among which is the *Blake Crusher* (Fig. 44), manufactured at New Haven, Conn. It is very simple in construction, but is made strong and massive on account of the great strain and wear to which its working parts are subjected in crushing minerals, some of which yield only to a pressure of over 13½ tons to the square inch. Its principal features are a heavy frame in which are set two upright jaws, one of which is usually fixed while the other has a slight vibratory movement imparted to it by a rotating shaft. These jaws are wide enough apart at the top to receive the stones to be broken, but converge towards each other below, so that at the bottom the opening is only wide enough to permit the fragments to pass when broken to the required size. It will thus be seen that when a mass of stone or ore is placed between the jaws at the top, the vibrating jaw advancing cracks it into two or more pieces; then receding, it liberates the fragments which drop lower down between the jaw-plates. It will be seen that the distance between the jaws at the bottom limits the size of the fragments. This distance, and consequently the size of the fragments, may be regulated at pleasure. A variation to the extent of ¾ of an inch may be made by turning the screw-nut *W*, which raises or lowers the wedge *N*, and moves the toggle-block *O* forward or back. Further variations may be made by substituting for the toggles *G I*, or either of them, others that are longer or shorter; extra toggles of different lengths being furnished for this purpose. This machine is

made of different sizes, the largest being capable of taking in a stone weighing half a ton and reducing it in five seconds to fragments of five inches and downwards. The opening at the bottom of the jaws may be varied at pleasure, so that fragments of any size may be produced.

**Breakfast-Cups**, china or earthenware cups larger than the ordinary sized tea-cups.

**Breaking-Bulk**, the act of commencing to discharge a cargo. The commander of any vessel carrying the mail becomes liable to a penalty of \$100 for breaking bulk before having delivered into the post-office every bag, parcel, or package of letters that were on board.

**Break-Van**, an empty van attached to the end of a railroad-train.

**Breakwater**, [*Fr. brise-lames*; *Ger. wellenbrecher*,] an artificial barrier designed to break the force of waves in

seaports and harbors, and thus to protect shipping from damage; but more commonly to create a harbor or a secure anchorage where none existed before.

**Bream**, a fresh-water fish of the carp family, *Abramis Brama*, which is much eaten in South-eastern Europe. The sea *B.* is a species of *Parqus*.

**Breaming**, the act of graving or cleansing the bottom of a vessel by burning.

**Breast-Plate**, a piece of metal armor.

**Breast-Ropes**, support ropes secured in the chains of a ship for the leadsmen to lean against.

**Breast-Wheel**, or **MIDDLE-SHOT WHEEL**, [*Fr. roue hydraulique de côté*; *Ger. kropfgrad*,] an hydraulic motor which receives the water on the float-boards on a level with the axis (Fig. 45).

**Breeches**, men's garments for the lower part of the body.

**Breeching**, the hinder part of the harness of a horse. — The tackling of a cannon.

**Breech-Loaders**, are ordnance and small arms which are loaded by putting in the shot or cartridge directly at the breech, instead of inserting it

Fig. 44. — SECTIONAL VIEW OF THE STONE-BREAKER.

*A A*, main frame; *B*, fly-wheel; *C*, driving-pulley; *D*, crank-shaft; *F*, pitman; *G O*, toggles; *H*, fixed jaw; *I*, cheek; *J*, movable jaw; *K*, jaw-shaft; *L*, rubber-spring; *N*, wedge; *O*, toggle-block; *P P*, jaw-plates; *W*, wedge-nut.

at the muzzle. This kind of arm dates as far back as the reign of Henry VI., and several ancient examples of it are found in the armory of the Tower of London. Of late years, *B.* have almost wholly superseded muzzle-loading pieces, and im-

provements in this kind of arm are being made almost annually. Among the more recent heavy guns of this character are the Armstrong, Blakely, Dahlgren, Whitworth, Lancaster, and Krupp guns, and the Mitrailleuse. Among small-arms we have the Chassepot, Sharp, Snider, Spencer, Ward-Burton, Remington, Enfield, and Martini-Henry rifles, etc.

Fig. 45.—BREAST-WHEEL.

**Breeze**, the small dust-coal of the mines, used to some extent in England for making coke and artificial fuel.—Ashes and cinders sifted from dust-holes, used in brick-making.

**Breluche**, a French druggot or floor-cloth, a mixture of thread and worsted.

**Bremen**, a free city of Germany (*Freie Stadt Bremen*), situated on both banks of the Weser, about 45 m. from the North Sea and 60 m. from Hamburg, in lat. 53° 4' N., lon. 8° 48' E. Its situation renders *B.* the principal emporium of Hanover, Brunswick, Hesse, and other countries traversed by the Weser. *B.* was for centuries one of the chief towns of the Hanseatic League; it is governed under a constitution revised in 1854 by a Senate of 18 members (elected for life) forming the executive, and the Bürgerconvent, or the Convent of Burgesses, of 150 members, invested with the power of legislation. Area of the State, 106 sq. m. Pop. 142,200 (including the Prussian garrison).

The entrance to the Weser lies between the Mellum and other sands on the S. W. side and the Teglers Plaat, etc., on the N. E. side. Vessels drawing not more than 7 feet come up to the town, and those drawing 13 feet may come up to Vegesack, about 13 m. below *B.*; but large vessels do not generally ascend higher than Bremerhaven, lying on the E. bank, about 38 m. below the town, and which is Bremen's seaport. The port and shipping charges are very moderate. The principal German exports are woollen goods, linens, grain, oak bark, glass, smalts, hams, hides, rapeseed, beef and pork, rags, wool, wine, wooden toys and clocks, oil-cake, etc. The imports consist of tobacco (of which large quantities are re-exported), coffee, sugar, and other colonial products; whale-oil, iron, rice, hides, wines, raw cotton, cotton stuffs and yarn, earthenware, coal, brandy, tar, tea, dyewoods, timber, hemp, etc. The over-sea trade of *B.* with the U. States is important. She sends to America a great variety of German products, and brings back large quantities of cotton, tobacco, rice, petroleum, and other American produce. Next to that of Hamburg the port of *B.* is the chief outlet of German emigration and the largest for the international trade of Germany. The number of merchant vessels belonging to the State in 1878 was 255, of 196,011 tons, including 58 steamers, of an aggregate burthen of 57,676 tons. In the same

year there arrived at the port of *B.* 2,720 vessels of 920,904 tons, and there cleared 2,799 vessels of 861,807 tons. The only expenditure of the State, nearly balanced by the revenue, is about \$3,000,000. The public debt, bearing 3½ and 4½ per cent. interest, amounts to 90,385,521 marks, or \$22,596,380; it was incurred for constructing railroads, harbors, and other public works.

The *Chamber of Commerce or Board of Trade* consists of 24 members and two syndics elected by and from merchants. It possesses certain legislative and executive functions.

The *Bank of B.* has a cap. of \$400,000 and a note circulation of about \$200,000. The *Discount and Deposit Bank* has a cap. of \$2,250,000, and is empowered to issue notes, payable on demand, to the amount of one-third of the bullion in its coffers. There are many other banks and institutions of credit. *Money, Measures, and Weights.* See *GERMANY*.

The *North German Lloyd Steamship Co.*, founded at *B.* in 1857, has a fleet of 30 large iron screw-steamers, running between *B.* and various ports in North and South America. Among these are 8 splendid steamers of 3,500 tons—the *America*, *Dona*, *Main*, *Mosel*, *Neckar*, *Oder*, *Rhein*, and *Weser*, which maintain a regular communication with New York, leaving New York every Saturday for Southampton and Bremen.

**Bremen Blue and Green.** See *VERDITER*.

**Brest.** See *FRANCE*.

**Bretagnes**, a kind of linen goods, made in lengths of 6 or 7 yards by 1 yard wide.

**Brevet d'Invention**, a French patent-right.

**Brevier**, an intermediate-sized type between bourgeois and minion; 112½ lines would be contained in a foot.

**Brewer**, one who manufactures

fermented liquors of any name or description for sale, from malt or from any substitute therefor.

*Internal Revenue Laws of the U. States (Aug. 8, 1878).—*“There shall be paid on all beer, lager-beer, ale, porter, and other similar fermented liquors, brewed or manufactured and sold, or removed for consumption or sale, within the United States, by whatever name such liquors may be called, a tax of one dollar for every barrel containing not more than 31 gals.; at a like rate for any other quantity or for any fractional part of a barrel.—Every person who manufactures fermented liquors of any name or description for sale from malt wholly or in part, or from any substitute therefor, shall be deemed a brewer.—Every *B.* shall, before commencing or continuing business, file with the collector of the district in which he designs to carry it on a notice in writing, stating the name of the person, company, corporation, or firm, their places of residence, description of the premises, and of his or their title thereto, and the name of the owner thereof.—At the time of filing the above notice, the *B.* will pay the special tax required by law, which is \$100 per annum where he manufactures 500 barrels or more per year, and fifty dollars per annum where he manufactures less than 500 bbls. per year.—“Every person who sells or offers for sale malt liquors in quantities of not less than five gallons at one time, but who does not deal in spirituous liquors, shall be regarded as a wholesale dealer in malt liquors, and shall pay a special tax of fifty dollars.—Every person who sells, or offers for sale, malt liquors in less quantities than five gallons at one time, but who does not deal in spirituous liquors, shall be regarded as a retail dealer in malt liquors, and shall pay a special tax of twenty dollars.—Every *B.* on filing notice, as aforesaid, and on the first of May in each succeeding year thereafter, shall execute a bond to the U. S. to be approved by the collector of the district, in a sum equal to twice the amount of the tax which, in the opinion of the collector, said *B.* will be liable to pay during any one month; and conditioned that he shall in all conditions faithfully comply without fraud or evasion, with all requirements of law relating to the manufacture and sale of any malt liquors aforesaid.—Every *B.* shall from day to day, enter, or cause to be entered, in a separate book to be kept by him for that purpose, the kind of malt liquors manufactured, the estimated quantity produced in barrels, and the actual quantity sold or removed for consumption or sale in barrels or fractional parts of barrels. He shall also from day to day enter in a separate book kept for that purpose, an account of all materials by him purchased for the purpose of producing such fermented liquors, including grain and malt. And he shall render to the collector on or before the tenth day of each month, a true statement, in writing, in duplicate, taken from his books, of the estimated quantity in barrels of

such malt liquors brewed, and the actual quantity sold or removed for consumption or sale during the preceding month. — The entries made in such books shall, on or before the 10th of each month, be verified by the oath of the person by whom they are made. The said oath shall be written in the book at the end of such entries, and be certified by the officer administering the same. — Every *B.* who evades, or attempts to evade, the payment of the tax on fermented liquor, or fraudulently neglects or refuses to do any of the things by law required to be done by him as aforesaid, shall forfeit all the liquors made by him or for him, and all the vessels, utensils, and apparatus used in making the same, and be liable to a penalty of not less than five hundred nor more than one thousand dollars, to be recovered with costs for suit, and shall be deemed guilty of a misdemeanor and be imprisoned for a term not exceeding one year. And every *B.* who neglects to keep books or refuses to furnish the account and duplicate thereof as provided by law, or refuses to permit the proper officer to examine the books in the manner provided, shall, for every such refusal or neglect, forfeit and pay the sum of three hundred dollars. — Every *B.* shall affix, upon the spigot-hole in the head of every hhd., bbl., keg, or other receptacle in which any fermented liquor is contained, when sold or removed from such brewery or warehouse (except in case of removal under permit), a stamp furnished by the collector of his district, denoting the amount of the tax required upon such fermented liquor, which stamp shall be destroyed by driving through the same the faucet through which the liquor is to be withdrawn, or an air-lancet of equal size, at the time the vessel is tapped, in case the vessel is tapped through the other spigot-hole, of which there shall be but two, one in the head and one in the side, and shall also, at the time of affixing such stamp, cancel the same by writing or imprinting thereon the name of the person, firm, or corporation by whom such liquor was made, or the initial letters thereof, and the date when cancelled. Every *B.* who refuses or neglects to affix and cancel the stamps required by law in the manner aforesaid, or who affixes a false or fraudulent stamp thereto, or knowingly permits the same to be done, shall pay a penalty of one hundred dollars for each barrel or package on which such omission or fraud occurs, and be imprisoned not more than one year. — The ownership or possession by any person of any fermented liquor after its sale or removal from the brewery or warehouse, or other place where it was made, upon which the tax required has not been paid, shall render such liquor liable to seizure wherever found, and to forfeiture, removal under said permits excepted. And the absence of the proper stamps from any hoghead, barrel, keg, or other vessel containing fermented liquor, after its sale or removal from the brewery where it was made, or warehouse as aforesaid, shall be notice to all persons that the tax has not been paid thereon, and shall be *prima-facie* evidence of the non-payment thereof.

**Bottling.** — Every person who carries on, or attempts to carry on, the business of bottling fermented liquor in any brewery or other place in which fermented liquor is made, or upon any premises having communication with such brewery, or any warehouse, shall be liable to a fine of five hundred dollars, and the property used in such bottling or business shall be liable to forfeiture. Beer intended for bottling must be drawn into stamped packages and removed from the brewery, and the bottling premises must be so separated from the brewery as that the beer must be carried over the public highway to its passage from the brewery to the bottling establishment. — Every *B.* shall, by branding, mark or canse to be marked upon every hhd., bbl., keg, or other vessel containing the fermented liquor made by him, before it is sold or removed from the brewery or brewery warehouse, or other place of manufacture, the name of the person, firm, or corporation by whom such liquor was manufactured, and the place of manufacture; and every person other than the owner thereof, or his agent authorized so to do, who intentionally removes or defaces such marks therefrom, shall be liable to a penalty of fifty dollars for each case or other vessel from which the mark is so removed or defaced. — Whenever any retail dealer, or other person, withdraws or aids in the withdrawal of any fermented liquor from any hhd., bbl., keg, or other vessel containing the same, without destroying or defacing the stamp affixed thereon, or withdraws, or aids in the withdrawal, of any fermented liquor from any hhd., bbl., keg, or other vessel, upon which the proper stamp has not been affixed, or on which a false or fraudulent stamp is affixed, he shall be fined one hundred dollars and imprisoned not more than one year.

The product of U. States taxes on fermented liquors, for the fiscal year ended June 30, 1878, was as follows:

Tax of \$1 per barrel of not more than 31 gals.....	\$9,473,360.70
Special tax of \$30 on brewers manufacturing less than 500 bbls.....	62,144.67
Special tax of \$100 on brewers manufacturing 500 barrels or more.....	150,668.10
Special tax of \$20 on retail dealers.....	191,595.26
Special tax of \$30 on wholesale dealers.....	59,293.06

Total collections on fermented liquors..... \$9,937,061.78

The percentage of each State in the above taxes was as follows:

New York.....	34.5082
Pennsylvania.....	10.0664
Ohio.....	9.4138
Massachusetts.....	8.7520
Illinois.....	5.9654
Missouri.....	5.2093
New Jersey.....	5.0014
Wisconsin.....	4.8876
California.....	3.6880
Maryland.....	2.3063
Michigan.....	2.1277
Iowa.....	1.9422
Indiana.....	1.8233
Kentucky.....	1.2395
New Hampshire.....	1.2046
Minnesota.....	1.1691
The 30 other States and Territories.....	7.9252
	100.0000

TABLE OF U. STATES RECEIPTS FOR TAXES FOR THE 16 YEARS 1863-1878:

*Exhibiting the steady increase in the manuf. of fermented liquors.*

1863.....	\$1,628,933.82	1872.....	\$8,258,498.46
1864.....	2,290,009.14	1873.....	9,324,937.84
1865.....	3,734,928.06	1874.....	9,304,679.72
1866.....	5,220,552.72	1875.....	9,144,004.41
1867.....	6,057,500.63	1876.....	9,571,280.66
1868.....	5,955,868.92	1877.....	9,480,780.17
1869.....	6,099,879.54	1878.....	9,937,061.78
1870.....	6,319,126.90		
1871.....	7,389,501.82		\$109,717,543.59

**Brewers' Grains,** the refuse malt of a brewery.  
**Brewing.** See BEER.

**Bribe,** a present or payment for some illegal purpose; as to a custom-house official to neglect his duty or to connive at fraud.

**Brick,** a common building-material of burnt clay, sand, and ashes, etc.

All the ancient *B.* were made by hand. It is supposed that the Babylonian *B.* were burned in a kiln; that those which the Israelites made in Egypt were baked in the open air; while in many countries they were merely sun-dried. In making *B.* by hand, the clay, tempered by exposure to the air, is mixed with a proper proportion of sand or ashes, and kneaded in a mill to the required consistency. It then is given the proper size and shape with a mould, and after exposure during a certain time to the action of the air, is baked or burnt in clamps or kilns. *B.* are now made almost exclusively by machinery. The best machines employed for making *B.* turn out, in ordinary works, 10 moulds or 60 *B.* per minute, or 18,000 to 20,000 per forenoon. They require the following plant and help per machine: 25 moulds, 4 trucks, and 8 men. If operated by steam, a machine turning out 18,000 per day requires 8 horse-power nominal high-pressure. In the machine here represented (Fig. 46), called the *Piston Brick-Press*, the clay passes from the hopper *U* into the box *S*; the latter is then moved by the cam *K* and the intermediate arm *V*, shifting the charge of clay over the mould *M*, into which it drops. The box *S* then retires, and the plunger *O* descends, being driven by toggle *B*, and

Fig. 46. — BRICK-MACHINE.

compresses the clay in mould M. The cam F, which regulates the motion of the said plunger, then causes the plunger O to rise, and cam L raises the plunger N, which removes the brick from the mould, to be swept from the table by the next forward movement of the box S. — *Burning*. Some *B.* require to be dried before burning, but not all. In the ordinary kilns there is a great loss of heat occasioned by the escape of hot air and smoke into the open air, no arrangements being made to economize it. To obviate this loss, Hoffman, of Berlin, has invented a much-improved kiln, capable of burning 25,000 *B.* per day. The kiln, 160 feet in diameter, is a kind of tunnel or arched passage running in a circle. Round the outside are 24 doors, opened or closed as may be needed; these belong to 24 compartments, into which the ring-formed passage is divided; and 24 flues lead from these compartments to a central chimney, with valves to cut off communication. There are dampers, easily opened and closed, between the several compartments. The compartments are filled with newly-made *B.* at different times, and are emptied at different times, in such a way that the heat, when it has done its work, travels on to other compartments, and is never wasted by escaping into the open air. — When the *B.* are sufficiently baked, they are divided into classes known as *cutters*, fine close-grained *B.*, rather soft, and better suited for work in which the *B.* requires cutting; *picked stocks*, *B.* of a uniform red tint; *paviors*, hard *B.* fit for paving; *common stocks*, or ordinary *B.*; *grizzles*, or soft *B.*, and *burrs*. The *B.* also vary in color, according to the degree of heat to which they were exposed. Kiln-baked *B.*, also called *maln B.*, are made of a finer clay, which contains a considerable quantity of carbonate of lime; for which reason great care is taken to prevent the air getting to the *B.* while they are baking, for this would cause the lime to pass into a caustic state; and, when exposed to the action of the atmosphere, it would absorb moisture, which would cause it to swell and burst the *B.* in pieces. *Malms* are used for ornamental purposes, being of a pretty buff color. They are less durable than the common *B.* Fire-*B.* are made of clay containing a considerable quantity of silicate of alumina, and as free as possible from lime in any form, or iron. The clay is carefully prepared, and the *B.* are exposed to an intense heat in kilns, as they are used in the building of furnaces and for other purposes, for which it is necessary that they should be able to withstand the action of fire. Paving *B.* are made of clay which contains a great amount of silica, that fuses when the *B.* are burnt, and causes them to become very hard. — *B.* are made almost everywhere, but those manuf. in Philadelphia, Baltimore, Milwaukee, and on the Hudson, are the best known in commerce. The size of American *B.* varies in the different States, running from  $7\frac{3}{4}$  to  $8\frac{1}{2}$  inches in length, 4 to  $4\frac{1}{2}$  in width, and from  $2\frac{1}{4}$  to  $2\frac{1}{2}$  in thickness. — *Bath B.* A scouring brick of calcareous earth, used in cleaning knives and for polishing purposes, made at Bridgewater, Somerset, England.

**Brickbat Cheese**, an English cheese made in Wiltshire of new milk and cream, so named from the shape of the square pieces into which it is formed.

**Bricklaying**, in building, the business of building with bricks.

**Brick-Mould**, a box in which clay for bricks is

moulded into shape. It is usually destitute of top and bottom, lies upon a board which, being filled, and when lifted, leaves the brick in position to dry.

**Brick-Nogging**, brick-work built up between timber framing.

**Brick-Tea**, a kind of adulterated tea sold in some parts of Asia, formed of the refuse tea-leaves and sweepings of granaries, dampened, and pressed into a mould, generally with bullock's blood. The Tartars and Thibetans make a soup of it with milk, butter, and salt.

**Bridge**, any structure carried across water or a roadway, for the purpose of connecting the opposite sides of a river, gorge, valley, etc., by means of certain materials, forming a passage from one side to the other. It may be of stone, brick, iron (cast or wrought), timber, or suspended from chains or wires, in which case it is termed a *suspension-bridge*.

**Bridle**, a curb or leather head-piece with guiding reins and a bit for horses.

**Bridoon**. See BRADOON.

**Brier-Wood Pipes**. See WOOD-PIPE.

**Brig**, a vessel with two masts, square-rigged in the same manner as a ship; the spanker and spanker-boom being in the brig attached to the mainmast.

**Brigantine**, a hermaphrodite brig, a two-masted vessel, that is brig-rigged forward and schooner-rigged aft, with a fore-and-aft sail in place of a mainsail.

**Brightening**, in calico-printing, a process of rendering the color of prints more brilliant by boiling in soda, etc.

**Brill**, a large flat fish resembling a turbot, but inferior to it as food.

**Brilliant**. See DIAMOND.

**Brilliant**, figured shirtings made in lengths of about 16 yards.

**Brimstone**. See SULPHUR.

**Brine**, the salt water pumped up from the brine springs (see SALT). — The salt in which beef or pork is being pickled, when liquefied by the juices of the meat.

**Brisbane**. See QUEENSLAND.

**Bristles**, [Fr. *soies*; Ger. *borsten*; It. *setole*; Russ. *schtschetina*; Sp. *cerdas*, *setas*], the strong, glossy hairs growing on the back of the hog and the wild boar. They are extensively used by brushmakers, shoemakers, saddlers, etc. They are of various colors, but before being used for brush-making, they are sorted into *black*, *grey*, *yellow*, *white*, and *lilies*. The lilies are silvery white in color, and are used for the best shaving- and tooth-brushes. The *B.* vary from 3 to 10 inches in length, the moderately long being better than the very long. The white are better than the yellow and the yellow better than the black; the wiry are better than the limp. Other things being equal, the thickest *B.* are the most sought after, and fetch the highest price per pound. The improved breeds of the hog are almost without hair, and the few they have are too soft; American *B.* are therefore of little value. Our supplies of *B.* are chiefly obtained from Russia, where the wild boar abounds, and to a small extent from Belgium, France, and Germany. They come tied into bundles and packed into casks containing from 400 to 500 pounds each. The value of *B.* imported in 1878 was \$614,110. Imp. duty, 15 cents per pound.

**Bristol**. See GREAT BRITAIN.

**Bristol-Board**, is a kind of strong card or

pasteboard, made smooth by glazing, and largely used by artists. The sizes are cap, demy, and medium, and of two and three sheets in thickness. It was first made at Bristol. In England, however, the first quality of drawing-boards is known as *London board*. *Imp. duty, 35 per cent.*

**Bristol-Stone**, a kind of quartz or rock-crystal, found at Clifton near Bristol, and used for vases, urns, mirrors, etc. The finest specimens, when cut and polished, are known as *Bristol diamonds*. *Imp. duty, 10 per cent.*

**Britannia Metal**, is a compound of tin and antimony, in the proportion of about 10 to 1, with sometimes a little zinc and copper. It is almost as white and brilliant as silver, and is hence very largely employed in making coffee and teapots, hot-water jugs, soup tureens, gravy and vegetable dishes, wine-coolers, liqueur stands and waiters, and other articles of table service—appearing something like silver, but much cheaper. It has remarkable ductility, which enables it to be worked by the process of *metal-spinning*; in which thin sheets are burnished or swaged down upon wooden moulds or other models, to the convexities and concavities of which they adapt themselves with remarkable facility. *Imp. duty, 35 per cent.*

**Britannia Ware**, or **BRITISH WARE**. See ALBATA.

**Britannias**, a kind of fine linen, exported in pieces from England to South America.

**British Brandy**, a common kind of brandy; a rectified and flavored corn-spirit, highly colored, and made in London.

**British Gum**. See DEXTRINE.

**Britt**, a very small kind of herring, *Clupea minima*, which sometimes appears in incredible numbers on the American coasts, serving as food for other fish.

**Britzaka**, a travelling carriage or chariot.

**Broach**, a tool or fitting for an Argand gas-burner.

**Broad-Cloth**, a fine kind of woollen for men's garments, exceeding 29 inches wide; all of less width are known as narrow cloths.

**Broad-Gauge**. See GAUGE.

**Broad Glass**, inferior or spread window-glass.

**Broadside**, a printer's term for a full printed page of any sized sheet.—The full length or side of a ship.

**Brocade**, a stuff of stout silk, raised and enriched with gold and silver flowers, foliage, etc., which was held in high repute for the dresses of both sexes during the 17th and 18th centuries.—A cloth of gold and silk, which in Eastern countries bears the name of *kinkebaba*.

**Brocatelle**, the French name for linsey-woolsey.—A silk material for drapery, linings for carriages, etc.

**Broccoli**, the *Brassica oleracea*, a variety of the cabbage, and a highly esteemed garden vegetable. It has considerable resemblance to cauliflower, from which it differs by the purple or green color of its heads.

**Brogans**, are rough-made and heavy shoes, chiefly worn by laborers and miners.

**Brogues**, the shoes of the Irish peasantry.—A name for breeches.

**Broken-Backed**, a term applied to a vessel which is hogged or loosened so as to droop at each end.

**Broker**, a person employed as an agent or middleman to transact business between merchants or

other individuals. *B.* generally confine themselves to negotiations for the purchase and sale of some particular articles, by which means they acquire an intimate knowledge of their qualities, as well as an acquaintance with the sellers and buyers, and the state of supply and demand; and they are thus enabled to negotiate between dealers on terms equitable for both. A merchant seldom has the same intimate knowledge for his guidance, and therefore generally finds it advantageous to effect his purchases and sales through the medium of *B.* In large commercial places, there are separate *B.* for almost every leading article of trade, as cotton *B.*, tea *B.*, produce *B.*, etc. Besides the commercial *B.* there are other kinds of *B.*, for which see CUSTOM-HOUSE *B.*, EXCHANGE *B.*, INSURANCE *B.*, NOTE *B.*, SHIP *B.*, STOCK *B.* See also PAWNROKER.

**Brokerage**, the commission or percentage paid to brokers on the sale or purchase of bills, funds, goods, etc. See COMMISSION.

**Brom**, a fermented liquor made from glutinous rice in Java.

**Bromine**, a substance obtained by a chemical process from the uncrystallizable residue of seawater, commonly called *bittern*. It is a liquid of a deep reddish-brown color and disagreeable, suffocating odor. Sp. gr. 3. It is used in medicine for the same purpose as iodine, and also to some extent in photography. It bleaches as well as chlorine, but is poisonous to animal life. *Imp. free.*

**Bronze**, [Fr. *bronze*; Ger. *stückgut*, *stückmetall*; It. *bronzo*; Sp. *metal de canones*,] an alloy of copper and tin, much harder and more fusible than copper, but less malleable. When well prepared it is the most durable of metallic materials, except gold, platinum, and some rare metals. It is much used for bells, cannon, large statues, toothed wheels, and other castings, as well as for fine ornamental statuettes, figures, clocks, cups, etc., and various kinds of stamped work. So greatly do the proportions vary, that while large bell *B.* has only 3 parts of copper to 1 of tin, machinery *B.* has often 10 to 1. The usefulness of this alloy depends chiefly on its being very hard and very durable; but it is also sonorous and pleasant in color. *Bronzes* is the common name for *B.* statuettes, figures, and other ornamental *B.* goods. *Imp. duty (B. and all manuf. of), 35 per cent.*

**Bronze Paint**, or **Gold Paint**, a mixture of gold-colored bronze powder with turpentine dissolved of its acid.

**Bronze Leaf**. See DUTCH LEAF.

**Bronze Powder**, a metallic powder resembling gold dust, and prepared in every shade of colors, by reducing Dutch leaf into powder by levigation with oil, to prevent oxidation. The principal uses of bronze colors are for japanning and bronzing tin and iron goods, statues, gas-fittings, papier-mâché work, printing, ornamental painting, and such like purposes. They are chiefly imported from Germany. *Imp. duty, 20 per cent.* See DUTCH LEAF.

**Bronzing**, is the process of covering articles of metal, wood, clay, plaster, etc., with bronze powder or other compositions, which give to them the appearance of bronze. The process and the composition of the coating vary with the articles to be coated.

**Brood-Mare**, a mare kept for breeding from.

**Brooklyn**, a city and seaport of the U. States,

cap. of King's Co., New York State, at N. W. end of Long Island, opposite New York city, from which it is separated by an arm of the sea called the East River, which is  $\frac{3}{4}$  of a mile wide, and with which it will soon be connected by a suspension-bridge now building, which is a marvel of modern engineering. *B.* has an extensive waterfront; and along the shore immense works have been constructed to facilitate commerce, the Atlantic Dock alone containing an area of 40 acres, with sufficient depth of water for any vessel. The docks and piers at South *B.* are among the most extensive and commodious in the country. Ship- and boat-building and repairing are extensively carried on at East *B.* and the N. E. part of the city called Green Point. Upon Wallabout Bay, a deep indentation of the sea between East and West *B.*, is located a U. S. Navy-Yard, occupying an area of 45 acres. In the extent and variety of its manufactures, *B.* ranks among the first cities in the Union. *B.* has also considerable shipping interests, but its trade is so intimately connected with that of New York, that, commercially speaking, *B.* can scarcely be said to have an independent existence. *Pop.* about 500,000. See NEW YORK.

**Brooklyn Bridge.** See EAST RIVER BRIDGE.

**Broom,** is a name common to several shrubs. The branches of the common *B.* of Europe, *Cytisus scoparius*, are used for making brooms, and its young tops and seeds, which are strongly diuretic, are used in medicine. The flowers of the green-wood or dyers' broom, *Genista tinctoria*, yield a bright yellow coloring matter, used by dyers.

**Broom-Corn,** a kind of grass, *Sorghum vulgare*, chiefly cultivated for its stalk, to make brooms. The tops are cut about two feet long, packed in bales, and sold by the 100 lbs. This plant is extensively grown in New York, New Jersey, and other parts of the U. States.

**Broom-Handle,** a slight wooden stick, made of light wood as ash, pine, etc., and prepared to fix in broom-heads. They are manuf. in almost all the Northern and Eastern States, and sold by the 100 or by the 1,000, in bundles.

**Broom-Head,** in broom-making, a clasp or cap for holding the bunch of broom-corn, so that a worn stump may be removed, and fresh brush substituted. There are broom-heads of very many forms.

**Brooms,** [Fr. *balais*; Ger. *besen*; It. *scope*; Sp. *escobas*,] well-known utensils, so called from having been originally made in England of broom twigs. In America they are generally made of broom-corn, and from hickory saplings made into splits. Fine hair-brooms are imported from France and England. *Imp. duty* for all kinds of brooms, 35 per cent.

**Brougham,** is a closed carriage, with a single inside seat for two persons, and an elevated driver's seat. The front is glazed, and the fore-wheels turn on a short lock.

**Brow-Band,** is a band of a bridle, head-stall, or halter, which passes in front of the horse's forehead, and has loops at its ends, through which pass the check-straps.

**Brown,** a dark, dusky, tertiary color, which is a mixture of red and black of various degrees of depth. *B.* pigments, employed by painters, are derived from the mineral and vegetable kingdoms, but chiefly the former. They comprise *umber*, *raw* and *burnt sienna*, *biatre*, *brown madder*, *Vandyke*,

*Spanish B.*, *purple B.*, *washed B.*, and others. In glass and enamel painting, *B.* effects are often produced by substances which are not *B.* in themselves, such as sulphates of some of the metals; while in dyeing and calico printing, *aniline*, *annotto*, *fustic*, *sumach*, *logwood*, and *alum* are all employed in various ways to produce browns.

**Brown Coal,** a variety of lignite, of a brownish-black color, of which there are beds on the borders of Cheesapeake Creek, in Middlesex Co., N. J. It differs from stone-coal by its tendency to split and fall to powder when exposed to the air, and by containing water, which interferes with its value as fuel.

**Brown Cottons,** are unbleached muslins, which vary from 27 to 108 inches in width, and are used for sheetings, shirtings, etc. Their relative prices depend on their weight and trade-mark.

**Brown Grease,** a grease obtained by pressure from wool skins. *Imp. duty*, 20 per cent.

**Brown Hemp,** a name in Bombay for the valuable fibre of *Crotolaria juncea*.

**Brown Holland,** an unbleached linen, used for various articles of clothing and upholstery. It chiefly comes from Scotland. *Imp. duty*, 35 per cent.

**Browning,** a shining brown lustre given to surfaces of articles of metals, as gun-barrels, etc., by chloride of antimony, or other compounds.

**Brown Ochre,** a peroxide of iron.

**Brown Paper,** is a coarse kind of wrapping-paper, made from unbleached junk, hemp, refuse flax, etc. There are various qualities, from *manila* to *straw*.

**Brown Spar,** a crystallized form of carbonate of iron.

**Brown Stone,** a dark variety of the red sandstone, chiefly brought from quarries on the Connecticut River, and much sought for in New York as a building-stone.

**Brown Stout,** a fermented liquor; a superior kind of porter.

**Brown Sugar,** the common dark Muscovado sugar. In commerce the term is applied to all grades of sugar which are not whitened by the refining process. See SUGAR.

**Brown Ware,** a common variety of pottery, named from its color.

**Brow-Post,** a carpenter's term for a beam that goes across a building.

**Brucine,** or BRUCIA, a very bitter and poisonous vegetable alkaloid, extracted from the bark of the *Strychnos nux vomica*. It is characterized by giving a blood-red color with concentrated nitric acid. Its toxicological effects are like those of strychnia, but it is far less active. Average cost in New York, \$3 per  $\frac{1}{4}$  oz. *Imp. duty*, 40 per cent.

**Bruiser,** a concave tool used in grinding lenses or the specula of telescopes.

**Bruising,** in leather manuf., the process of extending and rubbing on the grain-side, after it has been *grained* by folding grain-side in, and rubbed with a *crippler*.

**Bruising-Machines,** are crushing machines for breaking or grinding pulse, oats, Indian corn, etc., for cattle.

**Bruising-Mill,** a hand-mill in which grain for feed, malt for brewing, and flax-seed for pressing, are coarsely ground. It consists of two cast-iron rollers mounted on a strong frame, and so arranged that grain is carried between them and crushed more or less according to the degree to

which the rollers are tightened up by the hand-screw at the end of the frame.

**Brujula**, the Spanish name for the mariner's compass.

**Bruneta**, a kind of coarse black Spanish cloth.

**Brunswick**, [Ger. *Braunschweig*.] a duchy of the empire of Germany, consisting of five detached portions of territory, occupying part of the immense plain extending from the Hartz Mountains to the German Ocean, and contiguous to Hanover and Prussia. Area, 1,526 sq. m. Pop. 327,493. Capital, Brunswick, an old but fine city on the Ocker, 8 m. S. E. of Hanover; pop. 65,938. The government is a constitutional monarchy, regulated by the fundamental law of Nov. 28, 1851.

The northern districts, particularly Wolfenbüttel, have an undulating surface, and their soil is highly productive; the southern, including the Blankenburg territory, which lies within the limits of the Hartz, are composed of a succession of mountains, in part well wooded and studded with highly cultivated valleys. The aspect of the whole of the duchy is indicative of good order and prosperity. The principal articles of home manufacture exported, are timber, yarn, linen, grain, oil, chicory, madder, leather, hops, and ironware. *B.* has no coast, but it communicates with the German Ocean by means of the Weser and the Elbe.

**Finances.** The annual revenue is about \$7,000,000, with expenditure of same amount. The public debt in 1878 was 91,874,442 marks, or \$22,968,610, mostly contracted for the establishment of railroads.

**Money, Weights, and Measures.** See GERMANY.

**Brunswick Green.** See VERDITER.

**Brush**, [Duster, Fr. *brosse*; Ger. *bürste*.] Paint-brush, Fr. *pinceau*; Ger. *pinsel*.] a daubing and cleansing implement, of which there are endless varieties, for clothes, the hair, sweeping, painting, white-washing, etc. They are generally made of hogs' bristles, the whiter and better kinds being employed for hair-, tooth-, clothes-, and hat-*B.*, and also for the better classes of paint-*B.* The bristles are first sorted according to color, and then, by means of a series of combs, having teeth formed of needles of various sizes, and placed at different distances apart, they are assorted according to size, by employing at first the largest comb and then in succession the smaller ones, fixed to a work-table.—*Paint-B.*, the simplest form of *B.*, is made by inserting full-length bristles between two projecting prongs on the handle, and securing them by a wrapping of twine, which is afterward protected by a coating of glue mixed with red-lead. In other paint-brushes the bristles are surrounded by a metallic cap, which binds them to the handle. In large paint-brushes and painter's dusters, the handle is secured by driving its smaller end foremost into the bristles, placed within an iron cup, which binds them fast.—*Hair-B.*, *Dusters*, etc., are made by inserting tufts of bristles into a stock or head previously bored with holes for their reception. These are frequently bored angularly to the face, or the face itself is rounded so as to give the tufts an outward splay when inserted; the root-ends are first dipped into melted pitch, then bound with thread, again dipped, and then inserted with a sort of twisting motion. *B.* of this description are usually made with bristles of the full length, but where stiffness is required, as in scrubbing, hair, and other similar brushes, each tuft of bristles is doubled so as to present both ends outward; these are then cut off square and even, presenting a hard surface, especially when the doubling is made near the root-ends. The best sorts of *B.* are *trepanned*; in this process a number of holes are drilled in the bone back either transversely or longitudinally, and a num-

ber of holes are sunk through to these from the face-side of the brush; the tufts are then drawn with strong threads or silk, and the longitudinal or transverse holes filled with plugs of bone or ivory. Whalebone cut into strips, and split, is used in the same manner as bristles, to form *B.*, either by itself or in conjunction with bristles. In the latter case, the adulteration is soon detected by the more rapid wear and splitting of the ends of the whalebone. The *Woodbury's B. machine* is now used for making common *B.*—The smallest kind of *B.*, called *pencils*, are used in water-color, and some kinds of house, sign, and coach painting. They are made by inserting a tuft of camel, badger, squirrel, goat, fitch, or sable hairs with their roots bound together into a quill previously softened, which, in drying, serves to hold them fast; for the larger size, a tin tube, either round or flat, is employed.

**Brush-Weir**, a weir formed of stakes, driven at regular intervals, and interwoven with twigs, for catching fish in shallow bays, rivers, etc.

**Brush-Wheel**, a circular, revolving brush, used by the turner or lapidary for polishing, etc.

**Brussels.** See BELGIUM.

**Brussels-Carpeting.** See CARPET.

**Brussels-Lace.** See LACE.

**Brussels-Sprouts**, small delicate sprouts, produced in the axils of the leaves of a variety of the common cabbage. They are used as a pot-herb.

**Bryony Root**, the acrid root of black bryony, *Tamus communis*, by some considered a good substitute for sarsaparilla. The young shoots are eaten as asparagus in Italy.

**Bubble**, a small glass bead or hollow floating globe for testing the strength of spirits.—A familiar name applied to a fraudulent or unsubstantial commercial project, which holds out hopes of rapid gain, for the purpose of enriching the projectors at the expense of sanguine and ignorant adventurers; and particularly used to designate those projects the funds for which are raised by the sale of shares or subscription to a transferable stock. The term, which originated in England at the beginning of the last century with the collapse of the South Sea scheme, is now seldom used.

**Buchu Leaves**, the leaves of *Barosma crenata*, a small shrub growing at the Cape of Good Hope. They have an aromatic smell, and are esteemed in pharmacy for their diuretic properties. *Imp. free.*

**Buck**, a male rabbit; also applied to deer, to a ram, and to a male goat.

**Buckbean**, a name for the marsh trefoil, *Trifolium paludosum*, which has some medicinal properties, being tonic and cathartic.

**Bucket**, a lifting pail or vessel for holding water, made of wood, leather, metal, gutta-percha, or other material.

**Buckhorn**, a name in the west of England for any fish salted or dried in the sun.

**Bucking**, the process of cleaning or bleaching linen and cotton goods in an alkaline lye.

**Buckingham-Lace**, a common description of lace resembling Alençon lace.

**Bucking-Hammer**, an instrument for crushing ores fine for sampling.

**Buckle**, a link of metal or other substance for fastening harness, belts, or parts of dress together. They are used as fastenings for shoes, knee-bands,

ladies' waist-belts, etc. *B.*, as shoe and knee ornaments, have gone out of fashion. *Imp.* duty, according to material.

**Bucke-Chape**, the part by which the buckle is affixed to the band.

**Bucklers**, are blocks of wood made to fit in the hawser-holes of a ship.

**Buckram**, [Fr. *bougran*; Ger. *schettre*; Port. *olandilha*; Sp. *bucaran*,] a coarse kind of linen or cotton fabric, having a peculiar stiffness imparted to it by strong gum and calendering, and chiefly used in the making of clothes, to keep them in the proper shape. *B.* are  $\frac{1}{2}$  wide; when formed of cotton, they are generally in pieces of 28 yards in length; when of linen, 25 yards.

**Buckskin**, the white tanned skin of the common deer, from which gloves are made. The name, however, is frequently given to the tanned skins of the kid and goat, sheep, and lamb, and sometimes to calf-skins. *B.* leather is used for boots and shoes, breeches, saddle-seating, braces, polishing leathers, etc. *Imp.* duty, 25 per cent.

**Buck-Thorn**, is the *Rhamnus catharticus*. A syrup is made from the berries, which is used in medicine. The juice stains the paper green.

**Buckum-Wood**. See JAPAN WOOD.

**Buckwheat**, [Fr. *blé sarrasin*, *blé noir*; Ger. *buchweizen*, *heidekor*; It. *grano saraceno*; Port. and Sp. *trigo saraceno*, *trigo negro*,] a kind of grain, of a triangular form, produced by the *Fagopyrum esculentum*, an animal plant which grows on the poorest soils, with a strong branching stem of a reddish color. Its grain, when ground, produces a fine flour, which, in the poorest districts of France and other European countries, is made into bread, which is very wholesome. In the U. States, the *B.* flour enters into the composition of the well-known and delicious *B. cakes* (called in England *crumpets*). The grain is, next to Indian corn, the most valuable food for cattle, horses, poultry, etc. In this country two-thirds of the *B.* crop is annually produced in New York and Pennsylvania, to meet the winter demand for *B.* flour in the seaboard cities. The area of its cultivation is small, and not very rapidly extending, as shown in the following statement:

Years.	Bushels.	Value.	Value per bushel.	Value per acre.
1870 .....	9,841,500	\$7,725,044	\$0.784	\$14.38
1871 .....	8,328,700	6,900,268	82.8	16.67
1872 .....	8,133,500	6,747,618	82.9	15.04
1873 .....	7,837,700	6,382,043	81.4	14.05
1874 .....	8,016,600	6,477,885	80.8	14.31
1875 .....	10,082,100	7,166,267	71.0	12.45
1876 .....	9,668,800	7,021,498	72.6	10.53
1877 .....	10,177,000	6,998,810	68.7	10.76
Total.....	72,085,900	\$55,419,433	.....	.....
Average..	9,010,737	\$6,927,429	\$0.768	\$13.20

**Buck-Yam**, the *Dioscorea triphylla*, which is a native of Java, and is also grown in the West Indies for its tubers.

**Bucosidad**, the Spanish term for tonnage or capacity of a ship.

**Bude Light**, is an extension of the principle introduced in the Argand lamp. There is not only one cylindrical ring of burners, but sometimes two, and even three, are placed concentrically; and, to produce very powerful effects, the

interior of the flame is fed with oxygen instead of common air.

**Budget**, is the name applied in several countries of Europe to the annual statement of the public revenue and expenditure, submitted in England by the Chancellor of the Exchequer to the House of Commons, and in France by the Minister of Finances to the Chamber of Deputies. The accounts which accompany the statement show on one hand the sums required for the public service during the year, under the heads of Army, Navy, Public Instruction, etc., together with any incidental charges; and on the other hand are given the *Ways and Means* for meeting the same, consisting of the surplus (if any) of the preceding year, the annual taxes and duties, and such incidental receipts as come in aid of the national revenue.

**Buenos Ayres**. See ARGENTINE CONFEDERATION.

**Buff**, a color somewhat between pink and primrose-yellow.—Leather prepared from the skin of the buffalo, elk, etc., by imbuing it with an aluminous compound, and afterwards some oily matter; formerly much used for waist-belts and other military accoutrements.—A wheel coated with buff-leather, and used in polishing cutlery, etc.

**Buffalo**, a large and beautiful city and port of entry of the U. States, cap. of Erie co., in the State of New York, in lat. 42° 53' N., lon. 78° 55' W., situated at the E. extremity of Lake Erie, where it contracts into Niagara River, 22 m. S. of Niagara Falls, and 293 m. N. W. of New York city. *B.* is the third city of the State in population and wealth; it is the western terminus of the Erie Canal, and it has railroad trunk lines in almost every direction. Commanding the bulk of the trade of the Great Lakes by its numerous vessels, and controlling a large Western business by its almost unlimited railroad facilities, *B.* has long been a most important commercial entrepôt. It has large manuf. of agricultural implements, car-shops, flouring-mills, etc.; it has also numerous blast-furnaces, rolling-mills, machine-shops, stove-foundries, iron shipyards, etc. Its manuf. interests are steadily and rapidly increasing. It is, however, to its enormous traffic in grain that *B.* owes much of its importance and wealth. There are along both sides of the creek 30 elevators, having an aggregate capacity for storage of 7,000,000 bushels, and daily transfer capacity of 3,000,000 bushels. Separated only from Canada by the Niagara River, *B.* has with that country a very large trade. In 1878 its imports from Canada amounted to \$3,258,576, and its exports to same to \$193,684. *B.* creek is navigable for about 8 miles, and admits vessels drawing 14 feet of water. A pier, 1,500 feet in length, with a light-house upon it, facilitates the navigation; but, owing to the accumulating of ice at the end of the lake, the harbor becomes inaccessible during the cold months of the year. In 1878 the port was entered by 162 American and 293 foreign vessels, having an aggregate tonnage of 69,115; and cleared by 138 American and 264 foreign vessels, whose aggregate tonnage was 58,590. The registered marine of the port, on the 1st of Jan., 1879, was 224 vessels, of 99,529 tons, of which 119 were steam vessels. Two extensive establishments are devoted to iron ship-building; these have constructed the finest lake steamers, besides supplying the Government with a number of iron revenue vessels. *Pop.* about 150,000.

**Buffalo and Southwestern R.R.**, runs from Buffalo to Jamestown, N. Y., 66.5 m. This Co., whose offices are in Buffalo, was organized under its present title in 1877. Cap. stock authorized, \$2,000,000; subscribed, \$1,379,400; paid in, \$1,367,343.95; funded debt, \$1,432,695, interest 6%; and floating debt, \$127,706.47.

**Buffalo, Bradford, and Pittsburg R.R.**, runs from Carrollton, N. Y., to Gilesville, Pa., 25.97 m. This Co. was formed in 1859, by the consolidation of Buffalo and Pittsburg R.R. of N. Y., and Buffalo and Bradford R.R. of Pa. The road was opened in 1866, and leased to the Erie R.R. Co. for 499 years. Cap. stock, \$2,286,000; mortgage bonds, \$580,000, payable 1896, interest 7%.

**Buffalo Hides**, are the hides of the tame buffalo of India. They are largely exported from Manilla and other Eastern ports.

**Buffalo, New York, and Erie R.R.** This line runs from Buffalo to Painted Post, N. Y., 139.95 m., and was organized in 1858 as successor to the Buffalo, Corning, & New York R.R., bankrupt. In 1863 it was leased to the Erie R.R., at an annual rent of \$233,100. Cap. stock, \$950,000; funded debt, 7% bonds, \$2,380,000.

**Buffalo, New York, and Philadelphia R.R.**, runs from Buffalo, N. Y., to Emporium, Pa., 120.55 m. This Co., originally the Buffalo & Allegheny Valley R.R., was chartered under its present title in 1871. Its offices are in Buffalo. *Financial Statement*: Cap. stock authorized, \$3,500,000; subscribed, \$2,333,100; paid in, \$1,968,950. Funded Debt: first mortgage 6% bonds, payable 1896, \$3,000,000; second mortgage 10% bonds, payable 1893, \$807,500; total, \$3,807,500; floating debt, \$711,339.29. Total, \$4,518,839.29. Net earnings for 1877-78, \$450,449.15.

**Buffalo-Robes**, the unshorn, furry, dressed skins of the buffalo or bison of the regions of the Rocky Mountains (Fig. 47), of which thousands of

FIG. 47. — BISON, OR AMERICAN BUFFALO.

bales are still annually forwarded to the Eastern markets of the U. States and Canada, though the animal is becoming less year by year. *Imp. duty*, 20 per cent.

**Buffer**, a striking-block with elastic springs attached to a railroad carriage, for deadening the concussion received from the engine.

**Buffet** [Fr.], a kind of open cupboard or side-board, on which plate and glass are kept for ready use, or for show.

**Buggalow**, a crazy, ill-built, decked vessel, used in the coasting trade of the peninsula of India, with one mast and a latin sail.

**Buggy**, in the U. States, a light four-wheeled carriage with a movable calash top; in England, a sporting dog-cart; in India, a kind of gig.

**Bugle**, a kind of glass bead, formed into small capillary pipes, and broken into various lengths, used for ornamenting dresses. They are chiefly

made in the Levant, Austria, and North Italy. *Imp. duty*, 50 per cent. — A brass musical wind instrument, which has been improved by the addition of six keys so as to be capable of all the inflections of the scale. It is also called Bugle-horn. *Imp. duty*, 30 per cent.

**Buhl-Work**, is a kind of inlaying, in which a metal ornament is inserted in wood in such a way that both may be brought to the same level. The art was carried to much perfection by M. Buhl, a French cabinet-maker, in the time of Louis XIV. He usually employed a brass inlay upon tortoise-shell; but the combination may be varied almost *ad infinitum*, the two substances being usually as thin as veneers. The two veneers are glued to the opposite sides of a piece of paper; another piece of paper is glued or pasted to the outside of one of them; the device or pattern is drawn on the outside paper; and then the two veneers are cut through and through, following the line or lines of the device. This cutting is effected with a *buhl saw*, very fine, narrow, and thin, and fixed in a bowed or arched frame. When the cutting is completed, the two layers can easily be separated; and then two pieces of buhl-work may be produced, for each one serves as an inlay to the other. These inlays are placed as veneers to the surface of a cabinet, work-box, or any other article of ornamental furniture. Buhl, the cabinet-maker, mostly employed, as we have said, brass upon tortoise-shell; Reisner, a contemporary in the same trade, preferred tulip-wood upon some darker wood; and this is the chief difference between *buhl-work* and *reisner-work*. But the same principle will apply to ivory, mother-of-pearl, and a large number of other substances. Cheap imitations of buhl-work are produced by cutting out the veneer patterns with a stamping-press, instead of by sawing.

**Builder**, one who superintends and carries out building operations from the plans of an architect.

**Builders' Materials**, lime, cement, sand, hair, lathes, &c.

**Builders' Measurement**, a distinction in the admeasurement of mercantile tonnage; builders' admeasurement being nearly double the legal registered tonnage of a ship.

**Bujran**, a round-bottomed barge without keel, containing two or three cabins, used on the Ganges.

**Buke-Muslin**, or BOOK-MUSLIN, a plain, clear kind of muslin, woven for working in the tambour, and used for ladies' dresses.

**Bulk**, the whole dimensions of anything. The chief contents of a ship's cargo when laden; as, iron formed the *B.* of her freight. — A sale of merchandise by *B.* is a sale of a quantity such as it is, without measuring, counting, or weighing. — *Stowed in B.*, in shipping, is to have the cargo loose in the hold, and not packed in bales, cases, &c.

**Bulkheads**, the divisions or partitions of wood or iron which separate the interior of a ship into rooms or compartments. They are now often *water-tight*, being plates of iron so closely fastened to the sides, decks, beams, etc., as to render each compartment *water-tight*, and therefore buoyant, in case of injury to other compartments by wreck or by an enemy's shot.

**Bull**, in the language of the Stock Exchange, is a speculator who binds himself to take certain stocks or bonds at a price then fixed, said bonds to be delivered only at some future date. The difference in the price between time of sale and time of delivery makes the profit or loss on the transaction; for the purchaser buys what he does not

wish to receive, and the seller, called in the same language a *bear*, sells what he does not possess. If the stocks have at date of delivery increased in value since the date of sale, the balance is paid by the seller to the buyer; if the reverse, the seller receives the difference. Thus the interest of each party to the contract lies in the rise or fall of price of the stocks, and many stratagems are resorted to by the *B.* to increase the market price of the stocks, and by the bears to decrease it. It is a recognized form of gambling, by which vast sums change hands daily.

**Bullah**, a measure of weight for grain in Mysore, equal to  $4\frac{1}{2}$  lbs.

**Bullen-Nail**, a nail with round head and short shank, tinned and lackered, and used principally for hangings of rooms.

**Bullet**, is the general name for any kind of leaden projectile discharged from a rifle, fowling-piece, or pistol. Since the perfecting of the rifle, *B.* have been made oblong, egg-shaped, or pointed at one end, and scrupulously formed at every part. *B.* were formerly singly cast in moulds. In 1855, Robert Napier, a Scotch engineer, invented a machine to make them by compression, insuring much truer sphericity of form than before, and producing 40,000 *B.* a day. Other machines have been since invented, which are doubly as rapid in their action as Napier's.

**Bullet-Mould**, a mould for casting leaden balls for guns, etc.

**Bullion**, the commercial term for uncoined gold and silver, either when smelted and not perfectly refined, or when refined and melted down in bars or ingots. In political economy, the term is frequently used to denote the precious metals, both coined and uncoined. *Imp.* free. See **GOLD** and **SILVER**.

**Bullion-Brokers**, a dealer in precious metals, either coined or uncoined.

**Bullock**, a gelded bull.

**Bullocks' Hides**, a commercial name for the raw hides of cattle.

**Bullock-Yoke**, a wooden neck-yoke or collar for draught cattle.

**Bull's-Eye**, a small thick piece of glass let into the deck of a ship to admit light to a cabin. *Imp.* duty, 35 per cent. — A ship's block, a wooden thimble without a sheave, having a hole through the centre, and a groove round it. — The centre of a target.

**Bull's-Mouth**, a trade name for a species of helmet shell, *cassis ruta*, from which those cameos are cut that have a pale salmon color on an orange ground.

**Bulrushes**, the leaves of a marshy plant (*Scirpus lacustris*), which are employed in many parts of Europe for making mats and winter coverings for plants, for chair bottoms, etc. For shipping they are packed in bundles of about 36 inches in circumference, 63 bundles making a load. They come chiefly from Russia and Holland. *Imp.* duty, \$15 per ton.

**Bulwarks**, the parapet of woodwork raised around a vessel's deck, for the purpose of preventing men and goods from slipping overboard, and at the same time for protecting the deck from the waves.

**Bumboat**, a boat which supplies provisions to a ship in harbor or in a roadstead.

**Bun**, or **Boon**, a name in India for coffee-berries before they are ground.

**Bunch**, a number of things of the same kind which are or are put together; a cluster. Bananas are sold by the bunch.

**Bunch Raisins**, are raisins of a superior quality, dried and packed in bunches. The best come from Malaga.

**Bunder-Boat**, a strong, well-built boat, employed to land passengers from vessels on the pier at Bombay.

**Bundle**, a package or parcel made up loosely. — Two reams of printing paper.

**Bung**, a large cork or wooden stopple for a cask.

**Bunt**, the middle of a ship's sail.

**Bunting**, a thin, open-made kind of woollen worsted stuff goods, used chiefly for flags, colors, and ships' signals. *Imp.* duty, 20 cents per square yard, and 35 per cent.

**Buoy** [Fr. *bouée*; Ger. *ankerboye*; It. *garvitello*; Sp. *boya*], a floating mark or sea-beacon, usually made of copper or iron, but sometimes of cork, wood, etc., anchored over some danger, or placed at certain spots to mark the channel. They are also fastened to moorings for vessels to make fast to in harbor, or to warp by, and to indicate the position of the anchor of a ship.

**Bur**, or **Burr**, the rough, prickly head of the burdock, chestnut, etc.; a general name for any kind of grass seed which attaches itself to the sheep's fleece; *burry wool* requires more labor to clean it for manufacturing purposes. — A clinker-stone or brick. — A small circular saw. — A sort of triangular chisel.

**Bur-Bark**, a fibre obtained from the *Triumfetta semitriloba*, a common weed in the West Indies.

**Burden**, a load. — The contents of a ship; freight; cargo; the tonnage capacity of a vessel; as, a ship of 500 tons burden.

**Burdock**, the *Arctium Bardana*, a biennial plant, common in uncultivated places, the roots of which being aperient, diuretic, and sudorific, are used in medicine.

**Bure**, a coarse woollen cloth of a dark color, made in Finland.

**Bureau**, the French name for office and for desk. — In America, a chest of drawers.

**Burgee**, a kind of small coal, suited for burning in the furnaces of engines. — A three-cornered flag or distinguishing pennant used by cutters, yachts, and merchant vessels.

**Burgermeister**, the mayor or chief magistrate of a Dutch city or Flemish town.

**Burgundy Pitch**, the resin of the white pine (*Pinus alba*), is usually in softish masses of an aromatic odor, and a pale yellowish brown color, often intermixed with white streaks, and occasionally in rounded masses or tears, which have spontaneously exuded from and dried upon the trees. This resin is likewise obtained by incision of the bark; the different portions, being collected, are dissolved in boiling water, and cleansed by pressing through canvas cloths. *B. P.* is imported from Saxony and the north of Europe. Its only use is as an ingredient in some plasters. *Imp.* free.

**Burgundy Wines**, are perhaps the most perfect of all the known wines in the qualities that are deemed most essential to vinous perfection. The flavor is delicious, the bouquet exquisite, and the superior delicacy which they possess justly entitle them to be held first in estimation of all the red wines known. They cannot be mixed with any other; even two of the first growth, mingled, deteriorate the quality, and injure the bouquet. There is an infinite variety in the wines of *B.*, which an American can hardly comprehend. Accustomed to wines and liquors less delicate than intoxicating, his favorite beverage is chosen rather for strength

than perfection of flavor. The nature of the soil, the aspect, the season, the plant, and mode of culture, as well as the making, each and all equally affect the quality of these wines more than wines in general. The most finished and perfect *B.* is deteriorated even by a short voyage, and to drink it in perfection in this country, it must be imported in bottle. The best *B.*, called the *têtes de cuvées*, are from the choicest vines, namely, the *noirveau* and *pineau*, grown on the best spots in the vineyard, having the finest aspect. These rank first in quality, and are wines, when well made in favorable seasons, which contain every excellence that the most choice palate can appreciate. Fine color, enough of spirit, raciness, good body, great fineness, an aroma and bouquet very powerful, strong in odor, and that peculiar taste which so remarkably distinguishes them from all the other wines of France. The next, called *les premières cuvées*, or *vins de primeur*, approximate very closely to the first class in quality, except that the perfume is not quite so high. The quantity of alcohol in *B.* wines is said to be 13.50; but in this respect there is considerable variation in the return of the experiments, as no two wines are exactly alike in point of strength.

Ancient *B.* now forms the three French departments of Côte d'Or, Saône et Loire, and Yonne. The wine district is situated under the 45th and 46th degrees of latitude, and is about 150 m. long by 75 wide. The most celebrated district is the Côte d'Or, thus named on account of the richness of its vineyards. It consists for the most part of a chain of gentle calcareous hills, which extend N.E. and S.W. from Dijon into the department of Saône et Loire, including a small part of the arrondissement of Dijon, and all that of Beaune. The training of the vines is the low method, on sticks about three feet long. It is unnecessary to mention the lower growths of the wines of *B.*, because they are rarely exported. It will suffice to take a cursory notice of those wines which are best known out of France. The arrondissement of Dijon produces the red and white *Chambertin*. They also make there an effervescing *Chambertin*, a wine only inferior to very good Champagne, but it wants the delicate bouquet of Champagne, by the absence of which it is easily detected. The French complain of its having too much strength, but this would recommend it in America. It is a very delicate wine, notwithstanding, and highly agreeable to the palate. In spirit it is perhaps a little above the average of Champagne, which it resembles so much, that persons not judges might easily mistake the one for the other. The *Chambertin* of Dijon rivals the best wine produced in the vine ground of Beaune for excellence. The vineyard that yields it is small. It is a wine of great fullness, keeps well, and the aroma is perfect. It is sold at 350 to 400 francs per hectolitre, immediately upon making. At *Bèze*, *St. Jacques*, *Musigny*, *Clos Bernardon*, *Clos du Roi*, etc., most excellent wine is made. In the *Clos de la Perrière*, a wine in quality and value equal to *Chambertin* is grown. Many of these vineyards produce white wines as well as red. In the arrondissement of Beaune, the first commune is Vougeot, which produces the celebrated wine called *Clos Vougeot* (price 5 or 6 francs the bottle); also the *Esvejaur*, which is much esteemed, but less so than the *Clos Vougeot*. Further on is *Vosnes*, a village which produces the most exquisite wines that can be drunk, uniting to richness of color the most delicate perfume, a racy flavor, fine aroma, and spirit. The most celebrated of these wines are the *Romanée St. Vincent* (so called from a monastery of that name), *Romanée-Conti*, the most perfect and best wine in *B.* (price 6 or 7 francs a bottle), *Richebourg*, and *La Tache*. About 3 m. from Vosnes is the small town of Nuits, near which are grown wines superior to those of Beaune for aroma, body, softness, and raciness,—among them the well-known *St. George's*, of exquisite flavor, delicious bouquet, and great delicacy. In the commune of Aloxe, a wine called *Corton* is grown, which is in repute for its bouquet, delicacy, and brilliant color. The ground from which this wine is made gives only 10 or 12 litres of wine each hectare, of which there are but 46. Bordering on Aloxe is the vineyard of *Beaune*, a well-known wine, of a very agreeable character. Not far from thence is produced the *Volnay*, a fine, delicate, light wine, with a taste of raspberry, and *Pommard*, of somewhat more body than Volnay, and therefore better calculated to keep, especially in warm climates. These are wines which, when genuine, bear a good character all over the world. Between Volnay and Meursault the vineyard of *Santenot* is situated, producing a celebrated white wine, called *Meursault*, and a red wine considered preferable to Volnay. The situation to the N.W. of Meursault is noted for the delicious white wine called *Mont-Rachel*, remarked for its fineness, lightness, bou-

quet, and exquisite delicacy, having spirit without too great dryness, and a luscious taste without cloying. It is deemed the most perfect white wine of *B.*, and even of France, rivaling Tokay itself in the opinion of many connoisseurs. This wine sells for about 1,200 francs the hectolitre. There are two vine grounds near, called the *Perrières* and *Charvonnay*, which produce white wines, sought after only from their vicinity to Mont-Rachel. *Chassagne*, not far from Puligny, is a productive vine land. The canton of *Morgeot* produces a red wine, much sought after. The village of *Santenay*, on the borders of the department terminating the elevated land, grows some choice wines, such as *Clos-Tavannes*, *Clos-Pitois*, and the *Gravière*, though not equal in quality to those already enumerated. The best time to bottle the choice wines of the Côte d'Or is the third or fourth year from the vat. Their prices differ greatly, and cannot be fixed. The "*têtes de cuvées*," or choice products in the best years, are never sold under 300 francs the hectolitre; the "*premières cuvées*" in such seasons being 200 to 250 francs. When these wines have been kept for some years, they command a higher price. The longest duration of the finest wines most capable of keeping does not exceed 12 or 15 years from the season in which they are made. After that time, though they will support themselves some years, they decline instead of improve. From the second year in bottle, the fullest bodied and hardest wines have attained their highest degree of perfection. All that can be desired after this period is, that they shall not deteriorate.—The department of the Yonne produces a vast variety of wines, some of which are of very good quality, but inferior to those of the Côte d'Or. The best known is the white wine of *Chablis*. If this wine is the product of a favorable year, it should be very white; it is a dry wine, diuretic, and its taste is flinty; it usually sells at about 100 francs the hectolitre. The vineyards of *Avallon* and of *Tonnerre* produce several delicate, fine, spirituous, and good wines, which bring 100 francs the hectolitre. These wines will keep good in bottle from 5 to 10 years.—The department of the Saône et Loire produces wines which are by no means equal to those of the Côte d'Or or the Yonne, and they are therefore the *B.* of the less opulent classes. The arrondissement of *Macon* furnishes red wines of various qualities, which keep a good while in wood, and sell from 75 to 90 francs per hectolitre. The *Moulin-à-Vent* is a light and delicate species; but it must be drunk in the second or third year: it will not keep beyond the tenth. The *Turin* and the *Fleury* have a fine and delicate taste; they please by their agreeable odor and aroma. The white wines of *Pouilly* rank superior to any of the red wines of the Mâconnais. Their characteristic is the nutty taste they leave on the palate. One year old they drink smooth and agreeable, after which they much resemble dry Madeira, both in color and strength. They will keep a long time. The white wine of *Fuissé* does not taste of the nut, like Pouilly, but has a flinty flavor, is fine and delicate. It becomes more spirituous by age.

The wine of *Beaujolais*, commonly but improperly classified among *B.* wines, is produced in the department of the Rhone. It is remarkable for the excellence of its color, for clearness, strength, and perfume. The best quality sells from 150 to 175 francs per hectolitre. It increases in value by age, augmenting a fourth in price every year it is kept.

The care taken of the *B.* wines by the maker is by no means equal to that taken of Champagne. Nature and the site, with the observance of a very simple and common process, are all that are demanded to bring to their present perfection the first red wines in the world. The secret of the excellence of *B.* depends upon unknown qualities in the soil, which are developed only in particular places, often in the same vineyard, in all events, within a very narrow district. Whatever be the cause, France has in these wines a just cause of boast, and a staple in which she will never be excelled.

#### Burin. See GRAVER.

**Burlaps**, a coarsely woven fabric of hemp, flax, or jute, usually 40 inches in width, used for bagging. It is manuf. in Maine, and is also imported from Dundee in pieces of about 180 yards. *Imp.* duty, 30 per cent.

**Burlington, Cedar Rapids, and Northern R.R.**, runs from Burlington to Albert Lea, Minn., a distance of 252 m., including 11 m. from Manly Junction to Northwood, leased from the Central R.R. of Iowa, under a contract to run over that part of its road. This Co. owns and operates four branches; viz., Linn to Portville, 94 m.; Muscatine to Riverside, 31 m.; Vinton to Holland, 48 m.; and Elmira to Iowa City, 10 m. Total length of track, 435 m. This Co. also operates, under a lease (perpetual, with right of purchase), 12½ m. of the track of the Minneapolis & St. Louis R.R., extending from the State line to Albert Lea. The Co. was organized July 1, 1876.

The general offices are at Cedar Rapids, Iowa. Cap. stock (authorized), \$10,000,000; (issued), \$5,500,000. First mortgage 5% bonds, \$6,500,000; Minneapolis & St. Louis R.R. 7% gold bonds (secured by first mortgage upon 12½ m. of railroad from State line to Albert Lea, guaranteed by B., C. R. & N. R.R. Co.), \$150,000. The extensions on the Pacific Division from Traer to Holland 24½ m., and on the main line from Plymouth Junction to Manly Junction 5 m., and from Northwood to State line 4 m., total, 33½ m., are unencumbered, and have cost the Co. in cash \$287,969.82, in addition to its guaranty upon \$150,000 first mortgage bonds issued by the Minneapolis & St. Louis R.R. Co., or, in the aggregate, \$437,969.82, to which should be added about \$10,000 for improvements. Interests on bonds of this Co. are paid 1st June and Dec., in New York.

**Burlington and Missouri R.R.**, runs from Plattsmouth to Kearney Junction, Neb., 190.14 m.; leased lines, 252.74 m.; total, 443.74 m. Offices at Omaha. Cap. stock (authorized), \$12,000,000; (paid in), \$8,537,800. *Funded Debt*: Convertible bonds unsecured, issued 1873, \$600,000, payable 1883, interest 8% (Jan. and July); first mortgage convertible, issued 1869, \$19,500, payable 1894, interest 8% (Jan. and July); consolidated mortgage, dated 1878, \$6,729,000, payable 1908, interest 6% (Jan. and July); first mortgage O. & S. W., issued 1871, \$1,034,000, payable 1896, interest 8% (Dec. and June). This Co. has a total land grant from the U. States of 2,451,212.48 acres. Of this there have been sold, up to 1879, 1,300,148.09 acres, at an average price of \$7.47 per acre.

**Burner**, is that part of a lighting apparatus at which combustion takes place. See GAS-BURNER and LAMP-BURNER.

**Burnettising**, is one of the modes adopted for preventing timber from decay, invented by Sir Wm. Burnett. It consists of a strong solution of chloride of zinc, into which the timber is immersed. The same solution is applied to deodorize the bilge water which collects in ships' hulls.

**Burning-Fluid**. See CAMPHENE.

**Burning-Glass**, a small lens or mirror for concentrating the sun's rays to a focus.

**Burnished**, a term applied to articles polished and brightened by the use of the burnisher.

**Burnisher**, a bookbinder's tool, mounted with agate, blood-stone, or steel, for smoothing. It is also used by watchmakers.

**Burnous**, a cloak, or Arab wrapping, for the head.

**Burnt Sugar**. See CARAMEL.

**Burr-Oak**, the *Quercus macrocarpa*, a useful and ornamental tree of N. America; the wood is tough and close-grained, and more durable than the white oak.

**Burtah**, the salted and spiced flesh of the sulaiah fish (*Polynemus seles*), a piquant relish well known at the breakfast tables of Bengal.

**Burthen**, same as BURDEN.

**Burton Ale**, an ale of great strength, brewed at Burton-upon-Trent, England.

**Bus**, a London abbreviation for omnibus, a street carriage.

**Bush**, a circle or hollow cylinder of metal which lines the box or hollow of the nave of a wheel in which the axle works.—A similar circle let into other holes or orifices.

**Bushel**, the principal measure of capacity for corn and dry commodities in this country and in England. The imperial B., which is employed in all English possessions, measures 2,218.192 cubic in., or 36.348 French litres. The Winchester B.

(or old English standard corn B.), established by law in the U. States, is a cylindrical vessel, 18½ in. in diameter, and 8 in. deep inside, measuring 2,150.42 cubic in., or 35.237 litres; hence, 33 American B. equal 32 English B., nearly. The standard measure furnished by the U. States government to the States, and adopted by statutes in New York and other States, is the half B., measuring 1,075.21 cubic in. The New York statute provides "that the B. for coal, ashes, marl, Indian corn in the ear, fruits, and roots of every kind, and for all other commodities commonly sold by heap measure, shall be the half B., and its multiples and subdivisions; and the measures used to measure such commodities shall be made cylindrical, with plain and even bottom, and shall be of the following diameters: From outside to outside the B., 19½ in.; half B., 15½ in. All commodities sold by heap measure shall be duly heaped up in the form of a cone, the outside of the measure by which the same shall be measured to be the limit of the base of the cone, and such cone to be as high as the article will admit. Whenever wheat, rye, Indian corn, buckwheat, barley, oats, beans, pease, clover-seed, Timothy-seed, flaxseed, or potatoes shall be sold by the B., and no special agreement be made by the parties as to the mode of measuring, the B. shall consist of 62 lbs. of beans, 60 lbs. of wheat, pease, clover-seed, or potatoes, 58 lbs. of Indian corn, 56 lbs. of rye, 55 lbs. of flaxseed, 48 lbs. of buckwheat or barley, 44 lbs. of Timothy-seed, and 32 lbs. of oats." The weight of B. for wheat is reckoned at 60 lbs. in almost all the States, but the weight of B. for other grains and commodities varies in the different States.

**Bushire**. See PERSIA.

**Business**, is a word extensively used in commercial language, for trade, profession, or calling, in which case it follows the term by which it is qualified; as, the produce B., the wine B., &c.; also, to qualify or characterize a trade or a transaction; as, wholesale B., retail B., prosperous B., unsafe B., I have made a good B., etc.—*Business-like*, resembling B., made in the proper way.—*Business Man*, one who thoroughly understands his B., and conducts it as it should be.—*Business Tact*, aptness or readiness in transacting B.—*Business Way*, conducted or done in a business-like manner.

**Business Hours**, the time of the day during which B. is transacted; generally from 10 A.M. to 3 P.M. for banks and public offices,—which hours are also those during which principals of mercantile houses are expected to be found at their respective places of business.—In respect to the time of presentment and demand of bills or notes, B. II. generally range through the whole day, down to the hours of rest in the evening, except when the paper is payable at a bank or to a banker.

**Busk** [Fr. *busc*], a piece of flat whalebone, steel, or wooden supporter for the corset or stays of females.

**Buss**, the Dutch name for a large decked fishing lugger or cutter-built vessel.

**Bussorah Gum**, an Indian gum found in irregular white or yellow semi-transparent fragments, never very large. It makes a peculiar noise when chewed, and swells in water, but does not mix with it completely.

**Bussu**, a Brazilian name for a palm (*Manicaria saccifera*), which is applied to many useful purposes,—the large leaves for thatch, and the spathe for making durable cloth and ready-made bags.

**Bust**, a half-length statue; the representation of a person above the stomach.

**Bustle**, a lady's dress-pad.

**Busuck**, a small weight used in Borneo for gold and precious stones, the eighth part of a mace, and equal to 4.80 troy grains.

**Busy**, is a term denoting activity in trade; as, "the busy season."

**Butcher**, a slaughterer of beasts and vendor of flesh meat.

**Butea-kino**, a ruby-colored, astringent gum-resin obtained in India from the Dhak-tree (*Butea frondosa*), which affords a powerful and permanent dye.

**But-Joint**, a joint in which the pieces come square against each other, endwise. In iron-work the parts are welded, and the term is used in contradistinction to a lap-joint, or weld.

**Butler**, a family servant, who is intrusted with the charge of wines, etc.

**Butler's Tray**, a wooden tray for conveying articles to a dining-room.

**Butt**, the end of a plank. — A large cask of any kind. The English beer and wine butts contain 3 barrels, or 103 gallons. — In the leather trade, the tanned whole hide sole leather, from which the belly and shoulders have been cut off. See **BUTTS**.

**Butter** [Fr. *beurre*; Ger. *butter*; It. *burro*; Port. *manteiga*; Sp. *mantea*], a common name for all animal and vegetable solid oils and fats, but particularly applied to that from the milk of the cow, used for food.

**B.-making.** The amount of *B.* in cows' milk is about 4 per cent, though the kind of pasture, quantity of milk, and general condition, influence the relative quantity of the several ingredients of milk. In the extraction of *B.*, the milk is allowed to cool, and the cream, which rises to the surface, is skimmed off, and put into a large, deep, earthenware dish, where it lies for several days, till enough has been collected for a churning. In order to separate the *B.* from milk, recourse is always had to the process of agitation in a *Churn*. The principle involved in each and all of the forms of this apparatus is the thorough agitation of the contents, so as to cause the rupture of the minute fat globules present in the milk, and the incorporation or kneading of these ruptured fat globules into larger or smaller masses of *B.* The cream is strained through cloth into the churn, to remove any foreign matter; and the agitators being set in motion, the friction of the movement, combined with the admission of air and the chemical changes it induces, raises the temperature of the whole contents. At one time it was thought that one great object of the agitation was the admission of the oxygen of the air, which, becoming thoroughly incorporated with constituents of the milk, combined therewith, and, as a consequence, led to the separation of the *B.* It is found, however, that *B.* can be obtained from milk by mere agitation, without the admission of the oxygen of the air. At the same time, in the ordinary way of churning, oxygen does play a subordinate part, by combining with the sugar of the milk, and forming lactic acid, which, in its turn, *sours* the milk, and separates therefrom the caseine (cheese-matter) in minute clots or flakes, yielding what is commonly called *sour* or *butter milk*. The process of churning must be conducted at a medium rate. If too quickly performed, the *B.* is soft and frothy, and is said to be *burst*; whilst, when too slowly made, it is highly tenacious, strong tasted, and badly flavored. When all the *B.* has come, which is known by the particles agglutinating into irregular masses, the *B.* is made by taking the lumps and well washing and kneading them on a wooden board in a tub of pure spring-water till all the buttermilk has been expressed; it is then divided into the requisite size of lumps, fashioned into rolls, or moulded into forms, and usually stamped with some device. In the making up of the *B.*, the hands of the operator must be scrupulously clean, and be free from the slightest taint of soap. Persons who are subject to moist hands should never knead *B.*, as it is very liable to be contaminated by the slightest foreign matter, especially animal secretions; and it is better always for the operator to wash the hands with water containing some oatmeal before commencing. So important is this source of contamination regarded in this country, that every endeavor is made to get quit of manual labor in working the *B.*, and a wooden *butter-walker* has been invented, and is now largely used. When newly prepared, the *B.* is called *fresh* or *sweet B.*, and is of a yellow color, which is well known to be deeper as the pasture on which the cows have been fed is richer, and hence the poorer kinds of *B.* are often artificially colored with a little annatto, and rarely with the juice of carrots. A large quantity of the *B.* sent into market has more or less common salt added, for the purpose of preserving

it. For use within a week or two, the proportion of common salt employed is about half an ounce to two pounds of *B.*, though, where it has to be kept for some time, as much as one ounce of salt to one pound of *B.* is used. The incorporation requires to be carefully and dexterously done, so that the resulting material may be uniform; and the better plan is, to add only a portion of the salt at a time, and to knead and knead the *B.* till the whole is thoroughly mixed. When the less amount of salt has been employed, the result is *powdered B.*, and the larger quantity yields *salt B.* Great care must be taken to have every vessel used in the preparation as clean or *sweeter* as possible. Constant rinsings with cold water and scaldings with boiling water are resorted to. Attention must likewise be paid to the atmosphere of the apartments in which the milk is first placed, and in which the subsequent operations go on, as a tainted atmosphere always tends to injure the quality of the marketable commodity. The adulterations liable to be present in *B.* are an undue proportion of salt and water, and these run up occasionally to upwards of 33 per cent, or one third of the total weight. Another adulteration is the presence of lactate of zinc, derived from the milk being placed in zinc pails and basins, from the impression that by some imaginary electrical influence, an increase in the amount of cream will be the result; but though this is not attained, yet the milk tending to form lactic acid, the latter attacks the zinc vessel, and forms lactate of zinc, which dissolves in the milk, and thereby contaminates it, imparting an unpleasant taste, and, when present in larger quantity, leading to violent spasmodic vomiting. See **OLEOMARGARINE**.

The annual product of *B.* in the U. States is about 550,000,000 lbs., more than one fifth of which is produced in the State of New York, chiefly in the counties of St. Lawrence, Delaware, Chenango, Chautauqua, which now rivals the best Dutchess County *B.*, long recognized as the highest standard of packed or salted commercial *B.* Orange County still retains its reputation for excellent *B.* Pennsylvania, Ohio, and several other Middle and Western States are also large producers. The *B.* known as *Philadelphia Print*, chiefly produced in Chester, Lancaster, and Delaware Counties, is unsurpassed for sweetness, solidity, and golden color. It always commands a fancy price. The quality of *B.* marketed in Cincinnati is constantly improving; and the quality known as *Creamery B.* sustains its price better than other kinds under a strong competitive demand from the Eastern cities. *B.* is generally put in tubs of about 50 lbs. each, or in kegs or firkins of from 50 to 110 lbs. The exports of *B.* in 1878 were 21,837,117 lbs.; value, \$3,931,822, three quarters of which went to Great Britain and Colonies. *Imp. duty*, 4 cts. per lb.

**Butter-Crock**, an earthenware pan, mug, or jar for keeping salted butter. When filled, it weighs about half a cwt.

**Butternut**, **OIL-NUT**, or **WHITE WALNUT**, a species of walnut (*Juglans cinerea*), found in most parts of the U. States and in Canada. From its want of solidity, and from the difficulty of procuring pieces of considerable length, the timber of the *B.* is seldom used in the construction of houses. As it long resists the effects of heat and of moisture, it is esteemed for the posts and rails of rural fences. It is preferred to the red-flowering maple for wooden dishes, because it is lighter and less liable to split. It is also an excellent wood for the panels of carriages, not only from its lightness, but because it is not liable to split, and receives paint in a superior manner. The kernels of its hard, oblong nuts are very oily, very good to eat, and commonly served at table. The Indians formerly pounded and boiled them, and separating the oily substance which floated on the surface, mixed it with their food; hence the name. The bark of the *B.* makes a yellow dye.

**Butter of Cacao**, a concrete oil of most agreeable flavor, obtained by pressure from the seeds or chocolate beans of *Theobroma cacao*, and of which the nutritive properties of chocolate or cacao depends. One hundred parts of the seed yield from

60 to 80 parts of oil. It is largely used in the preparation of cosmetics, and also in pharmacy. *Imp. free.*

**Butter of Canara**, or **PINEY TALLOW**, a white, solid oil, obtained from the fruit of the *Vateria Indica*. It is used to make candles.

**Butter-Print**, a fancy turned wooden mould, for giving an ornamental appearance to butter-pats.

**Butt-Hinges**. See **BUTTS**.

**Butt-Howel**, a howelling-adze used by coopers.

**Butting-Machine**, a machine having planing-cutters on the face of a disk-wheel, and used for smoothing, cornering, or rounding the ends of joists or small timbers used in the frames of agricultural implements, etc.

**Butting-Ring**, in carriage-making, a collar on the axle, against which the hub butts, and which limits the inward movement of the wheel, as the linch-pin or axle-nut does the outward.

**Butting-Saw**, a cross-cut saw attached to a stock at one end, acting as does a drag-saw, and used for butting logs on the carriage of a saw-mill.

**Buttock**, in shipbuilding, the rounded-in, overhanging part on each side and in front of the rudder, terminating beneath by merging into the run.

**Button**, a projecting knob to fasten boots, articles of dress, etc. *B.* are made of an endless variety of materials: Iron, steel, brass, copper, pewter, lead, gold, silver, horn, shell, pearl, tortoise-shell, ivory, bone, hoof, hair, silk, cotton, linen, gutta-percha, india-rubber, amber, velvet, cloth, Florentine, glass, porcelain, enamel, jet, compressed earth, clay, gems, precious stones, etc. As examples of two wholly distinct classes of *B.* the *gilt* and the *covered* will suffice to give a general idea of the manufacture. — *Gilt B.*, a kind of brass (copper with a little zinc) is the metal of which these buttons are usually made. The metal is rolled into thin sheets, cut into narrow strips, and stamped out into disks or blanks by the action of a fly-press. Each blank is rolled between two steel bars, to smooth and round the edge. It is then *plumished*, or levelled on the surface, by smart blows from a steel hammer. The shanks are made of brass wire; a machine cuts off a small piece, bends it into a kind of eye, and flattens or spreads out the two ends. One of these shanks is soldered to each blank by the aid of a little simple mechanism. If the button is to have a plain face, the maker's name, &c., are stamped on the back by means of a die; but if the face is also to be embossed, a die and counter-die are used, so as to stamp both surfaces at once. The *B.* are scoured in a weak solution of aquafortis, washed, and dried, and then covered with a thin layer of gold. (See **GILDING**.) If the gold is only applied to the face, the *B.* are known as *tops*; but if to the back as well as to the face, they become *all-overs*. The layer of gold is so excessively thin that 3 grains are sometimes made to cover a gross of *B.*; and yet each *B.* admits of being well burnished with an agate or bloodstone burnisher. — *Covered B.* A metal *shell* is stamped out of a piece of thin sheet-iron; a metal *collet*, or smaller disk, with a hole for the shank, is similarly stamped out; a circular piece of silk, satin, Florentine, twill, mohair, cloth, or other textile material, is stamped out; a circular padding is made of soft paper, silk, and thread; and then all these pieces are brought together in a wonderfully quick and effective way, by the aid of a peculiar die, a stamping-press, and certain punches

and hollow tools. The shank, protruding through the hole in the collet, is not an eye of metal, but a tuft of soft material through which a needle and thread can be passed. The padding fills up the space between the metal face and the metal back. It would be impossible even to enumerate all the processes employed in this manufacture. Almost every manipulation known in the arts is rendered available by the *B.* makers, according to the substances employed, — casting, stamping, tracing, embossing, drilling, piercing, carving, welding, soldering, grinding, smoothing, burnishing, gilding, silvering, tinning, plating, electro-plating, japanning, chasing, engraving, all are brought into requisition. *B.* of several kinds are made in New York; but the most extensive *B.* manufactories in America are at Newark, N. J., Waterbury, Conn., Springfield and East Hampton, Mass. The value of *B.* imported to the U. States in 1878 was \$3,362,085, on which Germany contributed \$1,683,700; France, \$1,136,392; and England, \$514,016.

*Imp. duty*: Barrel *B.*, or *B.* of other forms, for tassels or ornaments, made in whole or part of wool, worsted, or mohair, 50 cts. per lb., and 50 per cent.

*B.*, convex-linen, so called, made of linen and brass (brass chief value), 30 per cent.

*B.*, cuff and sleeve, glass, 40 per cent.

*B.*, cuff and sleeve, if not jewelry, dutiable according to material, as personal ornaments, without reduction.

*B.*, cuff and sleeve, mother-of-pearl, 35 per cent.

Iron *B.*, not cuff or sleeve, 30 per cent.

*B.* of lastings, mohair, cloth, silk, twist, linen canvas, or other manuf. of cloth, woven or made in patterns of such size, shape, and form, or cut in such manner, as to be fit for *B.* exclusively, not combined with india-rubber, 10 per cent.

*B.* of silk, or silk component of chief value, containing no wool, worsted, or goats' hair, 50 per cent.

*B.* of vegetable ivory, 30 per cent.

**Button-hole Cutter**, a special kind of shears for cutting button-holes. There are several contrivances of the kind, chiefly differing in their means for adjusting the length of the cut, and its angle with the edge of the cloth.

**Button-Hook**, a curved metal loop for fastening the buttons on boots, gaiters, etc.

**Button-Lathe**, is a machine for cutting round disks for buttons, from plates of bone, ivory, wood, mother-of-pearl, etc.

**Button-Mould**, is a disk of bone, wood, or metal, to be covered with fabric to form a button.

**Button Rivetting-Machine**, a tool for fastening buttons to garments by swaging down on the back of the washer the end of the rivet which forms the shank of the button.

**Button-Wood**, **PLANE-TREE**, or **SYCAMORE**, is a large forest-tree of North America, the *Platanus occidentalis*. Its wood, in seasoning, becomes of a dull red; its grain is fine and close, and it is susceptible of a brighter polish than the wood of the beech, to which it bears some resemblance. Its concentric circles are divided into numerous sections, by fine medullary rays extending from the centre to the circumference. Cabinet-makers seldom make use of this wood, on account of its liability to warp, except for bedsteads, which retain the color of the wood, and are coated with varnish. This wood speedily decays when exposed to the atmosphere, hence it is only proper for work that is sheltered from the weather. It is used for musical instruments.

**Butts**, or **BUTT-HINGES**, are hinges for doors, formed of two plates and interlocking projecting pieces, which are connected by a pintle. They are so called from the leaves being secured to the door and casing at points which abut upon each other. The varieties known in the trade are the *broad*, *narrow*, *loose-joint*, *reversible*, *shutter*, *wrought*,

table, fast-joint, acorn-tipped, congress, and spring butts.

The *Geer's Double-Action Spring Butt* (Fig. 48), patented in 1877, and manuf at Unionville, Conn., combines the toggle arm with a spiral spring, which gives out from 60 to 80 per cent more force at the closing joint than when wide open, and *vice versa*, the spring acts with less resistance the wider the door is opened. It allows the door to be opened clear back to the wall, and the spring retains it there; thus the toggle and spring fill two important offices, — that of holding the door closed and also open.

Fig. 48. — GEER'S DOUBLE-ACTION SPRING BUTT.

**Butyraceous**, having the qualities of or resembling butter.

**Buyer**, a purchaser. In large importing and jobbing houses, the purchase of goods is the special department of one of the partners, or of a clerk, termed the buyer.

**Buying and Selling**, sale or exchange; the transmission of property from one person to

another, in consideration of some price or recompense in value. If the transfer is for money, it is a sale.

**Byapar**, or *Byonan*, in Hindustani, business affairs, a trade or calling; also a loan, hence *byohara* is a creditor or lender.

**By-Laws**, are regulations of any kind, enacted, adopted, and agreed upon for the better governance of certain trades, corporations, or joint-stock associations. The power to make by-laws is usually conferred by express terms of the charter creating a corporation; though, when not expressly granted, it is given by implication, and it is incidental to the very existence of a corporation. In some instances, by-laws have to be legally registered or published, in order to be binding.

**Byssus**, a viscid, silky fibre produced by the wing-shell mollusk (*Pinna angusta*) of the Mediterranean and Atlantic seas. The filaments are extremely fine and strong, and often reach 3 feet in length. The color, which is a reddish brown, never fades. Stockings, gloves, and other articles have been woven of it, but more as a curiosity than for use.

## C

**C**, a Roman numeral, representing one hundred; CC, two hundred.—A French abbreviation for *compte*, account; CC, *compte courant*, account current.

**Cab**, an abbreviation for cabriolet, is a light, two-wheeled English street carriage, with the driver perched on an elevated seat behind, and called a Hansom cab, from the name of the first patentee. There are now 10,000 in London.—The covered part in front of a locomotive which protects the engineer and fireman, and shields the levers, etc.

**Cabal**, a luscious beverage or rich raisin wine made in Portugal.

**Caballine**, anything belonging to a horse; hence coarse aloe, used in veterinary medicine, are called caballine aloes.

**Caban**, an Eastern measure of capacity. In the Philippines, the caban of rice weighs 133 lbs. avoirdupois, and of cocoa, 83½ lbs.—A French cloak, with a cape.

**Cabaret**, a French tavern, or tippling and smoking house.

**Cabaza**, a large Spanish cloak.

**Cabbage**, the *Brassica oleracea*, a well-known pot-herb, of which there are many cultivated culinary varieties, used in a boiled state, salted, or pickled. It is extensively cultivated in the U. States. See SAUER-KRAUT.

**Cabbage-Lettuce**, a species of lettuce, with leaves forming a low, full head, like the cabbage.

**Cabbage-Net**, a small net made of twine to hold vegetables in a pot.

**Cabbage-Palm**, the *Oreodona oleracea*, one of the loftiest of all palms. Its brittle flakes or young shoots form an esteemed esculent in the West Indies. The wood is sometimes used for ornamental furniture; but it does not answer very well, as the ends of the fibres are too hard, and the medullary part too soft for holding glue; the surface is also very difficult to polish, and cannot be preserved without varnish.

**Cabbling**, a process in iron-making, which consists in breaking up the flat masses of iron into pieces, to be again heated in a furnace, and wrought or hammered into bar-iron.

**Cabeca**, the Portuguese name for the finest kinds of silk received from India, as distinguished from the *bariga*, or inferior kind.

**Cabestrillo**, a Spanish neck-chain of gold or silver.

**Cabin**, an apartment or room in a ship apportioned to an officer, or to passengers.

**Cabinet**, a small closet or room.—A set of drawers to hold curiosities.—The French name for a private office.

**Cabinet-File**, a smooth, single-cut file, used by furniture-makers and joiners.

**Cabinet-Making**, comprises the more delicate kinds of working in wood, applicable to mahogany, rosewood, maple, walnut, satinwood, and other ornamental woods.

**Cabinet-Organ**, a superior class and size of reed organ.

**Cabinet-Picture**, a small-sized and valuable painting.

**Cabinet-Woods**, ornamental woods suited for the purposes of the cabinet-maker.

**Cabin Furniture**, light, compact, and folding articles, for the convenience of a passenger at sea, and occupying little space.

**Cabin Passenger**, a voyager at sea who has the best accommodation the ship affords; in contradistinction to the steerage and intermediate passengers.

**Cable**, a strong rope, chain, or cluster of wires, designed for holding a ship at anchor, for supporting the roadway of a suspension bridge, for moving, warping, and other purposes. Ship's *C.* are made of hemp, manilla, or cord, or of iron links. The regulations of Lloyd's require all vessels under 150 tons to have at least 150 fathoms of chain *C.*; those of 250 to 350 tons, 200 do.; of 350 and under 500 tons, 240 do.; of 500 and under 700 tons, 270 do.; those of 700 tons and upwards, 300 do.; but in all cases where hempen *C.* are used, then one sixth more in length is required. *C.* are of various sizes, from 1 to 18 inches in circumference; below 10 inches in circumference, a rope is called a *hawser*. A *stream C.* is a hawser for mooring. A rope *C.* is always composed of three strands, every strand of three ropes, and every rope of three twists; the twist is, however, made of more or less threads, according as the *C.* is to be thicker or thinner. A rope 2 inches in circumference, and 120 fathoms long, is generally found to weigh nearly 1 cwt. *C.* are now more generally formed of iron chains, which are much stronger and more durable than those of hemp. On a rocky bottom, a hempen *C.* is destroyed in a very short time, while the duration of the other is almost indefinite. It is sometimes desirable to cut the *C.* when of hemp; this contingency is provided for in iron *C.* by a bolt and shackle at short distances, so that by striking out the bolt the *C.* is easily detached. A chain *C.* is not simply a chain, for it has a cast-iron strengthening stay-piece across each link, or each alternate link. Nearly the whole mass is made by forging and welding, including the links themselves, as well as the shackles, swivels, and other parts. A chain *C.* made of 2½ inch rod-iron weighs 272 lbs. per fathom.—*C.* for supporting *suspension bridges* are made of separately stretched steel wires, each of which is brought to a certain strain, and the bunch bound up into a *C.*, wrapped, parcelled, and then served with wire and painted.—*Submarine C.* for telegraphic purposes have an interior core of copper wire surrounded by wires twisted after the manner of a rope, the whole being protected by a non-conducting waterproof coating of gutta-percha or india-rubber. *Imp. duty*, (chain) 2½ cts. per lb., (rope) see CORDAGE.

*Nautical terms:* To *bit* the *C.*, is to wind it around the bits.—To *buoy* the *C.*, is to support it by floats which keep it clear of the ground in a rocky anchorage.—To *coil* the *C.*, is to dispose it in helical tiers.—To *drag* the *C.*, is to haul it in the wake of the vessel.—To *fleet* the *C.*, is to allow it to surge back on the whelps of the capstan or windlass, as the cable climbs on to the larger part of the cone.—To *heave* the *C.*, is to haul in aboard.—A *kink* is a short turn in a *C.* which prevents its running through the hawse-hole.—To *nip* the *C.*, is to stop the running out by a pitching-rope, clamp, or lever.—A *C.* is *parcelled*, when wrapped with tarred canvas.—To *pay out*, is to allow the *C.* to run out.—To *serve* the *C.*, is to wrap it with ropes to keep it from being chafed.—To *slip* the *C.*, is to let it run clear out, thus losing the *C.*—*Spliced* is said of two *C.*, or two portions of a *C.*, united by working the yarns or strands of the two portions together.—To *stopper* the *C.*, to fasten it to the bits.—To *unbend* the *C.*, to detach it from the anchor.—To *underrun* the *C.*, is, with hempen hawsers, to take on board on one side of a boat and pay out on the other, examining and cleansing.—To *wed* a *C.*, is to allow it to run out, keeping command over it.—*Wormed* is said of a *C.* which has the spiral crevices between the lays filled with strands; usually a preliminary to serving.

**Cable-Laid**, anything twisted after the manner of a cable; thus there are cable-pattern gold chains, etc.

**Cable's Length**, a maritime measurement, ordinarily signifying 120 fathoms, or 240 yards; but the usual length of a ship's cable is only about 75 fathoms.

**Cable-Tier**, the space on the orlop deck or in the hold of a ship, where the cables are stored.

**Cable-Tow**, a small stream cable.

**Cabochon**, the French name for a precious stone, polished, but not cut.

**Caboose**, a house on deck of a ship where the cooking is done; a ship's fire-hearth, or stove, fitted with boilers, ovens, etc., for cooking meals for those on board; also termed a galley.

**Cabot**, a dry measure in general use in the island of Jersey, 19 of which are computed equal to 1 quarter of wheat, and 11 to a quarter of barley.

**Cabotage**, the French name for the coasting trade. *Petit cabotage* is applied to coasting voyages carried on in small vessels below 70 tons, between ports not far distant from each other; *grand cabotage*, to coasting voyages to distant ports of Europe.

**Cabotier**, a French coasting vessel.

**Cabrino**, the Spanish name for goat-skin.

**Cabriolet**, a carriage drawn by one horse, with a calash cover, and an apron or covering in front. See CAN.

**Cabritilla**, the Spanish name for a tanned or dressed lamb or sheep skin.

**Cabron**, the French name for a kid skin.

**Cabrouet**, a sort of cart used in sugar plantations.

**Caburns**, small lashings for binding a cable.

**Cacao** [Fr., Sp., Port., and It. *cacao*; Ger. *kakao*], the seeds or nuts of *Theobroma cacao*, the cacao or chocolate tree (Fig. 49). The pod resembles a cucumber in form, and contains from 20

Fig. 49. — CACAO TREE.

to 30 oval nuts, about as large as an olive, and covered with a violet or ash-gray skin, which encloses two cotyledons of a fatty nature, and of a brownish-black or violet color, which are very nutritious. These dried kernels, beans, or seeds are imported from the West Indies, Central America, and Brazil, in all which countries the tree grows wild, or is cultivated for the sake of its seeds. These seeds contain from 60 to 80 per cent of their weight of fat or oil, called *butter of cacao* (q. v.). In commerce, they are improperly called *cocoa*. After being picked, roasted, shaken, crushed, and winnowed, they constitute *cocoa nibs*; and a kind of rind or husk, which is separated from them, finds a sale as an inferior kind of cocoa. In an-

other form, the crushed nuts are heated, and ground into a paste, to which other substances are added, to enable water to mix with the fat or butter of the cacao. These additions are one or more along a large list,—sugar, honey, treacle, gum, starch, oatmeal, flour, rice, potato starch, nut meal, almond meal, arrowroot, together with spices and perfume. Mixing, heating, and casting in moulds are the processes adopted. The product is called *chocolate* if it requires boiling and stirring to dissolve, and *soluble chocolate* if it easily dissolves. By a change in the added ingredients, *chocolate paste* is produced. The plain *cocoa* of commerce is an inferior chocolate, containing some of the husk as well as the nut, and increased in bulk by treacle, flour, rice, or other ingredients cheaper than the nut. *Flake cocoa* is nearly the same as *cocoa* in powder, except in being condensed into flakes by passing through mills. The purest form of all is *cocoa nibs*. *Imp. duty* (nuts), free; (prepared or manuf.), 2 cts. per lb.

**Cacao-Butter**. See BUTTER OF CACAO.

**Cachaguyo**, the name in Chili for the *Durvillea utilis*, a sea-weed which is sold in bundles as an edible vegetable.

**Cachalot**, the sperm whale (*Physeter macrocephalus*), chiefly found in the South seas. It furnishes a fine oil and spermaceti, and hence the fishing for it is an object of commercial importance.

**Cacharado**, a kind of Spanish linen.

**Cacholong**, a milk-white variety of opal, first discovered on the banks of the river Cash, in Bokharax, but also found in the trap-rocks of Iceland and other Northern countries.

**Cachunde**, a paste flavored with musk and other aromatics in Spain.

**Caciocavalli**, a kind of Italian cheese.

**Cacoon**, a name for the seeds of *Eutada gignolobium*, which are used for making purses, scent-bottles, etc.

**Cactine**, the red coloring matter obtained from some species of the cactus group of plants.

**Cactus**, a common name for a large group of succulent plants belonging to several genera, most of which are curious and handsome, but of little use except as fences in tropical countries. *Opuntia cochinillifera* is, however, of importance, as on it are reared the cochineal insects. The fruit is not much esteemed as an edible, but it is used for feeding pigs in many quarters, and has also been turned to some account in producing alcohol.

**Cadafaes**, a Lisbon white wine.

**Cadarzo**, a name in Spain for coarse silk, which cannot be spun with a wheel.

**Caddy**, is a small tea-chest, or box, for table use.

**Cade**, a keg, or small barrel; also, a variable fish measure: 500 herrings or 1,000 sprats make a cade.

**Cade-Oil**, an empyreumatic oil, obtained by distillation in a retort from the wood of *Juniperus oxycedrus*. It is used in veterinary medicine.

**Cadiz**. See SPAIN.

**Cadjara**, a silk horse-cloth, or trapping, used in Russia.

**Cadmia**, the crust deposited on furnaces in which zinc ore is sublimed, containing from 10 to 20 per cent of cadmium.

**Cadmium**, a beautiful white metal, which in color and lustre has a strong resemblance to tin, but is somewhat harder and more tenacious. It is very ductile and malleable. Sp. gr., 8.604; average cost in New York, 20 cts. per oz. *Imp. free*.

**Cadmium Yellow**, the commercial name for the sulphide of cadmium, an artist's paint, the

finest and most permanent of all the yellow pigments in use.

**Café**, the French name for coffee; also, for coffee-house.

**Cafeine**, a trade name for a mixture of roasted grain and chicory ground, sold for coffee.

**Caffeine**, the active, nitrogenous principle giving the flavor to coffee, and which is similar to theine in tea.

**Caffir Corn**, a variety of *sorghum*, cultivated in parts of Southern Africa for its seeds.

**Caftan**, a thick quilted cloak or robe of wool or silk, used in Arabia and Turkey.

**Cag**. Same as **KEG** (q. v.).

**Cage**, a basket or enclosed frame for ascending and descending coal-mines. — A prison for birds. — *Cage of a whim*, is a mining name for the barrel on which the rope is wound up.

**Cagliari**. See **SARDINIA**.

**Cagmay**, an opprobrious term applied to bad meat or poultry.

**Cahan**, a nominal East Indian currency, which is the fourth part of a rupee.

**Cahier**, a number of sheets of paper tied loosely together. In the French paper-trade, a *C.* is a parcel of 5 or 6 sheets, the fourth or fifth of a quire.

**Cahiz**, plural **CAHICES**, a variable dry measure in Spain. The standard cahiz of 12 fanegas used in Cadiz and other places is rather more than 18 bushels, and in Valencia 100 cahices are equal to 70½ quarters. In some districts of Spain the cahiz is only 5 to 5½ bushels.

**Cahizada**, a superficial measure of Spain, consisting of 6 fanegadas, and equal to 1 acre (8 perches). What is generally understood by a *C.*, is the extent of land that can be sown with a cahiz of grain.

**Cahors Wine**, a red wine manuf. in the district of Cahors, a city in the S.W. of France. The grapes are plucked from the stems. After they have been well trodden, the muck or skins of the grapes are either partly or wholly set over the fire in large boilers, and boiled for some time. After this, the contents are poured into a vat with the other part of the juice which has not undergone the same operation. They commonly remain 8 or 10 days in the vat, when they are racked. They do not usually press the muck. These wines are most commonly treated by mixing them with one third of a liquor called *voysme*, which is the must of the *auxerrois* grape, made to boil for 5 or 6 minutes. They afterwards throw into it the highest proof spirit of wine, in the proportion of 1 gallon to 4 of the must, and it is then put in the cask. It is racked at the expiration of 2 or 3 months. Much of this liquor is sent to Bordeaux, to strengthen or color light wines. The *C. W.* carries little perfume, but it is strong in body. It is bottled at 2 or 3 years old. It will keep 20 or 30 years in wood, and 40 or 50 in bottle. In commerce, it increases 10 per cent in value each year it is kept. The best wines are grown on the hills, and in the communes of St. Gery, Vers, Savangac, and Cahors. The price at Cahors is about 100 francs the hectolitre.

**Cahoun**, or **COHUNE**, a plume-like palm, *Attalea cohune*, native of Honduras, bearing nuts, which grow in clusters like a bunch of grapes; an oil is obtained from them by expression, equal to that from the cocoa-nut.

**Caico**, a small Italian skiff; a jolly-boat.

**Caigue**, a light bark used on the Bosphorus.

**Caimehs**, the Turkish name for the much-depreciated paper currency of the Sultan.

**Cairngorm**, a variety of rock-crystal of various shades found on the mountain of that name in Inverness-shire, Scotland, and of which seals, necklaces, and other trinkets are made.

**Cairo**. See **EGYPT**.

**Cairo and St. Louis R.R.**, runs from Cairo to East St. Louis, Illinois, 146.5 m. Offices in St. Louis. This Co. was chartered in 1865, and the road was completed in 1875. Cap. stock, \$4,565,000; funded debt, \$2,500,000; total, \$7,065,000. The Co. first made default on its bonds in 1874. The funded debt consists of a first mortgage 7% bonds, issued 1871, payable 1901. Net earnings for 1878, \$21,950.98.

**Caisson**, a water-tight box for facilitating the commencement of the foundation of piers, bridges, etc. — A machine for raising vessels, resembling an enormous chest, with an air-tight chamber in the interior, which will not allow it to sink beyond a certain depth. In order to raise the vessel, it is sunk by letting the water into it, and brought under the ship's bottom, and there secured. The holes through which the water entered are then closed, and the water pumped out. This causes it to rise and lift the vessel, bringing the bottom out of the water for inspection and repairs, which can be thus effected without bringing the vessel into dock, or hauling her on shore.

**Cajeput**, an essential oil, limpid, transparent, of a greenish color, a camphoraceous smell, and an acridly aromatic taste. Sp. gr. 0.927. It is sometimes adulterated with other oils, particularly oil of turpentine. It is prepared in large quantities in the Dutch settlements of the Banda and Molucca islands, from the leaves of the *Melaleuca cajeputi*, and is imported by way of Holland, in copper flasks. It is used internally as a stimulant and antispasmodic, but more frequently externally as an embrocation. *Imp.* free.

**Cajon**, or **CAXON**, the Spanish name for a chest. In the South American mining districts it is applied to a weight of 50 quintals of mineral.

**Cake**, a kneaded or solid mass of any kind, as a cake of copper, of Indian ink, of pastry or baked dough, etc.

**Cake-Breaker**, a crushing or cutting implement for breaking up oil-cake for the feeding of stock, and pressing rape-cake for manure.

**Cake-Toaster**, a toasting-fork.

**Calabash**, [*Sp. calabaca*], a name given in the West Indies to a gourd or pompon, the fruit of the *Crescentia cujete*, which when young are pickled. The hard rind or covering, when the pulp has been taken out, is made into all kinds of domestic utensils by the negroes, — cups and saucers, baskets and bowls, pepper and salt dishes, etc., — which take the place of crockery, and are not so easily broken or destroyed. Many will stand the fire for cooking as well as an iron pot.

**Calabazate**, in Spain, pumpkins preserved in sugar, or steeped in honey.

**Calabria Wine**. See **ITALIAN WINES**.

**Calais**. See **FRANCE**.

**Calamanco**, a glossy, woollen stuff, checkered in the warp, either ribbed or plain, manuf. in Bradford, England.

**Calamander Wood**, a beautiful fancy wood obtained from *Diospyrus hirsuta*, a tree which grows in Ceylon. It is extremely hard, and finely veined with different shades of black and brown. It is scarce, and very dear.

**Calambour**, a kind of eagle or aloes wood, sometimes used for inlaying and cabinet-work.

**Calamine**, a native carbonate of zinc, used as a drug.

**Calamus Oil**, an oil obtained from the root of the sweet flag, *Acorus calamus*. It is used in pharmacy and perfumery.

**Calavance**, a name for several kinds of pulse, including the *Dolichos Barbadosensis* and *sinensis*.

**Calcar**, a calcining furnace in glass-works.

**Calcareous Earth**, a gritty soil which contains a large percentage of lime.

**Calculator**, one who reckons or estimates matters of figures or detail.

**Calcutta**. See INDIA (BRITISH).

**Caldron**, a large iron boiler or pot.

**Caleche**, or **CALASH**, a lady's hood. — A small hooded carriage running on low wheels.

**Calendar**, a register of times and seasons; an almanac. The principal measures of time are those

Fig. 50. — CALCULATING MACHINE.

**Calcareous Spar**, a carbonate of lime.

**Calcedony**. See CHALCEDONY.

**Calcination**, the reduction of substances to cinders or ash.

**Calcium**, the metallic base of lime. See LIME.

**Calculating Machine**, an instrument with toothed wheels, each turning freely on its own centre, for automaton calculation. The forms which some of these machines have assumed, and the work which they have effected, are truly wonderful. Thomas's *Arithmometer*, Babbage's *Difference Engine*, the same remarkable man's *Analytical Engine*, and Scheutz's *Calculating Machine*, are, with the following, the principal specimens hitherto produced.

The *Arithmometer*, invented by Mr. George B. Grant of Boston (Fig. 50), is a calculating machine for common operations in multiplication and division. It is about 7 inches in height, and covers  $5\frac{1}{2}$  by 13 inches on its base. Its works are of metal, and all striking and wearing parts are of tempered steel. "It works with rapidity and certainty, is composed of a comparatively small number of parts, is substantially constructed, not readily disarranged, and easily operated, effecting a saving in time of more than sixty per cent over ordinary methods, and relieving the mind from any strain, as well as removing all doubt of accuracy" (*Report of the Committee of the Franklin Institute*, Oct. 19, 1875). Example of multiplication:  $357 \times 403$ . Set up 357 on the three upper sliding rings on the sliding carriage, and turn three times. Shift the slide one point on the cylinder, and turn nine times; another shift, and four turns will complete the operation, and show the result, 145,881, in plain figures on the recording wheels on the lower shaft.

furnished by nature in the rotation of the earth on its axes, the revolution of the moon round the earth, and the revolution of the earth round the sun,—periods respectively denoted by the terms Day, Month, and Year. For ordinary purposes, however, they are reckoned by approximate or conventional methods. The Civil Day is the mean solar day. The Lunar Month is, except in Eastern countries, superseded by the Calendar month. The Civil Year, or mean solar year, was adjusted by Julius Cesar (n.c. 45), who, estimating the solar revolution at 365 days, 6 hours, fixed that the year should consist of 365 days in three successive years, and 366 in the fourth, called leap year. This method, denominated *Old*

GENERAL CALENDAR FROM 1798 TO 1899.

YEARS.							MONTHS.		SUNDAYS.						
G.	F.	E.	D.	C.	B.	A.			1	2	3	4	5	6	7

Use. — To find the day of the week answering to May 4, 1840. — Above 1840, in the left-hand table, is found the *Dominical or Sunday Letter D*, and over D, contiguous to May, in the right-hand table, is the figure 3, the date of Sunday; the 4th, therefore, is Monday.

The converse of this operation, namely, to find the day of the month corresponding to the day of the week, is too evident to require illustration.

The months January and February, it will be observed, are to be referred to separately in leap years; such years may be known by a blank space always preceding them in the left-hand table.

*Style*, was adopted and continued by all Christian nations until A.D. 1582, when it was discovered that the Julian year was too long by about 11 minutes, — the true length of the solar year being 365 days, 5 hours, 49 minutes nearly. To rectify this error, which had then led to an advance of about 10 days, Pope Gregory XIII. ordained that the year 1582 should consist of 365 days only; and, to prevent a like irregularity in future, it was decreed that when a number denoting a complete century is not divisible by 4, as the 17th, 18th, and 19th, such years should be reckoned as common years, — an arrangement involving an excess of but 1 day in 5,200 years. The Gregorian Calendar, or *New Style*, was gradually adopted in all Christian countries, except those which acknowledge the Greek Church, — Russia and Greece. In England, it was adopted in 1752, when the difference of time being 11 days, it was enacted that the 3d of September of that year should be called the

**Calf-Skin**, the hide of the calf, which, when tanned, forms the material for one of the most valuable kinds of leather. C.-S. for boot-makers are extensively manuf. in the U. States, but the best come from France. *Imp. duty* (tanned, or tanned and dressed), 25 per cent.

**Calibre**, a French word now generally adopted to express the bore of a piece of ordnance.

**Caliche**, a name for nitrate of soda found in Peru.

**Calico**, a general term in Europe for any plain white cloth made from cotton, but which receives peculiar distinctive names as it improves in quality and strength, and according to the purposes for which it is used. In the U. States the term is restricted to printed cotton cloths. See COTTON MANUFACTURE.

**CALICO PRINTING** [*Fr. impression d'indiennes*; *Ger. katten-druckerei*], is the art of producing figured patterns upon cotton cloths. It comprises mechanical and chemical processes which require much skill, and has been practised in India and China for many ages, the word "calico" itself being derived from Calicut, on the Malabar coast, whence printed goods were first imported. The dyes and colors are of two kinds, — those which penetrate through the whole substance, showing almost as brightly on one surface as on the other; and those which are intended to be seen only on one side. They comprise nearly the same series of animal, vegetable, and mineral substances as the dyer is in the habit of using; but there are additional precautions necessary to insure fast colors. — *Color Mixing*. The color-house at a print-work is an important place, in which a considerable knowledge of chemistry must be displayed. The mills and stones for grinding, the rotating machines for mixing, and the caldrens and boilers for heating, partake of the usual mechanical character; but there is much else to attend to in relation to the qualities of the various dyes and colors. Some must be thickened with starch, or flour, or gum, to make them act more like a paint than a dye; some have the mordant combined with the colors, instead of being used separately; some require a liquid vehicle that would be inappropriate for others; some require steam to act upon them after they have been applied to the cloth. — *Block-Printing*. In the early days of cotton-printing, the pattern or device was engraved on the surface of a large square block of sycamore, holly, or pear wood; and this plan is still adopted for choice patterns of which only a small supply is likely to be needed. The pattern may be engraved on any kind of smooth wood, or may be built up in relief with narrow slips of copper, or may be reproduced by electrotype. The color is spread out on a cushion or pad; the block, held by a handle at the back, takes up a thin layer of it; this layer is applied to the cloth, smoothly spread out on a table, and so on. If the pattern comprises many colors, there is one block to each; and the blocks are used in regular succession, each filling up its proper place in the design. The cloth is shifted on as fast as it is printed, and a new portion brought forward at each shifting. — *Perrotine-Printing*. A machine for block-printing, called the *Perrotine*, is used in France and Belgium. Three long wooden blocks, engraved with the pattern, are made to fit upon three sides of a square prism of iron. The prism rotates upon a horizontal axis; the calico or muslin passes between the prism and the bed; and the action is such that the calico receives a long stripe of colored pattern every time it touches one of the blocks. — *Cylinder-Printing*. This is the kind by which the great bulk of printed goods is produced. The pattern is engraved on a roller or cylinder, instead of on a flat block. The roller is of copper or brass; a coating of varnish is given to it; the pattern is etched on the varnish with a diamond point, and then eaten in or engraved by the action of dilute nitric acid. Sometimes the engraving is impressed by Perkins's rolling-machine; sometimes, again, the engraving is done by an engine like that employed in engine-turning; and occasionally the rollers are of wood, with a pattern made by inserted slips of copper. The rollers are from 30 to 40 inches long, by 4 to 12 in diameter. There are as many rollers as there are colors — one to each (Fig. 51); there are also as many distinct troughs or cells of dyestuff or pigment as there are colors; and the cylinder machine is a skillfully planed apparatus, by which all those rollers and troughs can be brought into action, each one just at its proper time and in its proper place. Some elaborate patterns have as many as 20 different colors and shades of color; and then the arrangements are very complicated; but from 1 to 4 is the most usual number. So perfect are the adjustments, that one mile of calico can be printed in one hour. — *Accessory Machines*. The machines and processes accessory to

Fig. 51. — CALICO PRINTING.

(Cylinder Machine printing in twelve Colors.)

14th. During the present century the Old Style is to be reckoned 12 days later than the New Style. Thus a Russian or Greek bill, dated the 10th day of any month, must be reckoned from the 22d day of the same month in every place where the Gregorian Calendar is used.

**Calender**, a machine for smoothing or hot-pressing fabrics between rollers, to give them a glossy or wavy appearance. Some of the rollers are indented or embossed, to produce *watered* or *figured* patterns at the same time as the pressing. Some of them are heated from within, some are used cold, according to the fabric. A more simple and well-known C. is described under MANGLE.

**Calf**, the young of a cow, usually so termed until it is past six months old, when it becomes a yearling. C. generally become fat enough for veal in 8 or 9 weeks. — The name given to calfskins prepared for book-binding, etc.

**Calfini**, a preparation made with the oil distilled from the outer bark of the birch, and used for flavoring Bavarian beer.

the actual printing are numerous. The printed cloth is dried by a gas-heated *drying-machine*; and then transferred to the *airing-room*, where the action of the air, aided sometimes by a little steam, causes the colors to adhere more firmly to the fibres. The *clearing-back* is a vessel in which the printed cloth (if some particular kinds of color are used) is scoured with soap and water; and there are *washing-machines* also, with clear water only. — The *Madder Style* is the name given to a particular series of processes when the printing is with a machine chiefly used when madder is the principal dye. The *Indigo Style* denotes another series of processes, when the printing is with a *resist paste*, which prevents the dye from attacking those particular spots. The *Pudding Style* is a third series, mostly suited for mineral colors, and requiring some of the colors to be in a thickened state. The *Discharge Style* is a fourth (already noticed under BANDANA). The *Steam Color Style*, largely employed for furniture chintzes, requires the action of steam to fix the colors upon the cloth.

**Calidad**, a choice kind of Cuba tobacco.

**California**, a Western State of the U. States, bounded W. by the Pacific Ocean, along the coast of which it extends from 32° 45' to 42° N lat., S. by the peninsula of Lower California and the Gila River, which divides it from Mexico, E. by Nevada and the Rio Colorado, and N. by the State of Oregon; average length, about 700 m., breadth, 200 m.; area, 156,687 sq. m., or more than 100,000,000 acres, of which 35,000,000 are arable, 23,000,000 pasture, and about 5,000,000 swampy and inundated lands, but possibly reclaimable. The surface and climate of C., although extremely varied in character, bear everywhere a peculiar impress, very different from that of the Atlantic coast and Mississippi Valley States. C. may be divided into

Fig. 62. — SEAL OF CALIFORNIA.

three great distinct portions, and these are very different from each other in importance, — the central being much the most densely populated, and in every respect the most valuable. This central portion is embraced between the parallels of 35° and 40°, and has on its eastern side the

Sierra Nevada, and on its western the Coast Ranges, with the Pacific Ocean at its western base. Between these two mountain chains lies the Great Central Valley, which is drained by the Sacramento and the San Joaquin, the two uniting about midway between the N. and S. extremities of the Valley, and entering the Bay of San Francisco through Suisun and San Pablo bays, which latter is, in fact, but the N. expansion of San Francisco Bay itself. The entire length of the Great Valley is about 450 m., and its breadth averages about 40 m.; area, 57,200 sq. m. The drainage of this entire area reaches the sea through the Golden Gate. There are several large mountain lakes in C., some of which are of pure and fresh water, while others are alkaline, being without an outlet. The finest of these is Tahoe, which lies on the very summit of the Sierra, and at an elevation of 6,200 feet. It has a length of about 20 m., and is 1,500 feet deep, its water being extremely pure. North of the parallel of 40°, where the Coast Ranges and the Sierra unite, and where the Great Valley disappears, the country is extremely rough and very thinly inhabited. The 7 counties which are included within the region N. from the head of the Sacramento Valley to the State line had in 1870 a pop. of only 19,269, and they had all lost in numbers during the previous decade. The N.W. corner of the State is also extremely rough and mountain-

ous, and a large part of it is quite uninhabited. That portion of C. which lies to the S. and E. of the southern insolation of the Coast Ranges and the Sierra, comprising an area of fully 50,000 sq. m., is also very thinly inhabited, with the exception of a narrow strip along the coast. Nearly all of San Diego and San Bernardino Counties belong to the Great Basin system, having no drainage to the sea. The Angeles County, however, has within its borders some of the most fertile lands in the State. These form a strip about 20 m. wide along the coast; the N.E. half of the county, on the other hand, is extremely barren. The region lying E. of the Sierra Nevada, and between the crest of that range and the boundary of the State, chiefly between the two counties of Mono and Inyo, is also a very mountainous tract of country. The climate of C. is very different in different parts of the State, according to distance from the ocean, situation with reference to the mountain ranges, and altitude above the sea level. But there are certain peculiar features which obtain all over the State. In the first place, the division of the year into two seasons — a dry and a rainy one — is the most marked characteristic of the C. climate. But as one goes north, the winter rain is found to begin earlier and last longer; while, on the other hand, the S.E. corner of the State is almost rainless. Again, the climate of the Pacific coast, along its whole length, is milder and more uniform than that of the States in a corresponding latitude E. of the mountains. We notice, in addition, that the means of summer and winter are much nearer the mean of the year in C. than in the East. This condition of things is not so marked as we advance into the interior of C.; but everywhere in the State the winters are comparatively mild, and the heat of summer is much less disagreeable in its effects, because the air is excessively dry and the evaporation proportionally rapid. The climate of San Francisco is indeed wonderfully uniform; and the bracing, cool air which sweeps in from the ocean during the afternoons of the summer, although not favorable to persons with weak lungs and sensitive throats, is the very breath of life for those who are in vigorous health. One great drawback to the enjoyment of the delightful climate of C., however, is the dust of summer, which seems, until one becomes accustomed to it, quite unbearable. C. was for many years chiefly known to the world as the region where gold was obtained in extraordinary quantities. The existence of gold in C. had long been known, but no discovery had been made, which attracted much attention, previous to January, 1848, when a piece of native gold was picked up in an excavation made for a mill-race on the south fork of the American River, at a place now called Coloma. The excitement caused by that discovery, and the consequent emigration to the land of gold, continued till 1854, when there was a decided reaction throughout the U. States in regard to mining matters. The Californian discoveries had given rise to a general search for metalliferous deposits in the Atlantic States; and this had been followed by wild speculations, a great deal of money having been sunk in opening new mines, and in attempting to develop old ones which had never yielded anything of value. Silver-mining has been attempted in many localities of C., and much money spent in trying to develop the argentiferous lodes which have from time to time been discovered; but the only paying silver mines in the State seem to be those of the Inyo Range, and Cerro Gerdo, where the ore is chiefly galena, rich

in silver, and also containing considerable gold. *Quicksilver* is largely produced at the New Almaden, Guadalupe, Aurora, and other mines. *Iron*, in large quantities and various forms, is found in all the Coast Ranges. *Platinum* is almost as widely dispersed through the State as gold, though in smaller quantities. Tin, chromium, gypsum, nickel, antimony, bismuth, sulphur, lead, salt, saltpetre, borax, coal, marble of extraordinary beauty, alabaster, granite, buhr-stone, lime, etc., are the other principal mineral products of the State. — Owing to the peculiarities of the climate, and especially its mildness in winter and the dryness in summer, the whole system of cultivation is very different in *C.* from what it is in the Mississippi Valley. If the season is favorable, that is, if rain falls in abundance in November, so that the ground becomes soft enough to plough, then sowing is begun at once, and the best crops are raised when the "latter rains," which fall in March and April, are tolerably abundant, and yet not so much as to cause inundations. Almost everything, except ploughing, in connection with agricultural work is done on a large scale, with the help of machinery; and the profitable farms are usually of great size, comprising many thousand acres. In 1878, the amount of the principal productions of the soil were as follows: Wheat, 22,000,000 bu.; Indian corn, 1,550,000 bu.; oats, 1,750,000 bu.; barley, 7,800,000 bu.; potatoes, 3,200,000 bu.; hay, 560,000 tons. In the same year there were in *C.* 1,000,800 oxen and other cattle; 6,561,000 sheep; 438,500 hogs; 262,600 horses; 25,400 mules; and 389,500 milk cows. Fruit is an item of great importance in the agriculture of *C.*, the quantity raised being very large, and the quality excellent. The pear, plum, apricot, and grape are especially good. A large amount of capital has been invested in the manuf. of wine; and though the quality is not still all that could be desired, it is gradually improving, and the day may be foreseen when the Eastern market will be widely open to it. *C.* is a country particularly adapted to raising sheep, and the wool interest is a very important one. The winters are so mild, that shelter for the flocks is not required, and they have no other food than that which they pick up for themselves on the lower plains in winter, and in the higher mountain valleys in the summer. The commerce of *C.* being mainly carried on through San Francisco, which is the only port of entry in the State, we refer to the name of that city for an account of the commercial and manufacturing interests of the State. The principal towns are San Francisco, Sacramento City (the capital), San José, Marysville, Stockton, Nevada, Grass Valley, Petaluma, Yreka, Placerville, Oakland, etc. *Pop.* 560,285. See SAN FRANCISCO.

**California Pacific R.R.**, runs from South Valjeo to Sacramento, Cal., 60.17 m., with branches, 78.01 m.; total, 138.18 m. Offices in San Francisco. This Co., chartered in 1869, is a consolidation of the California Pacific and the California Pacific Extension R.R. Cos., and is leased to the Central Pacific R.R. at a rental of \$550,000 per annum, in addition to three-quarters of the net earnings in excess of the amount. *Capital Stock*, \$12,000,000. *Funded Debt*: first mortgage, issued 1867, \$2,250,000, payable 1887, int. 7% (Jan. and July); second mortgage, issued 1871, \$1,000,000, payable 1891, int. 6% (Jan. and July); third mortgage A, issued 1875, \$2,000,000, payable 1905, int. 6% (Jan. and July); third mortgage B, issued 1875, \$1,000,000, payable 1905, int. 6% (Jan. and July). The three last are indorsed by the Central Pacific R.R. Co.

**Calin**, an alloy of tin and lead, used by the Chinese for tea-canisters and other articles.

**Calipers**, or **CALIPER COMPASSES**, are compasses with curved legs for measuring the diameter of cylinders, balls, or other round bodies.

**Calisaya**. See CINCHONA BARK.

**Calisthenic Instrument Maker**, a manufacturer of chest expanders, etc.

**Calk**, a name for lime.

**Calking**, the process of tracing with a style or hard pencil through a print which has been rubbed with colored chalk at the back; or, copying a drawing by tracing with chalk.

**Calkins**, or **CAWKINS**, the prominent or elevated extremities of the horse's shoe, forged thin, and turned downwards to prevent slipping.

**Call**, a visit. — The demand for payment of an instalment due on shares. — A speculation on the Stock Exchange, which consists in selling stocks to be delivered on call at any day within a fixed period. — *Call and Put*, is a stock-broker's term for a transaction such as the following: *A.*, anticipating the rise of a given stock, puts up \$100 with *D.* for the privilege of calling upon the latter for 100 shares of the stock at or within a given time, say 30 or 60 days. If the stock rises, he calls for his 100 shares, and takes the difference between the price agreed upon and the price on the day he calls. If the stock falls, the transaction is closed by the forfeiture of the \$100. On the other hand, if *A.* believes a given stock will fall, he puts up say \$100, and agrees to deliver to *D.* say 100 shares, at a given time at a given price. If the stock falls below the price agreed upon, he calls upon *D.* for the difference; if it rises, the transaction is closed by the forfeiture of the \$100 (*Thomas McElrath*). — *Call in*, to collect as outstanding debts, money, etc.; or, to recall from circulation, as currency notes. — *Call on*, to solicit payment of a debt; also, to ask assistance, as, to call on a bank for a loan.

**Callao**. See PERU.

**Callibogus**, a drink made in Newfoundland by adding spirits to spruce beer.

**Calligraphy**, the art of fine penmanship.

**Calipers**. See CALIPERS.

**Callipeva**, an esteemed river mullet of the West Indian seas (*Mugil liza*), seldom extending further than the embouchures of streams, or into the ponds and marshes. Its scales are useful for making ornaments, and its roe forms an excellent caviare.

**Callou**, the Spanish wine or fermented liquor extracted from palms.

**Calmucks**, a sort of woollen hair-cloth.

**Calmus**, a German wine resembling the sweet wines of Hungary, made in the territory of Frankfurt, at Aschaffenburg.

**Calomel**, a mild preparation of mercury, the dichloride, used in medicine as an alterative or purgative. *Imp. duty*, 30 per cent.

**Calorimeter**, an instrument to indicate the heat given out by bodies in cooling, or passing from one temperature to another, which is ascertained by the quantity of ice it will melt.

**Calotype Process**. See PHOTOGRAPHY.

**Calumba Root**. The calumba plant (*Coccinus palmatus*) grows in Malabar, and in the thick forests of the E. coast of Africa, between Oibo and Mozambo, from which last place the roots form a staple export to Ceylon, and thence to Europe. The root is generally brought in transverse sections, from half an inch to 3 inches diameter, rarely divided across; and the bark is of a dark brown color outside, and bright yellow within. It is very subject to decay by worms. When good, it looks bright and solid, breaks with a starchy

fracture, and has a faint aromatic odor and bitter taste. It is a most valuable antiseptic and tonic. *Imp. free.*—The American *C.* of the Southeastern States (*Feuerra walteri*) is not so valuable. It may be distinguished by its whiter color, lighter texture, the mixture of longitudinal pieces, and the taste being at first sweetish, and not nearly so bitter as the genuine root.

**Calzado**, the Spanish name for a shoe or sandal of any kind.

**Cam**, a contrivance for converting a uniform rotatory motion into a varied rectilinear motion. The end of a rod, which is free to move only in the direction of its length, is held in contact, by the action of a spring or weight, with the edge of an irregularly shaped mass, which revolves uniformly upon an axis. A varied motion is thus communicated to the rod, which carries with it the machinery by which the motion is to be applied. This contrivance is much used in the machinery for lace-making.

**Camail** [Fr.], a domino; a capuchin, or short cloak, sometimes made of fur.—A purple ornament worn by a bishop over his rochet.

**Camara**, a store-house for grain.—The hard, tough, and valuable timber of *Dipteryx odorata*, a tree found in Essequibo.

**Camata**, the commercial name for half-grown acorns, dried, which are imported for tanning.

**Cambay Stone**, a kind of cornelian, obtained in the East Indies.

**Camber**, a repairing wet dock, or inlet from a harbor.—*Camber-beams*, are those used in the flats of truncated roofs, and raised in the middle with an obtuse angle, for discharging the rain-water towards the sides of the roof.—*Camber-slip*, an instrument for drawing arches.

**Cambiale**, the Italian name for a bill of exchange.

**Cambio** [Sp.], barter, the giving or taking bills of exchange; a rise or fall in the course of exchange.

**Cambirt**, a money-changer; one well versed in exchanges and foreign moneys; a trafficker in bills. Also applied to a book descriptive of moneys, weights, and measures of various countries.

**Cambrel**, an iron with hooks to hang meat on.

**Cambric** [Fr. *batiste*; Ger. *kammertuch*; It. *cambraja*; Port. *cambraia*; Sp. *cambrai*], a very fine linen fabric, so called from having been originally manuf. at Cambray, a city of France; also, a fine cotton fabric in imitation of linen. Its varieties are glazed, white, and colored for linings, twilled, figured, striped, and corded. Cotton *C.* are either white or printed for dresses, or used as French batiste. The former are made chiefly in Lancashire, England; the latter in Glasgow, Scotland. Scotch *C.* is an imitation *C.* made from fine hard-twisted cotton. *Imp. duty* (valued at not over 30 cts. per sq. yd.), 35 per cent; (valued at over 30 cts. per sq. yd.), 40 per cent.

**Camel** [Arab. *djemal*], a ruminating quadruped of a grotesque form, which has been used from a

remote period in Eastern countries as the principal beast of burden. There are two species: the Bactrian *C.* (*Camelus bactrianus*), characterized by a couple of humps,—one on the rump and another above the shoulders,—is employed in Tibet, Turkestan, Tartary, and S. Russia; the dromedary (*Camelus dromedarius*), with one hump situated on the middle of the back, is indigenous in Arabia, from whence it has spread over the north of Africa, Syria, and Persia; and the intermixture of these two species has produced varieties which are more or less used in different localities. The *C.* is esteemed by Eastern nations one of the most precious gifts of Providence to man; and assuredly it seems formed by nature for a life of patient drudgery. Justly has the Arab named it the Living Ship of the Desert, as without it he could neither transport himself nor his merchandise across those oceans of sand with which his country is covered. Its spreading, cushioned feet, formed to tread lightly upon the dry and shifting

Fig. 53. — LOADED CAMELS.

soil; the nostrils, so formed that it can close them at will, to exclude the drift-sand of the parching simoom; the powerful upper teeth, for assisting in the division of the tough prickly shrubs, and dry, stunted herbage of the desert; and, above all, the cellular structure of the stomach, which is capable of being converted into an assemblage of water-tanks,—bear ample testimony to the care manifested in the structure of this extraordinary quadruped. The *C.* is weaned at the commencement of the second year, and begins to propagate when four years old, though it does not complete its full growth until the age of twelve. It will live as long as 40 years; but after 25 or 30 its activity begins to fail. *C.* are content with the coarsest food,—a bunch of dry grass, or the stunted shrubs of the wilderness. Their ordinary food is a ball of paste (*mantouk*), weighing about a pound, made of barley-meal and water, which each receives in the evening; and this is all the daily expense of these useful creatures. The value of the *C.* depends, of course, on its kind and quality. In Hejaz, the price of a good one is said to be \$75, but they sometimes cost \$200. *C.* are

used both for riding and carriage, for which purposes they are employed in large numbers in the Eastern caravans. The first thing that an Arab examines about his *C.*, when preparing for a long journey, is the hump, which is an infallible criterion as to the ability for exertion; for whenever it subsides, the beast gradually yields to fatigue. A long journey will cause the hump almost entirely to disappear. It is easily restored, however, by a few weeks of good nourishment and repose. The favorite pace of the riding *C.* is a kind of amble, at the rate of 5 or  $5\frac{1}{2}$  miles an hour. Many fabulous stories are related of the swiftness of this animal; but it never approaches, even for short distances, to that of a common horse, though it is perhaps unrivalled for the ease with which it will despatch an uninterrupted journey of several days and nights, if allowed its own natural pace, and not employed on hilly, woody, or slippery ground. The load of the carriage *C.*, in common cases, is from 400 to 500 lbs. for a short journey, and from 300 to 400 lbs. for one of any considerable distance. The capability of bearing thirst varies among the

Fig. 54. — SLIDING CAMERA OBSCURA.

different races. In the caravans from Darfūr they travel nine or ten days without water; but the Anatolian *C.* requires drink every second day, — *Camel* is also the name of a contrivance for lifting ships over a bar or shoal that obstructs the navigation of a river.

**Camels'-Hair** [Fr. *poil de chameau*; Ger. *kameelhaar*; It. *pelo di camello*], is much longer than sheep's wool, and often as fine as silk. It is imported from the Levant, principally for the manuf. of pencils for the painter. That produced in Persia is held in the highest estimation. The black hair is most valued, next the red, and the gray brings only half the price of the red. In the East, *C.-H.* is woven into clothing, and even tents, purposes to which it has been applied from a remote period. *Imp. duty* (cleaned or uncleaned, but not manuf.), 10 per cent; (pencils), 35 per cent.

**Camels'-hair Shawls.** See CASHMERE SHAWLS.

**Camellia**, a genus of beautiful evergreen shrubs. The seeds of *Camellia oleifera*, a native of China, yield an excellent table oil. The large, splendid, rose-like flowers of several species of *C.* are much prized, being cultivated in private hot-houses, and sold by florists.

**Camelot.** See CAMLET.

**Cameo** [Fr. *camée*], a gem worked in relief; a small bas-relief cut on various substances, as stone, shell, lava, ivory, etc. They are frequently cut on certain conch shells, or Strombos, the substance of which consists of two distinct layers of different colors, textures, and hardness. The black conch offers the most decided contrast of color in the layers. Shell cameos are now very common, and some display a great deal of taste in the design, cutting, and adaptation of the various layers of the helmet and other shells to the required tints. Imitation *C.* are made by pressing or moulding porcelain or other plastic material. *Imp. duty* (not set), 10 per cent; (in frames), 20 per cent; (imitations, set), 25 per cent; (imitations, not set), 40 per cent.

**Camera Lucida**, invented by Dr. Wollaston, is an apparatus containing a glass prism with angles of definite measurement. When the light from any object falls on one side of the prism, it is reflected down upon a piece of paper, and an eye, placed near an angle, sees the image and the paper at the same instant. The instrument assists in drawing or delineating, but is now nearly superseded by photography.

**Camera Obscura**, an optical instrument in the shape of a box with an opening at the end to receive a lens; and there is a kind of telescopic action which allows this lens to be brought into various positions for adjustment of focus. At the other end of the box is a screen of ground glass, so placed as to receive the image of any object focalized by the lens. For a common camera, there is an intermediate reflector at an angle of 45°, which throws the image on a horizontal ground glass; when it appears as a small picture. For a magic lantern, painted slides are used. See PHOTOGRAPHY.

The sliding camera obscura, represented in Fig. 54, enables any one, without a knowledge of the rules of drawing or perspective, to delineate distant objects, trace the outlines of landscapes, etc., with perfect accuracy. It consists of a rectangular box, in which the luminous rays *R* penetrate through a lens *B*, and are directed to the opposite side *O*, there to form an image. But the rays, intercepted by a glass mirror *M* at an angle of 45°, change their direction, and come to form the image on a screen of ground glass *N*. If a sheet of tracing-paper is placed on that screen, the image can be accurately delineated with a pencil. A little board *A* intercepts the light, which, if falling on the image, would not permit it to be seen. The box consists of two separate parts, sliding the one in the other, so that, by drawing more or less the anterior part, according to the distance of the object, the reflected image comes exactly on the screen *N*.

**Cames**, rods of cast-lead used by glaziers in framing church windows and other quarrels of glass.

**Camfering**, taking off an angle or edge of timber.

**Camion**, a term now used for a dray, formerly applied to a hand-truck.

**Camionage**, the French word for cartage or dray-hire.

**Camlet** [Fr. *camelot*; Ger. *kamelot*; It. *ciambello*], was originally a rough fabric made of the hair of the camel and the goat interwoven, which was used by ascetics. That of the East is made of the hair of the Angora goat. English *C.*, however, is a light stuff, made of long wool hard spun, some-

times mixed in the loom with cotton or linen yarn.

**Camomile**, or **CHAMOMILE**, the flowers of *Anthemis nobilis*, employed medicinally in Europe as a cheap, tonic, carminative anodyne; when taken in large doses, however, they prove powerfully emetic. *Imp.* free.

**Campeachy Wood**. See **LOGWOOD**.

**Camp-Bed**, a folding iron bedstead, with tester laths, for field use.

**Camp Furniture**, articles of cabinet-work, made compact, light, and portable, so as to be easily folded and transported.

**Camphine**, or **BURNING FLUID**, a trade-name for essential resinous oils, such as the purified oil or distilled spirits of turpentine. When intended for a burning fluid, it is mixed with alcohol in various proportions.

**Camphor** [*Ar. kaffoor*; *Fr. camphre*; *Ger. kampfer*; *It. and Port. camfora*; *Sp. canfor*], a peculiar vegetable principle arising from the separation of the volatile oil of different trees, which is used in medicine and the arts. Two kinds are distin-

guished in commerce: *China* or *Java C.*, the only kind met with in Europe, is the product of the *Laurus camphora* (Fig. 55), found in Quangtung and Fokien in China, in Cochin China, and in Japan. It is extracted from all parts of the tree, but chiefly from the roots, and is obtained in the state called *crude C.*, merely by sublimation. In this state it is generally imported, and is afterwards refined by mixture with lime and a second sublimation. *Crude C.* occurs in small brownish or gray grains mixed with impurities. Refined *C.* is a very white, soft, semi-transparent substance, having a crystalline appearance, a strong and fragrant odor, and a hot, pungent taste; very inflammable, and so volatile as totally to exhale when left exposed in a warm air. *Sp. gr.* 0.985. It occurs in round cakes, each weighing about 2 lbs., and is commonly packed in vessels containing nearly 250 cakes. The quantity of *C.* exported from Canton varies much from year to year. In the U. States, 1,117,290 lbs. of *crude C.*, valued \$166,635, were imported in 1878 — *Malay* or *Barus C.* is found in great purity concreted among the

woody fibres of the *Dryobalanops camphora*, growing in Borneo, Sumatra, and the Malayan Archipelago. As an article of commerce, it is found exclusively in the East, and particularly at Canton, where it fetches a price equal to about 100 times that of the article made from their own *L. camphora*. The former is far more fragrant than the latter, but whether it possesses any superior virtues is exceedingly doubtful. *Imp.* duty (crude), free; (refined), 5 cts. per lb.

**Camphor Julep** or **Water**, a solution of camphor, used as a vehicle for the administration of fever medicines.

**Camphor-Oil**, or **LIQUID CAMPHOR**, is a pale yellowish, limpid, and fragrant liquid, obtained from the Borneo camphor-tree (*Dryobalanops camphora*). It is largely used at Singapore instead of turpentine.

**Camphor-Wood**, the timber of the camphor-tree (*Laurus camphora*), is used for trunks and articles of furniture, its strong and aromatic odor having the property of keeping off moths and other noxious insects.

**Camphone**, the Italian name for a journal or ledger.

**Camwood**, a red dyeing wood, the produce of *Baphia nitida*, imported from the west coast of Africa. *Imp.* duty (in sticks), free.

**Can**, a tin vessel for milk, and for other purposes. — A liquid measure of Sum, equal to 4 19 pints; also, an abbreviated name for the candareen, a Chinese weight and measure.

**Canada** (**Dominion of**), the comprehensive name given to all of the British colonial provinces in N. America (Newfoundland excepted), divided as follows: —

Fig. 55. — CAMPHOR TREE.

guished in commerce: *China* or *Java C.*, the only kind met with in Europe, is the product of the *Laurus camphora* (Fig. 55), found in Quangtung and Fokien in China, in Cochin China, and in Japan. It is extracted from all parts of the tree, but chiefly from the roots, and is obtained in the state called *crude C.*, merely by sublimation. In this state it is generally imported, and is afterwards refined by mixture with lime and a second sublimation. *Crude C.* occurs in small brownish or gray grains mixed with impurities. Refined *C.* is a very white, soft, semi-transparent substance, having a crystalline appearance, a strong and fragrant odor, and a hot, pungent taste; very inflammable, and so volatile as totally to exhale when left exposed in a warm air. *Sp. gr.* 0.985. It occurs in round cakes, each weighing about 2 lbs., and is commonly packed in vessels containing nearly 250 cakes. The quantity of *C.* exported from Canton varies much from year to year. In the U. States, 1,117,290 lbs. of *crude C.*, valued \$166,635, were imported in 1878 — *Malay* or *Barus C.* is found in great purity concreted among the

Prince Edward Island....	2,173	94,921
Total.....	3,483,952	3,902,321

The above provinces are united under the provisions of an act of the British Parliament passed in March, 1867, known as "The British North America Act, 1867," which came into operation on the 1st July, 1867, by royal proclamation. The act orders that the constitution of the Dominion shall be "similar in principle to that of the United Kingdom;" that the executive authority shall be vested in the Sovereign of Great Britain and Ireland, and carried on in her name by a Governor-General and Privy Council; and that the legislative power shall be exercised by a Parliament of two Houses, called the "Senate" and the "House of Commons." The members of the Senate of the Parliament of the Dominion are nominated for life, by summons of the Governor-General under the Great Seal of Canada. By the terms of the constitution, there are 78 senators; namely, 24 from the Province of Ontario, 22 from Quebec, 12 from Nova Scotia, 12 from New Brunswick, 2 from Manitoba, 3 from British Columbia, and 3 from Prince Edward Island. Each senator must be 30 years of age, a born or naturalized subject, and possessed of property, real or personal, of the value of \$4,000 in the province for which he is appointed. The House of Commons of the Do-

minion is elected by the people, for five years, at the rate of one representative for every 17,000 souls. At present, on the basis of the census returns of 1871, the House of Commons consists of 206 members; namely, 92 for Ontario, 65 for Quebec, 18 for Nova Scotia, 4 for New Brunswick, 5 for Manitoba, 6 for British Columbia, and 6 for Prince Edward Island. The 7 prov. forming the Dominion have each a separate parliament and administration, with a Lieutenant-Governor at the head of the executive. They have full powers to regulate their own local affairs, dispose of their revenues, and enact such laws as they may deem best for their own internal welfare, provided only they do not interfere with, or are adverse to, the action and policy of the central administration under the Governor-General.

The political capital of the Dominion is Ottawa, in the Prov. of Ontario; pop. 21,545. The pop. of the other principal cities is as follows: Montreal, 107,225; Quebec, 59,695; Toronto, 46,062; Halifax, 29,582; St. John, 28,988; Hamilton, 26,716; and London, 15,826.

The Dominion of C. is bounded N. by Baffin's Bay, the Arctic Ocean, and Alaska, W. by Alaska and the Pacific Ocean, S. by the United States, and E. by the Atlantic Ocean. Though it includes the Rocky Mountains, with the picturesque and diversified region lying between them and the Pacific, and the Laurentian range, continued northward to the Arctic Ocean, C. is, upon the whole, a level and well-watered country. The climate is salubrious, and heat and cold, though felt in their extremes, are not oppressive, owing to the purity of the atmosphere. The thermometer ranges between 102° above and 36° below zero, Fahr. Throughout nearly its whole area, C. is characterized by greater heat in summer, and much lower temperature in winter, than in corresponding European latitudes; the variations, however, being less than in many countries of much smaller extent. The severity of the Canadian winter is much less unfavorable to the operations of agriculture than might at first appear. The snow effectually prevents the frost from penetrating deeply into the earth, and the rapid progress of the spring thaws, followed by frosty nights, pulverizes the soil, and helps to prepare it for seed. Against the severity of the winter must also be set down the steady weather which prevails during summer, and which renders the progress of vegetation so rapid, that the Canadian harvest is early, and almost always secured before bad weather commences. Hence the climate of C., severe though it is, presents no obstacle to the unlimited extension of almost every description of produce, except such as is peculiar to a tropical climate. The Canadians are scattered over a vast extent of country, but owing to the facility of communication by means of lakes, rivers, canals, and railroads, the expense of transport is relatively small. The St. Lawrence is navigable for large ships to Montreal, about 600 m., and to Quebec, 420 m., for ships of the line; above Montreal, its current is broken by rapids. The Ottawa and Saguenay, the principal tributaries of the St. Lawrence, are only partially navigable, having their course likewise interrupted by falls and rapids. Besides the Great Lakes, which find their outlet through the St. Lawrence to the sea, there are thousands of lakes throughout C., many of them of large dimensions, foremost among which is Lake Winnipeg. In 1875, C. had a network of railroads of a total length of 6,412 m. There were at the same period lines of a total length of 1,027 m. in course of construction, and 3,000 m. more had been surveyed, and concessions granted by the government. Partly included in the latter class is the railroad crossing the whole of the Dominion, from the Atlantic to the Pacific, to the construction of which the British government contributes a grant, in the form of a guaranteed loan of \$12,500,000.

In superficial extent the Dominion is nearly equal to the whole of Europe. About 120,000 sq. m. consist of prairie lands, with occasionally scattered groves and belts of trees along the rivers, admirably adapted for agriculture. A larger tract, consisting chiefly of timber land, but interspersed with prairies, and well fitted for settlement and farming operations, cover about 500,000 sq. m. Beyond these two available regions of land, adapted by soil and climate for the growth of wheat and other grains, and the raising of stock, there is a further belt of land, which, though lying in a colder zone, is timbered, clothed with good natural grasses, and fit for the growth of barley and oats. Its area is estimated at little less than 930,000 sq. m. All this, as well as much more still unexplored within the various provinces, has to be settled and brought under cultivation; and out of the great prairie and forest lands of the N.W. have yet to be furnished the future provinces of the Dominion.

Extending from the Atlantic to the Pacific Ocean, C. has an extensive line of sea-coast, indented with bays and harbors,

offering the most admirable facilities for every branch of maritime enterprise; and to this will, no doubt, be added ere long the island of Newfoundland, with the command of fisheries unequalled in value either in the Old World or the New. The peninsula of Nova Scotia and the island of Newfoundland form the eastern barriers of British North America, closing the Gulf of St. Lawrence, and commanding the Atlantic coast, with its ocean trade and its inexhaustible fisheries; while Vancouver Island and the shores of the neighboring mainland stretch along the Pacific coast, with estuaries, inlets, and well-sheltered harbors, awaiting the development of the growing trade of the Pacific. There the rivers abound with salmon; the whale fisheries of the neighboring ocean already yield valuable returns; and the cod, haddock, and other deep-sea fish invite enterprise, and guarantee an inexhaustible source of future wealth.

Shipbuilding is an important employment in all the ports of C., and the ships built at Quebec are renowned for their beauty, solidity, and sailing qualities. The tonnage of shipping registered in each of the provinces in 1878 was as follows:—

Provinces.	Vessels.	Tons.
Nova Scotia.....	2,786	505,144
New Brunswick.....	1,133	307,926
Quebec.....	1,831	222,955
Ontario.....	825	114,990
Prince Edward Island.....	335	50,677
British Columbia and Manitoba.....	42	3,863
Total.....	6,952	1,205,565

C. stands third in the list of maritime powers, only England and the U. States possessing a larger commercial marine. The development of this marine is due largely to the extensive fisheries of the Gulf of St. Lawrence.

The manufacturing interests are rapidly increasing in importance in the Provinces of Quebec and Ontario. The culture of the soil, however, is the principal occupation of the Canadian people, and the staple articles of export are wheat, wool, and wool. The trade of the Dominion is chiefly with the U. States and Great Britain. In 1878, the total value of imports was \$91,199,577, while the value of exports footed up to \$79,323,667, leaving a balance of trade against C. of \$11,775,910. For the same year, the commerce of the Dominion with the U. States was as follows:—

*Imports from the U. States.* \$34,613,890, principally composed of the following articles: Cattle, \$452,547; books, \$130,098; bread and biscuit, \$186,041; Indian corn, \$4,433,621; Indian corn meal, \$665,575; oats, \$692,601; wheat, \$6,945,515; wheat flour, \$2,002,141; bricks, \$234,203; carriages, \$71,236; bituminous coal, \$672,274; cordage, rope, etc., \$36,747; cotton, \$798,951; manufactured cotton, \$1,201,371; drugs and medicines, \$164,141; fancy articles, \$211,853; fruits (green and dried), \$425,718; furs, \$75,992; glass and glass ware, \$332,535; gold coin, \$802,748; jewelry, \$39,916; hats and caps, \$238,545; hides and skins, \$300,347; india-rubber manuf., \$95,675; iron (pig and bar), \$236,521; castings, \$133,013; machinery, \$299,203; nails and spikes, \$122,692; other manuf. of iron, \$1,086,756; steel (manuf.), \$105,366; boots and shoes, \$129,959; leather, \$93,225; lime and cement, \$55,990; marble (rough and manuf.), \$133,320; organs and pianos, \$149,695; mineral and lubricating oil, \$203,455; lard oil, \$34,909; paper and stationery, \$270,439; bacon and hams, \$508,732; salted beef, \$76,368; butter, \$173,971; cheese, \$179,433; fish (dried, pickled, and cured), \$158,990; lard, \$259,485; pork, \$878,641; seeds, \$297,297; sugar (refined), \$1,036,623; tobacco (leaf, cigars, etc.), \$982,616; wearing apparel, \$173,187; wood (boards, deals, shooks, staves, etc.), \$528,649; wood (sawn and hewn timber), \$676,210; wood (household furniture), \$563,645; wood (all other manuf. of), \$257,159; wool (manuf.), \$271,568.

*Exports to the U. States.* \$27,656,865, the chief articles of which were: Eggs, \$719,871; fish (fresh and pickled), \$1,920,396; fur-skins (undressed), \$449,192; gold bullion, \$880,936; gold coin, \$1,718,874; plaster of Paris, \$103,263; hides and skins (not furs), \$440,426; personal effects of travellers or immigrants, \$878,008; fish oil (foreign), \$107,116; barley, \$4,104,780; barley-malt, \$398,753; rye, \$277,467; wheat, \$1,534,283; peas, beans, etc., \$601,744; chemicals, drugs, etc., \$86,351; bituminous coal, \$924,899; copper (ore and manuf.), \$113,528; fruit, \$89,594; furs (dressed), \$103,827; iron (and manuf. of), \$463,308; marble, \$102,066; potatoes, \$143,321; provisions (meat, poultry, etc.), \$328,072; salt, \$109,925; seeds, \$89,371; sugar (brown), \$68,291; molasses, \$47,268; tin (in plates), \$367,413; spirits, \$131,317; wood (cabinet ware), \$155,862; wood (boards, planks, etc.), \$3,468,807; wool (manuf.), \$750,286.

In 1878, 11,007 Canadian vessels, of 2,599,365 tons, and 144 steamers, of 72,735 tons, entered the ports of the U. States; and 11,197 vessels of 2,608,696 tons, and 141 steamers of

71,211 tons, cleared. 5,501 American vessels of an aggregate tonnage of 1,318,058, and 445 steamers of 439,973 tons, entered the Canadian ports; and 5,805 vessels of 1,269,017 tons, and 437 steamers of 434,577 tons, cleared.

*Finances.* The financial accounts of the Dominion are made up under three different headings: namely, first, "Consolidated Fund," comprising the general sources of revenue and branches of expenditures; secondly, "Loans" in revenue, and "Reimbursement" with "Premiums and Discounts," in expenditures; and, thirdly, "Open Accounts." The total revenue, under these divisions, for the financial year 1877-8, was \$4,532,923.14; and the expenditure, \$3,755,849.95. The public debt, incurred chiefly on account of public works and the interest of which forms the largest branch of the expenditure (interest and sinking fund, \$7,313,452), was as follows:—

## FUND. DEBT.

*Money* The unit of account is the gold *dollar* of 100 cents = \$1 of the U. States.

*Weights and Measures.* A new and uniform system was introduced by Act 35 Viet. cap. 48, assented to May 23, 1873. The Act orders that "the *imperial yard* shall be the standard measure of length, the *imperial pound avoirdupois* the standard measure of weight, the *imperial gallon* the standard measure of capacity for liquids, and the *imperial bushel* the standard measure of capacity for commodities sold by dry measure" (see GREAT BRITAIN). Of old weights and measures usually employed, the chief are:—

Wine gallon.....	0.83333 gallon.
Ale gallon .....	1.01667 "
Bushel.....	0.9842 imperial bushel.

By Act of 22 Viet. cap. 21, the weights of many articles held equal to the Winchester bushel were prescribed, as follows:—

Potatoes, turnips, carrots, parsnips, beets, and onions . . .	60 lbs.
Flaxseed . . . . .	50 "
Hemp seed . . . . .	44 "
Blue-grass seed . . . . .	14 "
Castor beans . . . . .	40 "
Salt . . . . .	55 "
Dried apples . . . . .	22 "
Malt . . . . .	36 "

By the same act the British hundred-weight of 112 lbs., and the ton of 2,240 lbs., were abolished, and the hundred-weight was declared to be 100 lbs., and the ton 2,000 lbs. avoirdupois, thus assimilating the weights of C. and the U. States.

**Tariff.** A new and very protective tariff of customs dues went into force on March 15, 1879. Since then, however, duties

have been further advanced on several articles, and other changes are in contemplation, with the declared intention to force reciprocal duties with the U. States. The definit tariff will be given in the APPENDIX to this work. See also RECIPRO-CITY TREATY.

For particulars on the ports and principal commercial places of the Dominion, see, COLUMBIA (BRITISH), HALIFAX, MONTREAL, QUEBEC, PRINCE EDWARD ISLAND, ST. JOHN, and TORONTO.

**Canada**, or CANADO, an old liquid measure of Spain and Portugal, still occasionally used. In Lisbon, the *C.* is equal to nearly  $2\frac{1}{2}$  pints; in Brazil, a weight of 32 lbs., and  $\frac{7}{16}$  of a wine gallon, or about 4 bottles; in Ceylon, the *C.* passes for 2.66 pints. The Spanish *C.* is much larger, being equal to 8.68 gallons.

**Canada Balsam** (*Balsamum Canadense*), a thick, viscid oleo-resin, obtained from the *Abies balsamea*, a tree of common growth in Canada and the State of Maine. It is much employed as a medium for mounting microscopic objects. When pure it is perfectly transparent, has an agreeable odor (not terebinthinate), and is wholly soluble in rectified oil of turpentine, with which it forms a beautiful glassy and colorless varnish, much used for preparing a semi-transparent copying paper.

**Canada Rice**, a wild species of rice, the *Zizania aquatica*, growing in all the shallow streams and swamps of N. W. parts of the U. States, and in Canada. It is exceeding prolific of farinaceous seeds, which afford a very good food.

**Canada Snake-Root.** See **SENEKA-ROOT.**

**Canada Sugar.** See MAPLE SUGAR.

**Canada Wool**, the short staple or carding wool of the Canada sheep, readily sold in Boston and New York.

**Canadian Yellow-Root**, the root of *Hydrastis Canadensis*, which furnishes a valuable bitter and a useful yellow dye.

**Canaille**, a common name in Canada for shorts, or inferior flour.

**Canal.** An artificial navigable water-channel, formed for the passage of boats or vessels with cargo; also, sometimes for the purposes of irrigation, and the supplying of towns with water. Navigable *C.* have existed since a very remote period, but were principally confined to the low countries adjacent to the alluvial deltas of large rivers, such as the Nile, the Euphrates, and the great Chinese rivers; and in Europe the Po and the Rhine. In such countries, indeed, nature may be said to have pointed out this method of communication, as in every way the most convenient and simple. In Holland, the *C.* answer all the purposes of highways; they are mostly formed in straight lines, and the country being quite flat, they are constructed very simply, and without any of the costly expedients of deep cutting, embanking, or tunnelling. The lock, which is an indispensable appendage to *C.* in this and other countries, is comparatively a modern contrivance, having been first applied in Italy towards the end of the 15th century. The vast extent of water communicating in China has no locks even to this day. As a substitute, they have inclined planes of stone, over which they haul the vessels and launch them again in the upper level, thus applying main force to accomplish what is effected in the lock, by simply letting in the water from the upper level into the trough, and thereby raising the enclosed barge. In the planning of *C.*, the first object is to select a line that conforms best with the levels and natural drainage of the country, so as to have as few locks as possible, and a plentiful supply of water to them at all seasons. The latter has to be regulated in a great measure by the amount of trade, or number of barges that

pass the locks, and the water must be supplied at the highest part of the *C.*; but the greater part of the waste is generally owing to loss by leakage through the gates, absorption through the ground, and evaporation. It sometimes happens that the adjacent streams are insufficient in dry seasons, or their water is taken off for mills; in such cases, reservoirs must be constructed, with weirs and sluices, at a great expense. To prevent loss by absorption, the whole extent of the *C.* is lined with a clay puddle, impervious to water; and in embankments, vertical layers, or sunk walls of the same material, are generally placed at each side, as further security. The U. States are pre-eminently distinguished by the spirit with which they have undertaken, and the perseverance they have displayed in executing, the most magnificent plans for improving and extending internal navigation. Besides many others of great though inferior magnitude, the Erie *C.*, which connects the Hudson with Lake Erie, is cited as one of the greatest and

most important works of its kind in the world. This immense work, which is the property of the State of New York, has completely verified the predictions of its projector, De Witt Clinton, having been at once extremely profitable as a mercantile speculation, and of singular advantage, in a public point of view, to the State of New York and the Union generally. The foregoing table of the *C.* now in use in the U. States may give a general idea of the expense attending the constructing of *C.* In it are not included two *C.* which are now in course of enlargement,—the Illinois and Michigan *C.*, connecting Chicago on Lake Michigan with La Salle on the Illinois River, a distance of about 100 m., and the ship *C.*, 1 m. long, at the Sault Ste. Marie, which conveys the waters of Lake Superior into Lake Huron.—*Barge and boat C.*, for the purposes of commerce, are now to a certain extent superseded by railroads; but *ship C.*, judging from the stupendous works of this class recently executed and now in contem-

**Canal-Boat**, a flat-bottomed barge or boat of light draught, adapted for navigating canals.

**Canal-Lift**, a hydro-pneumatic elevator, for raising boats from one level to another.

**Canal-Lock**, a stop-gate, or sluice, to the chamber of a canal, for passing boats through from a higher to a lower level of the channel, or *vice versa*.

**Canamo**, the Spanish name for hemp.

**Canary-Bird**, a well-known song-bird, the *Carduelis Canaria*, is a native of the Canary Islands, but naturalized in Europe. About 150,000 are annually imported to New York from Bremen.

**Canary Islands**, or **CANARIES**, a group belonging to Spain, situated in the Atlantic, off the coast of Morocco, between 27° 40' and 29° 30' N. lat., and 13° 30' and 18° 20' W. lon.; total area, 3,220 sq. m. The inhabited islands are Teneriffe, Canary, Palma, Lanzarote, Fuerteventura, Gomera, and Hierro, or Ferro; total pop., 227,145. The seat of the governor-general is at Santa Cruz, the port of Teneriffe, in 28° 29' N., and 16° 15' W.; pop., 10,000. The other chief towns are Laguna and Orotava, in the same island, and Las Palmas in Canary.

The aspect of the *C. Is.* throughout, elevated, and some of the mountains, particularly the Peak of Teneriffe, rank among the loftiest in the globe. The sides of the mountains inclining towards the W. and N. exhibit, rising above each other, the plants of the torrid, the temperate, and even the frigid zone. The islands are within the limits of the trade-wind, and the climate eminently salubrious. The most fertile are Canary and Teneriffe. Lanzarote and Fuerteventura are dry and sandy. An active commercial intercourse exists among the different islands, and upwards of 30 vessels are employed in the fishery on the coast of Africa. The staple export is wine (see **CANARY WINE**). The chief of the other exports are barilla, cochineal, orchilla, fruit, and raw silk. The *C.* are frequently visited by ships for fresh provisions, which, except vegetables, may be obtained plentifully in most of the islands. There is, however, no accommodation for ships except open roadsteads, which are unsafe in winter.

**Canary Moss**, a lichen used for dyeing, the *Palmeria perlata*.

**Canary Seed**, the seeds of *Phalaris Canariensis*, a native grass of Europe, which are given for food to cage-birds, and of which as much as 500 tons are annually sold for that purpose in England only. *Imp. free*.

**Canary Stone**, a beautiful yellow species of

carneian, rather rare, and named from the resemblance of its color to the plumage of a canary-bird.

**Canary Weed**. See **ORCHILLA**.

**Canary Wine**. The Canary Islands produce annually about 25,000 pipes of white wine for exportation, while 15,000 are consumed in the islands, or submitted to distillation. There has been a great corruption of names in these wines. *Canary* was once much drunk in England, and was known only by that name. The writer of this tasted some which was 126 years old, it having been kept during all that period in the family cellars of a nobleman with whom he happened to be dining. Its flavor was good, and it had ample body. What is called *Vidonia* (a corruption of Verdone, a green wine of good body, formerly grown near Santa Cruz) is properly the dry Canary wine, best known as *Teneriffe*. The *Vidonia* is a wine which greatly improves by age, especially in warm climates, resembling Madeira. The *Malmsey* of Teneriffe is small in quantity, but very rich and perfect in its kind; it was once in great repute. At Gomera, the wines improve so much by age that the dry kind gain the flavor of Madeira, and may be easily mistaken for it. In Palma, *Malvasia*, or *Malmsey*, is grown, which in a few years gains a bouquet like a ripe pineapple. The best wines do not grow much more than a mile from the sea. The *C.* wines are second to those of Madeira, which may be ascribed to want of care in the management of the vintage.

In the early voyages to the Canary Islands, quoted in Ashley's collection, there is a passage relative to *sack*, which will puzzle wise heads about that wine. It is under the head of Nicols's Voyage. Nicols lived 8 years in the islands. "The island of Teneriffe produces three sorts of wine,—Canary, Malvasia, and Verdone,—which may all go under the denomination of sack." The term, then, was applied neither to sweet nor dry wines exclusively, but to Canary, Xeres, or Malaga generally. In Anglo-Spanish dictionaries of the beginning of last century, sack is given as *Vino de Canarias*. Hence, it was Canary sack, Xeres sack, or Malaga sack.

**Canary Wood**, a name given to the wood of the *Laurus indica*, a native of Madeira, and *Laurus Canariensis*, a native of the Canaries. It is a fancy wood of a golden-yellow color.

**Canaster**, or **C'NASTER**, a kind of tobacco prepared for smoking from the dried leaves of the plant coarsely triturated, which derives its name from a particular kind of rush basket, in which it was formerly exported from S. America.

**Can-Buoy**, a large floating buoy.

**Candareen**, a Chinese weight, the 100th part of a tael, and containing 10 le, or cash. In accounts, the money value of the *C.* ranges from 10 to 14 copper cash; but as a weight, whether for silver or any other article, the le, or cash, continues to be the same integral part of the *C.* The *C.* may be estimated at 5½ grains, although in some quarters of the East it weighs 6.38 grains.

**Candelabrum**, an ornamental metal stand, with branches for holding lights.

**Canderos**, an East Indian resin of a pellucid white, which, being susceptible of a good polish, has been turned into small ornaments and toys.

**Candia**. See **CRETE**.

**Candied**, dried with sugar. See **CANDYING**.

**Candied-Peel**, preserved lemon or citron peel, used for pastry or confectionery.

**Candiota**, the name for a barrel or keg in Spain; a large earthen jar.

**Candle**, is a wick covered with solidified oil or fat for giving light. No trade has undergone such revolutions as that of *C.* making. Formerly it was a mechanical occupation, but, since the researches of Chevreul and Brannconnot into the na-

ture of the fats, it has developed into an important branch of scientific industry, chiefly in Europe, where there still exists a decided prejudice against the use of gas in private houses. *C.* are either dipped, moulded, or rolled. The cheapest sorts of tallow *C.* are formed by the first process, and wax *C.* by the last, all the other kinds being moulded. The moulds are tubes of pewter, well polished on the inside, eight or more being fitted into a frame, the upper part of which forms a trough to receive the melted *C.* material. When in the moulds, the *C.* are inverted; in other words, the bottom of each mould corresponds to the top of the *C.* The wick passes through a small hole at the lower extremity of the tube, and is held in the axis by a little bar placed across the top. When quite cold, the *C.* are withdrawn. The plan of pulling them out one by one with the aid of a bodkin has been superseded in large factories by the ingenious device of blowing them out with compressed air. The wick of a *C.* must be formed of very fine cotton. The use of the wick is purely mechanical; when lighted, it first melts the solid candle, which, being drawn by capillary action, is diffused over the fibres of the wick, and thus prepared for decomposition and combustion. The quality of the

equal to that of 120 lbs. of spermaceti, or 133 lbs. of wax, or 144 lbs. of stearic, or 155 lbs. of the best composite *C.* They are sometimes delicately tinted with red, mauve, violet, crimson, and rose color. Aniline colors will not dissolve in paraffine. Stearic acid, however, is a solvent for them, and accordingly, when the *C.* are tinted with the coal-tar colors, these are previously dissolved in the stearic acid, always mixed with the paraffine. For coloring paraffine *C.* black, the paraffine is heated nearly to the boiling point with anacardium shells or nuts, which dissolve readily in the heated paraffine. Previous to the paraffine being made into *C.*, it is necessary that it should be purified and bleached, which is effected by digesting the paraffine at a temperature of 230° F. with about 12 per cent of powdered fuller's earth, agitating, and decanting when the fuller's earth has fallen down, the clear paraffine. Paraffine *C.* contain from 5 to 15 per cent of stearine, this addition being made for the purpose of diluting the paraffine, as well as for raising the melting point of the paraffine where this is low. The stearine, moreover, serves to preserve the rigidity of the *C.* in the candlestick, and to prevent its bending out of the upright position. Paraffine *C.* are always moulded, but previous to this being done the moulds must be heated to a temperature above the melting point of the paraffine; this may vary from 60°, 70°, and 87° centigrade, according to the paraffine employed. The moulds having been filled with the melted paraffine are, after one or two moments only, plunged into cold water, when the *C.* immediately becomes solid. Unless this were done the *C.* would be spoilt, owing to the crystallization of the paraffine. A thin wick is required for paraffine *C.* — *Spermaceti C.* are very delicate in appearance, but rather expensive. They burn well, but as the melting point of spermaceti is low, 120° F., they will not bear carrying about in the hand without guttering. They are generally adulterated with stearic acid or hard white

Fig. 56. — WAX-CANDLE ROLLERS.

*C.* depends very much upon the wick, as, if too thin, it will melt more than the fibres can decompose, and the candle will run; if, on the other hand, the wick be too thick, the *C.* will smoke, owing to the melted part not being in a perfect state of combustion for want of air at the centre of the wick. The wicks of the best *C.* are now made in such way that they do not require snuffing. This object is effected by causing the wick to bend over, and its end to fall outside, where it is exposed to the oxygen of the air. The best way to bring about this bending is by plaiting the cotton into a flat wick, which naturally takes the required curve. Such a wick is generally dipped into a solution of borax, which preserves it from being acted upon by the flame except at its extreme point at the edge of the flame. A very fine wire is sometimes included in the plaited wick.

*Composite C.*, are mould *C.* formed of a mixture of the hard fatty acid obtained from palm oil and the stearine of cocoanut oil. Other compositions are occasionally used, such as a mixture of spermaceti and hard white tallow, to which a little bleached resin is added. — *Meditated C.* have been proposed as a convenient means of diffusing the active principles of certain volatile substances through the atmosphere, and for complete and partial fumigations. — *Paraffine C.* are made from the beautiful transparent substance paraffine. These *C.* surpass all others in elegance, and are entirely free from odor and greasiness. The light produced by 98 lbs. of paraffine *C.* is

tallow. Spermaceti is usually mixed with 3 per cent of wax or paraffine, to destroy its highly crystalline structure; it is moulded in the usual way, with plaited wicks that require no snuffing. Occasionally the spermaceti *C.* are cast without any admixture of wax, the moulds being raised to a higher temperature, just as with stearic acid. Some manufacturers, in order to make the spermaceti appear like wax, use gamboge to give the desired tint: such *C.* are known as transparent wax. — *Stearic or adamantine C.* include the various sorts of *C.* moulded from the hard fatty acids of both animal and vegetable origin. The principal sources whence manufacturers derive their acids are tallow, palm oil, and cocoanut oil. *C.* formed of the fatty acids can now be prepared so as to imitate and almost rival those of wax and spermaceti; and they are quite as cheap as the nearly obsolete mould *C.* formed of common tallow. They are extremely hard; they do not grease the hands; and they burn away brightly and steadily, without giving off any offensive odor. Uncolored, they are snowy white, but a yellow tint is frequently given them by gamboge. — *Tallow C.* are made from ordinary tallow, or

from tallow which has been freed from much of its oleic acid by pressure. These have so unpleasant an odor, and are so apt to gutter, that they have almost entirely disappeared from use. — *Wax C.* are most frequently made by pouring melted white wax on to the wicks, which are hung upon frames, and covered with metal tags at the ends to protect the cotton from the wax in those parts. The frames are made to turn round, and melted white wax is poured down first one wick, and then the next, and so on. When the wicks have been subjected to this operation once, and have become sufficiently cooled, they have a second, and then a third coat given them, until they are of the required thickness. The *C.* are next rolled into proper shape between flat pieces of wet, hard-wood rollers (Fig. 56). The conical top is moulded by properly shaped tubes, and the bottoms are cut off and trimmed. Wax *C.* are now seldom moulded; but if so, the same processes are followed as for stearic and paraffine *C.* The large altar *C.*, which frequently weigh from 30 to 40 lbs., are made by hand. — *Wax Tapers*, are small wax *C.*, or rolls of wax, for office use. They are of various degrees of thickness, and are not made of pure wax, but of wax (usually vegetable wax) and tallow, the latter being added to give them flexibility. When they are required to be colored, resin and turpentine are added to the tallow.

Tallow and other *C.* are largely manuf. in the U. States. 1,567,265 lbs., valued at \$218,985, were exported in 1878, chiefly to the West Indies and Central America. The trade sizes are usually 6's (or 6 to the lb.) and 8's (or 8 to the lb.), the lb. being about 14 ounces. They are most generally packed in 20 lb. boxes. *Imp.*, duty (adamantine and stearine), 5 cts. per lb.; (paraffine, spermaceti,

and wax, pure or mixed), 8 cts. per lb.; (all others), 2½ cts per lb.

**Candleberry.** See BAYBERRY TALLOW.

**Candlenut,** a trade name for the kernels of *Aleurites triloba*, a plant growing in most tropical countries. The nuts, when dried and stuck upon a reed, are used by the natives of the Polynesian Islands as a substitute for candles. They contain a large amount of pure, palatable oil, which is sometimes used by artists as a drying oil.

**Candlestick,** the receiver or holder for a candle, which is made either of metal, glass, or earthenware; and of two shapes, tall or erect, or short, with a flat bottom.

**Candle-Wick,** a twisted length of cotton, round which the oil or fat is poured and solidifies. *Imp.* duty (wicks and wicking cotton), 35 per cent. See CANDLE.

**Candied Fruits,** are dry confections of fruit and sugar.

**Candroy,** a machine used in cotton-printing.

**Candy,** a preparation of sugar, made by melting and crystallizing it several times; a sweetmeat. — An Eastern dry measure of capacity and weight, which varies in different places. In Madras and Columbo it is equal to 500 lbs. avoirdupois; in Bombay and Mangalore, to 560 lbs. The Calicut *C.* is 640 lbs. For wool, coir, spices, and some other staples, in Bombay, the *C.* is 588 lbs. The Malabar *C.* is 695½ lbs. The Surat *C.*, for many articles of merchandise, is 784 lbs.; and for some few, 821½ lbs. The Mysore *C.* is equal to 560 lbs. Also a long measure of Malabar, equal to one cubic kolo, or 28½ inches.

**Candyng.** When the object is simply to form a confection or sweetmeat, imbued with the aroma, flavor, or medicinal property of any substance, candies are generally prepared by simply boiling lump sugar with a sufficient quantity of the infusion, decoction, tincture, expressed juice, or sometimes even the powder, of the particular article, until a portion taken out and cooled becomes quite solid, when it is either poured out on a marble slab, or into tin, marble, or paper moulds, dusted with powdered lump sugar. When the object is to preserve the form and character of the vegetable in the candy, the substance is boiled in water until soft, and then suspended in concentrated syrup (in the cold), until they become transparent; after which they are either dried in a current of warm air, or in a stove, at a heat not exceeding 120° Fahr. The syrup must be kept fully saturated with sugar, by reboiling it once or twice during the process.

**Cane,** the common commercial name for many important grasses, embracing especially the varieties of the sugar-cane, bamboos, rattans, and Spanish, *C.* The stems of several small palms are also called canes. The several *C.* will be found described under their common special names. — The French name for a walking-stick.

**Cane-Chair,** a chair with a platted cane seat or bottom, or one framed with bamboo or other cane.

**Cane-Juice,** the juice of the sugar-cane, expressed between the rollers of a mill, or by hydraulic pressure.

**Canella Alba,** the commercial and botanical name of an aromatic tree common in the West Indies, sometimes called the wild cinnamon. The bark of the young branches, free from its outer rind, is imported in rolls or quills 2 or 3 feet in length, or in small broken pieces, and employed as a cheap stomachic. It has a bitterish, acrid, peppery taste. *Imp.* free.

**Cane-Mill,** a set of rollers for crushing the sugar-cane, which are either horizontal or vertical, and set in motion by steam, water, wind, or cattle power.

**Canestra,** the Italian name for basket.

**Cane-Sugar,** the juice obtained from the saccharine of the sugar-cane, reduced to a concrete state. See SUGAR.

**Cane-Top Cutter,** a machine for cutting the upper part or sprouting shoots of the sugar-cane for cattle.

**Cane-Trash,** the dead or withered leaves stripped from the stalk to enable the sugar-cane to ripen; also, the stalk after the juice has been expressed, used for fuel and manure, sometimes called *megass*.

**Cangan,** or KANGAN, a piece of coarse, Chinese cloth, thinly woven, 19 inches broad, and 6 yards long, which has a fixed currency value.

**Cango,** a common kind of litter or palanquin, used in Japan, something like a basket with a round bottom and flat roof, which is carried by three men.

**Can-Hooks,** two pair of flat hooks connected by ropes for hoisting barrels or light casks.

**Canister,** a small box or case, usually of metal, for holding groceries, etc.

**Canister-Powder,** fine rifle or sporting powder, sold in tin canisters.

**Canna,** the wild plantain, a genus of plants belonging to the arrowroot family. One or more

Fig. 58. — THE WILD PLANTAIN.  
(*Canna indica*.)

species growing in the West Indies yield the *tous les mois*, a very pure and useful starch. The seeds of *C. indica* (Fig. 58), found in the East and West Indies, and in South America, are commonly called *Indian shot*, on account of their black color and peculiar hardness. Its leaves are used as envelopes for many articles of commerce.

**Cannabine,** a narcotic gum-resin obtained from the East Indian plant *Cannabis sativa*.

**Cannata**, or **CANNATE**, a liquid measure of Greece = 2 82 pints.

**Canned Goods**, a general term for vegetables, fruit, or fish put up and preserved in air-tight tin cans.

**Cannela-Wood**, a beautiful cabinet-wood of Santa Catharina, Brazil.

**Cannel-Coal**, a dense and compact variety of bituminous coal, which breaks with an uneven or largely conchoidal fracture, and does not soil the fingers. The name is a corruption of the word *candle*, which has been applied to it in consequence of the bright flame with which it burns, or because the poor people in some places in the colliery districts of England sometimes use it instead of candles. It is called *Parrot-coal* in Scotland, from the way in which it crackles or chatters in the fire. Being hard enough to take a polish, it is sometimes made into ornamental articles like jet; but its principal value is as a gas-coal.

**Cannelle**, the French name for cinnamon.

**Cannon**, or **GUN**, a piece of ordnance of iron, bronze, or brass, for discharging balls, made of many sizes, according to the service required from it.

Brass or bronze *C.* are cast in loam moulds. A centre is formed of a wooden bar, with rope coiled round it, and then clay to a certain thickness. This gives shape to a mould or shell of loam, and then the centre is removed. The interior of the loam will give form to the exterior of the *C.* To produce any ornaments and inscriptions, small devices are modelled in wax, and fixed on the clay centre before the loam is applied; being melted out afterwards, their places form cavities on the inner surface of the mould, which will produce *relievo* ornaments on the exterior of the gun. When the moulds are ready, they are placed upright in a casting pit, and the molten brass passed into each by proper apertures. Some *C.* are, however, cast solid. Iron *C.* are cast nearly in the same way as above described, with somewhat more powerful apparatus, on account of their usually large size. The names given to the different kinds of *C.* are indefinite and confusing. Before the recent improvements made by Armstrong, Whitworth, Palliser, Fraser, Krupp, and others, *iron shell guns* were of 8, 10, and 12 inches bore; *iron mortars*, of 8, 10, and 13 inches bore; *iron howitzers* of 8 and 10 inches bore; *brass mortars* of 4 and 5 inches bore; *long iron guns*, 9, 12, 18, 24, and 32 pounders; *long brass guns*, 1, 3, 6, 9, and 12 pounders; *short iron guns*, or *carronades*, 12, 18, 24, 32, 42, and 68 pounders; *brass howitzers*, 12, 24, and 32 pounders. Some of the designations are now falling into disuse, and new forms of *C.* are quickly appearing. Whether a *C.* be cast in a mould, or made by coiling strips of wrought-iron or steel round a mandril, the interior requires to be made very smooth and regular; this is done by *boring*, sharp-cutting tools being used, and either the tools or the *C.* being made to revolve; far more elaborate working being needed when the bore is *rifled*. See **RIFLE**.

**Cannon-Ball**, **CANNON-SHOT**, a cast-iron ball to be thrown from cannon.

**Cannon-Lock**, a contrivance to place over a touch-hole of a piece of ordnance, to explode the charge.

**Cannon-Metal**, a brass alloy for casting ordnance from, containing 91 per cent of copper and 9 parts of tin.

**Cannon-Shot**, is properly the distance to which a cannon will throw a ball; but, in international law, the distance is fixed to a marine league from the shore, which is the limit of the territory, and therefore of the jurisdiction of the admiralty. A vessel taken within cannon-shot of a neutral fortress is not a lawful prize.

**Canoe**, a rudely formed boat, shaped out of the trunk of a tree by cutting or burning; also, a skin or bark boat used by uncivilized natives.

**Canon**, a large sized printing-type, formerly used for printing the canons of the Church, now principally in posting bills. — In Spanish, the shaft of a mine.

**Canon-Bit**, that part of a horse's bit that enters the mouth.

**Canopy**, a covering overhead; the decoration crowning a pulpit, chair, throne, bed, etc.

**Cant**, anything standing awry; timbers out of the perpendicular, or not fixed square.

**Cantaloup**, a small, esteemed variety of muskmelon.

**Cantar**, **CANTARO**, an old liquid measure of Spain, ranging from 2½ to 4 gallons; 100, however, may be taken as equal to 356 gallons. The name is also sometimes given to the alqueire or pot of Portugal. As a commercial weight in the Levant, the *C.* is synonymous with the quintal of Europe, being employed in the sale of ponderous commodities; but it varies considerably in different localities. In Syria, the ordinary *C.* amounts to 502½ lbs.; the Maltese *C.* of 100 rottoli is 175 lbs. avoirdupois; in Smyrna, it is 127½ lbs.

**Canteen**, a tin case for holding food, etc., used by soldiers and others on the march; also, a place in barracks where provisions, liquors, etc. are sold.

**Canterbury**, a small ornamental music-stand, with two or three hollow-topped partitions, framed in light slips of mahogany, for holding music-books.

**Canteroy**, a weight for gold and silver, used in Bangalore, equal to 5.87 grains.

**Cantharides**, called also Spanish fly or blister-beetle, is an insect (*Cantharis vesicatoria*), found in the warmer parts of Europe, especially Spain and Italy. It is about three fourths of an inch long, of a bright green color, except the legs and antennæ, which are bluish black. They are used in medicine externally to raise blisters, and internally as a stimulant and diuretic, generally in the form of tincture. In excess they produce strangury, satyriasis, delirium, convulsions, and death. *Imp.* free.

**Cantharidine**, a crystalline principle obtained from the Spanish fly and other species of cantharides, powdered and steeped in an alcoholic tincture.

**Canton**. See **CHINA**.

**Canton Tea**, the lowest grade of green tea.

**Cantoon**, a kind of fustian, with a fine cord visible on one side.

**Canvas**, a coarse, strong cloth made of hemp, flax, or cotton, used for ships' sails, awnings, tents, etc., principally manu. in Ireland and Scotland. *Imp.* duty (for sails), 30 per cent; (all others), 35 per cent; and 40 per cent when valued over 30 cts. per sq. yd. — Also, a light material woven with the warp and woof at intervals, so as to leave square interstices between them, and used by ladies for tapestry and Berlin-wool work. *Imp.* duty, 35 per cent. — Painter's canvas, on the contrary, is a material of very close texture, called "ticking." It is generally purchased stretched on frames of various sizes, and primed with a light neutral gray or drab tint ready for use. — The sails of a ship, taken generally.

**Canvas-Back**, a wild duck, the *Aythya valisineria*, which arrives in the U. States from the north about the middle of October, and principally assembles in the numerous rivers in the neighborhood of Chesapeake Bay. It is highly esteemed by epicures for the delicacy of its flesh, and realizes a high price for the table.

**Canvasser**, one who solicits votes, or seeks support for any person, project, or publication.

**Caoutchouc**. See **INDIA-RUBBER**.

**Cap**, a cover for the head. Caps for ladies are made of lace, net, or some such light material; those for men are of cloth, fur, leather, and fancy materials, etc. — In ship-building, a thick, strong

block of wood with two holes through it, one square and the other round, used to confine together the head of a mast and the lower part of that next above it. — A cutler's term for a ring of metal surrounding a wooden wheel or lap. — See **PERCUSSION CAP**.

**Capa**, a term in Cuba for good tobacco, the best or outside leaves being suited for the wrappers of cigars.

**Capacity**, the power of containing, the extent of room or space in a vessel or cask.

**Capé**, a lady's article of dress; that part of a garment which covers the shoulders, as the *C.* of a cloak, coat, and the shoulder-trimmings of a dress.

**Cape Aloes**. See **ALOES**.

**Cape Breton**, an island of the Dominion of Canada, separated from the N.E. extremity of Nova Scotia, of which province it is a part, by a narrow, navigable channel, called the Gut of Cansu. It forms the S.E. boundary of the Gulf of St. Lawrence, and lies between 45° 27' and 47° 4' N. lat., and 59° 45' and 61° 38' W. lon.; area about 4,000 sq. m. It is penetrated by a mediterranean sea, called the Bras d'Or, which divides it nearly into two parts. Sydney, the capital, on the N.E. side, carries on a considerable trade in coal, extensive mines of which exist in the neighborhood. Pop. 75,483.

**Capelin**, a small migratory fish of the North American seas, somewhat resembling the smelt. It is caught by the Newfoundland fishermen, dried, and packed chiefly for the English market.

**Cape of Good Hope**, or **CAPE COLONY**, a British colony composed of the portion of Africa lying between the Southern Ocean and about lat. 29° S. The boundary is not accurately defined, having been gradually enlarged by the annexation of surrounding districts. The most important of these annexations were that of British Kaffraria in 1806; of Basutoland, at the head of the basin of the Orange river, in 1808; of two vast but partly unexplored districts called Fingoland and Nomansland, or Grigualand East, in 1875; of Grigualand West in 1876; and of the Transvaal in 1877. According to government returns published in 1877, the actual area is 347,855 sq. m., and the total pop. 1,420,162. The European inhabitants consist in part of the English authorities and English settlers; but the majority are of Dutch, German, and French origin, mostly descendants of the original settlers. The colored people are chiefly Hottentots and Kaffirs; the remaining portion of the pop. consists of Malays, and so-called Africans, the latter offspring of black women and Dutch fathers. Very little communication takes place between the Kaffirs, Africans, and Malays, each race holding the others in contempt. The administration of public affairs is vested in a governor, aided by executive and legislative councils.

The Cape Colony is in general rugged and barren, and deficient in the means both of internal and external communication. But a portion of the E. coast is of a different character, more especially towards the N.E. frontier, including the district of Albany, where the country is well wooded and watered, and favorable for agriculture and grazing. The W. coast, and a great portion of the rest of the country, consist of barren mountains and arid plains, one of which, the Great Karroo Desert, a high parched table-land, separating the Cape Town District from the finer country to the N.E., extends about 100 leagues in length, from E to W, and 30 in breadth. The climate, however, is one of the finest in the world; and were the aridity of the soil counteracted by irrigation, and the means of intercourse improved by the formation of roads, the character of the country would be very different, as the capabilities of the soil are naturally great. The only parts thickly settled are the Cape and Stellenbosch districts, which contain about three

eighths of the whole population, some parts of Worcester, Graaf Reinet, the British settlements at Graham Town and Bathurst, in Albany, and some parts of the Transvaal, in which the discovery of diamonds has, of late, attracted about 300,000 settlers; the other portions are occupied chiefly by Dutch graziers, called *Boers*. Nearly 250 acres are under crops, yielding annually about 600,000 bushels of wheat, besides small quantities of barley, oats, and rye; the remainder of the productive surface is chiefly pasture land. The sheep farms are often of very great extent, comprising from 3,000 to 15,000 acres, and upwards; those in tillage are comparatively small. The vine is grown within 40 m. round Cape Town; but the wines, except that made at Constantia, near Table Mountain, are almost all of very low quality. The commercial intercourse of the Colony is mainly with Great Britain. Among the articles of export, wool is the most important, the value shipped annually constituting nearly nine tenths of the total export. In 1877, it amounted to 32,912,225 lbs., valued at \$11,121,350. Among the minor exports are copper ore, ostrich-feathers, and sheepskins. There were in 1879 three lines of railroad open for traffic, of a total length of 526 m.: the Western, from Cape Town to Worcester; the Midland; and the Northwestern, starting from Port Elizabeth. The progress of the Colony has been almost continually, and down to the present time materially, impeded by wars with the Kaffirs. The ports are few. *Cape Town*, the capital and seat of the government, is on the S.W. coast and S. shore of Table Bay, at the foot of Table Mountain, about 32 m. from the Cape of Good Hope, lat. 33° 56' S., and lon. 18° 17' E. It is capable of containing any number of ships, and is on the whole a good harbor, except during the months of June, July, and August, when it is exposed to the heavy swell from the W. Pop. 29,082. *Port Elizabeth*, in Algoa Bay, is the shipping-place for the E. part of the Colony.

**Money, Weights, and Measures**. The coins in circulation within the Colony are exclusively British. All accounts are kept in pounds, shillings, and pence. The standard weights and measures are British, except the land measure, which is the old Amsterdam *Morgen* = 2.11654 acres.

**Capercaillie**, a Scotch name for the wood grouse.

**Capers** [Fr. *capres*; It. *cappari*], the flower-buds of various species of *Capparis*, particularly *C. spinosa*, the caper-tree, preserved in vinegar. They are chiefly imported from Spain, Italy, and the South of France, where the tree is largely cultivated for the purpose. The so much esteemed bright green color of the *C.* arises chiefly from the presence of copper derived from the sieves used in sorting them, and is injurious to health. The condiment tastes better without it. *Imp. duty*, 35 per cent.

**Caper Spurge**, the *Euphorbia lathyris*, the seeds of which yield an abundance of pure, clear cathartic oil.

**Caper Tea**, a black tea, a superior kind of sonchay (or sunglo) with a knotty, curled leaf; so named from its fanciful resemblance to the caper. That sold in London is usually scented with chloranthus, jasmine, or other flowers.

**Cape Verde Islands**, a group belonging to Portugal, situated in the N. Atlantic Ocean, about 370 m. W. of Cape Verde in Africa, between lat. 14° 20' and 17° 20' N., and lon. 22° 20' and 25° 30' W.; area, 1,650 sq. m.; pop. 76,063. Although of small extent, mountainous, and unproductive, the islands are estimated the most important colonial possessions of Portugal, politically and commercially. There are nine principal or inhabited islands. Five of these, viz. St. Nicholas, Bona Vista, San Antonio, St. Vincent, and Sal, compose the windward, and the four remaining islands, St. Jago, Fogo, Brava, and Maio, the leeward group. Placed as these islands are, in the direct route of steamers bound from Europe to the coast of Brazil, the River Plate, and the W. coast of South America, they are of great value as affording a convenient resting-place for coaling and renewing provisions and water. The climate, however, is exceedingly unhealthy. The island of St. Vincent, 170 sq. m. in extent, but with not more than 1,700 inhabitants, is possessed of a deep and excellent harbor, affording a secure anchorage at all seasons for vessels of the largest size. Porto Praya, in St.

Jago, is the residence of the governor-general, whose administration extends over these islands and the Portuguese settlements of Senegambia.

**Cape-Weed**, a commercial term for a dye lichen, the *Rocella tinctoria*, imported from the Cape Verde Islands.

**Cape Wines**, the product of the vineyards of the Cape of Good Hope, are, except the Constantia, red and white wines of the worst description, being generally infected with the earthy taste common to wines grown on bad soils. Some are sweet, but the larger part are dry. They are called *Cape Madeira*, *Cape Sherry*, *Cape Hock*, etc. The Constantia wine, so much celebrated among the luscious wines, is grown in the vicinity of Cape Town, and so called from the farm on which the small vineyard stands. The produce of the red and white Constantia does not exceed 80 or 90 pipes. This wine has been much overrated.

**Capillaire** [Fr.], a pharmaceutical name for a simple syrup, or a concentrated solution of sugar in water, or some other similar aromatic. The name was originally given to a mucilaginous syrup, prepared by adding to an infusion of maiden-hair (*Adiantum capillus veneris*) some sugar and orange-flower water.

**Capin**, the 8th part of a bahar, an Eastern measure, about 60 lbs. avoirdupois.

**Capital**, the amount of money or property subscribed or employed in a joint-stock company; the money assets invested in business by a trading firm or individual; the net worth of a party. — In political economy, the accumulated savings of industry, capable of being employed either for the support of human existence, or as an instrument of production. It is distinguished into two sorts, arising from a difference in the mode of applying it. *Fixed C.* consists of those articles of a durable nature which contribute to the production without being destroyed. Such are roads, canals, houses, docks, harbors, warehouses, and those tools, machines, and other accommodations which do not perish in the using. *Circulating C.* possesses this distinctive character, that it is necessarily consumed in contributing to production, and that it must be reproduced in order to enable the producer to continue his operations. Of this nature are food, coal, seed, wool, clothes, some kinds of tools, and all other articles subservient to production which perish in the using. These terms are not, however, always very definite. Thus, the lower animals are in some cases to be regarded as fixed, in others as circulating capital; oxen used permanently for draught belonging to the former, but when reared solely for the market, to the latter. It follows, necessarily, if the instruments of labor, the materials on which it is employed, and the subsistence of the laborer, are all included under the name of *C.*, that the productive industry of every country is in proportion to its *C.*, increases when its *C.* increases, and declines when its *C.* declines. It is obvious that when there are more instruments of labor, more materials to work upon, and more pay for workmen, there will be more work, provided more workmen can be obtained. If they cannot, two things will happen: wages will be raised, which, giving an impulse to population, will increase the number of laborers; while the immediate scarcity of hands will whet the ingenuity of capitalists to supply the deficiency by new inventions of machinery, and by distributing and dividing labor to greater advantage. *C.*, according to the sense in which the term is generally used in commerce, does not differ essentially from that now explained. It comprehends in addition the debts

due to traders; but in estimating *C.* in the aggregate, those must evidently be neglected, as what constitutes an article on the credit side of the books of one class of men forms an exactly equal item of debt in the books of others. The ratio of the accumulation of *C.* depends upon the degree in which production annually exceeds consumption. Accumulation is facilitated by the abatement of taxes, and by the removal of all impediments to the free employment of the *C.*, labor, and skill of a nation. It is also increased by whatever tends to economize the consumption in the different branches of industry, and by the prevalence of frugal habits, — objects which only can be secured by basing professional skill of every sort upon real knowledge, by the enlightenment of the people, and above all by the predominance of pure and simple tastes and sound morals.

**Capital Letters**, in printing, are types used at the head of a paragraph or sentence of printed matter, of a larger size than those forming the body of the page, and of different form.

Fig. 59. — CAPSICUM ANNUUM.

(Cayenne Pepper.)

**Capitalist**, a man of large property, one who has a considerable sum invested in the funds or in stock in trade; one who has surplus pecuniary means which he can invest at pleasure.

**Capitalize**, to add the interests or profits to the capital; to convert into capital or shares.

**Capivi**. See COPAIVA.

**Capoc**, a fine, short-stapled cotton-wool, used in India for stuffing cushions, lining palanquins, etc.

**Capon**, a young cock gelded to fatten for the table.

**Capoor Kitchely**, or KAPOOR KUCHREE, an aromatic drug of the Indian markets, the rhizoma of *Hedychium spicatum*.

**Capote**, a long cloak for females; a great-coat with a hood worn by soldiers on guard.

**Cappadine**, a sort of silk flock or waste obtained from the cocoon after the silk has been reeled off and used for shag.

**Cap-Paper.** See FOOLSCAP.

**Cap-Peak,** the front part of a man's cap, the shade over the eyes, that part which is ordinarily taken hold of to remove it from the head.

**Capellaio,** the Italian name for hatter.

**Capping,** ridge or roll metal, galvanized iron, etc., for roofing.

**Capsicum,** a genus of plants producing pungent capsules of various shapes, which are very generally used as seasonings and condiments. The pods of *C. annum* (Fig. 53) and *C. baccatum* of the East and West Indies, pounded, furnish the cayenne-pepper of commerce. It is employed medicinally, but is chiefly used as a stimulating condiment, being an essential ingredient in curry-powder. In taste it is very fiery and acrimonious; its color is reddish. *Imp.* duty (ground), 10 cents per lb.

**Cap-Spring Maker,** a maker of metal springs fitting to the head for ladies' caps, for flowers, wreaths, etc.

**Capstan,** a cylinder or truncated cone of wood, placed vertically in the deck of a vessel, moved by levers or hand-bars; chiefly used for weighing anchor, hoisting yards, sails, etc., or any purpose in a ship where great purchase is required. A windlass is a sort of horizontal *C.* in the fore part of the ship.

**Capsule,** the seed-vessel or dehiscent fruit found in several large orders of plants, many of which enter into commerce, as poppy-heads, capsicums, cardamoms, etc. — The metallic seal or cover for closing a bottle. — A small egg-shaped or spherical vessel, in which a medicine is placed, for the purpose of covering its nauseous taste at the time of swallowing it. They are commonly made of gelatine, mixtures of gelatine and sugar, or animal membrane.

*Gelatine C.* are made by dipping the bulbous extremity of an oiled metallic rod into a strong solution of gelatine. When the rod is withdrawn, it is rotated, in order to diffuse the fluid jelly over its surface. As soon as the gelatinous film has partially hardened, it is removed from the mould and placed on pins, furnished with suitable heads, and fixed on a cork table. When sufficiently dry, the *C.* are placed upright in little cells, made in the table to receive them, and the liquid with which they are to be filled is then introduced by means of a small glass tube. They are next closed by dropping some of the melted gelatine on the orifice of each. Six parts of gelatine, and one part sugar are now the common proportion.

**Captain,** the commander of a ship of war. The term is also generally applied, by courtesy, to the master of a merchant-vessel. See MASTER.

**Capuchin,** a cloak with a hood worn by females.

**Car,** in its original sense, is a small vehicle that runs or moves on wheels. In the U. States, the term is commonly applied to a passenger vehicle running upon rails. The *Irish car* is a one-horse cart, with very low, broad wheels, used for carting out manure, and carrying home grain, in the case of soft, peaty soils. The *Irish jaunting-car* is a kind of low, one-horse chaise, commonly without springs, in which the people sit back to back, and with their faces looking sideways. See RAILROAD CAR.

**Caracoly,** an alloyed metal of gold, silver, and copper, of which rings and trinkets are made, intended for shipment to quarters where the natives are not able to test the intrinsic value of the material.

**Character,** a Spanish apothecary's weight, = 3 grains.

**Carafa** [Fr.], a glass water-decanter for the table.

**Caraffa,** the Italian name for a flagon or bottle.

**Carafon** [Fr.], a small decanter; a half-pint.

**Caragi,** a Turkish name for import and export duties.

**Caraila, Caravela,** are East Indian names for the small, black, aromatic seeds of *Cleome pentaphylla*, which are used medicinally by the natives in decoction as a stimulant.

**Carambolas,** a name given by the Portuguese to the fruit of *Acerthou carambola*, much used to make tarts. The British call them Coromandel gooseberries. The fruits are used medicinally, in dyeing, and for various economical purposes.

**Caramel** is a dark-brown substance, obtained by heating sugar. It is formed during the roasting of all materials containing sugar, such as coffee and malt. It is much used for coloring soups, wines, spirits, and other liquids. *Crude C.*, also called *spirit coloring*, and *burnt sugar*, is made from cane sugar, by heating it to from 410° to 428° F., as long as aqueous vapor is formed, dissolving the product in water, and concentrating the solution by evaporation. To obtain *pure C.* *crude C.* is placed on a parchment-paper dialyzer. The undecomposed sugar, and certain intermediate compounds, diffuse out with considerable facility, and what ultimately remains on the dialyzer possesses five times the coloring power of the original *crude C.*, weight for weight.

**Carat,** or **KARAT**, a term used in a relative sense to express the fineness of gold. It means the 24th part of any given weight of that metal or of its alloy. If such weight be pure gold, it is said to be 24 carats fine; if three fourths only be gold, it is said to be 18 carats fine. The diamond carat, however, is a definite weight =  $3\frac{1}{8}$  troy grains; and the pearl carat =  $\frac{1}{4}$  of a troy grain. The carat was originally the 24th part of the old marc, or half-pound of the French.

**Caratello,** the Italian name for a keg for liquor.

**Caravan,** a troop or body of merchants or pilgrims, as they travel with camels in the East. The Koran, as is well known, enjoins every Mussulman, who has the means, to perform a pilgrimage to Mecca once at least in his life. Dullhadja, as the name imports, is the month in the Mohammedan calendar peculiarly set apart for the performance of this solemnity. Formerly, when devotional zeal was more ardent, the difficulties of the journey through the desert were held to increase the merit of the act; but of late a considerable portion of the hadjis do not travel by land with the caravans, but arrive by sea at Jidda. The regular hadj-caravans are six or seven in number, though they do not always make their appearance together, nor even perform the visit annually. One caravan proceeds from Syria, consisting chiefly of pilgrims from the Turkish empire. Another, issuing from Cairo in Egypt, conducts the Mogrebin, or African hadjis. A third caravan arrives from Bagdad with Persian pilgrims; and two smaller caravans go from Lahsa and Oman, besides a separate company of pilgrims from Yemen. The principal is that from Syria, which used to be accompanied by the Caliph in person. During the whole route, it is attended from town to town by the armed force of the district, and from Damascus to Medina it moves with great pomp across the desert, — a journey of 30 days. The Pasha of Damascus, or one of his principal officers, always escorts it; and the different classes of hadjis are stationed according to their town or district. At every stage (or distance of 11 or 12 hours' march) is a storehouse for provisions, with a small garrison, and a large tank at which the camels receive water. The usual time of travelling is from 3 o'clock in the

afternoon to an hour or two after sunrise next day,—torches being lighted during the night. The pomp and magnificence of this moving solemnity are still considerable, though much diminished since the time of the Caliphs, both in point of splendor and attendance. In 1814, the Syrian caravan, which was reckoned small, amounted only to 4,000 or 5,000 persons, attended by 15,000 camels. But of late years the numbers are understood to have increased, owing to the greater security afforded by the Pasha of Egypt against the Bedouins and Wahabees. Most of the pilgrims undertake the tour with a view to profit. Some accompany the caravan as soldiers; some are pilgrims by profession, and are paid to perform the sacred journey for others; and except mendicants, almost every hadji combines mercantile adventure with his religious duties. So much is this now the case, that the annual assemblage of Mecca, instead of a religious ceremony, may be more properly regarded as the principal Eastern fair for the exchange of the productions of Asia, Africa, and Europe. The Mogrebins bring their red bonnets and woollen cloaks; the western Turks, shoes and slippers, hardware, embroidered stuffs, sweetmeats, amber, European trinkets, and other small wares; the Anatolians bring carpets, silks, and Angora shawls; the Persians, cashmere shawls and large silk handkerchiefs; the Afghans, plain coarse shawls, beads, etc.; the Indians import the numerous productions of their rich and extensive regions; the people of Yemen bring sandals and various articles in leather; and of late years an increased quantity of European manufactures are carried there through various channels. Besides the religious caravans, there are many others which travel betwixt various places, both in Africa and Asia. Thus the intercourse between Egypt and Barbary and the interior of Africa is conducted by means of these associations; the trade between Russia and China is likewise a caravan trade, as is that between Aleppo and Bassora, and Bagdad. Similar lines exist in the countries to the E. of the Caspian; and others on a smaller scale are constantly occurring at various places where travellers and others assemble and organize an expedition for their mutual safety, one of their number being elected to regulate the order of march, and others to adjust disputes.

**Caravansary**, and **CARAVANSERA**, a large public building, or inn, for the reception and lodgment of caravans in the desert. Though serving instead of inns, there is this essential difference between them, that the traveller finds nothing in the *C.* for the use either of himself or his cattle, but must carry all his provisions and necessities with him. *C.* are also numerous in cities, where they serve not only as inns, but as shops, warehouses, and even exchanges.

**Caraway** [Fr. & It. *carvi*; Ger. *Feldkümmel*; Sp. *alcaravea*], a biennial umbelliferous plant (*Carum carui*), cultivated in many parts of Europe, chiefly for its seeds, which are used to a considerable extent in confectionery; also, for flavoring cheese, spirits, and liqueurs, and in medicine. The seeds have an aromatic smell, a warm pungent taste, and yield much essential oil. They are largely imported from Holland. *Imp.* (seeds and oil), free.

**Carbine**, a small short-barrelled gun, carried by mounted troopers.

**Carbolic Acid**, also called *Phenic acid* and *Phenol*, a powerful antiseptic substance, obtained from coal-tar oil. The pure anhydrous acid is in long, colorless, prismatic crystals, often, however,

on keeping, turning a beautiful pink, rose, or crimson, and which rapidly deliquesce in moist air, becoming converted into a colorless refractive liquid, having a faint odor of roses and tar. At 95° F. they become an oily liquid, having an odor and taste like creosote. Sp. gr. 1.065, boiling point 370° F. Exposed to the air, the crystals absorb moisture and liquefy. The acid is slightly soluble in water, but freely soluble in glycerine, alcohol, and ether. *C.* acid is poisonous. As a medical agent, it seems to have all the useful properties of creosote in an exalted degree, with some peculiar actions of its own. It is used as a disinfecting wash for ill-conditioned ulcers and gangrenous sores, etc.; also, in the preparation of picric acid, and of dyes. *Imp.* duty (for chemical or manuf. purposes), free; (dry or liquid, medicinal), 10 per cent; (as a disinfectant), 20 per cent.

**Carbon**, an elementary or simple non-metallic solid body, very widely diffused through nature. Its purest and rarest form is that of the diamond. Nearly pure, it occurs very abundantly in the forms of graphite and anthracite. In combination with oxygen, as carbonic acid, it exists in the atmosphere, and in the waters of most springs; also in limestone, marble, chalk, and dolomite. Combined with hydrogen, it enters largely into coal, peat, and lignite. It is an essential constituent of organic matter, and hence it has been termed the "organic element." *Charcoal*, *lamp-black*, and *coke*, are more or less pure forms of carbon. By strongly igniting lamp-black in a covered crucible the element is obtained sufficiently pure for most chemical purposes. It is best obtained purest by burning a jet of pure olefant gas in an atmosphere of pure chloride, collecting the amorphous *C.* deposited, and igniting in vacuo at a red heat. *C.* combines with other substances in numerous forms. With oxygen it constitutes *Carbonic acid*, purposely made in preparing aerated bread, soda-water, etc. This carbonic acid, combined with metals, earthen, and alkalies, produces the substances known as *carbonates*, so invaluable in the arts. When *C.* combines, not with oxygen, but with other simple substances, it produces *carburets* instead of carbonates. These, in the solid form, are not to any large extent useful; but the gaseous compound of carbon and hydrogen, forming *carburetted hydrogen*, may be taken as the type of all our most important materials for artificial heating and illumination. *Imp.* duty (pure), 20 per cent; (animal *C.*, crude, or burned bones), free.

*Sulphide- or Bisulphide of Carbon*, a colorless, pungent, fetid liquid, having the sp. gr. 1.27. It is exceedingly volatile, boiling at 118.5° F., and has never been frozen. It is highly inflammable, burning with a pale-blue flame, and giving off sulphurous and carbonic-acid gases. It freely dissolves sulphur and phosphorus, and by spontaneous evaporation deposits the first in beautiful crystals. The solution of phosphorus is much used in electrotyping objects, which are coated with a conducting film by its means. Its refractive power is remarkably high, and on this account it is employed to fill hollow lenses for spectroscopes and other optical instruments. It produces intense cold by its evaporation. A spirit thermometer, having its bulb covered with cotton, if dipped into this fluid and suspended in the air, rapidly sinks from 60° to 0°, and if put into the receiver of an air-pump it will fall to —81° F. A mixture of sulphide of carbon and solid carbonic anhydride forms almost the most powerful frigorific agent known. Sulphide of carbon is now prepared on a large scale, and extensively em-

ployed as a solvent, and as a disinfectant. *Imp.* duty, 20 per cent.

**Carboy**, a large green-glass bottle, cased in basket-work, varying in size from five to ten cubic inches, used for carrying distilled waters or liquid acids of too powerful nature to be carried in casks. *Imp.* duty, 35 per cent; American, reimported, free.

**Carbuncle**, or **ALMANDINE**, a fine large garnet cut with a rounded face. *Imp.* duty, not set, 10 per cent; set, 25 per cent.

**Carcanet**, a chain or collar of jewels.

**Carcass**, the dead body of an animal. — An iron shell fired from a mortar during sieges, to set fire to buildings in the besieged town. It is hollow, 4 to 13 inches in diameter, and is crammed with an infernal mixture of gunpowder, saltpetre, sulphur, pitch, resin, turpentine, and tallow.

**Carcavellos Wine**. See **OPORTO WINES**.

**Carcel Lamp**, a lamp of French invention, in which the oil is wound up by a kind of clock-work pump, which forces it up to the wick.

Fig. 60. — MODERATOR LAMP.

The real carcel principle is very scientific, but is seldom acted upon, as the lamps are very expensive, and are liable to get out of order. The *Moderator lamp* (Fig. 60) is almost as effective as the carcel, without being so costly and so delicate. A spiral spring, acting upon a piston, tends to press it constantly downwards, and to force up oil from beneath the piston through a small tube to the wick. Subsidiary apparatus insures the renewal of a supply of oil beneath the piston, the return to the vessel of any oil which overflows the wick, and the regulating or "moderating" according as the tension of the spring increases or diminishes.

**Cardamoms** [Fr. *cardamomes*; Ger. *Kardamom*; It. *cardamomi*; Sp. & Port. *cardamomos*], the capsules of various not very clearly defined species of *Anomum*, *Elettaria*, and other plants, *Elettaria cardamomum*, however, furnishing the true officinal Malabar *C*. The cardamom is an obtusely triangular three-celled pod, about half an inch in length, of a pale straw color, and furrowed longitudinally on its outer surface. This pod contains numerous reddish-brown rugose seeds, about the size of mustard-seeds, internally white, and having a pleasant aromatic odor and an agreeable taste. *C*. are principally employed as a flavoring ingredient, and occasionally as a stimulant and carminative, especially in the form of a simple or compound tincture. In India they are much used as a favorite condiment for various kinds of food, as curries, ketchups, and soups. Their active principle is a pungent volatile oil. They are shipped to Eng-

land from Ceylon, Sumatra, Java, Siam, and the Malabar coast. *Imp.* free.

**Card**, a small piece of card-board, on which are printed or engraved the name, business, and address of a mercantile house; commonly called *business card*. See **PLAYING-CARDS**.

**Card-board**, a very stiff paper substance, or pasteboard, for cutting cards from, for making boxes and for other uses. *C.*, for playing and address cards, consists of cartridge paper with finer paper on the two surfaces. *Bristol board* consists of fine paper throughout its whole substance. *Mill-board* is made of coarser and heavier paper, but is rendered smooth and glossy by heavy rolling. Pasting, pressing, drying, and rolling are the chief processes in the manufacture of all the varieties. Some *C.* is *enamelled* by means of a very fine preparation of white lead, rubbed on, and brushed in a peculiar way.

**Card-board Cutting-Machine**, a machine which cuts card-board into slips of a uniform size, and sometimes prints and numbers them for railroad tickets or other purposes.

**Card-Box**, a box for keeping playing cards in.

**Card-Case**, a portable fancy case for holding visiting-cards.

**Carder**, one who combs or clears wool or flax.

**Cardinal**. See **BISHOP**.

**Carding-Machine**, a mechanical engine in which the fibres of cotton are combed or carded, to disentangle them from each other, and bring them into a proper condition for spinning into yarns and thread. These machines consist of wooden cylinders or drums to which strips of leather are fastened, which are perforated with numerous wires regularly arranged. The wires are short and stiff, and the exterior of the cylinder resembles a circular brush. Several such cylinders are arranged so that the ends of the teeth are nearly in contact; and the cotton being brought to them, is caught up, passed from one to the other, and combed out as the cylinders revolve in the form of beautiful films or fleeces, which are removed by a smaller drum-card, called the *doffer*, and again from this by the *doffing-knife*. These films, which are of the width of the drum, are next contracted to a narrow ribbon, by being passed through a funnel; and thus narrowed, are called the *card ends* or *slivers*, and are now ready for the next process of *drawing* or *doubling*.

**Cardole**, a thick black oily substance obtained in the East Indies from the pericarp of the marking-nut. It is a powerful vesicating agent.

**Cardoon**, a culinary plant, the *Cynara cardunculus* (Fig. 61), resembling the artichoke, but larger; the blanched stems of the young leaves are stewed or used as an ingredient in soups in Germany and France.

**Card-Rack**, a receptacle for address, visiting, or business cards.

**Cards** are metal teeth fixed in an elastic band for teasing and separating the fibres of wool. See **CARDING-MACHINE**.

There is a beautiful engine, *Crabtree's Wire Card Setting Machine*, which inserts all the wires in the cards by self-acting movements. Wire is fed into the machine, and also the filelets which are to form the cards. The wire is cut into short pieces; each piece is held firmly, and the two ends bent to form a staple; a prickler makes holes in the filelet. The pieces of wire are inserted in the holes; while supplementary parts give force and finish to the teeth thus made. The fillet travels on just as fast as those operations are completed.

**Card-Table**, a light folding-top table covered with baize, for playing cards on.

**Card-Tray**, a small salver for a servant to deliver a card on.

**Card-wire Cloth**, cloth in which fine iron wire is inserted for combing and disentangling the fibres, etc. of wool, cotton, flax, and hemp.

Fig. 61. — CARDOON.

(*Cynara cardunculus*.)

**Carreen**, to heave a ship down on her side in order to examine her bottom, for cleaning or paying it with pitch. — When a vessel lies over with the wind in sailing, she is said to carreen.

**Carreenage**, a careening ground, a place suitable for placing a ship high and dry.

**Carga**, a standard Spanish liquid measure, equal in some parts of that kingdom to 32½ gallons, but in others only 27½ gallons; also a Spanish weight, ranging from 177½ lbs. to 338½ lbs. — In Candia and Milan the carga as a grain measure is equal to 4½ bushels. — A commercial weight in Central America equal to 81 lbs.

**Cargo**, the load carried by a ship or merchant-vessel; the freight; the goods, merchandise, lading, or whatever is carried by a ship (human beings excepted). That which cannot be stowed in the hold is termed *deck cargo*.

**Cargo-Boat**, a luggage-boat or barge for the conveyance of heavy goods on rivers or in harbors.

**Cariole**, a small, light, open carriage for general use.

**Carlings**, short, small square pieces of timber which lie fore and aft in a ship, in tiers from beam to beam, and which receive the ends of the ledges for framing the decks.

**Carlock**, a kind of isinglass obtained from the air-bladder of the sturgeon in Russia.

**Carman**, a carter, cartman, or drayman; one who drives a cart. A carman who carries goods for hire as an employment is a **COMMON CARRIER** (q. v.).

**Carminatives** are medicines that allay flatulency and spasmodic pains. Among the principal *C.* are *aniseed*, *caraway seed*, *cardamoms*, *cassia*, *cinnamon*, *ginger*, *peppermint*, and the *peppers*.

**Carmine**, **VEGETABLE SCARLET**, a beautiful red pigment prepared from the cochineal insect. Pure *C.* is a very light, lustrous, scarlet powder, entirely soluble in ammonia, a test by which its purity is readily determined. It is used as a pigment in velvet and miniature painting, and for tinting artificial flowers, and as rouge for the complexion. The powdered cochineal (carmine grounds), from which the colored liquor (liquid rouge, carmine liquor) has been decanted, is used by the paper-stainers, and both are used in the preparation of carminated lake. *Imp. duty*, 35 per cent.

**Preparation.** From cochineal 1 lb., and carbonate of potash ½ oz., boiled in water, 7 gals., for 15 minutes; the vessel is then removed from the fire, and powdered alum, 1 oz., added; the liquor is then well agitated and allowed to settle for about 15 minutes longer; the clear liquid is next decanted into a clean copper, and isinglass, ¼ oz., dissolved in water, 1 pint (and strained), added; as soon as a coagulum forms upon the surface, the heat is removed, and the liquid is strongly agitated with a bone or silver spatula, after which it is allowed to repose for 20 or 30 minutes. The deposited *C.* must be drained on a filter, and dried on shallow plates covered with silver paper. — *Liquid C.*, *Rouge liquid*, *C. ink*, is a solution of *C.* in ammonia water, or spirits of hartshorn. It is very rich and beautiful. — *Blue C.*, see **INDIGO**.

**Carnauba Root**, is the root of the palm (*Corypha cerifera*), growing on the shores of the Rio Francisco, in Brazil. The leaves yield a vegetable wax, which is made into candles; the fruit is eaten raw, or boiled; a farina is obtained from the trunk, and the wood is very durable.

**Carnelian**, an ornamental stone, so called because some kinds are of a flesh color, is a variety of agate or chalcedony. *C.*, when recent, is dark olive-green, inclining to greenish gray; but, by exposure to the sun and calcination, it becomes generally of a reddish color, though sometimes yellow or white, the deep, clear red being, however, the most valuable. They are never figured or striped. The great supply is from Japan. They are also imported from Bombay; but the best come from the Gulf of Cambay. Many of the antique gems are engraved in *C.* *Imp. duty*, unmanuf., free; stones, 10 per cent; rings, 25 per cent.

**Carnet**, in French commerce, a bill book.

**Carnucci**, dried skins and hide pieces, for making glue, exported from Sardinia.

**Caroba**, in Tunis, the 16th part of a piaster = about 3 cents.

**Carob-Beans**, **ST. JOHN'S BREAD**, **ALGARROBO**, the leguminous pods of the carob-tree, *Ceratonia siliqua*, which contain a succulent, sweetish pulp, and are often eaten in Spain and the countries bordering on the Mediterranean. They were once supposed to be the locust bean on which St. John the Baptist fed when in the wilderness. Most of the carob-beans imported into this country come from Sicily and Naples. They are occasionally sold to singers under the impression that they improve the voice. They are largely imported into England for feeding cattle. *Imp. free*.

**Caroteel**, the commercial name for a tierce or cask, in which dried fruit and some other commodities are packed, which usually averages about 7 cwt.

**Carp**, the *Cyprinus carpio*, a fresh-water fish of Europe and Asia, 1 to 3 ft. long, very tenacious of life, and said to attain the age of 200 years. It prefers still waters, and feeds on aquatic plants, worms, etc. It is remarkable for its fecundity. Its flesh is highly esteemed as food, but it is not a

very valuable fish for the angler, because it does not bite freely.

**Carpathian Balsam**, an oleo-resin or essential oil distilled from the fresh cones and green tops of *Pinus umbra*, in Germany.

**Carpenter**, a worker in woods, who usually combines the business of a joiner. See **CARPENTRY**. — A ship's officer, who has charge of the boats and repairs.

**Carpenter's Bench**, the work-table of a carpenter.

**Carpenter's Rule**, a two-foot folding rule for the pocket, subdivided into inches and parts, for measuring work.

**Carpenter's Square**, a tool for squaring wood-work.

**Carpentry**, the trade of a carpenter, the art of cutting, framing, and assembling pieces of timber, for house and ship building. It is distinguished from *Joinery* by the fact that the pieces of timber are put together by the use of other edge-tools than the axe, adze, saw, and chisel, whereas joinery requires the use of the plane; the distinction is, however, very artificial, as all wrought timber is planed.

**Names of Timber Pieces.** In some arrangements of wood-work the timbers tend to bend, in others to compress, in others to stretch. If the duty of a particular piece is to take longitudinal compression, it acts as a *strut*; if to take longitudinal extension, or stretching, as a *tie*; if a single timber is strengthened by subordinate pieces, it is a *truss*; a joint for lengthening a timber, by adding pieces at the ends, is a *scarf*; a joint for connecting timbers to form a truss, roof, centering, etc., is usually a *tenon and mortise*; joints for connecting timbers in braces, ties, etc., are *dove-tails*, *crumpings*, *notchings*, *lappings*, etc. *Wall-plates* distribute the pressure of the roof on the walls of a building; *principal rafters* are timbers to support the framework of the roof; *tie-beams* and *collar-beams* are timbers to connect these rafters; *purlines* are horizontal pieces which connect the principal with the common rafters; *pole-plates* connect the common rafters with the tie-beams; *king-posts* are upright pieces from the tie-beam to the principal rafters; *queen-posts* are similar in character, but different in position; *struts* and *braces* are diagonal strengthening pieces; *punchions*, or *studs*, are short pieces placed between two others to support them equally; *straining-beams* are placed between the queen-posts; *straining-sills* are placed upon the tie-beam at the bottom of the queen-posts; *camber-beams* are horizontal on the lower surface, but obtusely angular on the upper. The modes of fastening the various pieces together give rise to the processes of *scarfing*, *plain jointing*, *notched jointing*, *dove-tailing*, *mortising*, *relating*, etc., which, in fact, constitute the chief features in practical carpentry.

The tools ordinarily employed in *C.* are a *ripping-saw*, a *hand-saw*, an *adze*, an *axe*, a *socket-chisel*, a *firmer-chisel*, a *ripping-chisel*, an *auger*, a *gimlet*, a *hammer*, a *mallet*, a *pair of pincers*, and, sometimes, *planes*; but the latter are not necessarily used, as they, in most cases, belong to joinery.

**Carpet** [Fr. *tapis*; Ger. *Teppich*; It. *tappeto*], is the name applied to a woven or felted fabric, made generally of wool, which is used for covering the floors of chambers, or for spreading on the ground. *C.*, as manufactured at the present day, range themselves under two classes;—the first and ancient class being such as are made by knitting into the warp, tuft after tuft, the materials of the pattern; and the second consisting of those in

which the pattern is woven up in the loom. To the first class belong the Oriental *C.* generally, as well as such as are woven at many places throughout Europe under the name of Turkish *C.* Persia is now, as it has been from the most remote times, the recognized source of what is most truly artistic, durable, and valuable in this manuf.; and after the products of that country, those of various parts of India and Turkey are most esteemed. — *Turkey C.* are made on a vertical loom; the warp threads (linen) being unwound from an upper beam, and wound round a lower beam as the weaving goes on (Fig. 62). The weaver throws in the weft threads with a shuttle; but he introduces

Fig 62. — TURKISH CARPET LOOM.

with his fingers little bits of colored wool, which are twisted round the warp, and jammed up closely by the weft. Each little tuft or bunch is chosen of the proper color, according to the pattern; and therefore the selection and tying on of these bits form the generic peculiarity of the Turkish *C.* The surface is afterwards sheared, to bring the tufts to a level. — *Aubusson C.*, manufactured in the French town of that name, are generally in one piece, to suit the size of the room; they are the finest and most costly *C.* brought to the U. States. — *Axminster C.* are virtually imitations of the Turkey; they are not now much made. — *Brussels C.* have a linen web or foundation, with worsted yarns raised into loops to form a pattern. These loops are formed by means of wires, temporarily laid across the warp, the yarns being placed over the wires, and then

the loops left when the wires are removed. The colored threads to form the yarn are wound upon bobbins fixed in frames at the back of the loom. A complicated mechanism of weights, bench-wires, rails, cords, and pulleys is necessary to connect the several bobbins with the working part of the loom; and then the incorporation of linen warp, linen weft, and worsted yarns, so as to form at once a strong fabric and a colored pattern, is effected by a very intricate succession of movements. The wires are drawn out at the selvage edges of the C., and the loops which they leave form the visible surface. — *Moquette* or *Wilton C.* differ from Brussels chiefly in this, — that each wire has a groove along its upper surface, which guides a knife employed to sever all the loops, and thus disengage the wire. The surface of the C. is thus a *pile* of cut ends, and this pile is afterwards sheared to make it a level smooth *nap*. — *Kidderminster* or *Ingrain C.* have a peculiar double structure, being, in fact, two separate C. linked together. The two are woven simultaneously, and at the same time are linked together. The warp is worsted, and the weft woollen. — The visible pattern is mostly formed by the weft, the warp being more buried within the substance of the fabric. The weft of the lower web is at periodical intervals brought up to the surface, and does its part towards forming the pattern. An *Ingrain C.*, from the mode of its construction, presents the same pattern on both surfaces, only with the colors reversed. They are extensively made in many parts of Scotland and the North of England, and in the U. States. — *Scotch C.* are very similar in general character to *Ingrain*, but many of them have three thicknesses instead of two; they consist of three webs, curiously interlacing, and called *three-ply*. — *Venetian C.* are so woven that the warp gives the pattern, the weft being wholly concealed. This is the cause of the *stripes* which these C. usually exhibit. By a suitable selection of weft colors the stripes may be converted into checks, tartan, and twilled patterns. — *Tapestry C.* are made of yarns *printed* before being used, in such a way that each yarn shall present different colors in different parts of its length. A pattern is thus produced with less complexity of apparatus than for the Brussels or Wilton C. — *Felt C.* are, in fact, nothing more than printed pieces of felt. — *Hemp C.* and *Rag C.*, which are manufactured on a large scale in the U. States, are also cheap substitutes for real C. The U. States are now, after England, the principal seat of the C. manuf. in the world; and American C. now rival, sometimes favorably, the British C., in quality and colors. In 1871, the U. States imported from Great Britain 6,882,456 yards of C., valued at \$5,433,190 (which was 65 per cent of the total exports of British C. for that year), while in 1878 America received from foreign countries, chiefly from England and Scotland, only 278,262 yards of C., valued at \$398,889.

*Imp. duty*: — *Angola*, so called two-ply Ingrain, of wool, grass, and cotton, 12 cts. per sq. yd. and 35 per cent. — *Aubusson*, *Azminster*, *medaillon* or whole C., 50 per cent. — *Brussels*, wrought by the Jacquard machine, 44 cts. per sq. yd. and 35 per cent; *printed*, or *tapestry*, on warp, or otherwise, 28 cts. per sq. yd. and 35 per cent. — *Cotton*, 40 per cent. — *Felt*, 40 per cent. — *Flax*, 40 per cent. — *Hemp* or *Jute*, 8 cts. per sq. yd. — *Patent velvet*, *Tournay velvet*, *tapestry velvet*, printed on the warp or otherwise, value over \$1.25 per yd., 40 cts. per sq. yd. and 35 per cent. — *Saxony*, *Wilton*, and *Tournay*, wrought by the Jacquard machine, value over \$1.25 per yd. 70 cts. per sq. yd. and 35 per cent. — *Treble ingrain*, three-ply, worsted-chain Venetian, 17 cts. per sq. yd. and 35 per cent. — *Yarn Venetian*, two-ply, ingrain, 12 cts. per sq. yd. and 35 per cent. — *Wool*, also mixed, not otherwise provided, 40 per cent. — *Druggets*, *bockings*, printed, colored, or other-

wise, 25 cts. per sq. yd. and 35 per cent. — *Hassocks*, *rugs*, *screens*, *mats*, *bedsides*, *covers*, etc., pay duty as carpetings of like description.

**Carpet-Bag**, a portable sack for travellers, made from carpeting, capable of holding a few essential articles or changes of linen. The name has got to be applied also to black varnished linen bags resembling leather.

**Carpet-Beater**, one who takes carpets to shake and beat the dust from them.

**Carpet-Broom**, a long-handled stiff brush for sweeping the carpets of rooms, made of strong fibre, bristle, grass, etc.

**Carpet-Cleaning**, the process of scouring and removing dust and stains from carpets.

**Carpet-Hammer**, a tool for nailing down a carpet.

**Carpeting**, a general name for the material for carpets; carpets in general. The name is also often applied to small lengths or floor pieces for the sides of beds in a sleeping-room. See **CARPET**.

**Carpet-Loom**, a frame for weaving carpets.

**Carpet-Planner**, a cutter of carpets; a workman who measures rooms, and makes a plan on paper of the breaks, door-ways, windows, etc., to ascertain the quantity of material required, and the best mode of cutting, adapting, and laying it down with the least waste.

**Carpet-Shuttle**, a weaver's implement.

**Carpet-Strainer**, a kind of metal rake or tool for holding and stretching carpets tight on the floor of a room, when laying them down.

**Carpet-Weaver**, a workman employed in making carpets by hand or by machinery.

**Carpmeals**, a kind of coarse cloth formerly made in the North of England.

**Carrack**, a large Spanish ship.

**Carrageen**, **IRISH Moss**, a purplish-white, nearly transparent sea-weed (*Chondrus crispus*). It contains a large proportion of a peculiar jelly, which forms an agreeable article of food for invalids. It is used in medicine as a demulcent; also for feeding cattle, for thickening colors in calico-printing, and for sizing pulp in the paper-maker's vat.

**Carrara**. See **MARBLE**.

**Carrata**, a ton weight of marble at Carrara; also a solid measure of 12½ cubic feet.

**Carraway**. See **CARAWAY**.

**Carregator**, a Portuguese freighter and charterer of a ship.

**Carriage** [*Fr. voiture*; *Ger. Führe*], in its widest signification, includes all structures employed for the purposes of transport of merchandise and movable goods, and of human beings. Such vehicles are generally mounted on wheels, but the sledge and the litter are types of the exception to this rule. A narrower application, however, limits the term to such vehicles as are used for the conveyance of persons, and it is in this restricted sense that the term is used here. Cars or C. for use on railways are also included, and will be dealt with in other connections. The forms of C. as now built are so numerous as almost to defy classifying, and they altogether baffle detailed description. The climate, condition of life, and various other circumstances of different countries, have originated modified forms of C. in each of them, some of which have come into general use, while others are seldom seen out of the land of their origin. In comparing the C. of the present day with those of earlier periods, it should be borne in mind that many circumstances apart from the skill and invention of the C. builder have combined to modify such structures, or to necessitate the modification of them. The condition of streets and roads was

such, at no very remote date, as to permit of only the most cautious traffic within limited areas in vehicles of great strength, solidity, and weight. The paving of streets and macadamization of highways gave designers of *C.* facilities for planning vehicles of a light, airy type on more elegant lines, of which opportunities they were not slow to take advantage. Again, previous to the introduction of railroads, not only public coaches but private *C.* had to be built with a view to afford accommodation for undertaking long journeys, which are now entirely performed by railroads, and that circumstance also now enables the *C.* builder to give primary attention to the comfort, gracefulness, and elegance of the vehicles he constructs. But after allowance is made for all such circumstances, there remains to coach-builders a very large share of credit for the inventive skill and ingenuity which has brought the modern *C.* to that perfection of workmanship and artistic finish which it everywhere displays. — *C. making* is a combination of crafts rarely united in one trade, embracing, as it does, work in such diverse materials as wood, iron, steel, brass, cloth, leather, ivory, hair, etc. A great division of labor and numerous highly skilled hands are consequently employed in the various stages in the construction of a high-class *C.* The workmen include body-makers, who build up the part in which persons sit; *C. makers*, who make or fit together all the under parts of the vehicle on which the body rests; wheelwrights, joiners, and fitters; trimmers, who fit up the inside of the *C.*; and several classes of smiths for special work connected with the iron framing; axles, springs, etc. Painting is an important part of the business, those professing it being divided into body, *C.*, and ornamental painters; and after the painter comes the polisher, who gives the final brilliant polish to the outside of the whole structure. A very great deal in the *C. making* business depends on the selection of materials. Ash is the kind of wood commonly used in the framework both of body and *C.*; and the quality best suited for body-wood is that of a mild and free nature, while for the *C.* the wood cannot be too strong or robust. Full-grown wood, of course, is best suited for both purposes, and the planks must be allowed to lie until they are properly seasoned, as is indeed most essential with all the wood used in the building of a *C.* After the framework is made, the lower part of the body is panelled up with the softest bay mahogany, plain and free from grain. The kinds of wood generally applied to *C.* wheel making are elm or fustic for the naves, oak for the spokes, and ash for the felloes; but beech felloes are often used, and it has been found by experience that beech, when the felloes are cut from the log shortly after it is felled, and kept until they become dry before being put upon wheels, answers admirably for this purpose. American hickory is also one of the best available woods for spokes, as well as *C. poles*; and machine-made hickory wheels are now exported from the U. States to England and other countries. American black walnut has also come into use as a substitute for mahogany in panelling, and many other woods are available for special portions of *C.* The iron mounting of coach-work requires the skill of experienced smiths; for, besides solidity, some degree of taste is requisite to form the shapes and sets of the different parts. No branch of *C. making* contributes more to the elegance of the vehicle than that of the painter. His colors must be of the best quality in order to stand ex-

posure in all weathers. The varnish used is copal, of which there are two kinds, — the finest for finishing the body, and the second for finishing the carriage. Between paints of different qualities and varnish, a well-finished *C.* gets from 20 to 24 separate coats before it is finished. Between each coating of varnish color and varnish the work is carefully rubbed smooth and flat with pumice or fine glass paper, and the final polish is attained by rubbing with the palm of the hand. According to the U. States census of 1870, there are in this country 11,947 establishments, 56,294 hands, and a capital of \$37,637,000 engaged in the *C.* and wagon manuf. In 1878 the American exports of *C.*, carts, and parts of the same, amounted to \$979,003. *Imp duty*, (*C.* and parts of *C.* furniture, *C.* hardware, etc.,) 35 per cent.

**Carriage-Brake**, the drag or retarder applied to the wheel for stopping a carriage.

**Carriage-Builder**, one who designs and constructs carriages.

**Carriage-Fitters**, workmen who fit and suspend the bodies on the under works, and apply the various parts furnished by special manufacturers, such as lamps, handles, etc.

**Carriage-Fittings**, the iron or other metal parts of a vehicle.

**Carriage (Hand)**, an invalid's wheel chair, or child's perambulator.

**Carriage-Joiners**, operatives who make the glass frames, blinds, boxes, trunks, etc.

**Carriage-Makers**, persons who make the under works, apply the parts necessary for locking or turning the carriage, fix the axles, springs, etc.

**Carriage-Retarder**, a brake for carriage-wheels.

**Carriage-Rug**, a sheep-skin mat, fur, woolen, or other wrapper or rug for the feet and legs in travelling.

**Carriage-Smiths**, workmen engaged on the iron-work of carriages, who are divided into body-smiths, tire-smiths, spring-smiths, etc., from the different work they are engaged upon.

**Carriage-Spring**, a series of metallic banded plates; steel springs to lessen the motion of a carriage, and give elasticity.

**Carriage-Trimmers**, men who fit up the insides of carriages, fix the silk, cloth, and laces in the necessary parts.

**Carriage-Upholsterer**, a tradesman who furnishes braid, lace, buttons, silk, straps, etc., for the interior fittings of carriages.

**Carriage-Wheel**. See **WHEEL**.

**Carrick-Bend**, a peculiar kind of knot made in a cordage.

**Carrick-Bitts**, the windlass-bitts in a ship.

**Carrier**. See **COMMON CARRIER**.

**Carion**, the carcass of an animal; slaughtered meat unfit for human food.

**Carronade**, a short piece of ordnance carrying a 32 or 42 pound shot.

**Carrot** [*Fr. carotte*; *Ger. Möhe*; *It. carota*; *Port. cenoura*; *Sp. zanahoria*], an umbelliferous plant, *Daucus carota*, having a succulent root, which is largely used as human food, and in some places for the maintenance of stock, especially horses and dairy cows. Carrots can be kept for many months if the tops are cut off, and they are then placed in damp sand.

**Carrying-Trade**, the business of transporting merchandise, etc., from place to place by sea or land.

**Cart**, a vehicle on two or four wheels, adapted for conveying loads, light or heavy, according to the peculiar build or construction of the cart.

**Cartage, Drayage, Truckage**, the act of con-

veying goods in a cart, dray, or truck, from one part to any other part of a town; also, the charge for the same.

**Carte**, a French name for the bill of fare at an eating-house; the list of wines, etc.

**Carte-blanche** [Fr. white paper], paper containing nothing but the signature of the person who grants it, in order that the person to whom it has been delivered may insert such conditions as he chooses. This term is also used in a general sense to express an unlimited authority delegated by any one to another. The term is taken from the French. In France, however, the commercial and legal term is *blanc-sing*.

**Carthagera**. See COLOMBIA (U. STATES OF) and SPAIN.

**Carthamus**. See SAFFLOWER.

**Cart-Ladder**, a kind of rack thrown out at the head or tail of a cart, to enable it to carry a larger load of light goods.

**Cart-Load**, the quantity that a cart will hold, or a horse can draw. A single horse will convey a load of two tons over the paved streets of a town. A cart of grain is five quarters, or forty bushels.

**Carton**, **Cartonnage**, pasteboard for paper boxes.

**Cartonné**, a book bound in boards.

**Cartonnerie**, the French word for a pasteboard manufactory. The manufacture of stiff paper boxes is largely carried on in France. In Paris 4,000 persons are employed in it, and the trade is divided into six distinct branches, each making special kinds of boxes.

**Carton-Pierre**, a species of papier-maché, imitating stone or bronze sculpture. It has been used for roofing, and is composed of the pulp of paper mixed with whiting and glue. This is pressed into plaster piece-moulds, backed with paper, and, when sufficiently set, removed to a drying-room to harden.

**Cartoon**, a stiff paper or cardboard box, used by fancy-goods merchants and others. — A rough sketch or outline in chalk made on stout paper in order to be transferred on a fresh plastered wall to be painted in fresco.

**Cartouch**, a canvas or leather cartridge-box; a case for holding musket-balls and powder.

**Cartridge** [for guns, Fr. *gargousse*; Ger. *Kartusche*; for small arms, Fr. *cartouche*; Ger. *Patrone*], is a tube or case to contain ammunition, to be shot from some kind of fire-arm. The primary use of it is to save time in loading. *C.* for cannon are bags of gunpowder, and sometimes bullets, fastened up in a convenient way. *C.* for fowling-pieces, muskets, carbines, etc., are tubes of paper, pasteboard, or brass, each containing a definite quantity of powder, if for a *blank C.*; if for *service*, the tube also contains a bullet or else shot.

**Cartridge-Case**, a box with cells for holding cartridges. Also the paper in which the powder of a cartridge is enclosed.

**Cartridge-Paper**, a very stout paper for drawing rough designs on, or for making cartridge-cases, etc.

**Cart-Saddle**, the harness support on a horse's back to which is attached the breeching, chains, traces, etc. of a cart.

**Cart-Wheels**, large stout wheels made for carts, capable of supporting heavy loads.

**Cart-Wright**, an artificer who makes or repairs carts.

**Carved-Work**, sculpture, or open work in stone, wood, etc.

**Carvel**, **Caravel**, a small Spanish ship.

**Carver**, one who designs and works on sculpture, or who cuts wood and stone in the form of figures

or other devices as ornaments and in enrichments of mouldings. — A long pointed knife for cutting up joints of meat and poultry.

**Carving**, the art of forming any hard materials into a proposed shape or figure by means of sharp instruments. It is usually understood to refer exclusively to works in ivory or wood, to distinguish it from *C.* in marble or stone, which comes under the term *sculpture*; or in metals, when it is called *chasing*. The woods preferred by modern carvers are the pear, lime, American pine, maple, oak, and box; and the tools they employ are round hollow chisels called gouges; others, with an angular extremity, called from the shape V-tools; flat chisels of various sizes, and files. A mallet is sometimes used, but pressure, or a sharp blow from the bottom or heel of the hand is generally preferred. The surface is cleaned and polished with sand-papers of different qualities, by pumice-stone, and by friction. In preparing wooden blocks for printing from, the object is engraved with instruments similar to those commonly used for engraving. This branch of the art does not therefore properly come under the term *C.* See WOOD-WORKING MACHINERY.

**Carving-Fork**, a large fork with a protecting guard for carving joints of meat.

**Cascarilla**, the bark of *Croton leuteria*, a tree of the West Indies. It is an aromatic bitter, stomachic, and tonic.

**Case**, a box of any kind. — The outside of a watch. — A printer's box for the types, from which the compositor gathers them separately, and arranges them in lines and pages. They are usually in pairs; one of which is styled the *upper-case*, and is divided into 98 boxes or recesses of equal size, in which are deposited the capitals, small capitals, accented letters, etc.; the other is called the *lower-case*, and is divided into 54 boxes or recesses of unequal size, containing the small letters, figures, spaces, etc., the letters most in use having the largest boxes assigned to them. The cases are two feet nine inches long, one foot four inches and a half broad, and an inch in depth.

**Cased-Goods**, in the glass trade articles in which colored metal has been added to flint glass.

**Case-Hardening**, the process of converting the surface of iron into steel. The goods, previously polished, are heated to a bright red, and rubbed or sprinkled over with prussiate of potash. As soon as the prussiate appears to be decomposed and dissipated the articles are plunged into cold water. The process has been well conducted when the surface of the metal proves sufficiently hard to resist a file.

**Casein**, the curd or coagulable portion of milk.

**Case-Rack**, a printer's frame for placing the wooden cases of type on.

**Case-Shot**, pieces of iron, musket-balls, or other projectiles enclosed in a case for firing from a cannon.

**Caseum**, the purified curd of cheese.

**Cash**, the general name for coin and bank-notes, sometimes applied to checks, government bonds, and other property easily convertible into money. — The only coin of the Chinese, also called *le*, which is nominally divided into 10 *haous*. These cash are made of a very base alloy of copper, are round, measure between  $\frac{5}{8}$  and  $\frac{1}{4}$  of an inch in diameter, and have a square hole in the middle, by which a hundred or more are usually strung together. On one side are Chinese characters, denoting the reign under which they were cast; and on the other side are either Chinese or Mantchou characters, designating the place of coinage. The

cash is cast also in Japan, Corea, and Cochinchina.

**Cash-Account**, an account strictly limited to cash transactions.

**Cash-Book**, a book in which are registered the particulars of all cash transactions incidental to business. See **BOOK-KEEPING**.

**Cash-Box**, a metal or wooden case for keeping money in.

**Cash-Credit** is an undertaking on the part of a bank to advance to an individual, or to a partnership, such sums of money as may from time to time be required, not exceeding on the whole a certain definite amount; to be repaid, and a continual circulation kept up by the replacing in the bank of profits and sums as they come in. The security upon which the advances are made is usually a bond with sureties for the repayment, on demand, of the sums actually advanced, with interest upon each issue from the day on which it is made; interest at a lower rate being allowed by the banker for the sums paid into the bank. The security, in short, enables one to transact business with the bank, as if the sum for which the sureties have become responsible were actually deposited in his own name. When the banker discounts bills to the holder of the account, he may either enter them to the debit in the account, or hold them as separate transactions; but by adopting the latter step, he is not foreclosed from entering them afterwards on the account, and so making the sureties responsible. The bond thus covers every description of transaction on account of which the party may become responsible to the banker, whether it be by a single check drawn by the holder himself, or a bill discounted by him, for payment of which the banker may have looked at first to another party.

**Cashew-Nut** [*Fr. noix d'acajou*; *Ger. Akajunüsse*; *Port. nozes d'ucaju*; *Sp. nueces d'acaju*], a kidney-shaped nut attached to the fruit of a small tree (*Anacardium occidentale*), found in the West Indies and South America. The kernel is a wholesome article of food and is used as an ingredient in puddings. It is also sometimes roasted for communicating a flavor to Madeira wine. An oil is obtained from the inner shell. The fruit is highly esteemed in Brazil.

**Cashier**, **CASH-KEEPER**, one who has charge of money; one who superintends the books, payments, and receipts of a bank or trading concern. In a joint stock banking co., the C. is usually a permanent officer, appointed by the board of directors, and next in rank to the president.

**Cashmere**, a stuff made of goats' hair; also a fancy woollen fabric.

**Cashmere Shawls**, the costly and beautiful shawls made from the delicate downy wool found about the roots of the hair of the Thibet goat (*Capra hircus*). They are sometimes, but incorrectly, named *Camel's-hair shawls*. These Oriental fabrics are woven by very slow processes, and are therefore very expensive, being sold in Paris and London at from \$800 to \$2,000 apiece. The wool is spun by women, and afterwards colored. A fine shawl, with a pattern all over it, takes nearly a year in making. To the people of Cashmere this manufacture is very important. About 10,000 looms are continually at work, each one giving employment to 3 men. The annual sale there is calculated at 30,000 shawls. It has long been the aim of European nations, on account of the beauty and value of these shawls, to imitate them, if possible, and apply to their manufac-

ture the more speedy and elaborate methods which modern science has placed within our reach. The French have been most successful, and shawls are now produced at Paris, Lyons, and Nîmes, known in commerce as French cashmere, which closely approximate in stuff and style of work to the Oriental, while much lower in price, although still costly. Norwich, Bristol, Paisley, and Edinburgh have also manufactured very good imitations of these shawls. The Cashmere wool imported for this purpose comes into Europe through Kasan, on the eastern bank of the Volga, and also directly from India and Persia. *Imp. duty*, 50 cts per lb. and 40 per cent.

**Casimir**, the French word for Cassimere.

**Casing**, the act of packing in a case.—The process of plastering a building-frame or timber work, and indenting into squares, etc., while moist, so as to resemble stone.—A name for dried cow-dung, used as fuel in some parts of Ireland and other countries.

**Casino**, a public place of amusement, where music and dancing are carried on.

**Cask**, a wooden hooped vessel, or barrel, of staves and headings, of variable shape and dimensions, for holding liquors. See **BARREL**, **BUTT**, **HOGSHEAD**, **PIPE**, **TIERCE**, etc.

**Caskaval**, a kind of cheese resembling Chester, made in Moldavia.

**Casket**, a small jewel-case or box for ornaments, etc.

**Cask-Lifting Frame**, a tilter for facilitating the drawing off liquids when the cask gets low.

**Cassaba**, an Arab measure of about 4 yards.

**Cassareep**, the inspissated juice in which the starch of the bitter cassava (*Janipha manihot*) has been washed; it forms a delicious sauce in the tropics, and is the foundation of the far-famed pepper-pot of the West Indies.

**Cassava**, a poisonous shrub (*Janipha manihot*), cultivated in the West Indies and South America for the sake of the starchy matter contained in its roots. The name "bitter C." is commonly given to it in the West Indies, to distinguish it from another species of the same genus, which, from having no poisonous properties, is named the "sweet C." The roots of both species yield the starch, but those of the poisonous plant are the richer. The roots, after being well washed and scraped, are rasped or grated, and the pulp thus formed is subjected to strong pressure, to expel the poisonous juice which it contains. The compressed pulp is next thoroughly dried over the fire, being constantly stirred the whole time, by which any remaining portion of the noxious juice is either volatilized or decomposed. It now forms *C. meal*. When it is further prepared by grinding, it forms *fine C. meal* or *C. flour*. When the compressed pulp is baked on a hot plate, it forms *C. bread* or *C. cakes*, the flavor of which greatly resembles that of Scotch oat-cakes. See **TAPIOCA**.

**Casse**, the French name for Cassia bark; also for breakage.

**Casse-Paper**, broken or damaged paper.

**Casserole**, the French name for stew-pan.

**Cassia-Bark**. A large number of trees of the *Cinnamomum* family are stated to furnish the C.-bark of commerce in the East, although it is usually ascribed to *Cinnamomum Cassia*. C.-bark is easily distinguished from cinnamon by its very mucilaginous character when chewed. It appears, however, probable that C.-bark is merely an inferior kind of cinnamon, obtained from the larger branches and trunk of the true tree in Ceylon and other islands of the East. C.-bark is used as a

purgative. *Imp.* duty, 10 cts per lb.; ground, 20 cts. per lb.

**Cassia-Buds**, the immature flowers (perianth and ovary), gathered and dried, of several species of cinnamon, chiefly used in confectionery, having the flavor and pungency of cassia. *Imp.* duty, 20 cts. per lb.

**Cassia-Fistula**, the commercial and botanical name for the legumes or cylindrical pods of the pudding-pipe tree; the cells are filled with a sweetish pulp, which is an agreeable laxative and the base for purgative electuaries.

**Cassia-Oil**, a volatile oil, obtained from cassia-bark. It is of a fainter color than cinnamon oil; taste acrid and pungent, and odor agreeable.

**Cassimere**, or **KERSEYMERE**, a thin, fine woolen cloth, chiefly used for vests and waistcoats.

**Cassinets**, a light mixed cloth, the warp of cotton and the weft of very fine wool, or wool and silk, made for summer wear.

**Cassis**, the black currant (*Ribes nigrum*), formerly celebrated for its medical properties, but now only used in preparing the French liqueur of that name.

**Cassius-Purple**, a beautiful pigment used for staining glass and painting porcelain; a mixture of oxide of tin and gold.

**Cassock**, a clergyman's black gown or vestment.

**Cassollette**, a small box in glass, ivory, or precious metals, containing perfumes, with a capillary hole to allow the odor to escape.

**Cassonade**, the French name for coarse brown moist or muscovado sugar.

**Cassumanur**, or **CASSUMUR**, an aromatic root, the yellow zedoary (*Zingiber cassumanur*), of the East Indies, somewhat resembling ginger, but the rhizoma much larger, of a pungent bitter taste.

**Cast**, a mould or copy taken from a pattern.

**Castanets**, a pair of small concave shells, of ivory, bone, or hard wood, held on the thumbs and rattled by the fingers to make music, or to mark time for dancers and others.

**Castellano**, a weight for gold used in South America, of about 71 grains. The mark of gold is equal to 50 castellanos, or 3,550 grains.

**Caster**, a founder; one who makes castings in metals.

**Casters**, a bottle-frame or stand for holding cruets.

**Castile Soap**, a hard, mottled, curd soap, made with olive-oil and soda.

**Castings**, the process of giving to steel a better quality, by pouring it into moulds or ingots while in a liquid state. — A foundry operation; the process of running metal into a shape; the taking impressions from medals, figures, etc. — The metal so shaped.

*Castings and Founding.* There is no real difference in the meaning of these two terms, except that *casting* sometimes means pouring a cold liquid (such as liquid plaster of Paris) into a mould, whereas *foundings* always implies the use of a molten metal. The mould for large metal castings is mostly formed in some kind of sand or loam, but occasionally in iron. For some articles, such as plates and slabs, molten metal is poured out upon a smooth horizontal bed of sand; for others, into an upright mouldled cavity open at the top; for others, again, into a mould enclosed on all sides except an aperture or two to receive the flow. Very often a sand mould is made by pressing a wooden pattern upon or into the sand, thereby producing cavities which are afterwards to receive the molten metal. Some moulds contained in iron boxes are hinged together in two parts, to facilitate opening and closing. For casting small articles in brass, iron casting-boxes, called *flasks*, are employed; the sand contained in these receives its mould form from a pattern; and the same flask will then serve for an indefinite number of different patterns in brass. In large iron casting (of which examples are given under **CANNON**

**FOUNDING**, **CYLINDER CASTING**), the metal is melted in a furnace constructed for this particular kind of work. (See **CUPOLA FURNACE**.) When the metal is melted, it flows out of the opened tapping-hole either into channels in the casting-floor, or into ladles, which are of such varied sizes as to contain from 50 lbs. to 6 tons each, — the latter, of course, worked by powerful machine cranes. From the ladles the metal is poured into moulds. Most articles are cast horizontally, — that is, with the length and breadth horizontal; but such articles as cylinders, cannon, pipes, shafts, etc., are cast vertically, and mostly in pits. Most castings, when removed from the moulds and cleansed from the adhering sand, etc., require the seams and rough edges to be smoothed down by chisels and files.

**Castings-Net**, a net to be thrown in the water from a boat, and drawn instead of left.

**Castings-Pot**, a pot adapted for melting metals.

**Cast-Iron**, iron run from the furnace into pigs or ingots, instead of being beaten or wrought.

**Castor** [*Fr.*], a heavy milled cloth for overcoats.

**Castor-Beans**, a name sometimes given to the seeds of the castor-oil plant. See **CASTOR OIL**.

**Castoreum**, or **CASTOR** [*Fr. castoreum*; *Ger. Bi-bergel*; *Rus. bobowaja struga*], a concrete medicinal substance of a peculiar nature, found in two pear-shaped bags situated beside two smaller follicles, in the inguinal region of both sexes of the beaver. It is of a penetrating, unpleasant odor, and a bitterish and somewhat acrid taste. The Russian *C.*, which is the most esteemed, occurs in pairs of bags of unequal size, from 3 to 4 inches long, and 1½ to 2 inches broad at the base; it is now very rare. The bags of American *C.* are smaller, narrower at the base, and much corrugated. That which is very old, quite black, and almost destitute of taste and smell, should be avoided. It should be kept in a cool place, and in a well-corked bottle. *Imp.* free.

**Castor Hats** are hats made from beaver fur.

**Castor Oil** [*Fr. huile de ricin*; *Ger. Rizinusohl*; *It. olio di ricino*; *Port. oleo de mamona, de ricino*; *Sp. aceite de palma cristí*], is prepared from the seeds of the *Ricinus communis*, or *Palma Christi*, a plant which grows in the East and West Indies, America, and the S. of Europe. The oil is obtained from the seeds either by expression, without any assistance from heat, or by boiling. The first, called *cold-drawn C. oil*, is always to be preferred. It is of an amber color, and of a slightly nauseous smell and taste. The oil obtained by boiling the seeds is more deeply colored, more acrid, and more liable to become rancid. The nut or capsule is trilobular, nearly the size of a large marble, of a pale green color, and usually contains three whitish seeds of an oblong flat shape, and heavy taste. The plant is extensively cultivated in the Southwestern States, and most of the seeds are sent to St. Louis, where they are expressed into oil. *C. oil* is also largely produced at Jersey City from seeds mostly imported from India. *C. oil* is much used in medicine as a mild and certain purgative. It is the only fatty oil which combines readily with alcohol, and is therefore also much used in the preparation of hair-oil. *Imp.* duty, beans or seeds, per bushel of 50 lbs., 60 cts. per bushel; oil, expressed, \$1 per gallon.

**Castor Pomace**, the cake of the castor seeds after the oil is expressed. It is used as a manure.

**Castors**, small roller-wheels fixed to the feet of heavy household furniture, such as beds, tables, arm-chairs, etc., to admit of moving them with facility. There are plate *C.*, square and round, socket *C.*, claw *C.*, etc. — Cruets or bottles for holding sauces.

**Castrating-Clamp**, a contrivance used in confining the cords and vessels of the horse, or other animal, in the operation of orchotomy by excision of the parts.

**Cast Steel** is blister steel which has been broken up, fused in a crucible, poured into moulds, and rolled.

**Cat**, a wild and domestic animal, *Felis catus*, whose skin is largely used for furrier's purposes. — A kind of tackle used to hoist the anchor to the fore part of a ship.

**Catalogue**, a written or printed list of books or articles. *C. raisonné* is a classed or arranged *C.*, in which the articles are placed under regular heads or divisions.

**Catamaran**, a rude surf-boat or shaped log for a single individual, used to reach the shore at Madras in the East Indies. The Madras surf-boats consist of thin flattened timbers 8 or 10 feet long, tied together horizontally, and sharpened a little at the point. Also a light raft used on the coast of Brazil for landing goods through the surf.

**Cataract**, a lock-gate. — A contrivance to regulate the number of strokes per minute of an engine.

**Catawba Wine**. See WINE.

**Cat-Block**, a large block with three or four sheaves, used in hoisting up an anchor to the ship's side.

**Catch-Penny**, anything worthless or of little value, made merely to sell.

**Catchups** are sauces made from mushrooms, tomatoes, walnuts, etc.

**Catechu, Cashew, Cutch, Gambir, Terra Japonica** [Fr. *cachou*; Ger. *Katchu*; It. *catecu*; Port. *oras escaladas*; Sp. *cabial*], an astringent extract, chiefly prepared from a decoction of the brown heart-wood of the *Acacia catechu*, a tree indigenous to Hindostan. It is a dry, opaque, friable substance, of various forms, rounded masses, or cut into disks, squares, or lozenges. Its taste is powerfully astringent, afterwards bitterish, then sweet, and its color varies from pale brown to chocolate brown, the darker colored being the most astringent. It is soluble in water, but more easily in alcohol. It seems to keep for any length of time without change. *C.* contains a greater proportion of tannin than any other substance known, 1 lb. being in this respect equal to about 7 or 8 lbs. of oak bark; dissolved in water, it tans skins very rapidly, but the leather is not so durable or good as that which is more slowly prepared from oak bark. Two sorts are chiefly imported, namely, an inferior kind from Bengal, and another of a yellowish-brown color from Bombay. There is but little difference betwixt the two varieties; but according to the analysis of Davy the Bombay *C.* affords the greater proportion of tannin, and is therefore preferable. It is consumed in enormous quantities as a masticatory by the Malays and other betel-eating nations. In this country it is used in medicine as an astringent, occasionally for tanning, and in dyeing. With it the dyer produces, inexpensively, many of his most pleasing browns. Alum mordants are mostly employed in dyeing with *C.* The salts of copper with sal-ammoniac cause it to give a *bronze color*, which is very fast; the protochloride of tin, a *brownish yellow*; the perchloride of tin, with the addition of nitrate of copper, a *deep-bronze hue*; acetate of alumina, alone, a *reddish brown*, and with nitrate of copper, a *reddish-dree gray*; nitrate of iron, a *dark-brown gray*. For dyeing a *golden coffee-brown*, it has entirely superseded madder, 1 lb. of it being equivalent to 6 lbs. of that root. *Imp.* free.

**Caterer**, one who has to purchase, provide, or purvey for others; the manager of a mess.

**Cathetometer** is an instrument used to measure the vertical distance of two given points: for instance, the difference in height of two liquid columns. It consists substantially (Fig. 63) of a vertical rod along which slides a horizontal telescope, which, by its run between two points, ascends their vertical distance.

**Cat-Fall**, a pulley for hoisting the anchor of a ship to the cat-head.

**Catgut**, or **CATLING** [Fr. *corde à boyau*; Ger. *Darmsaite*; It. *corde di budella*], cord made of the twisted intestines of the sheep. There are different kinds, as whip-cord, hat-ter's cords, cords for bow-strings, clock-makers' cord, and fiddle and harp strings; these last, made of the peritoneal covering of the intestines, are chiefly imported from Naples, where they are manufactured of a quality superior to those prepared in any other country. *Imp.* duty, on whips, unmanuf., free; for musical instruments, free; on whip-gut strings for other purposes, 30 per cent.

**Cathartic Medicines**, those which have purgative properties.

**Catharine-Wheel**, a pyrotechnic which revolves and throws out radiations as it turns.

**Cat-Head**, a mariner's name for a small capstan. — A projecting timber or beam on each side of a ship's bow, to which the pulley is attached, to assist in heaving up the anchor, and securing it to the side.

**Cathedral Glass**, stained or painted glass for church windows, sold either in sheets or small squares.

**Catheter**, a surgical instrument for relieving obstructions in the bladder, made of various materials.

**Catjang**, the Malabar name for *Cajanus flavus*, a leguminous plant, the seed of which is much eaten by the poorer classes, and esteemed a wholesome pulse.

**Catling**. See CATGUT.

**Cat-Mint**, the *Nepeta cataria*, which has some stimulating qualities, and is a remarkable feline aphrodisiac.

**Cato**, a name for baskets in some of the Pacific Islands, which are very neatly and elegantly made from coir and other palm fibres, and grasses.

**Cat-o'-Nine-Tails**, a whip for corporal punishment, with nine lashes.

**Catoptr**, **Catoptron**, a mirror, a reflecting optical glass.

**Cat-Ropes**, the pulleys employed in hoisting a ship's anchor over the bows by the cat-heads.

**Cat-Salt**, a granulated coarse salt formed from the bittern or leach brine used in the manufacture of hard soap.

Fig. 63. — CATHETOMETER.

**Cat-Skins**, the skins of the wild or domestic cat, bought by furriers and others. Wild cats with a long and valuable fur abound in the forests of Hungary, and in Holland the domestic cat is bred for its fur, being fed on fish, and carefully tended until it arrives at perfection. The cat's skin makes an excellent rubber for electrical machinery, and is also used for sleigh coverings, railroad rugs, etc.

**Cat's-Eye**, a gem which presents a beautiful opalescence like the light of the eye of a cat. It is a variety of fibrous quartz, interspersed with filaments of asbestos. It is often brown and red, but commonly of a grayish or greenish color, and generally translucent. This stone, which is chiefly found in Ceylon and Malabar, is held in high estimation.

**Cat's-Paw**, a kind of hitch made by sailors in a rope.

**Catsup, Ketchup.** Same as CATCHUP, q. v.

**Cattemundoo**, or CALLEMUNDUO, an elastic gum, or hydro-carbon, obtained in India from the *Euphorbia antiquorum*, and other species.

**Cattle (Neat).** The domestic ox, *Bos taurus*, said to be of Asiatic origin, is found from the equator almost to the limits of vegetable life. According to the estimates of the statistician of the American Department of Agriculture there were, in round numbers, 28,000,000 neat *C.* in the U. States in 1876, valued at \$680,000,000. In this estimate the average price of milch cows is placed at \$28.29, and that of "oxen and other *C.*" at \$19.04. The low grade of the *C.* of Texas and several other of the Southern States in part accounts for these low general averages for the country at large. Other authorities, while agreeing with the Department as to the number of *C.*, raise the total valuation to \$1,000,000,000. But either of these totals is sufficient to call attention to the magnitude of the *C.* interest in the U. States. If to either of these great amounts, representing simply an invested capital in horned *C.*, the value of their annual produce in beef, milk, butter, cheese, hides, tallow, and hair be added, that interest will be found colossal in importance. If it be true that the improvement of the common herds of the country by means of judicious crossing with animals of superior races will add from one fourth to one half to the value of the progeny and their produce, then it is not difficult to ascertain to what extent the wealth of the country might be increased through the general adoption of such a course. Of course there are no means of ascertaining with any degree of accuracy to what extent the "grading" or crossing of common stock with thoroughbreds of the various imported races has been carried. It is safe to say, however, that out of the 28,000,000 neat *C.* in the country the percentage of improved animals is quite inconsiderable, and these confined, for the most part, to those of the Eastern dairying States, where improvement has been made on the common cow, and in several of the Western States where increased beef-production has been the object sought to be obtained. It is evident, therefore, in view of the comparatively small number of thorough-bred animals to breed from, and of the unaccustomed habits of our people in the practices of breeding and their undefined notions as to the importance of new infusions, that the task of raising the standard of American *C.* must be one of gradual accomplishment. Fortunately for the American farmer he is not compelled to experiment with his *C.* through many generations in order to develop and establish desirable qualities. He may find, within compara-

tively easy avail for the purpose of improving his own stock, races so thoroughly fashioned by the hands of successive breeders as to be almost worthy the name of creations on account of type-superiority. We are indebted to the persevering labor and unremitting experiment of English and Scotch graziers for the most valuable races which now contend for favor in this country. The power of transmission of cultivated qualities is one of the marked possessions of these animals, and upon this fact is predicated the possibility of carrying up the standard and the consequent profitability of our *C.* The breeds introduced into this country for their superior milking qualities are the Ayrshire, from Scotland, the Jersey, from the Channel Islands, and the Holstein, from Holland. The Ayrshire is hardy of constitution; it puts on flesh well when carefully fed, and when the cow is crossed with the short-horn bull the excellent qualities of both as to beef and milk are evenly developed in the offspring. It was introduced into the U. States about the year 1820, and its purity maintained in a comparatively large number of select herds, as is shown by the *Ayrshire herd-books*. The Jersey *C.*, originally a native of Normandy, is the most generally known in America, and has the reputation of affording an unusually rich quality of milk, rather than a great quantity. In this country, the *Jersey Cattle Club* exercise the strictest surveillance of importations in order to preserve the integrity of blood of the herds on this soil. There is a decided smack of aristocracy in the American-bred Jersey animals. In England the cow is the pet of the nobleman's park; in America, the favorite of the family living in vicinities where the range of pasturage is small, inasmuch as it thrives well in the stall or small enclosure. For richness of cream and of butter to yield of milk the Jersey cow is not surpassed. Its butter is a luxury, commanding in the large cities from 60 cents to \$1.15 per pound. The Jersey is smaller in size than our common *C.*, somewhat angular in appearance and tender in frame, and is usually of a very deep-red color. The *Holstein* is the most recent of the milking breeds imported for trial, having been introduced by Mr. Chenery, of Boston, in about 1860. It is remarkable rather for the quantity than for the richness of its milk; but it affords the advantages of being a good feeder and of laying on flesh in good proportion, thus enhancing the value of steer production. In size it is large and bulky, less elegant in frame than the Short-horn, and in color is a mixture of black and white. The imported breeds more especially valued on account of beef-producing qualities are the Hereford, the Devon, and the Short-horn. The first *Herefords* were brought to Kentucky by Henry Clay, who was a great admirer and patron of fine stock, in 1816. But, notwithstanding their well-defined excellences and great superiority over the cattle common to this country, for some reason not wholly explained this breed has not been as widely distributed nor attracted the public attention that its undoubted merits deserve. The race is highly prized in England, where, in some grazing districts, it is held in equal esteem with the Short-horn, which it nearly equals in size and weight. It is generally red in color, with white face, and frequently with white along the back and underneath the body. The first importation of *Devons* from England was made in 1817 into Maryland. As in the case of the *Herefords*, they have not occupied as great a place in the public mind as their merits would fully warrant. But there are nevertheless a number of fine herds in

the country, the purity of which has been maintained. It is red in color; in size medium. It has a hardy constitution, possesses milking traits in good degree, and is easy of improvement through cultivation for that object. The race now distinctively known as *Short-horns* (Fig. 64) was first imported into America in 1785. They now very largely outnumber all other improved breeds in the U. States, the *Herd's-Book* showing a record of more than 60,000 well-bred animals. The admirers of this breed consider the animals as well-nigh perfection in symmetry. The handsome head is firmly set on a strong and muscular neck; there is great width and depth of chest, the shoulders shapely and well formed. The fact that the race of *Short-horns* has attracted here, as in England, more particular and general attention than any other, is due, as far as the general public is concerned, more to the speculative interest that has been maintained for some years, carrying the prices of particular families and "fancy strains" to fabulous figures, than to an ultimate understanding of the actual merits of the breed. When a cow is sold for \$40,000, it is not surprising that the possession of extraordinary race-merits is attributed to the animal; but in what they particularly consist is not plain to ordinary ken.

There has been too much importance attached to the mere pedigree, and too little consideration of the intrinsic merits of the animal; too great desire to own an animal rather on account of the particular family it represents than for its capabilities in the direction of profit at the pail or at the butcher's block. "Fashionable" strains and fabulous prices have been the causes of incalculable mischief in the way of a wider breeding of a better class of

farm animals, as, undoubtedly, the collapse in prices in 1875 and 1876, carrying with it the fortunes of many "fancy" breeders, fully proves. A just and enlightened view of this aspect of the subject was taken by the Iowa Breeders' Association, which met at Marshalltown in Dec., 1877. In this convention were gentlemen of note in the political and agricultural annals of the State, and breeders of established reputation. As opposed to the practice of buying and selling thoroughbreds as a mere speculation, it was unanimously declared by the convention "that no member has had in his possession for five consecutive years a breeding *Short-horn* that has not proved a profitable investment of the capital employed." It was also declared that the objects ever to be borne in mind by breeders are the *improvement of the common stock of the country, and, where possible, of the pure stock itself*; and that the present depression in prices is the natural result of losing sight of the great objects of the business, as above stated, and is of precisely the same character as the uniform results of undue excitement and speculation in every business or employment. Further, the convention unhesitatingly condemned, as destructive of the utility of the animals and the interests and

profits of purchasers and breeders generally, the practice of the feeding to excess of breeding animals, too often indulged in under the stimulus of competitive sales or the mistaken demands of the show-ring. Nothing is truer than this, that practical farmers and breeders will not long follow the "traders" or speculative dealers in their race after mere fashion, and that there is a growing conviction that animals will be estimated according to individual worth in promoting certain ends, — their intrinsic value consisting in the greater capacity of one animal over another to produce the larger amount of beef, milk, or butter of superior quality, at less expense for feeding, and with the smaller amount of care. If the production of beef or of milk be the especial object, it is within the power of the ordinary farmer to so improve his *C.* that, for all practical purposes, he is about as well off as though his herds claimed full descent from the best names in the *Herd's-Book*. The butcher is not a dealer in descent or families; nor will the cheese or butter monger ask if the products offered him are from Ayrshire, Devon, or *Short-horn*, provided they suit his mar-

Fig. 64. — TYPE OF *SHORT-HORN*.

ket. The grazier wants *C.* that will feed and fatten well, and his practical eye will settle the value of the animal without reference to its pedigree; nor is he liable to ask troublesome questions about "Buzzard," or Galloway, or '17 blood that may have been filtering through generation after generation. The case of Mr. Saume, of Kellogg, Iowa, as communicated to a Western journal, is here in point. That gentleman in the month of Feb., 1877, sold at the Union Stock-Yards, Chicago, 64 head of *C.* All of these were two years old, and had been stall fed. A portion were natives or common stock, and the remainder half-blood *Short-horns*. The former averaged 1,236 lbs. in weight, and were, therefore, at that age heavier than average natives. These sold for \$4.65 per cwt., making an average of \$57.40 per head. The half-blood *Short-horns*, on the other hand, weighed 1,606 lbs., and sold for \$6.50 per cwt., or an average of \$108.29 per head. This was a difference in favor of the grades of \$50.82 per head; and the remark accompanies the statement, that at the Union Stock-Yards, where *C.* are sold on their merits, the grades command from one to three cents per pound more than the best natives. This, for the reason that the *offal* of the improved

stock is smaller in proportion to gross weight, and the carcass proportionately heavier in those parts which are most valuable, having less bone, shank, and unsalable gristle, with more loin, steak, and juicy roast. The development and steady increase of the export trade of the U. States in meats is shown in a special article (see BEEF). The corresponding increase in the exports of live *C.* is not less remarkable. A comparison of our horned cattle exports—mostly to England—for 4 years, as appears from the annual report of the U. States Bureau of Statistics, is as follows: Total in 1871, \$403,491; 1875, \$1,103,085; 1877, \$1,593,080; 1878, \$3,896,818. It has been wisely suggested that England will not look to America for beef for her laboring classes, who must perforce live cheaply, but will demand beef of a superior quality for the large class in that country who are able to pay for it. Poor beef could find no market in that land of beef-eaters. Nor is it plain that it would pay American dealers to ship a poor animal or a poor carcass. If there is a difference of from one fourth to one half as between common and well-bred *C.* in our home markets, which difference in most cases settles the question of either profit or actual loss for raising the animal, then certainly the superadded expense of shipment across the ocean would not favor the experiment of raising poor cattle for a foreign market. In establishing the export trade it has been asserted that the enterprising gentlemen who have been its promoters have exercised sound discretion in shipping carcasses of excellent quality. It is this fact, indeed, that makes the trade possible, and gives to American beef a reputation of equality with the home product, or even superiority to a large class of it, opening for our product a large and constantly increasing market. It is quite certain that the wild herds of Texas cannot supply the demand for this export trade. If it should grow to much larger proportion, it is evident that the grazing regions of the West must meet it. But as a condition precedent the standard of the common stock must be raised, and systems of feeding be adapted to secure the best quality of cattle at the least outlay. An additional incentive to the improvement of our herds exists in the fact that our own people, as they become more accustomed to what is excellent and desirable as a beef product, will be larger consumers of it, to the ultimate exclusion of that which is inferior.

There is growing activity in the live-stock interest at the West. In Iowa, 81 counties report to the Secretary of the State Agricultural Society the possession of herds, large and small, of improved breeds, mostly Short-horns; and West Liberty is becoming noted for its breeding-farms and live-stock sales. Within a radius of a few miles from that place there are more than 600 head of thorough-bred Short-horns, held at an average of \$300. In Illinois, it is stated by Hon. W. C. Flagg, in the Report of the State Agricultural Society for 1876, that the number of thorough-bred cattle is very large, nine tenths of them being Short-horns, and the remainder Jerseys, Devons, Herefords, and Ayrshires, and that a considerable proportion of the common cattle of the country in many parts of the State have now an infusion of the blood of the various thorough-breeds. The stock interest of the West has, in the National Live Stock Journal, published in Chicago, a very efficient and conscientious exponent and advocate. In the work of disseminating reliable and well-considered information on its specialty, it is ably seconded by journals of char-

acter in several of the Western States. The impulse given by these journals and the agricultural press generally, in connection with the various State breeders' associations, composed usually of substantial farmers, is apparent in the annually increasing attention given to the introduction of the better class of animals upon the farm.

No accurate information can be obtained regarding the internal commerce of the U. States in *C.*, from its scarcely coming within the range of public accounts. *C.* are largely imported from the Canadian Dominion, chiefly for shipment to Europe, but the exact number and value of our importation of *C.* is unknown, the tables of exports published by the U. States government including *C.* under the general heading of *Living animals*. In 1878 the total value of imports of living animals was \$2,664,676. *Imp. duty*, 20 per cent.

The parts of an ox to which the term *offal* is usually applied are the head and feet, the tallow, the hide and horns, and the entrails. The tallow is generally considered to be of the same value, weight for weight, as the flesh of the four quarters; and so likewise is the hide. These and the other parts termed *offal* are commonly regarded as forming about one fifth of the value of the animal. When beef is said to be sold at a certain price, *sinking the offals*, the meaning merely is, that the whole price of the animal is reckoned upon the carcass alone; hence, when beef is sold at a certain price, *sinking the offals*, that price is more than if it were sold without including in it the price of the offals. That portion of the ox which is used for food, exclusive of the offals, is usually termed the quarters, because the animal, on being cut up, is divided into four parts or quarters. The most esteemed parts for food are the hind quarters. These weigh somewhat less than the fore quarters; though the more perfect the form of the animal is, the more nearly do the fore and hind quarters approach in weight. Practice enables persons to judge of the weight of animals by the eye alone; but it is convenient to be able to ascertain the weight by measurement. This may be done with considerable correctness in the following manner. When the animal is standing in a natural position, measure his length in feet from the foremost upper corner of the shoulder-blade, in a straight line, to the hindmost point of the rump; then measure the girth or circumference immediately behind the fore-legs; multiply the square of the girth by the length, and this product by .238, which will give the weight of the quarters in stones of 14 lbs each. Another method of ascertaining the weight of fat cattle is by weighing them when alive, and multiplying the gross weight by .605. The present average dead-weight of bullocks is estimated at 656 lbs., and of calves, at 144 lbs.

**Cattle-Hair**, the short hair of cattle, used as an ingredient in mortar. Considerable quantities are imported, chiefly from Buenos Ayres. *Imp. free*.

**Cattle-Market**, the place, yard, or city, where cattle are bought and sold on stated days. Chicago is the greatest cattle-market in the U. States, and perhaps the greatest in the world.

**Cattle Medicines**, strong drastic medicines, used by veterinary surgeons, and owners of live stock.

**Cattle-Pen**, an enclosure for folding cattle for the night.

**Cattle-Show**, an assemblage of domestic animals, held periodically, to compete for superior breeds and conditions.

**Cattle-Truck**, an open or partially closed car for conveying live stock on a railroad.

**Catty**, or **Kin**, an Eastern weight, the hundredth part of the picul, and equal to  $1\frac{1}{4}$  lb. avoirdupois; 84 catties being about 1 cwt. The Chinese catty weighs  $22\frac{1}{2}$  Spanish dollars; the Malayan catty 24 dollars, or rather more than 2 lbs. The catty of silk in the East is equal to about  $2\frac{1}{2}$  lbs.

**Cauf**, a perforated chest to keep fish in under water.

**Cauk**, a mining name for sulphate of barytes.—A weight in Sumatra, the fifth part of the bamboo, which is 3 lbs. 10 oz.

**Caul**, a net for the hair worn by ladies.—A

cabinet-maker's term for a piece of solid wood, shaped and smoothed to fasten veneers on.

**Cauliflower**, a well-known esculent vegetable, consisting of the fleshy, young, undeveloped inflorescence of *Brassica oleracea botrytis*, a variety of the common cabbage. It is a light, easily digested, and nutritious aliment.

**Caulking, Cocking**, the process of filling the seams between the planks of a ship's deck or sides with oakum, and which is afterwards covered with pitch to keep out water.

**Caulking-Iron**, a kind of cold-chisel used by the ship-caulker.

**Caulking-Mallet**, a mallet used by the ship-caulker for driving in the iron to force the oakum between the seams.

**Causalty**, a mining name for light particles of ore carried away in the process of washing.

**Caustic**, a substance that corrodes or destroys the texture of organized bodies. This action is popularly termed "burning." The principal caustics are nitrate of silver, caustic potassa, sulphate of copper, red oxide of mercury, vertigris, chloride of zinc, chloride of antimony, nitric acid, acetic acid, and carbolic acid.

**Cautery**, a farrier's searing-iron.

**Cauthee**, a coarse Indian cotton cloth.

**Cautioner**, in Scotland one who becomes bond or security for another.

**Cautionnement**, in France a sum lodged by way of guaranty or security, — as by a newspaper proprietor to the government as a surety, — to be forfeited in case of misconduct.

**Cava**, a name for an intoxicating beverage made in the Pacific islands by first chewing the root of the *Macropiper methysticum*, and letting it ferment.

**Cavan**, or **Caban**, a dry measure used in the Philippine Islands for grain; a *C.* of paddy, or rice in the husk, will weigh about 96 lbs.; of cleaned rice, 120 to 135 lbs.

**Cave**, a name for the space under the fire of a furnace.

**Cavear**, or **Caveer**, a nominal division of the Spanish dollar, 40 caveers being reckoned equal to one dollar.

**Caveat** [Lat. from *cavea*, to take care]. Any citizen of the U. States who makes any new invention or discovery, and desires further time to mature the same, may, on payment of the fees required by law (\$10), file in the Patent-Office a caveat setting forth the design thereof, and its distinguishing characteristics, and praying protection of his right until he shall have matured his invention. Such *C.* shall be filed in the confidential archives of the office and preserved in secrecy, and shall be operative for the term of one year from the filing thereof; and if application is made within the year by any other person for a patent with which such *C.* would in any manner interfere, the Commissioner shall deposit the description, specification, drawings, and model of such application in like manner in the confidential archives of the office, and give notice thereof, by mail, to the person by whom the *C.* was filed. If such person desires to avail himself of his *C.*, he shall file his description, specifications, drawings, and model within three months from the time of placing the notice in the post-office in Washington, with the usual time required for transmitting it to the caveator added thereto; which time shall be indorsed on the notice. An alien shall have the privilege herein granted, if he has resided in the U. States one year next preceding the filing of his *C.*, and has made oath of his intention to become a

citizen. (*U. S. Revised Statutes*, Aug. 15, 1876, sect. 4302.)

*U. S. Patent-Office Rules*, Feb. 1878: — (93.) The caveator will not be entitled to notice of any application pending at the time of filing his *C.*, nor of any application filed after the expiration of one year from the date of filing the *C.*; but he may renew his *C.* at the end of one year by paying a second *C.* fee of \$10, which will continue it in force for one year longer, and so on from year to year as long as he may desire. If a *C.* is not renewed at the end of the year for which it was filed, it will still be preserved in the secret archives of the office. — (94.) No *C.* can be filed in the secret archives of the office unless accompanied by an oath of the caveator that he is a citizen of the U. States, or, if he is an alien, that he has resided for one year last past within the U. States, and has made oath of his intention to become a citizen thereof; nor unless the applicant also states, under oath, that he believes himself the original and first inventor of the art, machine, or improvement set forth in his *C.* — (95.) A *C.* need not contain as particular a description of the invention as is requisite in a specification; but still it must set forth the design of the invention and the distinguishing characteristics thereof, and the description should be sufficiently precise to enable the Office to judge whether there is a probable interference when a subsequent application is filed. A *C.*, equally with an application, must be limited to a single invention or improvement. — (96.) *C.* papers cannot be withdrawn from the Office, nor undergo alteration after they have once been filed; but copies of the papers may be obtained at the usual rates. Amendments which are necessary to secure a compliance with the above conditions may be received when required. The examination will only go to this extent. — (97.) When practicable, the *C.* must be accompanied by full and accurate drawings, separate from the specifications, well executed on tracing muslin or paper that may be folded, and of the same size as demanded in drawings for patents.

#### FORM OF CAVEAT.

The petition of A. B., of —, in the County of —, and State of —, respectfully represents:

That he has made certain improvements in velocipedes, and that he is now engaged in making experiments for the purpose of perfecting the same, preparatory to applying for letters-patent therefor. He therefore prays that the subjoined description of his invention may be filed as a caveat in the confidential archives of the Patent-Office.

A. B.

#### Specification.

The following is a description of my newly-invented velocipede, which is as full, clear, and exact as I am able at this time to give, reference being had to the drawing hereto annexed.

This invention relates to that class of velocipedes in which there are two wheels connected by a beam forming a saddle for the rider, the feet being applied to cranks that revolve the front wheel.

The object of my invention is to render it unnecessary to turn the front wheel so much as heretofore, and at the same time to facilitate the turning of sharp curves. This I accomplish by fitting the front and the hind wheels on vertical pivots, and connecting them by means of a diagonal bar, as shown in the drawing, so that the turning of the front wheel also turns the back wheel, with a position at an angle with the beams, thereby enabling it easily to turn a curve.

In the drawing, A is the front wheel, B the hind wheel, and C the standards, extending from the axle of the front wheel to the vertical pivot *a*, in the beam *b*, and D is the cross-bar upon the end of *a*, by which the steering is done. The hind wheel B is also fitted with jaws, *c*, and a vertical pivot, *d*.

A. B.

Witnesses:

C. D.

E. F.

[The form of oath will be substantially that provided for original applications, except that, as a *C.* can only be filed by a citizen, or an alien who has resided for one year last past in the U. States, and made oath of his intention to become a citizen, the oath should be modified accordingly.]

**Caveat Emptor**, a commercial law-term, expressing that a purchase is made without warranty, or at the buyer's own risk.

**Cavendish**, a kind of chewing tobacco pressed into cakes of square, oblong form, and sweetened with molasses or syrup.

**Cavezon**, or **CAVESSON**, a severe nose-band of various materials to punish or subdue an intractable horse.

**Caviar** [Fr. *caviar*; Ger. *Kaviar*; It. *caviario*; Rus. *ikra*], a substance prepared in Russia from

the roe of the sturgeon and other large fish. The roe is first freed of its membranes, and washed in vinegar or white wine. It is afterwards dried in the air, salted, and, the liquor being removed by compression in a bag, it is finally packed in kegs. When good, it is dry and of a brown color, and is generally eaten with oil and lemon-juice. *C.* is highly esteemed in Russia, and the consumption is very great. The best is made on the shores of the Caspian. A considerable quantity is exported from the ports of the Black Sea to Germany and Italy, but only a small portion is brought to this country. *Imp. duty*, 35 per cent.

**Caving-Rake**, a barn-floor rake with long teeth and a short head to separate the chaff from grain.

**Caxo**, a Spanish measure of ore containing many quintals, but varying in bulk at different places, — at Potosi, equal to about 5,000 lbs.

**Caya**, a bastard satin-wood shipped from St. Domingo.

**Cayenne Pepper**. See CAPSICUM.

**Caytongee**, a name given in Sumatra to the second quality of pepper.

Fig. 65. — CEDAR OF LEBANON.

**Cebadilla, Cevadilla, Sabadilla, Sevoeja**, names for the follicular fruits of *Stenanthium frigidum*, *Asagrea officinalis*, and *Veratrum sabadilla*, of Mexico and Central America, which contain the poisonous alkaloid veratria, used as an emetic and purgative in mania, and which has also been administered in cases of gout, rheumatism, and neuralgia.

**Cecograph**, a French writing apparatus for the use of the blind.

**Cedar** [Fr. *cèdre*; Ger. *Ceder*; It., Port., Sp., *cedro*], a name applied to several distinct kinds of forest trees. The *C.* of Lebanon is a valuable species of pine, *Pinus cedrus* (Fig. 65), cultivated in gardens on account of its majestic appearance, but seldom for economical purposes, as it is slow of growth, and requires a free space for circulation of air. The wood has a fragrant odor, and

is so bitter that no insect will touch it, — a circumstance which accounts for its great durability. The *C.* of Lebanon was, in ancient times, much employed in religious buildings, and most readers are familiar with the descriptions given of it for this purpose in Scripture. The tree is still to be found thinly scattered in the elevated valleys of Lebanon, Taurus, and other mountain-chains in Asia Minor. A second species, *P. deodara*, exists in the Himalayan mountains, where it is regarded by the natives with great veneration. The other kinds of *C.* do not belong to the pine family. The white *C.* of America, *Cupressus thyoides*, a noble tree of the Southern States, described under the heading CYPRESS. The Bermuda *C.*, *Juniperus Bermudiana*, is a large tree used for ship-building. The red *C.*, *Juniperus Virginiana*, of North America and the West Indies, is of great size and valuable. The wood is close, dark red, and odoriferous, and is much employed for cabinet work, wainscoting, and in the manuf. of pencils.

**Cedar Gum**, a gum resin obtained in the Cape Colony, from the branches and cones of the *Widdingtonia juniperoides*, much resembling gum olibanum. It is used for various medicinal purposes, for compounding plasters, and preparing varnish.

**Cedar-Wood Oil**, an aromatic essential oil, obtained by distillation from the wood of *Cedrela odorata*.

**Cedra**, or **Cedrat**, a species of Italian citron, having a thick rind, which contains much essential oil, and is used for making perfumes, and for flavoring liquors.

**Cedrium**, the resin of the cedar-tree, used to preserve books, and to protect other articles from insects.

**Ceiling-Floor**, the joists or frame-work on the lower surface of an apartment upon which the ceiling is made.

**Ceiling-Laths**, the thin strips of wood nailed to the joists for receiving the plaster.

**Ceinture**, a waist-belt, scarf, or girdle of gauze or muslin, cotton, linen, or silk.

**Celature**, the art of engraving, cutting, or embossing metals.

**Celebes**. See EASTERN ISLANDS.

**Celemin**, a Spanish dry measure, the 12th of a faneguda, ranging in different places from  $3\frac{1}{4}$  to 11 pints.

**Celery** [Fr. *celeri*; Ger. *Sellerie*; It. *selleri*; Port. *apio hortense*; Sp. *apio*], a sweet and wholesome vegetable (*Apium graveolens*), of which there are several varieties. The blanched footstalks of the leaves are used as an esculent. The red variety is coarse but hardy, and well adapted for stews and soups.

**Celestina**, a name for native sulphate of strontia. It is so called from the blue tint of many specimens, and is the source from which the nitrate of strontia employed in firework compositions is derived.

**Cellar-Flap**, the wooden lifting door which closes a cellar.

**Celluloid**, or **Celluloid Ivory**, a very curious material, of recent invention, which in normal appearance much resembles ivory. It is very light, and is susceptible of being colored in any shade, or produced in exact imitation of tortoise-shell, coral, amber, malachite, and other materials. It is not affected by heat, cold, or dampness; never becomes yellow or discolored; is strong, elastic, and durable; receives a beautiful polish, which improves with use, and is much less expensive than elephant ivory. *C.* is composed of paper tissue

and gum camphor, mingled with certain chemical ingredients, the whole being solidified by powerful pressure. The exact composition and manipulation of this article are secrets confined to the sole manufacturers, who now supply the *C.* in sheets of any desired size, thickness, or color, to about 15 companies, generally located in Newark, N. J., who are actively engaged in its conversion into articles of jewelry, combs, the backs of brushes, knife and fork handles, piano and organ keys, dental plates, trusses, harness trimmings, emery-wheels, chessmen, checkers, billiard-balls, collars, wristbands, etc.

**Celone**, a carpet in Italy.

**Cembalo** [It.], the harpsichord.

**Cement** [Fr. *ciment*; Ger. *Cement*; It., Sp. *cimento*], any substance that serves to bind or unite by cohesion, as glue, solder, mortars, etc. In building, *C.* is a concretion of rubble mortars; the name is also applied to hydraulic mortars, impervious to water, such as Roman and Portland *C.*, puzzolano, etc. A composition for uniting metals is called solder, and the name *C.* is given to a lute or paste surrounding bodies in pots or crucibles for chemical purposes. — The *C.* referred to below are among the most useful preparations of this class. In general, the thinner the stratum of interposed *C.*, the stronger is the junction of the surfaces operated on. This caution is necessary, as in their anxiety to unite broken articles persons generally defeat their object by spreading the *C.* too thickly on the edges of the fracture; whereas the least possible quantity should be used, so as to bring the edges as close as possible together.

**Alabaster C.** Take 1 part plaster of Paris in fine powder; make it into a cream with water, and melt and stir in it 2 parts yellow resin. Used to join or mend pieces of alabaster, white marble, porphyry, and other like substances, and to fill up cracks, supply chips out of corners, etc. It must be applied hot, the surfaces to be united having been previously warmed. See *Water-glass Cement*.

**Architectural C.** is a species of papier-mâché, made from paper reduced to a smooth paste by boiling it in water, sifted whiting, and good size, equal parts, boiled to a proper consistence. It is used to make architectural ornaments, busts, statues, columns, etc. It is very light, and receives a good polish, but will not stand the weather unless it is well varnished or painted.

**Armenian, Diamond, Jewellers', Persian, Turkish C.** The Jewellers of Turkey, who are mostly Armenians, have a singular method of ornamenting watch-cases, etc., with diamonds and other precious stones, by simply gluing or cementing them on. The stone is set in silver or gold, and the lower part of the metal made flat, or to correspond with the part to which it is to be fixed; it is then gently warmed, and the glue is applied, which is so very strong that the parts thus cemented never separate. This glue will strongly unite pieces of glass and china, and even polished steel, and may be applied to a variety of useful purposes. — *Original Armenian formula.* Dissolve 5 or 6 bits of gum mastic, each the size of a large pea, in as much rectified spirit of wine as will suffice to render it liquid; and, in another vessel, dissolve as much isinglass, previously a little softened in water (though none of the water must be used), in French brandy, or good ruin, as will make a two-ounce phial of very strong glue, adding two small bits of gum galbanum or ammoniacum, which must be rubbed or ground till they are dissolved. Then mix the whole with a sufficient heat. Keep the glue in a phial closely stopped, and when it is to be used set the phial in boiling water. — *2d formula.* Isinglass, 1 oz.; distilled water, 6 oz.; boil to 3 oz., and add rectified spirit, 1½ oz.; boil for a minute or two, strain, and add, while hot, first a milky emulsion of ammoniac, ½ oz., and then tincture of mastic, 5 dr. — When carefully made, this *C.* resists moisture, and dries colorless. As usually met with, it is not only of very bad quality, but sold at exorbitant prices.

**Building C. or Artificial Puzzolone.** From a mixture of clay or loam, broken pottery, flints, or siliceous sand, or broken bottle-glass, and wood ashes, exposed to a considerable heat in a furnace, until it becomes partially vitrified; it is then ground to fine powder, sifted, and mixed with one third its weight of quick-lime, also in fine powder, after which it must be packed (tight) in casks to preserve it from the air and moisture. For use it is mixed up with water and applied like Roman *C.*

**Chemical C., Soft C.** Melt together 4 parts yellow wax, 2 parts common turpentine, and 1 part Venetian red (well dried). Used as a temporary stopping or lute for the ends or joints of tubes, which are not exposed to much heat; as in alkalimetry, etc. See *Electrical C.*

**Chinese C., Liquid Glue, Shell-lac C.**, consists of finest pale orange shell-lac (broken small), 4 oz.; rectified spirit (strongest) 3 oz.; digested together in a corked bottle in a warm place until dissolved. Very strong and useful; almost odorless. It should have about the consistence of treacle. — *2d formula.* As before, but using rectified wood naphtha as the solvent. Inferior to the last, but excellent for many purposes. — *3d formula.* Macerate for several hours 6 parts of glue, in small pieces, in 16 parts of water; then add 1 part of hydrochloric acid, and 1½ parts of sulphate of zinc; and let the mixture be kept for 10 or 12 hours at a temperature of 68° or 70° C. — It is employed to mend glass, china, fancy work, jewelry, etc., for which it is only inferior to Armenian cement. The first formula produces a *C.* so strong that pieces of wood may be joined together, cut slopingly across the grain, and will afterwards resist every attempt to break them at the same place. In many of the islands of the Indian Ocean, in Japan, China, and the East Indies, a similar cement is used to join pieces of wood for bows, lances, etc. The fluid is thinly smeared over each face of the joint, a piece of very thin gauze interposed, and the whole pressed tightly together and maintained so until the next day. Joints so made will even bear the continual flexure of a bow without separating. It is admirably adapted for fishing rods. The product of the second formula is commonly sold as *liquid glue*. That of the last is much used by the druggists and oilmen, instead of gum, for fixing paper labels to tin, and to glass when exposed to damp.

**Coppersmiths' C., Blood C.**, is made from bullock's blood thickened with finely powdered quick-lime. Used to secure the edges and rivets of copper boilers, to mend leaks from joints, etc. It must be used as soon as mixed, as it rapidly gets hard. It is cheap and durable, and is suited for many other purposes.

**Curd C.** Take ½ pint of the curd of skimmed milk (obtained by the addition of vinegar or rennet) and rub it with a cold solution of borax, till a thick liquid is obtained, that becomes clear on standing. This is an excellent cement for artificial meerschams, and may be used to give consistency to silk goods, or to coat artificial flowers and court-plaster, to the latter of which it imparts more adhesiveness and firmness.

**Cutters' C.** Take black resin, 4 lbs.; beeswax, 1 lb.; melt, and add finely powdered and well-dried brick-dust, 1 lb.; mix well. It is used to fix knives and forks in their handles. It is put into the hollow of the handle, and the metal, previously made hot enough to melt the composition, pressed into its place whilst warm, and the whole kept upright and still until quite cold.

**Diamond C.** See *Armenian C.*

**Electrical C.** From black resin, 7 lbs.; red ochre, 1 lb.; plaster of Paris, ½ lb. (both well dried and still warm); melted together, and the heat and agitation continued until all frothing ceases, and the liquid runs smooth; the vessel is then withdrawn from the fire, and the mixture stirred until cooled sufficiently. Used to cement the plates in galvanic troughs, join chemical vessels, etc.

**Engineers' C.** consists of equal weights of red lead and white lead, mixed with boiled linseed oil, to a proper consistence. Used by engineers and others to make metallic joints. A washer of hemp, yarn, or canvas, smeared with the cement, is placed in the joint, which is then "brought home," or screwed up tight. It dries as hard as stone. It also answers well for joining broken stones, however large. Cisterns built of square stones, put together, while dry, with this *C.*, will never leak or come to repair.

**Flour C., Paste, Flour Paste.** This useful and well-known article is made by mixing about a tablespoonful of wheat flour with cold water, say ½ pint, adding the latter gradually, and thoroughly stirring in each portion before pouring in more; the vessel is then placed over the fire, and the whole assiduously stirred until it boils, great care being taken to prevent caking on the bottom, or burning. Some persons add about ½ of a teaspoonful of powdered alum to the water, which is said to strengthen the product; the shoemakers add a little quantity of powdered resin to the flour, with the same intention. The addition of a little brown sugar and a few grains of corrosive sublimate will prevent it turning mouldy, and is said to preserve it for years. When too hard or dry, it may be softened by beating it up with a little hot water.

**French C.** is a mullage of gum Arabic, thickened with starch-powder or farina. A little lemon-juice is sometimes added. Used by naturalists in mounting specimens; by artificial flower makers; and by confectioners, to stick paper, wafer papers, ornaments, etc. on their fancy cakes. Plain mullage is often used in the same way.

**Hydraulic C.** Hydraulic mortars or *C.* are those which set or become hard under water. Common lime does not possess this property; but limestone containing from 8% to 25% of alumina, magnesia, and silica, yield a lime on burning, which does not slake when moistened with water, but forms a mortar with it, which hardens in a few days when covered with water, although it does not acquire much solidity in the air. Puzzo-

lana, septaria, and argillaceous or siliceous earths, burnt, either with or without the addition of common limestone, and then ground to powder, form excellent hydraulic C. A very good hydraulic mortar is made by slaking lime with water containing about 2 per cent of gypsum, and adding a little sand to the product. The presence of the gypsum tends to delay the slaking of the lime, and also to harden the substance formed after the slaking.

**Japanese C, Rice Glue.** From rice flour, mixed with a little cold water, and boiling water, gradually poured in until it acquires proper consistence; when it is boiled for 1 or 2 minutes in a clean sauceman or earthen pipkin. It is beautifully white, and almost transparent, for which reason it is well adapted for fancy paper work, which requires a strong and colorless C. It is superior to French C.

**Mahogany C.** Melt 4 oz. beeswax; then add 1 oz. Indian red, and enough yellow ochre to produce the required tint. It is used to fill up holes and cracks in mahogany furniture by the cabinet-makers. Red putty is also used for the same purpose.

**Major's Centennial C.** Under this name a C. whose formula is not given. It is very strong and effective for repairing glass, china, furniture, billiard-cues, etc.

**Parker's C.** is made of the nodules of indurated and slightly ferruginous marl, called by mineralogists "septaria," and also of some other species of argillaceous limestone. These are burnt in conical kilns, with pit coal, in a similar way to other limestone, care being taken to avoid the use of too much heat, as if the pieces undergo the slightest degree of fusion, even on the surface, they will be unfit to form the C. After being properly roasted the calx is reduced to a very fine powder by grinding, and immediately packed in barrels, to keep it from the air and moisture. This C. is tempered with water, and applied at once, as it soon hardens, and will not bear being again softened down with water. For foundations and cornices exposed to the weather it is usually mixed with an equal quantity of clean angular sand; for use as a common mortar, with about twice as much sand; for coating walls exposed to cold and wet, the common proportions are 3 of sand to 2 of C., and for walls exposed to extreme dryness or heat, about 2½ or 3 of sand to 1 of C.; for facing cistern-work, water frontages, etc., nothing but C. and water should be employed. Under the name of *Compo*, or *Roman C.*, it is much employed for facing houses, water cisterns, setting the foundations of large edifices, etc.

**Plumbers' C.** consists of black resin melted with about an equal weight of brick-dust. Sometimes a little pitch or tallow is added.

**Portland C.** is made from clay or chalk, or argillaceous river-mud and chalk or limestone, calcined together, and then ground to powder. See *Parker's C.*

**Roman C.** Genuine Roman C. consists of puzzolene (a ferruginous clay from Pozzuoli, calcined by the fires of Vesuvius), lime, and sand. The only preparation which the puzzolene undergoes is that of pounding and sifting. It is generally mixed up with water, like most other cements, but occasionally with bullock's blood and oil, to give the composition more tenacity. That imported from England is now generally prepared from the septaria of either Harwich or Sheppy, or of the lias formation, or from the cement stone found in the upper division of the lias formation, or in the shale beds of the Kimmeridge clay. It is also prepared from several artificial mixtures of ferruginous clay and lime, calcined together. It must be kept in close vessels, and mixed with water when used. *Imp.* duty, 20 per cent. See *Parker's C.*

**Steam-boiler C.** Take litharge in fine powder, 2 parts; very fine sand and quick-lime (that has been allowed to slake spontaneously in a damp place), of each 1 part; mix and keep it from the air. Used to mend the cracks in boilers and ovens, and to secure steam joints. It is made into a paste with boiled oil before application.

**Stucco C.** is a compound of powdered gypsum or strong gelatine. It is used for coating walls, and also for ornamenting ceilings. It takes a high polish, and colored designs can be painted on it. When employed on walls a coarser kind is first laid on, which is followed by a coating made of choicer specimens of gypsum, or glue, or isinglass. When this latter and outer coat becomes dry it is polished with pumice, tripoli, and linen. The color is incorporated with the outer coatings of the stucco by mixing the metallic pigments with it, and then applying it to the wall, after which a very thin coating of gypsum and isinglass, or sometimes of oil, is given to it, and when the whole is partially dried the tint is brought out by polishing, as before stated. Generally the finest effect is obtained by oil.

**Water-glass C.** For glass, earthen-ware, porcelain, and all kinds of stone-ware, these C. are excellent. For glass and marble a C. is prepared by rubbing together one part of fine pulverized glass, and two parts of pulverized fluor-spar, and then adding enough water-glass solution to give it the consistency necessary in a C. Water-glass mixed with hydraulic C. to a thick dough makes a good cement for the edges and joints of stone and marble slabs. It is well to mix but little at a time, as it hardens very quickly.

**Water-proof C.** The celebrated "water-proof C. of Dühl" consists of porcelain clay or pipe-clay, dried by a gentle heat, and powdered, mixed up to the consistence of a paste with

boiled linseed oil, and, sometimes, a little oil of turpentine. It is colored by adding a little red or yellow ochre, or any similar pigment. It is used to cover the fronts of buildings, roofs of verandas, etc.

**Cementation** is the process of converting iron into steel by being heated, in the form of bars, for several hours with charcoal powder in a chest of refractory clay. The result of the operation is called *blistered-steel*, from the appearance of the surface.

**Censer**, a chafing-dish or pan attached to a chain, used for burning incense in religious ceremonies.

**Census**, an enumeration or statistical account taken occasionally or periodically, of persons or things; as of population, land under crop, stock, and produce. In this country, a general C. is taken every ten years, in accordance with the provisions of the Constitution, and the 9th C. was taken in 1870.

**Cent**, the hundredth part, an abbreviation of the Latin *centum*; used as a prefix to many words, weights, coins, etc.—A copper or nickel coin of the U. States, equivalent to 10 mills or the 100th part of a dollar.—A money of account in Holland, the 100th part of a guilder or florin.—*Per cent.* A certain rate by the hundred, as *five per cent*, the 20th part of 100. See *CENTIME*.

**Centage**, a rate by the hundred; *percentage* being a commission or allowance at so much per cent.

**Centaur**, a wild plant of Europe, the *Erythraea centaureum*, which is very bitter, and is sold by herbalists.

**Centenaar**, the old Amsterdam hundred-weight or quintal, equal to nearly 109 lbs. avoirdupois. See *CENTNER*.

**Centesimal**, a division into hundredth parts.

**Centiare**, the metre superficial, the hundredth part of the French arc = 1.19 sq. yards.

**Centigrade**, the division into grades or degrees by hundredth parts, called also *centesimal*.—A name for the thermometer of Celsius, used chiefly in France. The distance between the freezing point of water and the boiling point is divided 100 degrees, each being equal to 1½ of Fahrenheit's scale. See *THERMOMETER*.

**Centigramme**, the hundredth part of the French gramme = 0.15 grain.

**Centilitre**, the hundredth part of the French litre = 0.017 pint, also 0.617 cubic inch.

**Centime**, a French copper coin rarely seen in trade, the fifth part of a cent, 100 centimes making a franc. The C. is also used in accounts in Belgium, Switzerland, Italy, Austria, and other countries which have adopted the French decimal system.

**Centimetre**, a linear measure in France, the hundredth part of the metre = 0.39 inch. In Holland the legal name of the C. is *duim* or *ponce*.

**Centesimo**, an Italian money of account, the hundredth part of the lira = ¼ cent

**Centistere**, the hundredth part of the French stere = 0.353 cubic foot.

**Centner**, the commercial hundred-weight or quintal of several European States, which varies in most. The C. of Germany is 110½ lbs. avoirdupois; that of Austria, 123½ lbs.

**Central Pacific R.R.**, runs from San Francisco, California, to Ogden, Utah, 882.89 m.; Oregon Division from Roseville to Redding, Cal., 152.22 m.; Visalia Div., Lathrop to Goshen, Cal., 146.08 m.; San José Div., Niles to San José, 17.64 m.; branches, 14.65 m.; total, 1,213.38 m. This

Co., whose offices are in San Francisco, was formed in 1870 by the consolidation of the Central Pacific, the California & Oregon, the San Francisco & Oakland, the San Francisco & Alameda, and the San Joaquin Valley R.R.s., and in connection with the Union Pacific R.R. forms a continuous line from San Francisco to Omaha, Neb., in length 1,916 m., and there connecting with the lines eastward. This Co. also operates the California Pacific, the Northern, and the Stockton & Copperopolis R.R.s. *Financial statement*. — Cap. stock, \$54,275,500; funded debt, \$54,885,000; United States subsidy bonds, \$27,885,680; other liabilities, current accounts, etc., \$11,598,220.01; sundry accounts, \$337,039.75. Funded debt in detail: convertible mortgage issued 1872, \$1,483,000, payable 1883, interest 7% (Jan. & July); California State aid, issued 1864, \$1,500,000, payable 1884, interest 7% (Jan. & July); 1st mortgage (Cen. Pac.), ser. A, issued 1865, \$2,995,000, payable 1895, interest 6% (Jan. & July); 1st mortgage (C. P.), ser. B, C, D, issued 1866, \$3,383,000, payable 1896, interest 6% (Jan. & July); 1st mortgage (C. P.), ser. E, issued 1867, \$3,997,000, payable 1897, interest 6% (Jan. & July); 1st mortgage (C. P.), ser. F, G, H, I, issued 1868, \$15,508,000, payable 1898, interest 6% (Jan. & July); 1st mortgage (West. Pac.), old, issued 1865, \$112,000, payable 1895, interest 6% (June & Dec.); 1st mortgage (W. P.), ser. A & B, issued 1869, \$2,623,000, payable 1899, interest 6% (Jan. & July); 1st mortgage (Cal. & Oreg.), ser. A, issued 1868, \$6,000,000, payable 1888, interest 6% (Jan. & July); 1st mortgage (C. & O.), C. P., ser. B, issued 1872, \$2,000,000, payable 1892, interest 6% (Jan. & July); 1st mortgage (S. Fr., Or. & Ala.), issued 1870, \$500,000, payable 1890, interest 8% (Jan. & July); 1st mortgage (San Joaquin Valley), issued 1870, \$6,080,000, payable 1900, interest 6% (Apr. & Oct.); land trust mortgage, issued 1870, \$10,000,000, payable 1890, interest 6% (Apr. & Oct.). Total amount of bonds issued, \$55,457,000.

**Central Vermont R.R.** runs from Windsor, Vt., to Rouse's Point, N. Y., 158 m.; branches and leased lines, 276 m.; total, 433 m. Offices at St. Albans, Vt. This Co. took its title in July, 1873. The Vermont Central R.R. was originally chartered in 1843, and in 1849 leased the Vermont & Canada R.R., then under construction, agreeing to pay an annual rental of 8% on cost. This lease has been the subject of litigation since 1854. The Vermont Central having defaulted on its rental and interest on its mortgage bonds, the Trustees took possession of the two roads in 1852, and it was operated by them until July, 1873, when, by virtue of an act of the Legislature of Vermont, and under the direction of the Court of Chancery of that State, the Central Vermont Co., as Receivers and Managers, took possession and have since operated the road. — *Financial statement*, 1878. Funded debt: —

Equipment bonds.....	\$2,000,000
Guaranteed bonds.....	905,000
Income and extension bonds.....	1,000,000
	\$3,911,000
Old 1st mortgage bonds, issued in 1851.....	\$3,000,000
Old 2d mortgage bonds, issued in 1852.....	1,500,000
Net earnings for year ending Dec. 31, 1878.....	\$618,066.68

**Centre-Bit**, a carpenter's tool for boring circular holes.

**Centrifugal Machine**, a whirling machine for drying sugar, or clearing it from molasses. The sugar is enclosed in cylindrical strainers, a rapid rotary motion is imparted, by which the moisture is thrown off more speedily than by the old pro-

cess of leaving the molasses to drain away from the sugar gradually in flat coolers and casks.

**Centrifugal Pump**, an engine so constructed as to raise water by centrifugal force, aided by the pressure of the atmosphere.

**Centripetal Press**, a mechanical contrivance for pressing square in all directions.

**Centum** [Lat.], a hundred.

**Ceramics**, a word used in the arts, to express all the varieties of the potter's trade which have been burnt or roasted in a kiln. These productions are of great beauty and delicacy, and they often display the highest artistic talent.

**Cerasin**, a name given to such gums as cherry-tree gum, which swell in water, but do not readily dissolve.

**Cerate**, a thick species of ointment containing wax. Cerates are intermediate in consistence between ointments and plasters; but are less frequently employed than either of those preparations. The medicinal ingredients which enter into the cerates are very numerous; indeed, almost every kind of medicine capable of exercising a topical effect may be prescribed in this form.

**Cereal**, pertaining to edible grain; the grasses which produce bread-corn, and are the object of a continuous culture for food, as wheat, rye, barley, Indian corn, oats, rice, and millet, are called cereals.

**Cerin**, a white crystallizable substance, which is a chief constituent of wax; beeswax containing nearly 80 per cent of C.

**Cerisin**, a substance obtained from ozokeri or fossil wax, very similar in appearance and properties to white wax, for which it has been proposed as a substitute in pharmaceutical preparations. At present it is chiefly used in the mannif. of candles.

**Ceroon, Seron, or Seroon**, a kind of skin package; a bale formed of pieces of wood, covered or fastened with hide. Cochineal, cacao, indigo, and various drugs are imported in this form. Sometimes a matted bale of almonds, or a pannier of raisins, weighing about 87½ lbs., is called a C.

**Ceroxyline**, a resin of palm-wax.

**Certificate**, a written testimony properly authenticated; as, a C. of stock in a bank, a shipmaster's C. — C. of registry is a C. that a ship has been registered as the law requires. Under the U. States Statutes, "every alteration in the property of a ship must be indorsed on the C. of registry, and must itself be registered." Unless this is done, the ship or vessel loses its national privilege as an American vessel. — C. of Origin, in England, a custom-house document, testifying to particular articles being the growth of a British colony.

**Certified Check**. See CHECK.

**Ceruleum**, a blue Roman pigment, a silicate of copper.

**Ceruse**. See WHITE LEAD.

**Cerussite**, a valuable ore of lead.

**Cerveza**, the Spanish name for beer or ale.

**Cessio Bonorum**, a process in Scotland by which the effects of an insolvent debtor, who does not come under the system of sequestration applicable to traders, is divided among his creditors.

**Cessionnaire**, in France, an assignee or receiver.

**Cette**. See FRANCE.

**Cevadilla**. See CERADILLA.

**Ceventeria**, a name in Italy for rouge, or paint for the face.

**Ceylon**, a large island belonging to Great Britain, lying near the S. point of India, from which it is separated by the Gulf of Manaar, between

lat.  $5^{\circ} 56'$  and  $9^{\circ} 50'$  N., lon.  $79^{\circ} 41'$  and  $81^{\circ} 54'$  E. Extreme length from N. to S., 266 m.; average breadth, 100 m.; area, 24,702 sq. m.; pop., 2,459,542, of which 19,000 are whites; the remainder, chiefly Singalese, Malabar and other Hindoo tribes, Moors, and Vadahs. The chief town and seat of government is Colombo. The administration is vested in a governor, assisted by executive and legislative councils.

The coasts of C. are on the N. and N. W. low and flat, on the S. and E. bold and rocky, and present some good harbors. A ridge of dangerous sand-banks, called Adam's Ridge, crosses from C. to the island of Ramisseram on the mainland of Hindostan. This shoal has three channels, but is generally impracticable for navigation. The centre of C. is occupied by an extensive table-land, 67 m. long by 50 wide, at an elevation of from 2,000 to 3,000 feet above sea-level. For a tropical country, C. has a comparatively salubrious climate, but the low lands of the sea-board are quite unhealthy. Of its mineral wealth little is known. C., however, is rich in precious stones. The gems

Fig. 66. — PALMYRA-TREE.

most esteemed are the ruby and cat's-eye; but there are likewise found the amethyst, topaz, garnet, cinnamon-stone, sapphire, and diamond; and the pearl and chank fisheries in the Gulf of Manaar are among the most celebrated in the world. C. is rich in vegetable productions. Of these the most important, next to coffee, rice, and other grain, is cinnamon (called by the natives *corundoo*), which here arrives at its greatest perfection, and has always been a chief article of export. It delights in a poor sandy soil, with a moist atmosphere, and is almost exclusively confined to the S.E. part of the island. The cocoa-nut tree flourishes here in perfection, and is of prime importance to the natives, almost every part of the tree being converted into articles of food or domestic use. The Palmyra (Fig 66) and Tallipot palms, and the bread fruit, are also found in their most luxuriant growth. Cotton is cultivated, but it is not equal to that of India. Indigo, betel, tobacco, gum-lac, gamboge, and cardamoms, all of excellent quality, are produced. The commerce of C. is mainly with Great Britain and India. Its exports in 1878 amounted to \$22,547,975, consisting chiefly of coffee, cocoa-nut oil, and cinnamon. C. had, in 1879, 106 m. of railroad open for traffic, and 32 under construction. The chief ports are Colombo, Trincomale, and Point-de-Galle.

Colombo, in lat.  $6^{\circ} 57'$  N., lon.  $80^{\circ}$  E., where nearly the whole maritime trade of the island is carried on, has a wooden quay adapted for vessels not exceeding 100 tons; larger vessels

anchor in the small, semicircular bay within which the quay is built or in an outer roadstead, which, however, is safe only during the N.E. monsoon, from Nov. to the end of March. The climate is salubrious. Pop., 40,000.

*Weights and Measures* are the same as those of Great Britain. The *money* is the rupee of British India.

**Ceylon Moss**, a small and delicate fucus, believed to be the *Gracilaria lichenoides*, obtained in the salt lakes, on the coasts of Ceylon, which contains a large proportion of true starch, and is used for jellies.

**Ceylon Stone**, a general name given to many fine minerals and jewels obtained in the island of Ceylon; specially applied, however, to a species of black spinelle.

**Cha**, a kind of tea rolled up like tobacco, which goes to the interior of Asia.

**Chablis**. See BURGUNDY WINES.

**Chabutarah**, or **Chubootura**, in India, a market-place, custom-house, or police-station.

**Chaco**, an unctuous earth of La Paz, Bolivia, which is made into little pats, and eaten with chocolate.

**Chacoli**, a light Biscayan wine of two kinds, red and white.

**Chafe**, to rub or damage the surface of anything.

**Chaff**, the pericarp or dry calyx of grain removed by thrashing and winnowing, which has many medicinal and economical uses. It is occasionally mixed with mortar, and employed as a substitute for hair in making plaster for rooms, and sometimes used for stuffing beds.

**Chaffer**, to bargain; to cheapen; to haggle.

**Chaffery**, a name given to that part of a foundry where the forges are placed for hammering iron into bars.

**Chafing-Dish**, a vessel for holding charcoal or coal to give heat.

**Chagreen**. See SHAGREEN.

**Chagres**. See COLOMBIA (U. STATES OF).

**Chain**, a line of connected links of any kind. — A lineal measure used in surveying or plotting, made of links of iron wire united together. The surveyor's C. contains 22 yards or 792 inches, which, being divided into 100 links, gives 7.92 inches for each link. The square C. is the 10th of an acre, or 484 sq. yards.

**Chain-Boat**, a substantial boat used in harbors for getting up mooring chains or anchors.

**Chain-Bolts**, the large bolts used to secure to the ship's side the links, or dead-eyes, through which the standing rigging is rove.

**Chain-Bridge**, a suspension-bridge.

**Chain-Cable**, a mooring or anchoring cable made of stout iron rings. See CABLE.

Fig. 67. — CHAIN-PUMP.

**Chain-Plates**, strong thick plates of iron used in merchant-vessels, bolted to the ship's side, instead of chains to the dead-eyes, for holding the blocks by which the rigging of the mast is secured. They take their name from the mast, and are hence called fore-chains, main-chains, or mizzen-chains.

**Chain-Pump**, an hydraulic machine (Fig. 67) for raising water to a small height.

**Chain-Rule, or Rule of Equations**, an arithmetical formula, which is of great practical utility, particularly in exchange operations. It is so called from the terms being stated as equations, and connected, as it were, by a chain, so as to obtain by one operation the same result as by any number of different questions in the rule of three. The principle may be familiarly illustrated as follows:—

Required the number of Grecian drachmas which may be had for \$300, reckoning \$1 = 5 French francs, and 100 francs = 112 drachmas.

This case contains obviously two different questions:—

1. If 5 francs be equivalent to \$1, how many francs may be had for \$300?

1 : 300 :: 5 : 1500. *Answer*, 1500 francs may be had for \$300.

1)1500(1500

2. If 100 francs be equivalent to 112 drachmas, how many drachmas may be had for 1500 francs?

100 : 112 :: 1500 : 1680. *Answer*, 1680 drachmas may be had for 1500 francs.

100)168,000(1680

Which is evidently the answer originally required, as 1500 francs are equivalent to \$300, the original term of demand.

In the course of these operations, the term of demand, 300, is first multiplied into 5, then divided by 1, next multiplied into 112, and afterwards divided by 100. But it would obviously produce the same result to collect the multipliers and the term of demand into one product, and the divisors into another, and then to divide the former by the latter. The preceding case may therefore be stated thus:—

$$\begin{aligned} \$300 &= 5 \text{ francs} \\ 100 \text{ francs} &= 112 \text{ drachmas} \\ \text{And } \frac{300 \times 5 \times 112}{1 \times 100} &= \frac{168,000}{100} = 1680, \text{ as before.} \end{aligned}$$

By this mode of arranging the terms, it is obvious that those which would form the divisors in continued statements in the Rule of Three are multiplied together for a common divisor, and the other terms for a common dividend.

The same reasoning may be applied to those cases which involve three or more different questions. Hence the following

**GENERAL RULE.**—Arrange the several terms into two columns of antecedents and consequents, in this manner:—

1. In the right-hand column enter first the term of demand.
2. On the line below, and in the left-hand column, enter the first antecedent, which must be of the same denomination as the term of demand, and equal in value to the corresponding consequent placed contiguously in the right-hand column.
3. Similarly make the second antecedent of the same denomination as the preceding consequent,

and equal in value to the annexed consequent, and so on throughout, introducing equations according to the nature of the case, and making the terms lead from one to another, so that the last term may be of the same denomination as the answer required.

Then multiply the antecedents together for a divisor, and the consequents, including the term of demand, together for a dividend, and the quotient will be the answer required.

*Example*—Required the price per lb. avoird. of tea purchased in Japan at 30 yens per pecul of 133 lbs.; 260 yens being equal to 1,000 Dutch florins, and the rate of exchange 38.5 per florin?

Arranging these data according to the preceding rules, we have,—

$$\begin{aligned} 133 \text{ lbs.} &= 1 \text{ pecul} \\ 1 \text{ pecul} &= 30 \text{ yens} \\ 260 \text{ yens} &= 1000 \text{ florins} \\ 1 \text{ florin} &= 38.5 \text{ cents} \end{aligned}$$

$$\frac{1 \times 1 \times 30 \times 1000 \times 38.5}{133 \times 1 \times 260 \times 1} = \frac{11,550,000}{34,580} = 33.4 \text{ cts., the price per lb. required.}$$

The operations are in practice simplified by striking out the same numbers when they occur in different columns; or when terms in different columns are measured by the same number, by cancelling the original terms, and using the quotients in their stead. Fractions likewise are generally converted into whole numbers by multiplying both terms of the equations in which they occur by the denominator. Thus, multiplying the first equation of the preceding case by 3, we have 400 lbs. = 3 peculs.

The chain-rule admits of being applied advantageously to a great variety of cases in commercial arithmetic, but it is in questions of exchange that it is chiefly employed.

**Chain-Shot**, large iron balls or bullets chained together, used in sea-battles to destroy the spars, rigging, etc. of an enemy's vessel.

**Chain-Timber**, large joists used in the middle stories of a building, to bind and give it strength.

**Chain-Work**, a style of fabric made with open spaces like chain-links, of which tambouring, net, and hosiery are examples.

**Chair**, a movable seat, of which there are numberless kinds made to suit special uses, such as light and ornamental drawing-room chairs, heavy and substantial office chairs, dining-room chairs, and folding, rocking, and reclining chairs, hall chairs, shop chairs, garden chairs, etc.—A heavy cast-iron socket for receiving and securing the bars of a railroad.

**Chairman**, the presiding officer of a company, board of directors, or public meeting.

**Chaise**, an obsolete name for a light two-wheeled pleasure-carriage drawn by one horse.

**Chaise-Longue** [Fr.], a couch or sofa with one arm or end.

**Chakkara**, the Malabar name of a coarse sugar made from the tari or juice of the cocoa-nut and other palms.

**Chalan, Chillaum, or Chulan**, a common East-Indian name for an invoice, pass, voucher, or way-bill.

**Chaland**, a large barge or lighter used on the French rivers for the transport of goods, and towed by steam or horses.

**Chalcedony, or Calcedony**, a kind of semi-transparent quartz, which occurs of various colors, but usually milk-white. It is often banded with concentric laminae of two or more colors, when

it is called *Agate*. The red and yellow varieties are called *Carnelian*, and those of a deep brownish-red, *Sard*. Agate, Cat's-eye, Chrysoprase, Flint, Hornstone, Onyx, and Plasma are all varieties of chalcedony.

**Chalco-graphy**, the art of engraving on brass and copper.

**Chaldron**, a heaped measure for various dry goods = 36 bu., but now more usually employed as a weight for coals; the London *C.* being 25½ cwt., the Newcastle *C.* of 3 wains 52½ cwt., but for boats estimated at 53 cwt. The ordinary weight required in the markets of the U. States is 2,940 lbs.; but at New York the *C.* of coals is only 2,500 lbs.

**Chaldron-Wagon**, a wagon which conveys the coal from the pit's mouth to the place of shipment, and holds a chaldron of coals.

**Chalice**, a sacramental cup used in the celebration of the Eucharist.

**Chalk**, [Fr. *craye*; Ger. *Kreide*; It. *creta*; Port. *creda*; Sp. *greda*], is a massive opaque carbonate of lime, of a white, grayish, or yellow color, having an earthy fracture. Sp. gr. 2.5. It varies much in hardness, but is generally soft to the touch, and adheres to the tongue. *C.* forms the basis of whitening, crayons, and some white colors. In medicine it is used in the form of prepared *C.* and compound *C.* powder, as an astringent and antacid. In agriculture, *C.* is extensively used in Europe, being added in many instances to the soil to alter the constituents and to fertilize land. *C.* does not exist in America, but is extremely abundant in England and France, whence it is imported in bulk, generally as ballast. *Red C.* is an ochreous clay used in an indurated state by painters, builders, etc.—*French C.* See *SOARSTONE*. Imp. duty, white, unmanuf., free; red and French *C.*, 20 per cent; all manuf. of *C.*, 25 per cent.

**Chalk-Cement**, an hydraulic cement made of chalk, which hardens under water in a few minutes.

**Chalk-Drawing**, a drawing sketched and filled in with black and colored crayons.

**Chalk-Lime**, the burnt carbonate or chalk from which heat has driven off the carbonic acid.

**Chalk-Line**, a carpenter's line which is chalked so as to leave a mark for working by.

**Challis**, a fine printed soft woollen fabric, used for ladies' dresses.

**Chaloupe**, the French name for the long-boat of a ship.

**Chalybeates**, mineral waters and medicines which hold iron.

**Chama**, the Malabar name for the *Panicum millicecum*, the seed of which is sometimes used as a substitute for rice.—Also a very large bivalve found in the Indian ocean, the shells of which are used for *Cenitiers*.

**Chambard Fabrics** are stuffs made from soft worsted yarn in Saxony by hand weavers at their houses.

**Chamber**, an apartment in an upper story of a dwelling-house.—A cell or cavity at the bottom of the bore of a gun to receive the charge of powder.—A receptacle formed in a mine to receive a charge of powder.—The inside of a lock, a partition in a canal.

**Chamber-Hangings**, the curtains or tapestry of a sleeping-room.

**Chamber of Commerce, or Board of Trade**, a body of merchants and traders, associated for the purpose of promoting the interests of its own members, of the town or district to which it belongs, and of the community generally, in so far as these

have reference to trade and merchandise. Of the means by which these objects are sought to be accomplished, the following may be mentioned as the most prominent: 1. By representing and urging on the legislature the views of their members in mercantile affairs; 2. By aiding in the preparation of legislative measures having reference to trade, as, for instance, the much wanted National Bankrupt Law; 3. By collecting statistics bearing upon the staple trade of the district; 4. In some places, by acting as a sort of court of arbitration in mercantile questions; 5. By attaining by combination advantages in trade which might be beyond the reach of individual enterprise. The oldest *C. of C.* on record was that of Marseilles, in France, which dates from the end of the 14th or beginning of the 15th century. The oldest in Great Britain is believed to be that of Glasgow, which was chartered in 1783. The oldest in America is that of New York, which was organized in 1768, and incorporated by royal charter in 1770; its legitimate influence has been since continually exercised for the benefit of mankind. The copious and well digested annual reports, which, since 1858, have been uninterruptedly issued by the New York *C. of C.*, offer the best statistical commercial periodical for reference issued in this country.

**Chambrays**, plain gingham with white wool and colored warp.

**Chamois**, or **SHAMMY LEATHER**, is leather made from the skin of the *chamois*, a species of antelope inhabiting the high mountains of W. Europe, but also from sheep and doe skins dressed with fish-oil. The oil is hammered or beaten by a mill into the pores of the skin, which is afterwards partially dried, and washed in strong alkali, when it becomes very soft and pliable.

**Chamomile**, a useful herb, *Anthemis nobilis*, cultivated in Europe for its flowers, which are bitter, stomachic, and tonic.

**Champagne Wines**. These wines, which rank first in excellence among the wines of France, are the produce of the vineyards of the old province of Champagne, comprising the departments of Ardennes, Marne, Aube, and Haute Marne. *C.* wines are divided into sparkling (*mousseux*), demi-sparkling (*demi-mousseux*), and still wines (*non mousseux*). Some are white or straw-color, others gray, others rose-color, and some are red. They are of light quality in respect to spirit, their average of alcohol generally being but 12.61 per cent. The entire quantity of wine made in *C.* of all kinds varies with the season; but the average may be taken at 30,000,000 gallons from 140,000 acres of vines. The most famous of these wines are made in the arrondissements of Epernay and Rheims. Though in America most people understand by *C.* only wine which effervesces, this, as we have seen, is an error. There are many kinds of *C.* wine, but the best are those which froth least. They are improved in the drinking by ice, which tends to repress the effervescence; the Sillery has no sparkle at all. Every connoisseur in *C.* will select wine of moderate effervescence, and such wine carries the best price. When the glass is entirely filled with froth, on pouring out the contents of the bottle, the better qualities of the wine and the spirit evaporate. The quantity of spirit in *C.* is but small, and the residue is a flat, meagre fluid. It is on the banks of the river Marne that the best effervescing wines are made. The French divide this district, or vine-ground of Rheims, into four general divisions, namely, the river vineyard district, that of the mountain of Rheims, that of the estate of St. Thierry, and that of the valleys of

Norrois and Tardenois. The river district is situated on a calcareous declivity open to the south, at the foot of which runs the Marne. On this declivity come first in order the vineyards of *Ay*, *Mareuil*, and *Dizy*, which produce *C.* wine of the very first quality known. They are light and delicate, vinous, of the most agreeable taste, and preserve to a great age their virtues and effervescence. When these wines are destitute of the sparkling quality, they rival those of Sillery, or still *C.*, and are frequently preferred to Sillery, because they are lighter and more luscious. The next vine lands in rank in this district are those of *Cumières* and *Hautvilliers*, which yield red wine of the 2d quality. Hautvilliers was the spot where, towards the end of the 17th century, the Benedictine monk Dom Perignon, first introduced the mixing grapes of different qualities in making *C.* wine, and discovered that the best white wine could be made from the blackest grapes. The mountain or hilly district of Rheims is at the back of the preceding declivity, and its soil is of the same calcareous description. The aspect is E. and N. The best vine lands are those of *Bouzy*, *Ambonnay*, *Verzenay*, *Sillery*, *Milly*, and *Verzy*. It is here that the best red wines of *C.* are produced. They have good body; are spirituous, fine, and keep their qualities to an advanced age. Here, also, is produced the white still *C.* called Sillery. This wine has more body, is more spirituous than any other white *C.* wine, and is distinguished by a dry and agreeable taste. It is grown principally on the lands of Verzenay and Milly, of the blackest grape, of which, also, the gray bright wine, having the complexion of crystal, is made. Very little is now produced in the commune of Sillery. The grape is subjected for making this wine to a less pressure than for red wine, and it is kept longer in wood than the other sorts are, or about 3 years. It is perhaps the most durable, as well as wholesome to drink, of all the wines of *C.*, the fermentation being more perfect than that of any other species. At *Epernay*, where the black grape is mostly cultivated, there are lands which produce wine approaching that of *Ay* in delicacy, in the abundance of the saccharine principle, and in the fragrance of the bouquet. Near *Epernay* is produced the most esteemed white wine of *Pierry*. It is dry, spirituous, and will keep longer than any of the other kinds. To a still class of *Epernay* wines, put in bottles when about 10 or 11 months old, the French give the name of *tisane* of *C.* It is a delicious summer drink, much recommended by physicians as aperient and diuretic. The white wines of *C.*, whether still or effervescing, gray or rose, whether solely of black or white grapes, or of both mingled, are generally in perfection the third year of bottling. The best wines, however, gain rather than lose in delicacy for 10 and even 20 years, and are often found good at the age of 30 or 40.

It will not now be amiss to give a cursory view of the mode in which the effervescing wines of *C.* are made. By this means some idea may be formed of the care required in bringing them to a perfection, which has placed them beyond all rivalry. The vine crop is gathered with the greatest care possible. The grapes for the purest wines consist only of those from an approved species of vine. Every grape which has not acquired a perfect maturity, every rotten grape, touched with the frost,

or pricked, is rejected. In the gathering, or in the emptying of the baskets, and in the carriage to the press, every motion that can injure the fruit is avoided, as well as the sun's action upon it. On arriving at the press, the baskets, or whatever the grapes are carried upon, are placed in the shade in a cool spot. When the quantity is sufficient for a pressing, they are heaped with as little motion as possible on the press, and the bunches are most carefully arranged. The must is not immediately casked, but is placed in a vat, where it remains for about 10 hours, for the dregs to deposit, and when it begins to ferment is immediately transferred to the cask. Perhaps there are none of the productions of the earth which require more care than the grape, to make it produce the more delicious wines in perfection. In no country is the art of making wine so well understood as in France, and being a commodity which it is impossible to equal except in a soil and temperature of exactly the same character, it is improbable that country will be excelled by any other in this its staple product:—an advantage of no slight moment, when compared with those man-

Fig 63. — CHATEAU OF SILLERY.

ufactures which time may enable foreigners to equal, and in many cases to surpass. The following is an account of the process of bottling and the treatment of the wines of *C.*, before they are ready for the market. About Christmas, after the vintage, the fermentation being complete, the wine is racked. This is always done in dry weather, and if possible during frost. A month after it is racked a second time, and fined with isinglass. Before it is bottled it undergoes a third racking, and a second fining. There are some makers of wine who only fine it once after the second racking, and immediately bottle it, taking care that it has been well fined in the cask; others rack it twice, but fine it at each racking. The wine which is designed in effervescence is racked and fined in March and April in the cellar, out of which it is only taken in bottles. After being racked and fined, the produce of the different vineyards is now ready for mixing together. The mixing is usually effected in gigantic vats holding at times as many as 12,000 gallons each, and having fan-shaped appliances, which, on being worked by handles, insure a complete amalgamation of the wine. This process of marrying wine on a gigantic scale is technically known as making the *cuvée*. Usually four fifths of wine from black grapes are tempered by one fifth of the juice of white ones. The aim is to combine and develop the special qualities of the respective *cuvées*, body and vivacity being secured by the red vineyards of Bouzy and Verzenay, softness and roundness by those of Ay and Dizy, and lightness, delicacy, and effervescence by the white growths

of Avize and Cramant. The proportions are never absolute, but vary according to the manufacturer's style of wine and the taste of the countries which form his principal markets. The wine at this period being imperfectly fermented and crude, the reader may imagine the delicacy and discrimination of palate requisite to judge of the flavor, finesse, and bouquet which the *cuvée* is likely eventually to develop. These, however, are not the only matters to be considered. There is, above everything, the effervescence, which depends upon the quantity of carbonic acid gas the wine contains, and this, in turn, upon the amount of its natural saccharine. If the gas be present in excess, there will be a shattering of bottles and a flooding of cellars; and if there be a paucity, the corks will refuse to pop, and the wine to sparkle aright in the glass. Therefore the amount of saccharine in the *cuvée* has to be accurately ascertained by means of a glucometer; and if it fails to reach the required standard, the deficiency is made up by the addition of the purest sugar-candy. If, on the other hand, there be an excess of saccharine, the only thing to be done is to defer the final blending and bottling until the superfluous saccharine matter has been absorbed by fermentation in the cask. The *cuvée* completed, the blended wine is drawn off again into casks for further treatment. This comprises fluing with some gelatinous substance, and, as a precaution against ropiness and other maladies, liquid tannin is at the same time frequently added to supply the place of the natural tannin which has departed from the wine with its reddish hue at the epoch of its first fermentation. The operation of bottling the wine next ensues, when the Scriptural advice not to put new wine into old bottles is rigorously followed. For the tremendous pressure of the gas engendered during the subsequent fermentation of the wine is such that the bottle becomes weakened and can never be safely trusted again. It is because of this pressure that the *C.* bottle is one of the strongest made, its weight being about 2 lbs. The wine is emptied from the casks into vats or tuns of varying capacity, whence it flows through pipes into oblong reservoirs, each provided with a row of syphon taps, on to which the bottles are slipped, and from which the wine ceases to flow directly the bottles become filled. The full bottles are conveyed to the corks, whose guillotine machines are incessantly in motion; next, the *agrafeurs* secure the corks by means of an iron staple, termed an *agrafe*; and then the bottles are conveyed either to a capacious apartment above ground, known as a cellar, or to a cool cellar, according to the number of atmospheres the wine may indicate. It should be explained that air compressed to half its volume acquires twice its ordinary force, and to a quarter of its volume quadruple this force,—hence the phrase of two, four, or more atmospheres. The exact degree of pressure is readily ascertained by means of a manometer, an instrument resembling a pressure gauge, with a hollow screw at the base which is driven through the cork of the bottle. A pressure of 5½ atmospheres constitutes what is styled a *grand mousseux*, and the wine exhibiting it may be safely conveyed to the coolest subterranean depths, for no doubt need be entertained as to its future effervescent properties. Should the pressure, however, scarcely exceed 4 atmospheres, it is advisable to keep the wine in a cellar above ground that it may more rapidly acquire the requisite sparkling qualities. The bottles are placed in a horizontal position and stacked in rows of varying length and depth, one above the other, to about the height of a man, and with narrow laths between them. Thus they will spend the summer providing all goes well, but in about three weeks' time the process of gas-making inside the bottles is at its height, and may cause an undue number of them to burst. The glucometer notwithstanding, it is impossible to check a certain amount of breakage, especially when a hot season has caused the grapes, and consequently the raw wine, to be sweeter than usual. Moreover, when once *casse* or breakage sets in on a large scale, the temperature of the cellar is raised by the volume of carbonic acid gas let loose, which is not without its effect on the remaining bottles. The only remedy is at once to remove the wine to a lower temperature when this is practicable. In spite of the teachings of science the bursting of *C.* bottles has not still been reduced to a minimum, for whereas in some cellars it averages 7 to 8 per cent, in others it rarely exceeds 2½ or 3. In the month of Oct., the first and severest breakage being over, the newly bottled wine is definitively stacked in the cellars, where the bottles usually remain in a horizontal position for about 18 or 20 months, though some firms, who pride themselves upon shipping perfectly matured wines, leave them thus for double this space of time. By this time the fermentation is over, but in the interval, commencing from a few days after the bottling of the wine, a loose dark-brown sediment has been forming, which has now settled on the lower side of the bottle, and to get rid of which is a delicate and tedious task. The bottles are placed *sur pointe*, as it is termed,—that is to say, slantingly in racks with their necks downwards, the inclination being increased from time to time to one more abrupt. The object of this change in their position is to cause the sediment to leave the side of the bottle where it has gathered; it afterwards becomes necessary to twist and turn it, and coagulate it, as it were, until it forms a kind of muddy ball, and eventually to get it well down into the neck of the bottle, so that it may be finally expelled with a bang when the temporary

cork is removed and the proper one adjusted. To accomplish this the bottles are sharply turned in one direction every day for at least a month or six weeks, the time being indefinitely extended until the sediment shows a disposition to settle near the cork. The younger the wine, the longer the period necessary for the bottles to be shaken, new wine often requiring as much as three months. Only a thoroughly practised hand can give the right amount of revolution and the requisite degree of slope. Each bottle is then taken by the bottom, kept carefully in its reversed position, and the wire and twine being broken, the bottle resting between the workman's knees, the cork is dexterously withdrawn, so as to admit an explosion of the gas, which carries the deposition with it. A temporary cork is then slipped into the bottle, and the wine is ready for the important operation of the *dosage*, upon the nature and amount of which the character of the perfected wine, whether it be dry or sweet, light or strong, very much depends. The dosage varies with the quality of the wine and the country for which it is intended; but the genuine liquor consists of nothing but old wine of the best quality, to which a certain amount of sugar-candy and perhaps a dash of the finest cognac has been added. The saccharine addition varies according to the market for which the wine is destined: thus the high-class English and American buyers demand a dry *C.*, the Russian a wine sweet and strong as "ladies' grog," and the Frenchman and German a sweet light wine. To the extra-dry *C.* a modicum dose is added. In some establishments the dose is administered with a tin can or ladle; but more generally an ingenious machine of pure silver and glass, which regulates the percentage of liquor to a nicety, is employed. The *dosage* accomplished, the bottle passes to another workman known as the *égaliseur*, who fills it up with pure wine. Should a plink *C.* be required, the wine thus added will be red, although manufacturers of questionable reputation sometimes employ the solution known as *teinte de Fismes*. The *égaliseur* in turn hands the bottle to the corker, who places it under a machine furnished with a pair of claws, which compress the cork to a size sufficiently small to allow it to enter the neck of the bottle, and a suspended weight, which in falling drives it home. These corks, which are principally obtained from Catalonia and Andalusia, cost more than 4 cents each, and are delivered in huge sacks resembling hop-pockets. Before they are used they have been either boiled in wine, soaked in a solution of tartar, or else steamed by the cork merchants, both to prevent their imparting a bad flavor to the wine and to hinder any leakage. They are commonly handed warm to the corker, who dips them into a small vessel of wine before making use of them. The *ficeleur* receives the bottle from the corker, and with a twist of the fingers secures the cork with string, at the same time rounding its hitherto flat top. The *metteur de fil* next affixes the wire with like celerity; and then the final operation is performed by a workman seizing a couple of bottles by the neck and whirling them round his head, as though engaged in the Indian-club exercise, in order to secure a perfect amalgamation of the wine and the liquor. The final manipulation accomplished, the agitated course of existence through which the wine has been passing of late comes to an end, and the bottles are conveyed to another part of the establishment, where they repose for several days, or even weeks, in order that the mutual action of the wine and the liquor upon each other may be complete. When the time arrives for despatching them they are confided to feminine hands to have their dainty toilettes made, and are tastefully labelled, and either capped or else have their corks and necks imbedded in sealing-wax, or swathed in gold or silver foil, whereby they are ready to be sent away by the maker.

*C.* of fine quality should never be mixed with ice or iced water; neither should it be iced to extent *C.* ordinary are; for, in the first place, the natural lightness of the wine is such as not to admit of its being diluted without utterly spoiling it, and, in the next, excessive cold destroys alike the fragrant bouquet of the wine and its delicate vinous flavor.

The U. States are, after Russia, England, and the East Indies, the best market for *C.* wine, which is imported generally in baskets or boxes containing 1 doz. quart or 2 doz. pint bottles. *Imp. duty*, in bottles of ½ pint or less each, \$1.50 per doz.; in bottles of over ½ pint, and not over 1 pint each, \$3 per doz.; in bottles of over 1 pint and not over 1 quart each, \$6 per doz.; in bottles of over 1 quart each, \$8 per doz., and \$2 per gallon on excess.

Other sparkling wines produced in France, Germany, and the U. States, and frequently, though improperly, sold as *C.*, are given under the general heading SPARKLING WINES.

The following table gives the imports of *C.* into the port of New York for three successive years.

**Champignon**, the French name for mushroom.

**Chancaca**, a name in the West Indies for coarse sugar.

**Chancelier, Chancellor**, the keeper of the records of a consul.

**Chancery**, the official abode of a consul in a foreign country.

**Chandelier**, a hanging or fixed lamp with branches, or a frame with branches, to hold candles for lighting a room.

**Chandler**, an old name for a dealer, as corn-chandler, tallow-chandler, ship-chandler, etc.

**Chandler's Shop**, a petty huckster's shop; a place where small articles of provisions, etc. are vended.

**Change**, to barter; to give one kind of money for another, as to change notes for gold; small money given for larger pieces, as change for a dollar; small money. — Also an abbreviated mode of designating an exchange or place where merchants and men of business assemble.

**Chankari**, an Indian grain measure, about half a pound.

**Chanks**, the Indian name for the large white massive shells of *Turbinella pyrum*, which are much prized and extensively used in India for the manufacture of bangles or shell-bracelets and anklets, etc. *C.*, cut in segments of circles, form ornaments for the forearms and wrists of women. The chief supply of these shells is from Ceylon; and when the volutes turn to the right, the shell is held in peculiar estimation, and fetches a very high price. When the end is cut off, the shell is used as a kind of sounding-horn.

**Channelling-Machine**, in boot-making, a machine which cuts the channels in boot-soles to receive the thread and protect it from wear.

**Channelling-Tool**, a tool for cutting a channel near the edge of a piece of leather, sinking grooves in shoe-soles, etc., so as to facilitate, hide, and protect the sewing.

**Channels, Chainwales**, strong projecting planks at the sides of a ship, over which the shrouds are spread, to obtain a greater angle.

**Channel Steamer**, a steamer employed in running across the channels around the British islands, or in crossing the channel between England and France.

**Chanteur**, the French name for a male singer; *chanteuse* being a female vocalist.

**Chantier**, the French name for a timber-yard or naval dock-yard.

**Chantilly Lace**, a fine, rich, and costly French hand-made lace, originally made at Chantilly, near Paris.

**Chanvre**, the French name for hemp.

**Chanwan**, in India, a small sort of millet.

**Chap**, the lower and upper parts of the mouth in animals, the jaw; hence, pig's cheeks smoked and dried are vended in England as Bath chaps.

**Chape**, the back piece or catch by which a buckle is attached to the article or garment; a thin plate at the point of a scabbard.

**Chapeau** [Fr.], a bonnet or hat. — In maritime commerce, a primage.

**Chapelier**, the French name for hatter.

**Chaplet**, a pair of stirrup leathers. — A rosary.

**Chapman**, a vender or seller on a small scale; a pedler or itinerant dealer.

**Charbon**, the French name for charcoal and coal.

**Charcoal** is a form of carbon, the fixed residuum of vegetable or animal matter exposed to a high temperature out of contact with atmospheric air. There are several different varieties of *C.*, the chief of which, however, are animal *C.*, and vegetable or wood *C.*

**Animal C.** [Fr. *noir animal*; Ger. *Thierkohle*], also called *Animal Black*, *Bone Black*, *Ivory Black*, is obtained by burning bone in close vessels. The bones, after being carbonized, are ground in a mill, and the resulting coarse powder, sorted by sieves into two kinds, — one granular, somewhat resembling gunpowder, for decolorizing liquids, and the other quite fine, to be used as a pigment. The first is sold under the name of animal *C.*, the second as bone or ivory black. This crude animal *C.* possesses the valuable property of taking lime and other saline matter from syrups and other aqueous solutions, especially organic ones, at the same time that it decolors them. Its power as a decolorizer may be tested by adding it to a solution of brown sugar or of molasses, or to water containing <sup>TOBACCO</sup> part of indigo dissolved in sulphuric acid. The test should be made in a small glass tube. By well washing and carefully reburning it, this *C.* may be used any number of times. As a decolorizer and deodorizer, animal *C.* is vastly superior to vegetable *C.* *Imp. free.*

**Vegetable or Wood C.** [Fr. *charbon de bois*; Ger. *Holzkhole*], is the residue obtained after heating wood without access of air to about 572° F. It is extremely porous, and retains the structure of the wood from which it is derived. It consists essentially of carbon and of the fixed or inorganic matter which exists in wood; but if carbonization be imperfectly effected, it may contain a sensible amount of hydrogen. *C.* burning is effected in the open air in piles or stacks provided with a yielding cover, in pits, in closed chambers of brick or stone, and in iron retorts heated externally like common gas retorts. The latter method is only practised by the manufacturers of pyrolineous acid and gunpowder. The most perfect *C.* is a very important element in the manuf. of gunpowder. The other uses of *C.* are numerous and varied. It is employed as a fuel in France, Germany, etc., and in metallurgy for tempering metals, making steel, etc.; reduced to powder, it is used to surround

vessels and bodies required to retain their heat for some time; a coating of *C.*, formed on piles and stakes of wood by charring them, promotes their preservation. Fresh burnt *C.*, in coarse powder, restores tainted meat and putrid water, discolors vegetable solutions, deodorizes fetid substances, and withdraws lime from syrups filtered through it. It is also a material for water filters. In medicine, *C.* is principally used as a deodorizer and disinfectant, either in the form of powder or made into a poultice. It is given internally with advantage in various diseases. *C.* forms the best tooth-powder known, as it both whitens the teeth and deodorizes the breath. In all cases, to be useful, the *C.* must be both fresh-burnt and fresh-powdered, and carefully preserved out of contact with the air until about to be administered.

**Charcoal Filter**, a fountain or other filter for water filled with charcoal.

**Charcuterie**, the French name for cooked flesh, such as dressed hams, tongues, sausages, cold meats and fowls, etc.

**Charge**, the quantity of powder which is necessary to fire a ball or bullet from any kind of cannon or fire-arm. — In metallurgy, any quantity of ore put at one time into a furnace to fuse.

**Charged**, burthened or loaded; trusted or debited for payment.

**Chargement** [Fr.], the cargo, bulk, or lading of a ship.

**Charger**, a soldier's horse, trained for duty.

**Chargeur** [Fr.], a shipper.

**Charges**. In the custom-house laws of the U. States, this plural term includes all accessory expenses attending the purchase and importation of foreign merchandise, such as packing, transportation to the port of shipping, bill of expenses of the shipping agent, etc. The importer must add them to his invoice, and pay duty thereon.

**Chariot**, a light coach, of which there are many kinds, as, for travelling, Britzka *C.*, Post *C.*, Dormeuse Post *C.*, Dress *C.*, and *C.* for town use, etc. In France the term generally implies a wagon.

**Charkana**, an East Indian name for a checked Dacca muslin.

**Charkey, Charka, Tsharkey**, the hundredth part of the Russian vedro, a liquid measure equal to 0.21 of a pint; 100 vedro are equal to 270½ gallons.

**Charleston**, a fine city and seaport of the U. States, the cap. of Charleston Co., South Carolina, is situated in 32° 45' N. lat. and 79° 57' W. lon. It stands on a flat tongue of land pointing S.E. between the Ashley and Cooper Rivers, which here debouche into a spacious harbor extending about 7 m. S.E. to the Atlantic, with an average width of 2 m. The harbor is surrounded by land on all sides except the entrance, which is about 1 m. wide and 18 feet deep. The water in the harbor, however, is very much deeper, and the work of increasing the depth of the entrance is in progress. Fronting the Atlantic, and extending northwards, is Sullivan's Island, about 6 m. long; and on the other side of the entrance is Morris Island, which stretches to the southward. The city covers an area of about 5 sq. m., and has a water front of about 9 m. *C.* is one of the leading commercial cities of the South, being the outlet of a very rich rice and cotton producing country, and a point of supply for an extensive territory, embracing S. Carolina, and parts of N. Carolina, Georgia, Alabama, Florida, Tennessee, and Mississippi. The commerce consists chiefly of exports. During the year 1878, the foreign commerce comprised exports to the value of \$17,727,

783, and imports valued at \$134,564. Included in the exports there were 135,130,071 lbs. of cotton, valued at \$15,794,887. Besides this foreign commerce, there is an extensive trade in cotton, rice, naval stores, phosphate, and lumber, which are shipped in large quantities to ports of the U. States. In 1878, 278 vessels, of 126,746 tons, entered in the foreign trade, and 296, of 139,474 tons, cleared; 396 vessels, of 321,705 tons, entered, and 294, of 202,883 tons, cleared in the coastwise trade. The number of vessels belonging to the port was 186; tonnage, 11,127. The manuf. of *C.* are of inferior importance compared with its commerce. Among the most important industries are the manuf. of fertilizers from the phosphate obtained in the vicinity of the city, where the richest deposits of this material in the U. States have been discovered. *C.* has an extensive wholesale trade in dry goods, boots and shoes, clothing, hats and caps, drugs and medicines, etc. The city has 3 national, 4 state, and 5 savings banks. Three railroads have their termini here, — the Northeastern, extending to Florence; the South Carolina, to Augusta, Ga.; and the Savannah & *C.* The Santee Canal, 22 m. long, connects *C.* with the Santee River. The city has an excellent fire department and an efficient police system. Pop., 48,956.

**Charlotte, Columbia, and Augusta R.R. Co.**, from Charlotte, N. C., to Augusta, Ga., 195 m. This Co., whose offices are in Columbia, S. C., was formed in 1869 by the consolidation of the Charlotte & South Carolina and the Columbia & Augusta R.Rs. *Financial Statement*: Capital stock (\$13,220.59 per m.), \$2,578,000; funded debt (\$12,820.57 per m.), \$2,500,000; floating debt, \$132,775.95; profit and loss, \$192,880.16. Funded debt in detail: 1st consol. mortgage, issued 1869, \$1,806,500, payable 1895, interest 7% (Jan. and July); 1st (Col. & Aug.) mortgage, issued 1869, \$183,500, payable 1890, interest 7% (Jan. and July); 1st (Chas. & S. C.) mortgage, issued 1860, \$10,000, payable 1888, interest 7% (Jan. and July); 2d consol. mortgage, issued 1876, \$500,000, payable 1910, interest 7% (Jan. and July). Net earnings, 1878, \$168,578.19.

**Charms**, amulets, fancy ornaments, and articles of various kinds sold to wear, from an imaginary belief that they ward off evil.

**Charnley Forest Stone**, a description of whetstone or hone obtained from Leicestershire, England.

**Charpoys**, small portable stretcher beds, used in India, consisting of a wooden frame resting on four legs, with tape across to support the bedding.

**Charred Wood** is wood of which the surface has been carbonized, to prevent its decay from exposure to air and moisture. Stakes and piles are generally thus treated before they are driven into the ground. Casks are charred on the inside by coopers when they are intended to hold water. In both these cases the fire is commonly applied directly to the wood. A new method has, however, been employed with apparent success. This consists in washing the wood with the strongest oil of vitriol. In this way, not only the outer surface, but the surface of all the cracks and holes, get carbonized, which is not the case when heat is employed. It succeeds well with musty casks and vats.

**Chart**, a hydrographic map for the use of navigators, being a projection of some part of the sea or coast on a plane surface. *C.*, as well as ordinary maps, may be constructed on any of the

principles by which a spherical surface is represented on a plane. Mercator's Projection, however, is the one most generally used.

**Charter**, a writing conferring or bestowing powers, rights, or privileges. See **CORPORATION**. — The letting or hiring of a vessel for a certain purpose, and by special contract, as a ship is advertised for *charter*.

**Chartered**, said of a ship hired for a voyage.

**Charterer**, one who engages a ship and causes it to be laden wholly with his own goods, or partly with merchandise or produce belonging to others.

**Chartermaster**, in the mining districts, one who raises coal or iron-stone by the ton, at a contract price.

**Charter-Party** is a contract in writing by which an entire ship, or some principal part thereof, is let to a merchant for the conveyance of goods, on a determined voyage to one or more places. This contract, which is a branch of the contract of affreightment, generally contains specifications of the ship and her burden, the amount of freight, the limitation of the agreement, by time or voyage, and the time of loading and unloading. The amount of demurrage is generally fixed. The most important questions regarding charter-parties generally relate to the risks and responsibilities of parties arising out of the usual perils of the sea, compensation or damage for delays, alterations of the agreement, etc. Information on these subjects will be found under the heads **AFFREIGHTMENT**, **BILL OF LADING**, **DEMURRAGE**, and **SHIPPING**.

**Chart-Maker**, an artist who draws or engraves charts on metal plates.

**Chartometer**, an instrument adapted for the admeasurement of charts or maps.

**Chartreuse**, a celebrated and highly tonic French liqueur, manufactured by the Carthusian monks of the Grande Chartreuse, a monastery situated near Grenoble, among lofty mountains, at an elevation of 9,483 feet above sea-level. This liqueur, into the composition of which enter many herbs, has never been successfully compounded elsewhere. Every bottle of the genuine cordial bears the signature of Father Garnier, a superscription which is constantly imitated by fraudulent manufacturers.

**Charvolant**, a carriage drawn by kites.

**Charwoman**, a woman who goes out to work by the day or job.

**Chase**, to hunt or pursue game. — An iron frame to fasten forms of type in, to print from; chases are made of either cast or malleable iron.

**Chaser**, a tool for cutting threads in the hand-lathe.

**Chasing**, or **Enchasing**, the art of embossing or making bas-reliefs in metals. The work is punched out from the back, and then cut on steel blocks or punches, and cleared with small chisels and gravers. Much *C.* is done by filling the vessel to be chased with a composition of pitch, and then hammering with a point and chisel on the outside.

**Chasse-Marée**, a French shallop or coasting vessel.

**Chassepot**. See **GUN**.

**Chateau-Haut-Brion**, **C-Lafitte**, **C-Latour**, **C-Margaux**. See **CLARET WINES**.

**Chatelaine**, a steel chain worn at a lady's waist-belt, on which to suspend keys, scissors, and fancy ornaments.

**Chatham**. See **GREAT BRITAIN**.

**Chatoyant** [*Fr.*], a term applied to minerals,

as the precious opal, which, when turned, successively exhibit different prismatic colors.

**Chattah**, an umbrella-hat, or sun-screen, made in the East of the leaves of the *Licuala peltata* palm, and also of a dried talipot or plantain leaf. These *C.* hats are much worn by the ploughmen, cow-keepers, and coolies of Bengal, Assam, etc.

**Chattel**, a legal term comprehending all articles of goods, movable or immovable, except such as have the nature of freehold.

**Chauli**, or **Chawali**, a small silver coin in the Mahratta country, worth about 2 annas, or 6 cents.

**Chautia**, a common grain measure in the north-west provinces of India, about equal to a seer or 2 lbs.; 5 *C.* make a pansiri.

**Chawl**, a weight for precious metals in Malwa, about the fourth of a grain. — Also a vernacular name for rice in India.

**Chay**, or **Chaya**, a red dye-stuff obtained in India from the root of *Heliotropis umbellata*, and used there by dyers for the same purpose as madder.

**Cheap**, to be had at a low price; at a low price or rate; being a good bargain; bearing a low price, as, a *cheap* article of sale.

**Cheapen**, to beat down, depreciate, or lower in price.

**Cheap-Jack**, the common name in England for a travelling hawk or a stationary vender of refuse or cheap articles.

**Cheat**, to practise extortion and fraud; to impose upon; to effect or obtain by trick, artifice, or low cunning. — Anything false or defrauding.

**Chebacco**, or **Pinkstern**, a kind of sailing-craft, employed in the Newfoundland fisheries.

**Check**, or **Cheque**, a written order on a banker by a person having money in the banker's hands, directing him to pay on presentment, or to bearer, or to a person named, a certain sum of money. *C.* partake of the nature of bills of exchange, in their indorsability, as the representative of cash. The chief differences between a *C.* and a bill of exchange are: 1. that a *C.* is not due until presented, and, consequently, can be negotiated any time before presentment, and yet not subject the holder to any equities existing between the previous parties; 2. that the drawer of a *C.* is not discharged for want of immediate presentment with due diligence, while the drawer of a bill of exchange is; 3. that the death of the drawer of a *C.* rescinds the authority of the banker to pay it; while the death of the drawer of a bill of exchange does not alter the relation of the parties. — A check ought to be drawn within the State where the bank is situated, because if not so drawn it becomes a foreign bill of exchange, subject to mercantile law; requiring that it be protested, and that due diligence be used in presenting it, in order to hold the drawer and indorsers. If a bank pay a forged check, it cannot be charged to the depositor whose name was forged; but a bank can, if the demand of return is immediately made, recover the money from a person who innocently presented a forged check and was paid. — A check, being payable on demand, is not to be accepted. There is a practice, however, of making *C.* good, by the banker, which fixes his responsibility to pay that particular *C.* when presented, and amounts, in fact, to an acceptance. Such a marking is called *certifying*, and a check so marked is called a *certified C.* A certified *C.* is immediately charged to the account of the drawer, although it may not be presented for payment till several days or weeks later. Sometimes a *C.* is *crossed*, that is, made payable only through a banking firm, instead of on de-

mand by presentation at the counter. — A two-cent revenue stamp must be affixed on every bank *C*.

**Check-Book**, a printed book of blank forms, for writing orders or drafts on a banker, for money lodged to his credit by the drawer.

**Checker-Work**, any kind of work in which crossed or angular patterns occur.

**Check-Rail**, a contrivance used on a double line of railroad, at the crossing from one line of rails to another, or at a siding-place, to allow the trains of cars to run on, or to move into the other line or siding, as it may be adjusted.

**Checkrum**, an East Indian money equal to 1½ rupees, or about 73 cents.

**Checks** are fancy cambric muslins with stripes and cords placed checkerwise, by thick threads being introduced into the warp or weft. Also a trousers material, a cross-barred fabric, chiefly black and white worsted and cotton, but some is made all of cotton. — A kind of Venetian blind used as screens or sun-shades in India.

**Cheddar**. See CHEESE.

**Cheeks**, those pieces of a machine, or other implement or instrument, which form corresponding sides, or which are double and alike; as, the *cheeks* of a windlass. — The shears or bed of a lathe as made with two pieces for conducting the puppets. — Two upright equal and similar parts of any piece of timber-work, as the sides of a dormer-window. — *Cheeks of a mortise* are the two solid parts upon the sides of the mortise. The thickness of each cheek should not be less than the thickness of the mortise, unless mouldings on the stiles require it to be otherwise. — *Cheeks of a mast or block*, the projection on each side of a mast, upon which the trestle-trees rest; the sides of the sheet of a block.

**Cheese** [Du. *Kaas*; Fr. *fromage*; Ger. *Käse*; It. *fromaggio*, *cacio*; Port. *queijo*; Sp. *queso*], the curd of milk, salted, dried, and compressed into a solid mass. There are *C.* of many different varieties and qualities, the principal distinctions arising from differences in the composition and condition of the milk operated upon, from variations in the method of preparation and curing, and from the use of the milk of other animals besides the cow, as, for example, the goat and the ewe, from the milk of both of which *C.* is manufactured on a commercial scale. The quality and the composition of the milk operated on are of prime importance in *C.*-making. Not only does this substance vary widely in richness and flavor owing to the breed, the nature of the food, and state of the health of the animal yielding it, and many other circumstances; but in *C.*-making the differences are still further increased, in some cases by adding cream to it, and in others by using it as skim-milk or milk deprived of a portion of its fat. The essential constituents of milk are the nitrogenous substance called *caseine*, and butter. The object of the *C.*-maker is to obtain in a solid form as large a proportion as possible of the *caseine* and butter contained in the milk dealt with. The poverty in these constituents of the whey or liquid matter separated in the process of making *C.* is therefore, to some extent, a measure of the success of the operation. Milk, as is well known, if allowed to stand for some time, becomes thick, and is then separable into two portions, — a solid white curd, and a greenish liquid whey. Such a coagulation and separation is essential in the making of *C.* Acid substances readily curdle *C.*, and hydrochloric acid, vinegar, and cream of tartar have been employed to produce coagulation for *C.*-making. The curdling is also, in practice, pro-

duced by the action of such substances as the juice of figs, the butter-wort, and other plants. But the substance used in all great *C.*-producing districts is *rennet*, a preparation of the fourth or digesting stomach of the suckling calf. *Rennet* is prepared by cutting up the membrane in strips, salting, smoking, and sometimes treating it with spices and aromatics. In order to hasten the coagulating action of *rennet*, and to produce a curd of sufficient hardness, it is found necessary to heat the milk to a temperature ranging from 72° to 90° F. The lower temperature, it is found, yields a soft *C.*, retaining much whey and ripening soon; while the increased heat produces a firm curd and a solid slow-ripening *C.* After due coagulation the curd is broken, and by a variety of manipulative processes as much as possible of the whey is drained away, and the curd is reduced to comparatively dry crumbly fragments. At this stage, sometimes, but not frequently, the curd is salted; it is then collected into a clean *C.*-cloth, placed in a *C.* vat of the form and size of the *C.* to be made, and submitted to pressure in the *C.* press. While in the press it is frequently turned, a good deal of whey meantime continuing to exude; and it is found that the amount of pressure has much influence on the solidity and rate of ripening of the *C.* As soon as a sufficient skin has formed on the *C.* to preserve its shape, it is removed from the press and salted by repeated rubbings of salt over its surface. The *C.* is then put aside in a clean, cool, airy situation for ripening, a process which takes a variable period according to the quality of the *C.*, its method of preparation, and other circumstances. The ripening of *C.* is the result of a slow process of decay caused by a spontaneous fermentative action. In hard, solid, poor *C.* it acts very slowly, while in those which contain butter in large proportions its action is very energetic, and they cannot be preserved for any considerable period. *C.* when newly made has an acid reaction, but by degrees from without inwards the acid reaction becomes less apparent, and the *C.* ripens. A portion of the *caseine* suffers decomposition, evolving ammonia and ammoniacal bases which neutralize the acid of the *C.* In a similar way the fat is partly decomposed, and the resulting fatty acids also combine with the ammonia evolved by the *caseine*. When this action is allowed to proceed too far, the *C.* becomes alkaline, putrefactive decay ensues, free ammonia is evolved, an offensive odor is produced, and sometimes even poisonous compounds are formed. A satisfactory indication of ripening found in Stilton and other rich *C.* is the appearance of a green mould, streaked throughout the mass, produced by the fungus *Aspergillus glaucus*. A red mould also develops from *Sporendonema casei*, and when the ripening becomes advanced the *C.*-mite, *Acarus domesticus*, is produced with great rapidity, in inconceivable numbers. — The storing of the newly made *C.* is an important point for the maker and the wholesale dealer. A cool cellar, neither damp nor dry, and which is uninfluenced by change of weather or season, is commonly regarded as the best for the purpose. If possible, the temperature should on no account be permitted to exceed 50° or 52° F. at any portion of the year. — As an article of food *C.* is used in a double capacity. Rich *C.* in an advanced stage of ripeness is eaten in small quantities, partly on account of its piquancy, and partly also as a digestive stimulant. Skim-milk *C.*, and all the varieties poor in fat, again, are valuable articles of food on account of their high percentage of nitrogenous matter, and the cheaper quali-

ties are, on this account, extensively consumed among the classes by whom other animal food is not usually obtainable. As an article of ordinary diet, *C.* labors under the disadvantage of being hard of digestion; and especially when it is toasted, as is frequently the practice, it really is, as has been observed, "about as digestible as leather."

In America and England the milk of cows only is used in the manuf. of *C.* Excluding the so-called cream *C.*,—a preparation of a soft, buttery consistence, made from cream gently pressed, which must be used new and fresh,—English *C.* may be divided into three classes: 1st, that made with whole milk plus cream; 2d, that made with whole milk; and 3d, that made with milk minus cream, or skim-milk. Stilton and Double Gloucester belong to the first class, being made of morning milk to which the cream of the previous evening's milking is added. Whole milk *C.* are represented by Single Gloucester, Cheshire, Cheddar, and Dunlop; and the ordinary country *C.* used by the laboring classes represents the third class. Almost all the English *C.* are very extensively and successfully made in the U. States, where *C.* has become an article of commerce of great importance. Most of the American *C.* is made at factories, which are carried on by associations of farmers, who employ a manager; the usual practice being to send the milk to the factory every night and morning, keeping it as cool as possible during transportation. The number of cows supplying one factory ranges from 100 to more than 1,000, the average being about 400. The State of New York produces more than half of the *C.* made in the U. States. The other principal States producing *C.* are Ohio, Illinois, Vermont, Massachusetts, New Jersey, California, etc. The following table of exports of *C.* from the U. States for 20 years shows the steady increase of this important branch of commerce.

	Pounds	Dollars.		Pounds.	Dollars
1859...	7,103,323	649,302	1869...	39,990,337	6,437,895
1860...	15,515,799	1,595,530	1870...	57,295,327	8,881,934
1861...	32,331,428	3,321,631	1871...	63,608,867	8,752,900
1862...	31,052,678	2,715,892	1872...	66,264,025	7,752,918
1863...	42,045,954	4,216,894	1873...	80,399,510	10,493,010
1864...	47,751,320	5,638,907	1874...	94,611,077	11,893,905
1865...	53,089,468	11,684,927	1875...	101,010,533	13,659,993
1866...	53,411,985	6,690,828	1876...	97,676,264	12,270,083
1867...	52,332,127	7,903,535	1877...	107,334,666	12,729,615
1868...	51,697,203	7,010,424	1878...	123,783,733	14,103,629

On the exports of *C.* in 1878, 120,929,600 lbs., valued at \$13,759,385, went to England; and 1,598,420 lbs., valued at \$172,170, to Canada. During the same year the U. States imported *C.* from France, Germany, Holland, and Italy, to the value of about \$150,000. *Imp. duty*, 4 cts. per lb., grated, 4 cts. per lb.; if in glass bottles, the same is dutiable as such.

The varieties of *C.* met with in commerce are very numerous and differ greatly from each other in richness, color, and flavor. These are commonly distinguished by names indicative of the places in which they have been manufactured, or of the quality of the materials from which they have been prepared. The following are the principal varieties met with in Europe, many others being mentioned under their particular names.—

*Brickbat C.*, so called from its form, made in Wiltshire, England, of new milk and cream.

*Brie C.*, a very excellent French *C.*, made of the purest cream. It was formerly imported, but is now made in perfection in the State of New Jersey.

*Cheddar C.*, a fine, spongy kind of *C.*, the eyes or vesicles of which contain a rich oil; made up into round, thick *C.*, of considerable size (150 to 200 lbs.).

*Cheshire C.* is made from new milk, without skimming, the morning's milk being mixed with that of the preceding evening, previously warmed, so that the whole may be brought to the heat of new milk. To this the rennet is added, in less quantity than is commonly used for other kinds of *C.* On this point much of the flavor and mildness of the *C.* is said to depend. It is made in large, round, thick *C.* (100 to 200 lbs. each). It is generally solid, homogeneous, dry, and friable rather than viscid.

*Cottingham C.*, a rich kind of English *C.*, in flavor and consistence not unlike Stilton, from which, however, it differs in shape, being flatter and broader than the latter.

*Derbyshire C.*, a small, rich variety, very similar to Dunlop *C.*

*Dunlop C.*, a rich, white, and buttery English *C.*, in round forms, weighing from 30 to 60 lbs.

*Dutch C.*, made in Holland. It is of a globular form, and weighs from 5 to 14 lbs. Those from Edam are very highly salted; those from Gouda less so.

*Gloucester C.* The Single Gloucester is made from milk deprived of part of its cream: Double Gloucester, from milk retaining the whole of the cream. Mild tasted, semi-buttery consistence, without being friable; in large, round, flattish forms.

*Gruyère C.*, a fine description of *C.*, chiefly made in the Canton of Fribourg, Switzerland, and known in this country as *Schweizerkase*. It is firm and dry, and exhibits numerous cells of considerable magnitude. It is made in the States of New York and Ohio; but it is said that the American Gruyère lacks the flavor of the Swiss, because of the difference of the grass upon which the cattle feed.

*Limbourg C.*, made at Limbourg, Belgium, is eaten while in a high state of putrefaction. Large quantities of this *C.* are made in New York, Ohio, Illinois, and Wisconsin, but Oneida, Lewis, and Jefferson Counties are the principal seats of its manufacture.

*Lincoln C.*, an English *C.*, made from new milk and cream, in pieces about 2 inches thick. It is soft, and will not keep over 2 or 3 months.

*Neufchâtel C.*, a French *C.*, made in Normandy, of pure cream, thickened by heat and compressed in a mould. It is esteemed as a great delicacy, but, from the difficulty of preserving its good qualities, can be scarcely appreciated out of France. It is now largely, but not very successfully, made in the State of New Jersey.

*Norfolk C.*, an English *C.*, dyed yellow with annatto or saffron, good, but not superior; in cheeses of 30 to 50 lbs.

*Parmesan C.*, an Italian *C.*, made at Parma, etc., from the curd of skimmed milk, hardened by a gentle heat. About a fortnight after making, the outer crust is cut off, and the new surface varnished with linsed oil, and one side colored red. It is used, grated, as an ingredient in soups and macaroni.

*Roquefort C.*, the best French *C.*, made from ewe's milk, greatly resembles Stilton, but possesses a peculiar pungency and flavor. The quality of this very excellent *C.* depends exclusively upon the places where the *C.* are kept after pressing, and during maturation. Those are cellars, communicating with mountain grottoes and caverns, which are kept constantly cool, at about 41° to 42° F., by currents of air from clefts in the mountains. The value of these cellars as store-houses varies with their property of maintaining an equable and low temperature.

*Schabzigerkase* is made in the Canton of Glarus, Switzerland, of curd which has been fermented. It is mixed with the pulverized flowers of *Melilotus caruulus*, and pressed in a mould. It is usually eaten grated, spread upon buttered bread, and has a sharp and peculiar flavor much relished by many.

*Stilton C.*, the richest and finest of the English *C.*, is made from raw milk, to which cream taken from other milk is added; in cheeses generally twice as high as they are broad. Like wine, this *C.* is vastly improved by age, and is therefore seldom eaten before it is 2 years old. A spurious appearance of age is sometimes given to it by placing it in a warm, damp cellar, or by surrounding it with masses of fermenting straw or dung.

*Suffolk C.*, an English *C.*, from skimmed milk; in round, flat forms, from 2 to 30 lbs. each. Very hard and horny.

*Swiss C.* See GRUYÈRE and SCHABZIGERKASE, above.

*Westphalian C.* is a German *C.*, in small balls or rolls of about 1 lb. each. It derives its peculiar flavor from the curd being allowed to become partially putrid before being pressed. In small balls or rolls of about 1 lb. each.

**Cheese-Coloring.** See ANNOTTO.

**Cheese-Dairy**, a cool room where cheese is made.

**Cheese-Factor, Cheese-Monger**, a dealer in cheese, a provision merchant.

**Cheese-Knife**, a wooden spatula made use of in dairies to break down the curd whilst in the cheese-tub.

**Cheese-Lep**, a bag in which rennet is kept for making cheese.

**Cheese-Press**, a screw press employed in cheese-dairies to force the whey from the curd in the cheese-vat.

**Cheese-Rennet**, a wild-flower, the yellow bed-straw (*Galium verum*), sometimes used for curdling milk to make cheese.

**Cheese-Scoop**, **Cheese-Taster**, an auger instrument for boring and tasting cheese.

**Cheese-Toaster**, an instrument hung at the bars of a grate to toast cheese.

**Cheese-Vat**, the case in which the curd is placed to be pressed in cheese making.

**Cheh**, the tenth part of the Chinese tael.

**Cheki**, a jeweller's weight in Persia, of 7,200 grains.

**Chekma**, a fabric of silk and gold thread, mixed with cotton, made in Turkey.

**Chemic**, a commercial name for bleaching powder.

**Chemist**, a scientific manufacturer of substances used in chemistry; also, a drug-seller. Sometimes the business of operative and retail C. is combined.

**Chemistry**, the study of the various elementary bodies of nature, their affinity, properties, laws, and combinations, and their useful applications to the arts and manufactures.

**Chemitype**, a name under which have been introduced several processes by which a drawing or impression from an engraved plate is obtained in relief, so as to be printed on an ordinary printing-press.

**Chemnitz**, a town of Germany, in Saxony, 87 m. W. S. W. of Dresden, is one of the principal manufacturing places of Germany, and is celebrated for its manuf. of hosiery and other woollen and cotton goods. Pop. 78,209.

**Chendi**, an Eastern name for the fermented juice of the date palm.

**Chène**, the French name for an oak.

**Chenevis**, a name for hemp-seed in France.

**Chenille** [Fr.], a silk or worsted cord woven in tufts, and used as a trimming for ladies' dresses.

**Chenille Carpet**, a soft and beautiful, but costly carpet. It is made by stretching out horizontally the warp-threads, while the weft is thrown in by a shuttle. The weft consists of chenille, and when the weaving is completed, the loose, colored threads of the chenille are combed up and made to appear at the surface, where they are cut and sheared to a state of velvety softness. The pattern is dyed in the chenille itself, nothing appearing at the surface of the carpet except the ends of the chenille fringe.

**Cheoh**, a long measure in Sumatra = 14½ inches.

**Cheque**. See CHECK.

**Chequee**, a small Turkish weight. The C. used in weighing gold, silver, and precious stones contains 100 dirhems or drams, and is equal to 4,950 troy grains; but the C. for goat-wool contains 800 drams, and that for opium 250 drams.

**Cheramella**, a vernacular Indian name for the subacid fruit of the *Cicca disticha*, universally used as an article of food, raw or cooked, or in pickles or preserves.

**Cherang**, a lac varnish used in Cambodia for lackering cabinets, cases, etc.

**Cherbourg**. See FRANCE.

**Cherimoya**, an esteemed fruit of Peru and Brazil, the produce of *Anona cherimolia*.

**Cheroot**, a species of cigar imported from Manila, in the Philippine Islands, distinguished by extreme simplicity of construction as well as delicacy of flavor. The cigars now commonly sold as C. are, for the most part, made of inferior tobacco, and are often much adulterated articles.

**Cherray**, a commercial weight of Persia, 78.85 of which are equal to 100 lbs. avoirdupois.

**Cherry** [Fr. *cérise*; Ger. *Kirsche*; It. *ciriegia*; Port. *cereja*, *jinja*; Sp. *cereza*], the well-known fruit of the *Prunus cerasus*, of which there are now several hundred cultivated varieties. The wood of the tree is close, and takes a fine polish; it is worked up into common chairs and other articles,

Fig. 69. — CHESTNUT-TREE.

**Chemical Balance**, a very accurate balance for assays, and other nice operations.

**Chemical Paper**, paper prepared for chemical operations, as filtering paper, paper for photographs, etc.

**Chemicals**, a commercial term for all substances used in medicine, the arts, and manufactures, which are produced by chemical processes.

**Chemical Stopperer**, a manufacturer of stoppers for glass bottles.

**Chemicking**, in bleaching, a process which precedes the *souring*, and which consists in steeping goods in a dilute solution of chloride of lime in stone vats, the liquid being continuously pumped up and straining through the goods until the action is complete.

**Chemise**, a French name for the lining of a furace. — A female inner garment.

**Chemisette**, a lady's lace or net stomacher.

being stained to imitate mahogany, and is also used for musical instruments. The wood of the Black Cherry-tree of N. America, *Cerasus serotina*, is hard, handsome, and durable, resembling mahogany.

**Cherry-brandy** is a sweetened or cordial spirit in which cherries are steeped. — **Cherry-wine** is a sweet wine made from cherries. — The *Maraschino* of Zara is prepared from a particular species of *C.* cultivated in Dalmatia. — *Kirschwasser* is the fermented liquor of a small black *C.*

**Cherry-Coffee**, the planters' name for the fruit of the coffee as picked from the tree, before it has undergone the operations of pulping, drying, etc., to prepare the berry for shipment.

**Cherry-Laurel.** See LAUREL.

**Chert-Stone**, a variety of horn-stone, quarried in Derbyshire for making the stones of pottery mills to pulverize flints.

**Chertwert.** See CHETVERT.

**Chervice**, a fine kind of tallow shipped to Constantinople from the Black Sea ports, and used for culinary purposes.

**Chervil** [*Fr. cerfeuil*], a common pot-herb with edible roots, the *Anthriscus cerefolium*. The young leaves are much used in France as an ingredient in salads.

**Chesapeake & Ohio R.R.**, from Richmond, Va., to Huntingdon, W.V., 427.79 m.; branches, 6.81 m.; total, 434.60 m. This Co., located in Richmond, is a consolidation of the Virginia Central and the Covington & Ohio R.Rs. In 1873 the Co. made default in payment of their Nov. coupons, and a receiver was appointed in 1875. The road was sold under foreclosure in 1878 for \$2,750,000, and reorganized. *Cap. stock*, \$15,000,000. *Funded debt*: First preferred 7% stock, \$1,500,000; Second preferred 6% stock, \$8,500,000; Virginia Central R.R. bonds and interest, \$2,000,000; 1st mortgage 30 yrs. 6% bonds A, \$2,000,000, debts B, \$15,000,000; 2d mortgage 40 yrs. 6% bonds, \$10,000,000. Total stock and bonds, \$54,000,000.

**Cheshire-Cheese.** See CHEESE.

**Cheshire R.R.**, from South Burnham, Massachusetts, to Bellows Falls, New Hampshire, 53.02 m. This Co., whose offices are in Keene, N. H., was chartered in 1844. *Capital stock and funded debt*: 21,000 preferred shares, \$2,100,000; 533 original shares representing \$53,300; outstanding bonds of various issues, \$833,500; total, \$2,986,800. Net earnings for 1878, \$77,492.22; surplus for the year, after payment of interest on stock and bonds, \$23,033.42.

**Chess-Board**, a board with sixty-four checkers or squares of alternate light and dark colors, for playing the game of chess on.

**Chessel**, the perforated wooden mould or vat in which cheese is pressed.

**Chess-Table**, a small fancy table with inlaid squares on the top for playing the game of chess on.

**Chesa-Trees**, are pieces of wood bolted to the sides of a ship to secure the clews of the mainsail.

**Chest**, a wooden box or package of no certain dimensions. The chest of opium weighs 141½ lbs., the tare allowance for leaf and dust being 1½ lbs. A chest of tea varies: the chest of Pekoe contains but seven cattie, of souchong and pouchong 25, and of hyson 60. The chest of sugar from Brazil is about 13 cwt.; of indigo from Bengal, about 200 lbs. The chest of olive oil contains 60 flasks, or a little over two gallons.

**Chester.** See GREAT BRITAIN.

**Chestnut** [*Fr. châtaigne*; *Ger. Kastanie*; *It. castagna*; *Port. castanha*; *Sp. castaña*] is a dark brown,

ovate, sharp-pointed nut, or fruit, containing a nutritive starchy kernel, of a sweet flavor, which is extensively used as food, boiled, roasted, ground, or otherwise prepared, in Italy, Spain, and the S. of France, where the tree, *Castanea vesca* (Fig. 69) chiefly abounds. The American variety, abundantly found in the mountainous parts of the Eastern States, from New York to Georgia, has smaller but sweeter nuts than those of the European or Spanish *C.* The American *C.* are sold by the bushel; the Spanish *C.* are imported in casks of about 125 lbs., and are sold by the pound. The *C.*-tree in a wild state sometimes attains an extraordinary size. The timber, which is coarse-grained, strong, elastic, light, and very durable, is used for posts and rails, and also for cabinet-ware. See HORSE-CHESTNUT.

**Chest of Drawers**, a set of drawers for keeping clothes or other articles in, made of mahogany, deal, or other wood.

**Chest-Protector**, a hare-skin or any covering for the chest worn by persons suffering from pulmonary complaints.

**Chest-upon-Chest**, a double set of drawers that divides in the middle for the convenience of moving or travelling.

**Chetvert**, or **Tchetvert**, a Russian dry measure = 5.77 bushels.

**Cheval**, the French name for a horse.

**Cheval-Glass**, a lady's dressing-room looking-glass, in which the full-length figure may be seen.

**Chevalier Barley**, an esteemed kind of malt-ing barley, named after the person who first brought it into notice.

**Cheveril**, leather prepared from kid-skin.

**Cheviot Wool**, the wool of a peculiar and valuable breed of sheep of Scotland, used in the manuf. of Scotch shawls, tweeds, etc.

**Chevrette**, an engine for raising pieces of artillery into their carriages.

**Chewing-Ball**, a medicinal bolus for a horse.

**Chewing-Tobacco.** See TOBACCO.

**Chew-Stick**, the branches and twigs of the *Gouania Domingensis*, which are used in the West Indies for cleaning the teeth, and also powdered as a dentifrice.

**Chhap**, or **Chop**, in India, an official mark on weights and measures, to indicate their accuracy; also, an Eastern custom-house stamp or seal on goods that have been examined and have paid duty.

**Chian Turpentine**, a resinous juice obtained in small quantities from the *Pistacia terebinthus*, used medicinally, and employed in the East as a masticatory to sweeten the breath and preserve the teeth.

**Chiavari.** See ITALY.

**Chibouk**, a Turkish pipe, usually with an ebony or cherry-wood stem, and an amber mouthpiece, the bowl being of baked clay.

**Chica**, a fermented intoxicating beverage made in South America, usually from maize steeped in warm water; that most prized is, however, first chewed and then mashed in hot water; sometimes it is made from other vegetable substances. — Also, the red coloring-matter deposited by a decoction of the leaves of *Bignonia chica* in cooling. It is used by some of the North American Indian tribes to stain their skins.

**Chicago**, a city and port of entry of the State to Illinois, in Cook Co., and one of the most important cities of the U. States. It is situated on the W. shore of Lake Michigan, 960 m. by rail from New York; lat. 41° 50' 1" N., lon. 87° 34' 8" W. The city is at an elevation of nearly 600 feet

above sea-level, but only 14 feet above the lake. There is an inlet called the Chicago River which runs from the lake nearly a mile west, then separates into two branches, one running N. W., the other S. W., thus dividing the city into 3 divisions, connected by more than 35 bridges, and by two tunnels running under the bed of the river. This river ("Chacagua," Indian for thunder, and so called after the Indian Thor, or thunder god) gave the city its name. Originally it emptied into the lake, but a remarkable piece of engineering caused it to change its course, and, so to speak, run "up-hill." The Illinois and Michigan Canal, with which the main branch of the river is connected, was so deepened as to draw the water out from the lake; the canal empties into the Illinois River, and the Illinois River into the Mississippi River, so that the water of Lake Michigan flows into the Gulf of Mexico. The river has been so deepened that the largest vessels may be towed into any of its branches, which are supplied with docks and water-ships, affording a dockage capacity of nearly 400,000, more than 20 of which are already in use.

Fig. 70. — CHICAGO BOARD OF TRADE BUILDING.

The growth of *C.* in population, commerce, and wealth, is without a parallel in history. The pop. of the city, ascertained at different dates since its foundation, is as follows:—

1830 .....	70	1865 .....	178,900
1840 .....	4,853	1870 .....	298,977
1850 .....	29,963	1871 .. (before the fire)	334,270
1853 .....	60,627	1872 .....	364,377
1860 .....	112,172	1879 .. (estimated)	525,000

The valuation of real estate and personal property for purposes of taxation (rated at about one half the actual value), from \$37,053,512 in 1860, had reached \$131,981,436 in 1878. The financial affairs of the city are in a very favorable position. The floating debt, which amounted to about \$4,000,000 in 1875, has been since almost entirely extinguished, and the bonded debt was reduced in 1878 to \$13,037,000, and this under an abatement of over \$1,500,000 in annual city taxes. Municipal taxation, although there, as almost everywhere, more or less a subject of complaint, is in fact considerably less than one per cent on a fair cash valuation of the taxable property of the city. The great conflagration of October 8 and 9, 1871, which destroyed almost all

the business part of *C.*, illustrated the indomitable energy of the population. The work of rebuilding the city was begun before the cinders were cold, and within three years *C.* was provided with buildings equal in capacity, and of twofold the value of those that had been destroyed. The "fire limits" were extended so as to exclude the erection of other than stone, brick, or iron buildings within a large area, and subsequently this prohibition was applied to the entire city. The result has been to make New *C.* the most beautiful city of *A.* in its business centres. The business and population continued to increase in spite of the disaster; indeed, the ratio of growth became larger. The solidity and permanence of this prosperity were confirmed during the panic of 1873, when the *C.* banks alone, among those of all large cities, were not compelled to issue certificates of deposit, but continued steadily to pay out current funds. There were few mercantile failures, and the business of the year following the panic still showed an increase. This superior resistance to the general contraction is attributed to the marvelous development of the great Northwest, especially such portions of it as may be said to be commercially tributary to *C.* There are in *C.* 20 grain elevators, with an aggregate storage capacity of 15,155,000 bushels. The banking capital of the city at the latest official reports was as follows: National banks, \$6,472,418; State banks and private bankers, \$3,612,908; total \$10,085,326. *C.* has an annual industrial exhibition held in a building especially erected by a joint-stock Co. for the purpose, 200 feet wide and 800 feet long, which attracts exhibitors for one month from all parts of the Northwest. It was visited in Oct. 1878 by 296,510 persons, and the total expenditures for that year were \$83,318, while the total receipts were \$98,113.95. There are 18 trunk lines of railroads running from *C.*, five to the east, and the others west and south, viz.: The Baltimore and Ohio; Lake Shore and Michigan Southern; Pittsburg, Fort Wayne, and *C.*; Pittsburg, Cincinnati, and St. Louis; Michigan Central; *C.* and Michigan; *C.* and Alton; *C.*, Danville, and Vincennes; *C.* and Iowa; *C.*, Rock Island, and Pacific; *C.* and Northwestern (comprising 3 trunk lines); *C.* and Pacific; *C.*, Milwaukee, and St. Paul; Illinois Central; Western Union; *C.*, Burlington, and Quincy. The aggregate mileage of the railroads centring directly in *C.* is nearly 10,000 miles, and 750 trains arrive and depart daily. The Board of Trade of *C.* (an association consisting of 1799 on Jan. 1st, 1879) publishes yearly very copious and valuable reports, from which the following statements are partly taken.

*Trade, Commerce, and Manufactures* — The amount of trade for 1878 was estimated as follows:—

Produce trade .....	\$207,400,000
Wholesale business .....	277,900,000
Manufactures .....	227,560,000
	\$712,866,000
Less manufactures included in wholesale business .....	52,860,000
Total business .....	\$660,000,000
The value of farm products shipped from <i>C.</i> in 1878 was as follows:—	
Flour and Grain (equal to 118,675,269 bushels) .....	\$68,150,000
Live Stock .....	34,300,000
Meats, Lard, Tallow, and Dressed Hogs .....	66,750,000
Butter and Cheese .....	10,750,000
Wool and Hides .....	17,250,000
Seeds and Broom Corn .....	3,800,000
High Wines and Alcohol .....	4,100,000
Miscellaneous Products .....	2,300,000
Total .....	\$207,400,000

*Flour.* — The wholesale flour trade is each year becoming more and more strictly a local one, and hence is subject to few

fluctuations in sympathy with wheat. The demand is more steady and continuous than it used to be, and the margins of profit to the seller seem to have been reduced to a minimum. The movement of flour through the city in 1878 was fair in volume. Reducing bags to their equivalent in barrels, the receipts of the fiscal year were 3,121,445 barrels, against 2,691,142 in 1877; and the shipments were 2,845,840 barrels, against 2,482,335 barrels the previous year. The mills were kept running to their full capacity, but with no increase in their facilities of manufacture, the business not being profitable enough to induce the investment of new capital in mills. But the volume of receipts and shipments is no longer a correct idea of the magnitude of the whole-sale flour trade. A few years ago the millers of the West sent all their surplus flour to C to find a market, and it was sold there on orders for cargoes to go to the Eastern States and to Europe. But their production increased faster than C's ability to sell, especially as the improvement in the methods of wheat handling enabled millers in the East and in Western Europe to obtain American wheat at relatively less cost than before. Then the millers began to solicit direct orders from bakers and retailers, and this has wrought a radical change in the trade. They now have their depots and agents scattered all over the East, consigning directly to them, and even in England, Scotland, and France the system prevails, — solicitors taking orders for small lots, and filling them by direct consignments from the mills in the West. C millers operate in the same way, very little of their flour being placed on the whole-sale market in their city. Hence, few large shipping orders are now received there. A large proportion of the flour "received" simply passes through the city on its way to the Eastern consumer, some of it being sent to C to be submitted to our local inspection, which is everywhere highly valued. Some dealers thought that a partial revival of old-time activity might be secured by changing the system of flour inspection so as to make it conform to an Eastern model. At their suggestion new grades were established, ranging from "double extras" downward, but no appreciable improvement followed the reform. The changes in the trade, above referred to, have made consumers acquainted with individual brands, and they now pay more attention to them than to any arbitrary classification made by non-manufacturers. The new grading is, however, a good thing, and will possibly be appreciated more highly in the future, when other conditions are more favorable to direct trade than they have been recently. The foreign demand for flour from Western mills has fallen off, as well as that from Chicago. The trade has suffered in the past by offerings of refuse flours from New England mills, and from those in the Southern States. This has not especially in Scotland, where they use a better class of flours than in England. Another fact which tells against us is the high price which the bran, etc., commands in Western Europe for feed. This enables foreign millers to sell their flour at very low prices, making their profit on the offal. They have taken very largely of our low grades of wheat for mixing with other qualities, and, with low wages, make it difficult for Western millers to compete with them. They have also recently adopted patent processes quite extensively, but their work is still crude; their flours are not so well dressed as ours, and have less strength.

Wheat and Corn received and shipped for ten years: —

Years.	Wheat received.	Wheat shipped.	Corn received.	Corn shipped.
	Bushels.	Bushels.	Bushels.	Bushels.
1900.....	16,876,701	13,244,249	23,475,800	21,580,808
1870.....	17,391,409	16,432,585	20,189,775	17,777,377
1871.....	14,439,656	12,965,449	41,853,138	36,716,091
1872.....	12,724,141	12,101,946	47,399,087	47,013,552
1873.....	26,299,692	24,455,657	38,157,232	36,754,943
1874.....	29,764,622	27,694,587	35,769,638	32,705,224
1875.....	24,246,370	23,184,349	28,341,150	26,443,884
1876.....	16,574,058	14,391,950	48,698,640	45,652,035
1877.....	11,664,515	11,999,160	47,915,728	46,391,301
1878.....	29,713,577	24,211,739	63,651,518	59,344,209

The trade in corn assumed in 1878 a magnitude so far beyond any previous year that its volume is somewhat startling, the receipts having been nearly 15,000,000 bushels in excess of any previous year.

Other Grain. — The shipments of oats in 1878 were 16,464,513 bu.; rye, 2,025,554 bu.; barley, 3,520,683 bu.

Live Stock. — The receipts and valuations of Live Stock received for 7 years, as compiled by Geo. T. Williams, Esq., Secretary of the Stock Yards Co., were as follows: —

Years.	Cattle.	Hogs.	Sheep.	Horses.	Total Value.
1872.....	684,075	3,252,623	310,211	12,145	\$87,720,000
1873.....	761,428	4,337,750	291,734	20,289	91,321,192
1874.....	843,946	4,258,379	334,695	17,388	115,049,140
1875.....	929,813	3,912,110	418,918	11,346	117,531,942
1876.....	1,096,745	4,100,096	394,065	8,159	111,185,690
1877.....	1,031,151	4,025,970	310,240	7,874	99,024,100
1878.....	1,083,068	6,339,654	310,420	9,415	106,101,879

Pork Packing and Provision Trade. — C now packs more hogs annually than were packed in the whole country west of the Alleghany Mountains some years since. This immense business is almost wholly conducted within a small area of territory near the southern city limits, and is but little seen, or its extent appreciated, by most of the people of the city, save by the occasional aroma which floats on the southern breeze. The business, which in former years was confined almost exclusively to the winter months, now extends over the whole year, so that the so-called packing season has come to have neither beginning nor ending. In former years, pork packing meant, in the main, the packing of pork into barrels; now, less than 15 per cent of the product is so packed, the remainder being dry salted, and either shipped in bulk or in boxes. The operations of the larger packing establishments are reduced to a science, and every step in the process is carefully guarded with reference to economy and the utilization of every particle of the slaughtered animal. No feature of the business of C will be a source of greater interest to the visitor than an inspection of some of these great establishments. There are now two large establishments, each killing in the neighborhood of 8,000 hogs per day, and about forty others. One of these almost rivals the two above referred to, but packs chiefly on English account. The rest range from a daily "capacity" of 4,000 downwards; about one third of the number buying dressed hogs, or curing green meats, or have their hogs killed for them by other parties on commission. They employ altogether about 7,800 workers, including foremen and clerks, during the four winter months, and nearly three fourths of that number during the remainder of the year. The aggregate weekly wages in cold weather is about \$84,000, the pay of workers ranging from \$1.50 to \$4 per day. The general pay of laborers is \$1.75 per day, or \$10.50 per week. The following shows the number, weight, and value of the hogs cut in C during two calendar years: —

	1878.	1877.
January and February.....	1,448,700	697,140
March 1 to October 31.....	2,075,000	1,508,000
November and December.....	1,694,300	1,652,600
Total No. year.....	5,128,000	3,127,740
Weight, tons.....	648,200	388,000
Value.....	\$44,610,000	\$38,180,000
Value of product.....	55,590,000	43,400,000

The last-named value includes salt and packages. We note that the items of labor, salt, barrels, tierces, boxes, and ice during the hot weather foot up to just about \$7,000,000 of the total, or not far from 15 per cent addition to the original cost of the hogs, to which must be added the items of rent, taxes, insurance, fuel, water, and profits to give the whole value of the product of C packing-houses for the year. The limit of production is now the ability of C packers to dispose of the product. The course of the market indicates that even more hogs would come there if they could be sold, and that many more would be bought if the stuff could be got rid of. C leading packers have established agencies for its sale in almost all the principal cities of both the Old World and the New, and now ship it to nearly all the countries of Europe, besides not a few points south of the U. States. The exports of hog products in 1878 had increased by 40 per cent or more over those of 1877, the great bulk of this movement being by way of New York. Direct exports from C to Europe having been 549,225 boxes bacon and hams and 280,732 packages lard in that year, against 385,413 boxes bacon and hams and 159,649 packages lard in 1877.

Lumber. — The receipts and shipments of lumber and shingles in 1877 and 1878 were as follows: —

	Receipts.		Shipments.	
	1878.	1877.	1878.	1877.
Lumber, m. ft. ....	1,171,394	1,000,452	618,108	586,723
Shingles, m. ....	604,143	546,400	121,590	170,411

The receipts by lake in 1878 were 1,078,247 m. ft. lumber, and 629,111 m. shingles.

Manufactures. — The principal industries, besides hog-packing, are beef-packing, brewing, and distilling, and the manufacturing of iron and steel, wood, brick, leather, boots and shoes, chemicals, and cigars and tobacco. The statistics of manufacture for Jan. 1, 1879, were as follows: —

Number of establishments.....	2,617
Number of workers.....	67,704
Aggregate wages paid.....	\$31,007,000
Capital employed.....	\$5,782,000
Value of product.....	227,590,000

Foreign Trade. — The direct exports of domestic produce, mostly by railroads, consigned on through bills of lading issued in C direct to European ports, were: — Flour, 147,028 bar; wheat, 6,121,981 bu.; corn, 4,149,552 bu.; oats, 183,874 bu.; barley, 25,334 bu.; oat meal, 213,440 bu.; corn meal, 9,601 bu.; seeds, 2,952,851 lbs.; hides, 826,162 lbs.; leather, 282,529 lbs.; bacon and hams, 549,225 boxes; pork, beef, and tongues,

67,010 pkgs.; lard, 290,792 pkgs.; canned meats, 184,342 pkgs.; butter and cheese, 227,286 pkgs.; tallow, 18,005 pkgs.; oil-cake, 1,553 tons; alcohol, 29,231 bar; miscellaneous, 4,617 tons. Total, 602,018 tons, against 309,185 tons in 1877, and 113,776 in 1874. In the above figures are not included exports of domestic produce to Canada by lake, valued for 1878 at \$3,206,261.

The direct imports of goods from Europe in 1878, of which dry goods were the principal item, amounted to \$2,857,493, on which duties collected were \$1,451,535. C. imported besides in that year \$3,931 half-chests of tea by steamers via San Francisco, and 55,724 bags of Brazilian coffee by steamers and sailing vessels.

*Marine and Shipping.*—The vessels owned at the port of C. on Jan. 1, 1879, were as follows:—

CLASS.	No.	Tonnage.
Steamers .....	3	239
Propellers .....	18	6,108
Steam canal-boats .....	29	2,670
Tugs .....	57	1,690
Barks .....	9	3,029
Brigs .....	4	1,157
Schooners .....	245	53,705
Sloops .....	2	21
Total .....	367	68,619

During the year 1878, 12 vessels, tonnage 478, were built, and 7 schooners, aggregating 1,944 tons, and valued at \$44,000, were lost.

The navigation on Lake Michigan is usually opened at the Straits of Mackinac in April. The last clearance for Buffalo in 1878 was on Dec. 5. The shipping for 1878 was as follows:—Number of vessels arrived, 10,490, with a tonnage of 3,608,534; vessels cleared, 10,494, with a tonnage of 3,631,139.

**Chicago & Alton R.R.** Main line from Chicago to East St. Louis, Illinois, 280.70 m.; branches and leased lines, 397.08 m.; total, 677.78. This Co., whose offices are in Chicago, was organized in 1861. In 1877, it took lease of the Mississippi River Bridge, at an annual rental of \$63,000, to be applied in payment of 7% dividends on \$300,000 stock, and 6% interest on \$700,000 bonds. *Financial statement:*—Common stock, \$10,065,400; preferred stock, \$2,425,400; bonded debt, \$8,579,850; aggregate stock and bonded debt, \$21,070,650. *Equipment:*—Locomotives, 156; passenger cars, 54; sleeping and dining cars, 17; freight cars, 2,964. Net earnings for 1878, \$2,103,568.12.

**Chicago, Burlington, & Quincy R.R.** Main line from Chicago to East Plattsmouth, Iowa, 488.54 m.; branches and leased lines, 860.71 m.; total length of road, 1,349.25 m. The leased line consists of the Quincy, Alton, & St. Louis R.R., which was leased in 1876, at an annual rental not exceeding \$42,000. *Financial statement:*—Cap. stock, \$27,729,916.51; bonded debt, \$26,634,825; aggregate stock and bonded debt, \$54,364,741.51. *Equipment:*—Locomotives, 309; passenger cars, 116; sleeping and dining cars, 15; freight cars, 8,532; Net earnings for 1878, \$5,348,098.63.

**Chicago & Eastern Illinois R.R.** Main line from Danville to Dolton, Illinois, 128.13 m.; branches, 24.13 m.; total length, 152.50 m. This Co., whose offices are in Chicago, was organized in 1865, as Chicago, Danville, & Vincennes R.R.; it was sold under foreclosure in 1877 for \$1,450,000, and reorganized under its present title. It leases the Chicago and Southern R.R. (from Dolton to Chicago, 266 m.), at a rental of \$1,866.66 per month. *Financial statement:*—Cap. stock, \$318,700; bonded debt, \$4,000,000; floating debt, \$127,318.83; aggregate stock, bonded and floating debt, \$4,446,018.83. *Equipment:*—Locomotives, 28; passenger cars, 6; freight cars, 1,245. Net earnings for 1878, \$194,152.97.

**Chicago & Iowa R.R.**, from Aurora to Foreston, Illinois, 80 m.; leased line, Chicago, Rockford, & Northern R.R., 23 m.; total, 103 m. This Co., whose offices are in Rochelle, Ill., was organized in 1869, and opened in 1872. It connects the Chi-

ago, Burlington, & Quincy R.R. at Aurora with the Illinois Central at Foreston. *Financial statement:*—Cap. stock, \$1,328,000; funded debt, \$1,750,000; floating debt, \$44,553.23; total, \$3,122,553.23. The company made default on the interest of its bonds, due 1st August, 1877, and the road was placed in the hands of a receiver. Net earnings, 1877, \$278,818.

**Chicago, Iowa, & Nebraska R.R.**, from Clinton to Cedar Rapids, Iowa, 82.40 m., was opened 1859, and is leased in perpetuity to the Chicago & N.W. Co. The lease provides that the C. & N.W. shall operate the road and pay 37½% of the gross earnings as rental. *Financial statement:*—Cap. stock, \$3,916,200; funded debt, \$779,700; as follows: 2d (Nov. 1st) mortgage bonds, \$568,200, payable 1880, interest 7% (Jan. & July); 3d (Nov. 2d) mortgage bonds, \$211,500, payable 1892, interest 7% (Aug. & Feb.). Rental received for 1878, \$545,536.87.

**Chicago and Lake Huron R.R.**, from Chicago, Ill., to Port Huron, Mich., 329 m. Office, Port Huron, Mich. This Co. was formed in 1873 by the consolidation of the Peninsula R.R. Co., and the Port Huron & Michigan R.R. Has been operated by a receiver since 1874. *Financial statement, 1877:*—Cap. stock paid in, \$5,775,000; funded debt, \$5,518,000; sundry accounts, \$873,395.28; other liabilities, \$1,842,477.76. Description of bonds outstanding, 1877: 1st mortgage Penin. Div., issued 1869, \$3,600,000, payable 1869, int. 7% (May & Nov.); 1st mortgage C. & I. R.R., issued 1870, \$1,000,000, payable 1900, interest 7% (May & Nov.); 2d mortgage, issued 1870, \$540,000, payable 1881, interest 7% (Aug. & Feb.).

**Chicago & Michigan Lake Shore R.R.**, from New Buffalo, Mich., to Pentwater, Mich., 170 m., with branches from Holland, Mich., to Grand Rapids, Mich., 24.4 m., and from Muskegon, Mich., to Big Rapids, Mich., 51.2 m. Total length of road owned and operated, 245.6 m. The offices of this Co. are in Muskegon. Opened in 1872, and placed in hands of a receiver in 1876. *Financial statement, 1877:*—Cap. stock, \$1,514,667.80; funded debt, \$6,630,000; bills payable, \$141,714.90; unpaid coupons, \$1,723,800; sundry accounts, \$753,459.17. Character of bonds: 1st mortgage bonds, issued 1869, \$477,000, payable 1889, interest 8% (Mar. & Sept.); 1st mortgage bonds, issued 1870, \$3,523,000, payable 1890, interest 8% (July & Jan.); 1st mortgage bonds, issued 1871, \$1,350,000, payable 1891, interest 8% (Nov. & May); 1st mortgage bonds, issued 1872, \$1,380,000, payable 1892, interest 8% (Mar. & Sept.).

**Chicago, Milwaukee, & St. Paul Railway**, located in Milwaukee. The total length of line owned and operated by this Co. is 1,512 m. *Financial statement:*—Cap. stock (preferred), \$12,279,483; common, \$15,404,261; bonds of various issues, \$32,088,500; other liabilities, \$791,692.61; total liabilities, \$60,663,836.61; cost of road, \$58,755,184.22; bonds, miscellaneous accounts, cash on hand, etc., \$4,328,726.41; total assets, \$63,083,910.63. Net earnings for 1878, \$3,672,884.91, from which have been paid interest on bonds and dividend on preferred stock, \$2,020,512.46, leaving net surplus for the year, \$1,052,372.45.

**Chicago & Northwestern R.R.** This powerful Co., located in Chicago, is a consolidation (June, 1864) of the Chicago & Northwestern R.R., the Galena & Chicago Union R.R., and the Peninsula R.R., which, together with railroads since constructed and purchased, extend to 1,615.96 m. The lines leased are the Winona and St. Peter R.R., 327 m.; Winona, Mankato, & New-Ulm

Fig. 71. — CHICK-PEA.

R.R., 3.75 m.; Iowa Midland Railway, 68.80 m.; and Northwestern Union Railway, 62.03 m. Total length of lines operated, 2,078.14 m. *Financial statement*: — Common stock and scrip, \$14,988,807.49; preferred stock and scrip, \$21,525,002.72; bonds of various issues, \$32,793,000; other liabilities, \$3,003,924.90; total liabilities, \$72,911,335.11; cost and equipment of all the roads, \$72,673,894.26; bonds, securities, cash, materials on hand, etc., \$1,414,131.02; total assets, \$77,088,350.28. Net profit for the year 1878, after payment of interest on bonds, etc., \$2,464,487.16; from which have been paid two dividends of 3½% each on preferred stock (Dec. 30, 1877, and May 16, 1878), \$1,509,598; and 3% on common stock (May 16, 1878), \$449,409, leaving surplus for the year, \$508,453.16.

**Chicago, Pekin, & Southwestern R.R.**, from Pekin to Mazin Bridge, Ill., 941 m. Chartered in 1859, as the Chicago & Plainfield R.R. Co., and opened to its present terminus in 1876. Offices in Chicago, Ill. *Financial statement*, 1877: — Cap. stock paid in: common, \$788,200; preferred, \$3,000, bearing 7% interest; total, \$3,788,200. Funded debt: 1st mortgage 7% bonds, \$1,000,000, payable 1891. Floating debt, \$270,000. Total stock, bonds, and debt, \$2,000,200. In 1877, the road was placed in the hands of a receiver. Net earnings, 1878, \$31,300.52.

**Chicago, Rock Island, & Pacific R.R.** Main line from Chicago to Council Bluffs, Iowa, 600.25 m.; branches and leased lines, 592.75 m.; total miles of railroad operated, 1,003. Offices in Chicago. In 1877, the property formerly known as the Chicago & Southwestern R.R., now Iowa Southern & Missouri Northern R.R., passed fully under the control of this Co. *Financial statement*: — Cap. stock, \$24,981,000; bonded debt, \$15,000,000; floating debt, \$102,874.98; aggregate stock, bonded, and floating debts, \$39,372,874.98. *Equipment*: — Locomotives, 229; passenger cars, 73; sleeping and dining cars, 10; freight cars, 4,702. Total cost of construction and equipment, \$33,710,120.83. Net earnings for 1878, \$3,511,350.20; surplus for the year, after payment of interest on bonds, rentals, and four quarterly dividends (2% each), \$365,617.23.

**Chick**, a name for the inspissated juice of the poppy, three pounds of which will make one of opium.

**Chicken Mother-of-Pearl**, a small and fine kind of Manilla pearl oyster-shell.

**Chick-Pea**, a leguminous plant, the *Cicer arietinum* (Fig. 71), which is a common crop in India, where it is known as *gram*. It is also cultivated in the South of Europe. Its seeds are parched, and in Spain are sold in the shops for food. When roasted, these seeds are said to sustain life longer than other food in similarly small quantities, hence they are much used by travellers through the deserts, where the carriage of bulky food is inconvenient.

**Chicory**, a hardy perennial plant with blue flowers, *Chicorium intybus*, found wild in most parts of Europe and U. States. It resembles a dandelion. Its slender roots are much employed in France for forcing into growth in dark apartments, during winter, the delicate blanched leaves, which are quite bitter, being used as a salad under the name of *laine de capucine*. The large tap-roots are sliced and dried in kilns; they are then roasted and reduced to powder, and this, when boiled, yields a drink not unlike coffee. *C.* is perfectly wholesome, containing no alkaloid or oil, and only a small amount of narcotic matter. When added to coffee in small quantities, it rather improves its flavor, neutralizes its oil, and renders it less difficult of digestion. Many persons prefer the coffee with *C.* The adulteration of coffee with *C.* is easily detected. Roasted coffee imparts its color very slightly to cold water, but *C.* colors the water a deep reddish brown. Coffee is light, and floats on the surface of the water; *C.* is heavy, and sinks to the bottom. 3,153,329 lbs., valued at \$100,358, came to this country in 1878, mostly from Germany and England. *Imp. duty*, ground or unground, 1 ct. per lb.; burnt or prepared, 5 cts. per lb.

Fig. 72. — MICROSCOPIC APPEARANCE OF CHICORY ROOT.

The ground *C.* of the shops, like ground coffee, is almost universally adulterated. Pigments are added to it to color it, and various vegetable substances to lessen its value. Adulteration may be detected by the following tests: — 1. Powdered *C.* thrown on water turns it reddish brown and rapidly sinks, leaving light impurities either floating or diffused through the liquid. — 2. The cold decoction tested with tincture, or solution of iodine, gives a brown color; if it turns purple, blue, or black, it indicates the presence of roasted peas, beans, rye, or some other like substance, containing starch. — 3. Persulphate or perchloride of iron, added in the same way, should not materially affect the liquid; if it turns it bluish or blackish, it indicates the presence of roasted acorns, oak-bark tan, or some other substance containing tannin. — 4. Water adulterated with vinegar, digested on the powder, should not be blackened, or even materially darkened, by tincture of galls, or a solution of red prussiate of potash; the contrary shows the presence of

ferruginous coloring matter. — 5. The dry powder, when incinerated, should not leave more than  $4\frac{1}{2}$  to 5% of ash, which should be of a grayish or fawn color; the contrary indicates the presence of reddish, red clay, ochre, or the like. — 6. To the above may be added attention to the odor, color, and appearance, both to the naked eye and under the microscope (Fig. 72); by the latter, adulteration may be easily detected.

**Chik**, a bamboo mat to hang at the entrance of a room in India; they are sometimes lined with cotton.

**Chikan**, the Hindustani name for embroidering and working flowers on muslin.

**Chiksa**, a fragrant Indian powder composed of sandal-wood, andropogon, benzoin, and other aromatic ingredients.

**Chile**, or **Chili**, a republic of S. America, occupying a strip of land on the W. side of that continent, extending from  $24^{\circ}$  to  $56^{\circ}$   $28'$   $50''$  S. lat. from the Bay of Mejillones to Cape Horn, a distance of 2,270 m. It is bounded E. by the Andes,

Fig. 73. — CUSTOM-HOUSE OF VALPARAÍSO.

W. by the Pacific Ocean, and N. by Bolivia. Its breadth varies from 40 to 200 m. Area (including the archipelago of Chiloé, but excluding the newly annexed territories, and the land of the Araucanians, which is claimed by the republic, and which is calculated to embrace 120,000 sq. m., within which live about 70,000 inhabitants) 132,606 sq. m. *C.* is divided into the 16 prov. of Chiloé, Llanquihue, Valdivia, Arauco, Concepcion, Nuble, Maule, Linares, Talca, Curico, Colchagua, Santiago, Valparaíso, Aconcagua, Coquimbo, and Atacama. Pop. (census of 1875) 2,068,447, chiefly Spanish-Americans and Indians. Subsequently to the census, the prov. of Biobío, the territory of Angol, and the settlement of Arauco, have been annexed, which brings the total pop. of *C.* up to 2,283,568. Capital, Santiago, a handsome inland city; pop. 129,807. The legislative power is vested in two assemblies, called the Senate and the Chamber of Deputies. The executive is exercised by a President, elected for a term of five years. "The Chilians themselves hold the same position to Spain as the inhabitants of the U. States do towards England. Their interests and language are Spanish, modified by admixture with other nations. The conventionalities of social life are much the same in *C.* as in France and Catholic Germany; and this remark applies to dress, living, amusements, and propensities. Sunday is spent as a holiday, and enlivened by festivals, balls, theatricals, and concerts. The great extent of seaboard not only induces large numbers of the inhabitants to visit

foreign lands, but promotes the diffusion of the civilization of the most highly cultivated nations over the whole of *C.* The beautiful prov. of Valdivia and Llanquihue are colonized by Germans and North Americans, who prepare timber, meat, cheese, butter, beer, cider, and leather. The universality and the learned professions have ever numbered among their distinguished members, Polish, French, German, and English men of science. The North American colonists have been chiefly instrumental in the construction of flour-mills, telegraphs, and railways."

The lofty chain of the Andes runs along the whole eastern boundary of *C.*, and the country below is composed, to a considerable extent, of valleys, surrounded by high mountains or ridges. The climate varies much in the different districts, but it is everywhere salubrious, and in the central provinces is similar to that of Italy. Rain occurs seldom except between May and August. Spring begins in Sept., and the hottest months are Jan. and Feb. The northern provinces are in general dry and sterile, destitute of wood, but rich in minerals. On the other hand, the southern provinces are humid, highly fertile, and abound in fine timber, but are much less rich in minerals. The chief metallic productions of Chili are gold, silver, and copper, but the sterile condition of the provinces in which they are principally found prevents the mines from being worked except where very rich. Gold is obtained both from the sand of the rivers and from mines. The copper mines are exceedingly numerous between the cities of Copiapo and Coquimbo, and form one of the chief sources of national wealth; lead and iron are found in abundance, but neither is much sought after. Zinc, antimony, manganese, arsenic, tin, sulphur (so pure as not to need refining), alum, salt, and nitre are plentiful. Coal mines have been opened, and this article has become a considerable article of trade at Valparaíso. Agriculture has been much improved. The largest and most approved agricultural implements manufactured in the U. States are now employed, while the flour-mills in power and machinery rival the best in this country. About 82 per cent of the entire surface of *C.* is desert, mountain pasture, and forests, and only about 13 per cent arable land. Intertropical plants do not succeed in *C.*; and the sugar-cane, after being tried, was abandoned. Wheat is the great staple; Indian corn, barley, and hemp are also leading objects of culture; and the latter is of a quality even superior to that of Russia. The vine and olive are also cultivated extensively; but the wine and oil manuf. are of indifferent quality: wine-making, however, is progressing rapidly. The rearing of stock forms an important source of wealth; the pastures N. of the river Maule are filled with innumerable herds of cattle; and swine are abundant in the archipelago of Chiloé. The wealth of *C.* consists in the development of its great and abundant resources, for which its scanty population is insufficient; hence manuf. which require many skilled hands and much cheap labor have as yet not prospered, — the cost of labor being too great. But such works as flour-mills, smelting-works, tanneries, breweries, roperies, and soap-works, have long proved successful. — The commerce of *C.* has vastly increased since its separation from Spain, but very little in recent years. The imports average now \$29,000,000, and the exports \$30,000,000. The principal exports are copper in bars and ores (nearly 50 per cent of total exports), silver in bars and ores, wheat, flour, biscuits, barley, wool, etc. Of the imports 17 or 18 per cent are for nutrition, such as sugar, rice, and cattle; 20 to 21 per cent are necessities of social life, as clothing, domestic utensils, crockery, drugs, machinery, tools, books, paper, etc.; and 13 to 14 per cent are articles of luxury, such as rich carpets, silks, toys, perfumery, tobacco, pictures, jewelry, tea, coffee, etc. Tea was formerly largely imported from China, but it has been in great part superseded by the *maté* or Paraguay tea, the dried leaves of the *Ilex paraguayensis*. Nearly 60 per cent of the exports go to Great Britain, while the imports are from England, France, Germany, the U. States, and Peru. The imports from Great Britain, from \$16,000,000 in 1874, have gradually fallen down to \$6,600,000 in 1878.

In 1878, the total imports from the U. States amounted to \$1,977,450. The principal articles imported were: wheat and wheat flour, \$127,927; manuf. cotton, \$573,128; manuf. of iron, \$130,975; mineral oil, \$111,891; lard, \$127,160; refined sugar, \$332,035; wood (boards, deals, etc.), \$165,411; household furniture, \$46,602. The total exports to the U. States during the same year were \$670,466, consisting chiefly of nitrate of soda, \$261,525; and wool, \$314,712.

The commercial navy of *C.* consisted, in 1878, of 87 vessels of 22,434 tons, including 22 steamers of 9,641 tons.

*C.* was among the first States in S. America in the construction of railroads. In 1879, the total length of lines open for traffic was 977 m. The length of telegraph lines in same year was 2,650, the whole of them, with the exception of a short line from Santiago to Valparaíso, belonging to the State.

**Finances.** — The annual income of *C.*, mainly derived from customs duties, is about \$17,500, and the expenditures sometimes a little more and sometimes a little less. The national

debt amounts to about \$63,000,000, of which about \$17,000,000 is of internal, and \$46,000,000 of external debt. The whole of the foreign loans were contracted in England, the last, of 1875 (5 per cent interest), at the price of 88½ per cent. There is no government paper in C., but some of the banks issue, under due restrictions, notes payable in coin. Numerous banks and insurance cos. are conducted under the principle of limited liability.

**VALPARAISO**, a fine city and sea-port, in lat. 33° 1' 56" S., lon. 71° 41' 45" W., 90 m. W. N.W. of Santiago, on Valparaíso Bay, is the cap. of a prov. of the same name, and the centre of the foreign trade of C. It stands on a rugged promontory, forming, with the shore, a deep crescent, the concavity of which, opening to the N., forms the harbor, where ships of any size may ride in safety against all winds, except those from the N., which blow with great violence along the whole coast in the beginning of the rainy season. It is one of the principal places of rendezvous for ships on the Pacific sea-board. Pop. 91,775.

The chief other ports are Concepcion, pop. 19,000; Caldaíra (the port of Copiapo), pop. 7,000; Coquimbo, the principal port of the mining region, pop. 17,000; and Valdivia, pop. 2,000.

**Weights and Measures.**—The metric weights and measures of France were adopted in 1858, and are since the only legal ones. The following old W. and M., however, are still in general use:—The ounce = 1.014 oz. avoirdupois; the libra = 1.014 lb.; the quintal = 101.44 lb.; the vara = 0.927 yards; the square vara = 0.859 sq. yd.

**Money.**—The *peso* or *dollar*, of 100 *centavos* (gold) = \$.912. In the monetary system C. possesses the double standard, gold and silver, the coins being as follows:—Of gold, a 10 dollar piece, weighing 15.233 grammes, and pieces of 5 and 2 dollars in proportion; of silver, a dollar piece of 25 grammes, and pieces of 50, 20, 10, and 5 cents in proportion; and also twenty-cent pieces, and cent pieces, of a bronze containing zinc and nickel. The gold and larger silver coins contain one tenth of alloy; the smaller silver ones, which are of limited legal tender, are rather less pure.

**Chilian Pine**, the *Araucaria imbricata*, a handsome, lofty tree, valuable not only for its beauty, but for the large seeds in the pine-cones, which supply the natives with a great part of their usual food.

**Chillies**, a name given to the small pungent pods or fruit of the *Capsicum annuum*, which, when pounded and ground, form Cayenne pepper.

**Chilloes**, colored cotton goods used in the African trade, made in lengths of 18 yards by 29 inches wide.

**Chiloé** (ISLAND AND ARCHIPELAGO OF), a prov. of Chili, consisting of a large island in the S. Pacific, near the S. coast of Chili and the N.W. coast of Patagonia, between lat. 40° 48' and 43° 50' S.; and having on its E. side 63 small islands, 36 of which are inhabited. The group, including the town of Maulin, on the main-land of the continent, forms the most S. prov. of Chili. Shape of the island of C., oblong; length, N. to S., 120 m.; average breadth, 40 m. Area, 4,800 sq. m. The island is mountainous and wooded, chiefly with a bastard cedar, very durable, and exported in great quantities to Peru and Chili. There are several good harbors; in those of San Carlos (the cap., in the N.E. part of the island), and Castro, vessels ride quite land-locked close to the shore, in good holding ground. The island swarms with hogs, and the hams of C. are celebrated in S. America. Population of prov., 61,523.

**Chimes**, the ends of the staves of a cask, which come out beyond the head.—The ringing of church bells.

**Chimney**, the gullet, funnel, or passage through which smoke is conveyed to the open air; a flue.—A glass tube or funnel for a lamp. See SMOKE-STACK.

**Chimney-Piece**, a projection over the front of the fire-place of a room; also called mantel-piece.

**Chimney-Pot**, an addition to the top of a chimney, of metal or pottery ware.

**Chimney-Sweeping-Machine**, a series of connecting rods, by which a stiff whalebone brush

is raised through the chimney to cleanse it from soot.

**Chimo**, a nutritive food made in Peru from potatoes, which are first frozen, and afterwards reduced to powder.

**China**, a vast empire of Asia, extending from 18° 30' to 53° 25' N. lat., and from 80° to 130° E. lon. It is bounded, N., by Asiatic Russia, along a frontier extending nearly 3,000 m.; E., by the Sea of Japan, the Yellow Sea, and the China Sea, which are parts of the Pacific Ocean; S. and S.W., by the China Sea, Cochín China, and Burmah; W., by Kashmir and Eastern Turkestan. In these limits are included, besides China Proper, the dependencies of Manchuria, Mongolia, and Thibet. The capital of the empire is *Peking*, in the Province of *Chih-le*, in 39° 50' lat. N., 116° 30' lon. E.; pop. 2,000,000. The pop. of C. is believed to be very dense, but nothing accurate is known respecting either the area or the number of inhabitants. According to various missionary reports, none of which, however, can lay claim to be more than vague estimates, the area of the empire and its dependencies embraces 3,924,627 sq. m., with a pop. of 425 millions, distributed as follows:—

	Area—sq. miles.	Population.
China Proper.....	1,534,053	405,213,152
Dependencies:—		
Manchuria.....	362,213	3,000,000
Mongolia.....	1,288,035	2,000,000
Thibet.....	643,734	6,000,000
Corea.....	90,300	8,000,000
Liaotong.....	2,982	1,000,000
Total.....	3,924,627	425,213,152

The above population, giving 263 souls per sq. m. throughout C. proper, appears to be excessive, considering that some of the outlying portions of the immense territory are by no means densely inhabited. Nevertheless, other returns give still higher figures. It is stated that in 1842 the pop. of C. was officially ascertained to number 414,986,994, or 320 per sq. m., and that in 1852 it had risen to 450,000,000, or 347 inhabitants per sq. m. There is great probability that the present pop. of C., devastated as the country has been for years by internecine wars and occasional famines, does not surpass 300 millions. According to a return of the Imperial customs authorities, the total number of foreigners in C. was 3,661 at the end of 1872. Among them were 1,771 natives of Great Britain and Ireland, 541 of the U. States, 481 of Germany, and 239 of France; all other nationalities being represented by very few members. More than one half of the total number of foreigners, viz. 2,047, resided at Shanghai, and 308 at Canton, the remainder being scattered in small numbers over the ports open to foreign commerce.

The government is a despotic monarchy. There is no law of hereditary succession to the throne, but it is left to each sovereign to appoint his successor from among the members of his family. The fundamental laws of the empire are laid down in the *Ta-tsing-hwei-tien*, or "Collected Regulations of the Great Pure Dynasty," which prescribes the government of the state to be based upon the government of the family. The Emperor is spiritual as well as temporal sovereign and, as high priest of the empire, can alone, with his immediate representatives and ministers, perform the great religious ceremonies. No ecclesiastical hierarchy is maintained at the public expense, nor any priesthood attached to the Confucian or state religion. The administration of the empire is under the supreme direction of the "Interior Council Chamber," comprising four members, two of Tartar and two of Chinese origin, besides two assistants from the *Han-lin*, or Great College, who have to see that nothing is done contrary to the civil and religious laws of the empire, contained in the *Ta-tsing-hwei-tien*, and in the sacred

books of Confucius. These members are denominated *Ta-hyo-si*, or Minister of State. Under their orders are the *Liu-poo*, or six boards of government, each of which is presided over by a Tartar and a Chinese. They are:—1. The board of civil appointments, which takes cognizance of the conduct and administration of all civil officers; 2. The board of revenues, regulating all financial affairs; 3. The board of rites and ceremonies, which enforces the laws and customs to be observed by the people; 4. The military board, superintending the administration of the army; 5. The board of public works; and 6. The high tribunal of criminal jurisdiction. Independent of the government, and theoretically above the central administration, is the *Tu-chah-yuen*, or board of public censors. It consists of from 40 to 50 members, under two presidents, the one of Tartar and the other of Chinese birth. By the ancient custom of the empire, all the members of this board are privileged to present any remonstrance to the sovereign. One censor must be present at the meetings of each of the six government boards.

Manchuria, Mongolia, and Thibet are comparatively thinly peopled territories, inhabited by wandering and semi-barbarous tribes, who are held as tributaries, or under loose military government, without any attempt to impose on them the laws and general character of *C* itself. The source of the vast wealth of the state is to be found in *C*. Proper, the local features of which are understood to possess the same character of vastness, pervaded by a certain sameness approaching to monotony, which generally distinguishes the empire. The number of provinces is nineteen (of which one is Manchuria), and these are subdivided into districts, each dependent on one of the great cities. These last, according to their importance, are arranged in three classes, generally expressed by the terms *foo* and *chow* annexed to their names. The northern, central, southern, and western provinces possess each peculiar and distinctive characters.

1. *The Northern Provinces*—Chih-le, Shan-tung, Shing-king, and Shan-se—consist of very extensive plains, rising on the N. and W. into mountains or high table-land which form the lower declivity of the lofty chain that traverses Mantchoo Tartary. The winter is extremely rigorous compared with that of European countries under the same latitude; so that all the rivers, not excepting the largest, are then frozen. Hence, though the summers are proportionately hot, the more valuable articles of rice, silk, and tea, which constitute the pride of Chinese culture, cannot be reared; even wheat does not successfully resist the cold, and millet is therefore the standard grain. The high grounds wear somewhat of a pastoral aspect, and support several domestic animals, which have been banished from the more cultivated provinces. The fine manufactures that distinguish *C*. are also unknown, though there are some remains of the woollen fabrics in which she anciently excelled. The mineral products consist of iron, large quantities of coal, with lapis-lazuli, and other varieties of beautifully colored stone. This district contains the capital, Peking, which is situated in Chih-le; and its northern boundary for 1500 miles is the celebrated Great Wall, composed of two parallel brick walls, 24 feet in height, and twelve feet apart, the interval between which is filled with earth, and towers are erected at distances of 300 or 400 feet.

2. *The Central Provinces* consist of Honan, Keang-soo, Gan-hwuy, Keang-si, Che-Keang, Ho-o-Pih, and Hunan, which form decidedly the finest part of the empire. All its most valuable productions, all its finest fabrics, are here reared or manufactured. This territory consists, with little interruption, of an immense plain, through the midst of which flows the great river Yang-tse-kiang, while the numerous tributaries which fall into it from both sides, as well as those flowing northwards to the Hoang-ho, render it one of the best-watered regions upon earth. Indeed, the excess of moisture, as it renders some districts marshy, is the chief disadvantage under which it labors. Keang-soo is the province in which the riches and beauty of this part of *C*. are most amply displayed; all the products of nature and art being carried to a perfection unequalled in any other. The rice and wheat are excellent; the silk is rivalled only in Che-keang; cotton is nowhere so good. The song-lo, or green tea, the most delicate of that species, grows only on the hills of Keang-soo, and in Che-Keang, chiefly the former. The people are said to be more intelligent, and Nan-king, its chief town, was in former ages the capital, and still is the literary metropolis of the empire, and its finest city. It is celebrated for its porcelain tower, and for its flourishing manufactures,—the satias, the cotton cloth bearing its name, and its ink and paper, which are superior to any made elsewhere. Che-Keang, the rival of Keang-soo, forms, in a great measure, a continuation of the same vast plain, equally fertile and beautiful. In particular, it is completely pervaded by rivers and canals, covered with innumerable barks. All the tropical productions flourish here to a great extent; but that of silk is particularly distinguished for its quality and abundance. The commerce and manufactures of its capital, Hang-choo-foo, rank it with the greatest cities in *C*. Silks, particularly flowered taffetas, and different kinds of satia, are its peculiar staple. Keang-si, though to a considerable extent mountainous or marshy, shares in some degree the manufactures of the neighboring provinces, but is chiefly distinguished for the finest por-

celain, which is exclusively confined to King-tih-chin, one of its towns, said to contain 1,000,000 inhabitants. The other provinces in this district are less distinguished for their productions, whether natural or artificial.

3. *The Southern Provinces* are composed of Kwang-tung, or Canton, Foo-keen, and Kwang-si. These consist of the level country intervening between the sea and the extensive mountain chain which is prolonged from the Himmaleh, along the whole south of *C*, with an elevation diminishing in its progress eastward, and which forms a steep barrier separating them from the rest of the empire. High ranges also shoot across them, and terminate in rugged cliffs. In the intervals, however, are many valleys, and even extensive plains, that rival the finest of the central provinces, and are cultivated with equal diligence, though they yield no very valuable productions, except the bohea tea, reared chiefly on the hill-slopes of Foo-keen. The manufactures are various and actively pursued, yet none of them can match those of Nan-king, Hang-choo-foo, and King-tih-chin. The coast, however, is the seat of nearly all the foreign trade of the empire. Its position relative to the eastern peninsula and archipelago, its fine harbors, even the ruggedness of many of its districts, seem to have united in turning the industry of the people in this direction. Canton is the oldest seat of the trade with Europe and America, while the Chinese junks sent to the neighboring coasts and islands are almost all fitted out from the ports of Foo-keen. A bolder and more enterprising race, addicted to maritime adventure and even to emigration, inhabits these shores.

4. *The Western Provinces* bordering on Mongolia, Thibet, and Manchuria, are Sze-chuen, Yun-nan, Kwei-choo, Shen-se, and Kan-suh, but our knowledge of them is more imperfect than of any other quarter. According to every description hitherto received, their aspect, productions, and social state differ very widely from those of the other parts of the empire. The mountains are much loftier, and their recesses are occupied to a great extent by the Miao-tse, Lolo, and other independent and almost savage tribes. This region, however, is not altogether sterile or unproductive; there are some extended plains, and the mountains are generally interspersed with rich and beautiful valleys. The store of metals and minerals is particularly ample, including gold, silver, and copper. On the hills of some districts are rhubarb and other medicinal plants; and among the numerous wild animals is the one which yields musk. The rivers afford commodious channels for transporting those articles through the whole empire.

Besides these 18 provinces, the Chinese possess various islands on the coast; the principal, Formosa, being on the west, and Hainan on the south. Formosa forms part of the province of Foo-keen. It is situated at about 80 m. from the mainland, stretching from lat. 21° 53' 30" to lat. 25° 33'. The fertility of the plains has gained for Formosa the name of the Granary of *C*. On every available piece of land fields of rice and sugar are carefully cultivated, and recompense the farmer by yielding him constant and abundant crops. These alone, in addition to such products as jute, grass cloth, fibre, rice paper, and ratan, would make the island a valuable possession; but far more precious are the sulphur and the camphor which are obtained from the mines and the mountains of the island, and which are claimed by the government as crown monopolies. As the gigantic laurels from which the camphor is obtained are in the possession of the natives, the acquisition of a constant supply is somewhat difficult. About 14,000 cwt. of this commodity are, however, annually exported from the ports of Tam-say and Kelung. The Treaty Ports in Formosa are *Tai-wan-foo* (including *Ta-kong*), on the S.W. coast, and *Tam-say* (including *Kelung*), on the S.W. and N. coast.—*Hainan* is the largest of several islands situated on the coast of the province Kwang-tung. It extends for about 100 m. from N to S, and the same distance from E. to W. Gold is found in its central part; and sugar, cocoa-nuts, betel-nuts, birds' nests, and agar-agar, or sea-vegetable, are among the products of the island. The Chinese have long been represented as averse to all traffic; but we actually well know that no people are more solicitous to acquire riches, or less fastidious as to the means, and that the wealthy class are as desirous as in any other land to procure whatever appears to them useful or agreeable, without any scrupulous inquiry as to how or whence it comes. The *Internal Trade* of this vast country constitutes by far the most important part of its commerce. The variety of climate and productions throughout the empire renders the provinces mutually dependent upon each other, and affords ample scope for exchange; while the traffic is increased by the circumstance that the court, and with it the great body of opulent families, is resident at Peking, near the northern frontier, and in a country which yields scarcely a single article of elegance or luxury. Tea, the universal beverage, though produced in almost every province, is not to be found of fine quality except in the few districts already mentioned. Rice is raised only in the central and southern divisions, whence the whole consumption of the north must be furnished. Sugar is confined within nearly the same limits. The silk and cotton manufactures are carried to perfection only in the great cities of Keang-soo and Che-keang; porcelain only at King-tih-chin. Timber grows only on the mountains, and chiefly on the southern range. Salt, a government monopoly,

exists in mines as well as rock springs, but is principally procured from sea-water on the eastern and southern coasts. Although these are the principal commodities, there are obviously many others, the conveyance of which, on a scale requisite for the wants of so vast a population, must give occasion to a very extensive commerce. This great trade is conducted almost entirely by means of water communications, consisting not only of the great rivers, particularly Hoang-ho and Keangku, with their tributaries, but also of canals, with which almost the whole empire is furrowed, and upon which the Chinese have made the most lavish display of their industry and resources. The principal is the Imperial Canal, which extends 500 miles in Shang-tung and Keang-si. Compared with this grand system of water-communication, land-carriage is little regarded, and few of the roads are better than footpaths; though, when one does become actually necessary to connect any of their points of intercourse, the inhabitants spare neither labor nor cost in making it complete. The coasting trade is discouraged by government, on account of its diminishing the internal transit-dues. It is, however, pretty extensive. It is stated that the most populous part of C is singularly well adapted for the establishment of a network of railways, and a first attempt to introduce them into the country was made by the construction of a short line from Shanghai to Woosung, 40 m. in length. One half of this line, from Shanghai to Kangwang, was opened to traffic June 3, 1876, but closed again, having been purchased by the Chinese authorities.

A Chinese ship or *junk* is seldom the property of one individual. Sometimes 40, 50, or even 100 different merchants purchase a vessel, and divide her into as many different compartments as there are partners; so that each knows his own particular part of the ship, which he is at liberty to fit up and secure as he pleases. The bulk-heads, by which these divisions are formed, consist of stout planks, so well caulked as to be completely water-tight. A ship thus formed may strike on a rock and yet sustain no serious injury; a leak springing in one division of the hold will not be attended with any damage to articles placed in another; and from her firmness she is qualified to resist a more than ordinary shock. A considerable loss of stowage is, of course, sustained; but the Chinese exports generally contain a considerable value in small bulk. It is only the very largest class of junks that have so many owners; but even in the smallest class the number is very considerable.

The *External Commerce* is inconsiderable when compared to the great resources of the country. This has arisen partly from the variety of productions and manufactures exchanged by means of the vast internal trade, but chiefly from the restrictions imposed upon the foreign trade by the Chinese government. The principal article of export is tea, and it is mainly owing to the diffusion of the taste for it, and its consumption by all classes of people, that the foreign trade of C has attained its present importance. The other articles of export are raw silk and silk manufactured, cassia lignea, and a few more; but they are of very inferior value and importance as compared with tea. The principal articles of import are opium, cotton and woollen goods, mineral oil, etc. The commercial intercourse of C is mainly with India, Great Britain, and the U. States. The exports to Great Britain consist mainly of tea and raw silk. The imports of British produce, consisting for the most part of manufactured cotton and woollen goods, are gradually decreasing, the value of total imports from that country in 1877 being \$22,023,439, against \$33,141,180 in 1871.

The commerce of C with the U. States is second in importance only to that with Great Britain. Its increase during the few last years has been considerable, and the textile industries of America, especially the manufacture of cotton, are rapidly gaining in favor and reputation, while the consumption of the British-made piece goods, which come into competition with our own, is on the decrease. The total imports of American goods into C amounted in 1874 to \$11,491,628, and the total exports to \$15,805,379. The principal articles of imports were:—Cotton manufactured, \$2,557,554; mineral oil, \$597,293; carriages, \$109,013; silver bullion, \$7,752,048. The principal articles exported were:—Tea, \$9,218,065; raw silk, \$2,957,617; rice, \$317,973; opium, \$241,183; palm-leaf, \$376,393; brown sugar, \$137,031.

The U. States have, in virtue of various treaties with the Chinese government (the first and most important signed June 18, 1858), the right of access to 21 ports of the empire, known as treaty ports, and divided into 11 primary or consular ports (in each of which the U. States have a consulate), and 10 secondary ports, the first class comprising Canton, Amoy, Foo-chow, Ningpo, Shanghai, Swatow, Tientsin, Chee-foo, Hankow, Kinkiang, and Newchwang. By an additional convention, made in 1876, the Chinese government consented to open, on the 1st of February, 1877, three more towns to foreign trade, namely, Wenchow, a seaport between Foo-chow and Ningpo; Woo-hoo, on the lower Yang-tse, beyond Nankin; and Ichang, on the Upper Yang-tse, 330 m. further inland than Hankow, and nearly in the centre of the Empire. The following are the most important ports open to foreign trade:—

Amoy, in Foo keen Co., on an island called Hia Mun, lat. 24° 40' N., lon. 118° E. It is the most accessible of all the consular ports in C, no pilots being required on entering or departing, though boatmen often board the ship to offer assistance. Some

regulations were once issued requiring merchantmen to engage pilots to and from the Chau Chat rocks, but their use is now optional. The water communication with the interior is not, however, equal to that enjoyed by the other ports. The harbor is a bay, and an inner harbor. The inner harbor is one of the best on the coast. There is good holding ground in the outer harbor, and vessels can anchor in the inner, within a short distance of the beach, and be perfectly secure. The tide rises and falls from 14 to 16 feet. The western side of the harbor, from 675 to 840 yards wide, is formed by the island of Kulangsu. The channel round the island of Amoy is so narrow and winding that directions would be useless, the chart being the best guide. Besides the excellent shelter that this harbor affords, the Chinese have docks for repairing and building their largest junks. The docks are worthy of notice. Vessels of almost any size can obtain anything necessary for repairs. The company's large granite dock is 286 feet long on the blocks, and at average springs can take vessels drawing from 16 to 17 feet. The dock is fitted with a caisson gate, and with a centrifugal steam pump of great power, insuring despatch at all states of the tide. Pop., 300,000.

Canton, formerly the chief commercial mart of C, is the capital of prov. Kwang-tung, in lat. 23° 5' 10" N., lon. 113° 14' 30" E., on a broad and navigable tidal stream, the Chu-Kiang, or Pearl River, forming one of the channels by which the united waters of two great interior streams, the North and West Rivers, reach the sea. Canton is situated in the most southerly of the provinces on the seaboard of C. This province is traversed from W. to E., from N. to S., and from E. to W., by three magnificent streams, of which the two latter are navigable by heavily-laden boats for distances of from 200 to 300 m., whilst the former is derived from the remotest interior, 400 m. accessible for fully 700 m. along its own channel, and navigable also by large steamers for nearly 300 m. from the sea. The North and West Rivers join about 30 m. to the westward and northward of Canton, whence, in a noble channel of more than a mile broad known as the Lower West River, or the Broadway, they pursue a direct southerly course to the sea. A portion of the united West and North Rivers is, however, diverted at the junction through a narrow channel in an easterly direction, and, after passing the important trading and manufacturing town of Fat-shan (Foo-shan), expands at Canton into the broad tidal river, branching into two channels (eventually subdivided into an intricate network around numberless flat, alluvial islands), which has the name of Chu-Kiang. 12 m. farther down the river is the sale and commodities anchorage of Whampoa, and 10 m. lower the East River joins, discharging itself by several mouths channelled through an alluvial plain. The bold shore a few miles lower down, and some rocky islets, compress the stream into a considerably narrower channel, called by the Chinese Hu Mun, or Tiger's Mouth, and by the Portuguese Boca Tigris, and hence *The Fogue*. On leaving the Bogue, the river expands to a breadth of several miles, joining by numerous tortuous channels the waters of the Lower West River, until it is finally lost in the sea about 80 m. from Canton. The breadth of the estuary is fully 70 geographical miles. At the extreme eastern limit lies the island forming the British colony of Hong Kong, 40 m. to the westward of which, and close to the Broadway Channel, is the Portuguese settlement of Macao. The facilities offered to commerce by so extensive a river-system, and its accessibility from the sea, made Canton at a very early date the principal seaport of the empire. This distinction it retained despite the drawback it suffers by its distance from the rich producing districts of Central C. The opening of new ports to the foreign trade was very prejudicial to the prosperity of Canton. The teas and other exports which were formerly brought by a land journey of 600 m. from the producing districts of Hu-peh across the mountains, and down the North River to the Canton market, were now purchased at Hankow, in the centre of the producing districts, and despatched by steamers navigating the Yang-tse to Shanghai, whence they were shipped to America and England direct. Imports, in like manner, were introduced at half a dozen eligible points to the markets of the interior. Hong Kong, too, in 1854, suddenly rose in importance, owing to the prevalence of the rebellion around Canton, which caused many of the native traders to seek security in Hong Kong, either as residents or by transporting merchandise thence in steamers to Canton. Two years later the entire foreign community was removed from Canton, owing to the pending hostilities with England, and a large accession to the importance of Hong Kong as a settlement was the natural consequence. The proximity of the English colony to the seat of trade gave encouragement to merchants to maintain their depots and residences in the island, inducing the Chinese dealers to visit them there for the purchase of imports. For the introduction of these into the interior, exceptional facilities were afforded by the numerous branches of the Canton River, through which merchandise, and especially opium, can be clandestinely conveyed, and the payment of customs duties at Canton avoided. Under these circumstances Hong Kong grew rapidly at the expense of Canton; and when tranquillity was restored, it became apparent, after a year or two, that the great mercantile houses need no longer make the latter place their head quarters. The number of foreign residents has dwindled year by year in pro-

portion to the growth of Hong Kong, whilst the introduction of powerful river steamers built in the U. States, and making the voyage between Canton and Hong Kong daily in less than six hours, has rendered it still more easy for the Chinese dealers to visit the colony and supply their wants from the importers there in the cheapest and most expeditious manner. In consequence of this revolution in the method of conducting trade, many of the principal firms have withdrawn altogether from Canton, whilst others are still represented by assistants employed for the purchase of tea and silk; but a large and increasing proportion of the trade has passed into the hands of commission agents, whilst the Chinese themselves are learning very rapidly to do business on their own account, or through the medium of the foreign commission agencies, thus progressively curtailing the importance of those few celebrated houses which once drew to themselves all but a fractional part of the entire outward and inward trade. Rapidity of intercommunication, the employment of steam, the extended use of the English language, and the vast influx of competitors from all parts of the world, are rapidly reducing the power of capital to a level with that of energy and enterprise, native as well as foreign; but with the more uniform distribution of the advantages of trade are entailed the evils of commercial insecurity and unsettled markets, with the attendant calamities of periodical failure and panics. Although Canton is situated nearly in the

is well supplied with fish from the numerous canals and rivers by which it is intersected. Steamers of heavy burden can ascend the river to an anchorage immediately facing the Shamien Site; and, although the limits of the port of Canton are officially held not to extend above the anchorage of Whampoa, the advantage to trade which is entailed by the loading and discharging of steamers at Canton is so great, that a tacit permission is given to the practice. Several large steamers trade regularly between Canton, Shanghai, and Tien-tsin, carrying almost exclusively native merchandise, such as drugs, dried fruits, iron and brass ware, paper (of which large quantities are manufactured near Canton from the macerated hull of the bamboo), etc. It is rarely that foreign traders are concerned in these shipments. The great staples of tea and silk, opium and cotton goods, may still be said to occupy almost exclusively the attention of foreign merchants. German and French houses do, indeed, import some quantities of petty European manufactures, among which watches and fire-arms take the lead; but the importance of this trade is not great. Among the articles of the second class to be enumerated are matting and fire-crackers (largely shipped to the U. States), and drugs. Pop., 1,200,000.

FOO-CHOW, the capital of prov. Foo-keen, is one of the principal Treaty ports. It lies on the river Min, 34 m. from its mouth in the Formosa Channel, in lat.  $26^{\circ} 2' 24''$  N., and lon.

Fig. 74. — MANDARIN'S BOAT.

same parallel of latitude as Calcutta, there is a considerable difference in their temperature; the former being much cooler, and requiring fires during the winter months. The streets are very narrow, paved with little round stones, and flagged close to the sides of the houses. The front of every house is a shop, and those of particular streets are laid out for the supply of strangers. China Street is appropriated to Europeans; and here the productions of almost every part of the globe are to be found. One of the shop-keepers is always to be found sitting on the counter, writing with a camel's-hair brush, or calculating with his swanpan, on which instrument a Chinese will perform operations in numbers with as much celerity as the most expert European arithmetician. The Chinese, considered as traders, are eminently active, persevering, and intelligent. They are, in fact, a highly commercial people; and the notion that was once very generally entertained, of their being peculiarly characterized by a contempt of commerce and of strangers, is as utterly unfounded as any notion can possibly be. Business is transacted at Canton with great despatch; and nowhere in the world may cargoes be sold and bought, loaded and unloaded, with more business-like speed and activity. Provisions and refreshments of all sorts are abundant in Canton, and, in general, of an excellent quality; nor is the price exorbitant. Every description of them, dead and alive, is sold by weight. It is a curious fact that the Chinese make no use of milk, either in its liquid state, or in the shape of curds, butter, or cheese. Among the delicacies of a Chinese market are to be seen horse-flesh, dogs, cats, hawks, and owls. The country

119° 25' E., 185 m. from Amoy, 335 from Swatow, 410 from Shanghai, and 510 from Hong Kong. The navigation of the estuary of the Min is intricate and dangerous, the guide to the transit being the prominent landmark called Sharp Island Peak. At about 8 m. from the mouth the stream contracts to a channel not more than half a mile in width, at the passes of Kin-pai and Minguan. Above these passes is the anchorage for foreign vessels at Lo-sing Island, called also Pagoda Island. Vessels are held to have entered the port when they have passed Kin-pai, and the shipment and discharge of cargo take place at Pagoda Island, Kushan, and the river between the bridge and Tien-how Island. The shallowness of the river above Pagoda Island, about 10 m. from Foo-chow, precludes the passage of any but very light craft. The principal exports are of tea, of which about 75,000,000 lbs are annually exported. The qualities are Oolong to the U. States, and Congou and Souchong to England. The local weights are one third less than those employed elsewhere. Thus the Foo-chow catty is nearly equal to the lb. avoirdupois. The payments are reckoned in Sycee, cut dollars being 13.2 per cent discount, clean Mexican 12 per cent. There is a dock at Pagoda anchorage, 300 feet long, 95 broad, and 22 deep, which is owned and managed by Europeans. Pop. 800,000.

HANKOW, one of the five chief commercial cities in the empire, and the most important among the river ports in C. opened to foreign trade, in lat.  $30^{\circ} 32' 51''$  N., lon.  $114^{\circ} 19' 55''$  E.; 582 geographical miles from Shanghai. It faces Han-yang city, across the Han, and Woo-chang across the Yangtze.

It is nearly in the centre of C., at the junction of the Han and Yangtze, and commands the most extensive river communication in the world. The depth of the river at the mouth of the Han is 11 fathoms in Dec., and much more in July. The export trade consists chiefly in tea, silk, wool, oil, tobacco, and vegetable tallow, and amounts in value to about 15,000,000 taels annually. Most of the tea is transhipped at Shanghai, but some is loaded at Hankow for America and England direct. The imports are chiefly cotton piece goods, woollens, silk, and sugar. The trade with this port is said to be seriously hindered by the practice of affording long credits to the native buyers of imports. The navigation of the Yangtze is difficult and somewhat dangerous. Pop. 600,000.

KIU-KIANG, a river port on the right bank of the Kiang-se, and close to the outfall into that river of the waters of the So-yang lake, 137 m. by land from Hankow. Tea is the principal export. The chief imports are textile fabrics and opium. The foreign inhabitants are not numerous, and trade has not increased according to expectation. In 1877 the value of imports in foreign vessels was \$19,676,500, and of the exports \$15,770,476. Pop. 400,000.

NEUCHWANG, the most northerly of the Treaty ports, in the Manchurian prov. of Shing-king, on the river Liaou, lat. 41° N., lon. 122° 30' E., at 35 m. from Monkden. The trade, which is rapidly increasing, is mostly confined to Shanghai and Swatow. Navigation is closed 3 months of the year by ice. The imports consist chiefly of opium, sugar, and cotton goods. The import of cotton goods for the year ending June 30, 1878, consisted of 974,387 pieces, against 769,468 in 1877. The increase was notably on American drills, of which 200,000 pieces were imported, against 79,000 during the preceding year, and American and English sheetings. Of iron, bar and nail-rod, 11,294,705 tons were imported in 1878, against 4,905,466 tons in 1877. There was also an increased demand for lead. 360 vessels of 152,009 tons cleared the port in 1878, against 286 vessels of 100,289 tons in 1877.

NINGPO, in the prov. of Che-keang, on the river Yung, lat. 29° 55' 12" N., long. 121° 22' E. The port commences at the river's mouth; three islets, called the Triangles or Yew Islands, forming three passages to the river. The port is 11 m. up the stream, which is about 600 yards wide at this point, with depths varying from 5 to 2 fathoms. Vessels of 17 feet draught can proceed to the city at half-tide in the spring. European pilots procured at Chin Hai. The access to the river Yung was facilitated by the construction of two lighthouses on the islands off its mouth. The first is built on Square Island, and is 186 feet above the sea-coast, lat. 29° 59' 22" N., long. 121° 45' 6" E. The second lighthouse, 154 feet above the sea level, is on Tiger's Island, about half a mile from the entrance of the river, lat. 29° 57' 43" N., long. 121° 43' 51" E. The chief exports are tea, silk, and cotton; the imports, textile fabrics, opium, and rice. In 1877 vessels of all nations entered 477, tons 268,643. There is a custom-house under foreign management. On the opposite side of the river is a foreign settlement, where the consuls reside, and from 30 to 40 foreigners carry on trade. Pop. 115,000.

SHANGHAI, or *Shanghai*, a seaport city, and the chief emporium now open for foreign commerce, in prov. Keang-soo, on the Wong-poo River, 100 m. E.S.E. of Nankin, and 12 m. above the mouth of the Wong-poo, in the estuary of the Yangtze. The Wong-poo, though three fourths of a mile broad, opposite Shanghai, with a depth of 3 or 4 fathoms, is little better than a mere tidal channel reaching 40 m. inland, and draining away the surplus waters from the interior chain of lakes. The land to the N. and E. of Shanghai has been formed within the last three centuries by the alluvium brought down the Yangtze. This process of deposition going on, the great city may, in course of time, find itself cut off from its communications with the sea, and the sources of its present prosperity dried up. Lat. 31° 15' N.; lon. 121° 29' E. It stands on a level and highly cultivated plain, and is enclosed by a wall 5 m. in circuit, immediately outside of which are several populous suburbs. It is an important entrepot of the commerce between the N. and S. provs. of China, exporting manufactured goods to Tien-tsin, in the metropolitan prov. of Chih-le, and importing large quantities of pulse, flour, meats, rhubarb, and skins from the shores of the Yellow Sea. An extensive internal communication by water facilitates its trade with all the N. half of China, and it is stated to have a direct trade with the countries of Central Asia. Its coasting trade is also very extensive, and 3,000 junks are often crowded together in its river, many being from Hankow, Canton, and the Malay archipelago. This refers to the native city only, the foreign settlement being entirely distinct. It is situated outside the walls to the N. and E., on the left bank of the Wong-poo River, 3 m. long by 1 m. wide, and divided into the American, British, and French concessions. On the opposite bank is the Pootung suburb, where are large manufs. of machinery, and ship-building establishments. The river is here crowded with shipping from all parts of the world, the anchorage extending for 5 m. down, where from 250 to 300 sailing ships and steamers may be seen at anchor, some of the latter 2,500 tons burthen. The chief custom-house under foreign control in China is at this port, with a harbor-master and pilot board. There are fifteen consuls, the principal being British, American, and French. These have criminal

jurisdiction over the subjects of their several nations, and the Chinese are amenable to the *Taotai*, or chief magistrate of the city. There is also a foreign municipality for the construction and conservation of public works, with power to tax the natives; but beyond these there is no regular executive or legislative government. *Shanghai* has few products of its own; its importance arises from its position as a central emporium of N. China, and the country up the Yangtze-Kiang. It has regular steam communication with all the open ports in China and Japan, and fortnightly with India and Europe. There are three daily newspapers, two weekly, and two fortnightly, published in the English language; and four three times a week in Chinese. Principal exports to foreign countries are silk, tea, cotton, cassia, camphor, and porcelain; and imports opium, specie, cotton and woollen goods, munitions of war, hardware, and general merchandise. In 1877, 1979 vessels of 211,316 tons entered, and 1,971 of 1,244,636 tons cleared the port. The annual export of tea to the U. States averages about 22,000,000 lbs. Pop. 400,000.

SWATOW, or *Chan-chow*, in prov. Kwang-tung, on the left bank of the river Han and 5 m. from its mouth, 22 m. E.N.E. of Canton. Its foreign trade is considerable. 809 vessels of 391,600 tons, of all nations, cleared the port in 1877. The value of imports for that year, consisting chiefly of bean-cake, opium, cotton piece goods, and woollen goods, was \$8,872,400.

TIENTSIN, in the metropolitan prov. of Chih-le, in which is situated Peking, the cap. of the empire. It is situated at the junction of the rivers Wan-ho and Peiho, which flow into the Gulf of Pih-chih-li, lat. 39° N., lon. 118° E. Two miles below the city is the "concession," or quarter for foreigners. The U. States, together with almost every European nation, is here represented by a consul. It is a great entrepot for salt. The trade of the city has for several years been going over in great part into the hands of the Chinese merchants, who, by going to Shanghai and purchasing for themselves and shipping direct, are in a position to undersell the foreign merchant at Tien-tsin. The port is closed three months of each year (Dec. to March) by ice, but during this time sledges supply the place of junks on the river, and commercial activity does not flag. In 1877, 712 vessels, of 288,348 tons, entered and cleared. The imports consist chiefly of gray and white shirtings, T-cloths, Turkey-red cambrics, camlets, and opium.

*Finances.*—The amount of the public revenue of China is only known by estimates. According to the most authentic of these, the total receipts of the government in recent years averaged \$125,000,000, derived from taxes on land, grain, licenses, and customs duties upon exports and imports. The receipts from customs alone are made known. They amounted to 7,572,257 hai-kwan tael, or \$11,783,565, in 1864, and gradually increasing, had risen to 12,152,921 hai-kwan tael, or \$18,229,390, in 1876. The customs duties fall more upon exports than imports. The expenditure of the government is mainly for the army; the maintenance is estimated to cost \$75,000,000 per annum on the average. C. had no foreign debt till the end of 1874. In Dec., 1874, the government contracted a loan of \$3,138,376, bearing 8 per cent interest, secured by the customs revenue. A second 8 per cent foreign loan, likewise secured on the customs, to the amount of \$8,021,350, was issued in July, 1878.

*Money.*—The Chinese have no silver coin, and keep their accounts in tael, mace, candarens, and cash, forming a decimal system, of which only the lowest member is represented by a coin. Weight of silver is, indeed, the basis of their notation in this respect. A tael or *taang* equals 1½ oz. of silver, and is divided into 10 mace (*tsen*), the mace into 10 candarens (*sen*), and the candarens into 10 *tsi*, to which 1 cash in copper should precisely correspond. Owing, however, to the decline in the value of the cash, which for nearly half a century has undergone progressive depreciation in the mintage, the average value of the tael is 1.400 copper cash (*lung-tai-tsen*). These coins are cast in moulds, with a square hole occupying the centre, around which, on the obverse, are Chinese characters, denoting the reign, with the words "Circulating Value," and on the reverse the name of the mint in Mantchoo characters. In large native transactions, pure silver, known as *Sycee*, is the basis of exchange. The silver is cast in ingots, called *shaos*, from a fancied resemblance in shape; these weigh from 1 to a tael 100 taels. Silver of the highest standard of purity is produced at the Customs Bank by melting and refining the foreign coin received in payment of duties, and is known as *Hai-kwan* (i. e. customs) *Sycee*. The *Hai-kwan Tael* = \$1.61.

The *fineness of gold and silver* is expressed by dividing the weight into 100 parts, called *taques*, or touch, similar to the French practice. Thus, if an ingot be 93 touch, it is understood to contain 7 parts of alloy and 93 of pure metal, making in the whole 100. The fineness of the precious metals, expressed in these decimal proportions, may be converted into English proportions by the following analogies. Suppose gold is 91.66 touch, say, as 100 : 91.66 :: 12 : 11, the standard, and *vice versa*; and to convert standard silver into touch, say, as 240 : 222 :: 100 : 92.5, the touch of sterling silver.—*Gold* is not considered as money, but as merchandise; it is sold in regular ingots of a determined weight; the largest of these weigh 10 taels each; and the gold is reckoned 94 touch, though it may be only 92 or 93.

Table for converting Chinese Money Weight into English Troy Weight.

Taels	oz.	dwt.	grs.	Mace.	oz.	dwt.	grs.
100	120	16	0	8	0	19	7.872

9	1	1	17.856				

**Weights and Measures.**—Gold and silver are weighed by the tael of 16 taels; the tael is divided into 10 mace, 100 candareens, or 1,000 cash. 100 taels are reckoned to weigh 120 oz 16 dwt troy, which makes the tael equal to 579.8 English grains, or 37.568 grammes. The weights and measures in ordinary use for merchandise at the treaty ports, and in the intercourse with foreigners, are as follows:—

The *Liang*, or Tael = 1½ oz avoirdupois.  
 " *Picul* = 133 lbs.  
 " *Catty* = 1½ " "  
 " *Chih* = 14.1 inches.  
 " *Chang* = 11½ feet.  
 " *Lys*, or *Li* = 194 to a degree, or about ½ Eng. mile.

In the tariff settled by treaty between Great Britain, America, and China, the *Chih* of 14.1 English inches has been adopted as the legal standard. It is the only authorized measure of length at all the ports of trade, and its use is gradually spreading all over the empire.

**Banking.**—The following lines on the course of banking with C. which may be pursued, may be of interest to many American merchants who seek to extend their business relations in this direction.—say goods from New York to Shanghai. If no advance is required in New York, shippers may send to one of the Chinese agencies of a London bank (the Oriental Bank Corporation for instance) the bills of lading authorizing delivery against payment. The usual charge for collecting and remitting in this way is one half per cent. In case the above instanced bank was employed, the best form of remittance would be its six months' sight draft on the Union Bank of London, which could be discounted there if required. If money is wanted in New York at time of shipment, a credit on London could be arranged, the charges for this credit being a question for the London head office,—probably 1½ per cent. The shipping documents may then be sent to Shanghai bank agents direct by the banker negotiating in New York, or they can accompany the draft, and be sent on from London. On receipt of payment, or partial payment, of any amount, the Shanghai bank would remit by sight draft, which would go against the New York draft and any interest due. The interest would not be much, if any, less than 6 per cent per annum, and more when the Bank of England rate was over 6 per cent, and may be chargeable from date of maturity of the New York draft till due date of China remittance. If the goods are shipped to a port in China where the London bank has no agent, its Shanghai branch will constitute an agent or agents for the time being, who would be entitled to charge a commission on their own account in addition to the one half per cent charged by the bank.

**Chinese Immigration.**—Important among the proceedings of the Chamber of Commerce of New York, affecting the international relations of the U. States, was its action, in Feb. 1879, upon the bill passed by both Houses of Congress, and, fortunately for the credit of the nation, vetoed by the President, restricting Chinese immigration to the U. States. The subject was presented by Mr. A. A. Low, whose life-long connection with the Chinese trade gave to his opinions peculiar weight. He called attention to the fact, that, in any attempt of such exclusiveness, we were but repeating the traditional policy of non-intercourse of the Celestial Empire itself, which has been altered with so much difficulty, and he gave warning that C.

might well retaliate by putting an end to the treaty of amity, commerce, and navigation now existing between the Empire and the Republic. He concluded with an earnest appeal to the President to withhold his sanction from the bill as unworthy of the country. Mr. William H. Fogg, also one of the oldest merchants in the trade with C., followed in support of the arguments presented. He pointed to the fact, that we are just entering upon a new era in our relations with the Celestial Empire, and showed the folly of our giving just cause of offence to this sensitive people at the precise moment when their secular prejudices are beginning to yield to the pressure of civilization from without. Mr. Elliot C. Cowdin then addressed the Chamber as follows:—"What is the cause of the extraordinary action of our national legislators in regard to our hitherto much vaunted treaties with the Chinese government? California has come to Congress with three special complaints with regard to the Chinese, and these complaints have proved sufficient to excite, and I might almost say to frighten, a nation of well-nigh fifty millions of people, into a proceeding unprecedented in its history. These complaints are: 1st. That the Chinese are coming to this country in overwhelming numbers, and, by an unfair competition with white labor, are driving it from the field. 2d. That this enormous immigration is not voluntary, but that these Chinamen are, in reality, a servile class. 3d. That their vices make them a demoralizing and destructive element in a community. Now, what are the facts? As to the enormous immigration, the official records of the San Francisco Custom-House show that of all the Chinese who had arrived in California for the twenty years ended July 1st, 1868, nearly three eighths had returned to China, and that the total number remaining at that time on the Pacific coast was less than 65,000. Since that time the reports of the U. States Bureau of Statistics indicate that not more than 48,000, at a liberal estimate, have been added to that number, if we allow the same percentage as in previous years for their returning. According to these figures, it is difficult to see how there can be, on the whole Pacific slope, more than about 130,000 Chinese scattered through all the States and Territories of that vast region. As to the number in California itself, so late an authority as the *Sacramento Union*, of the 15th of the present month, estimates it at not more than 60,000. Are these numbers now increasing? Far from it. On the contrary, the recently published record of arrivals and departures for the last six months in 1878 shows that during that period 4,646 Chinese sailed from California, while only 1,955 arrived there. So much for the overwhelming volume of Chinese immigration! As to the allegation that these Chinamen are creating an unfair competition especially detrimental to white labor, let us see what they have done. The State records of California show that the Chinese, so early as 1861, paid in taxes, licenses, water rates for mining, the purchase of native products, and in other ways directly beneficial to the country, upwards of \$13,000,000 in a single year. An excellent authority estimated that in 1867 this sum had increased to \$18,000,000, being \$45 to each one of the white population of the State, estimating that population at 400,000. Can such a sum pass into the general business of a State without greatly benefiting its industrial classes? What sane man, who is annually relieved of \$45 of taxation, can accuse the people who have done this of burdening the community? Let us now look at the question as to the voluntary character of their immigration. Mr. George F. Seward, our present Minister to C., and for more than ten years Consul and Consul-General in that Empire, has written explicitly, 'This emigration has been entirely voluntary in its character.' Dr. S. Wells Williams, for more than twenty years our Secretary of Legation, and repeatedly Acting Minister to China, says: 'They come and go from their own shores just as freely as Americans do from theirs.' Further authority is certainly unnecessary, yet this high testimony can be confirmed by the report of almost every official who has investigated the subject. With regard to the charge, that the vices of the Chinese make them a dangerous class, we have the testimony of the Californians themselves, given at a time when politics had not entered into this question. In 1862, a Joint Select Committee of the California Legislature made a report in which these passages occur: 'It is charged that the Chinese demoralize the whites. We cannot find any ground for the allegation. We adopt none of their habits, form no social relations with them, but keep them separate and apart, a distinct, inferior race. They work for us; they help us build up our State by contributing largely to our taxes, to our shipping, farming, and mechanical interests, without, to any extent, entering these departments as competitors. They are denied privileges equal with other foreigners; they cannot vote, nor testify in courts of justice, nor have any voice in making our laws, nor mingle with us in social life. Certainly we have nothing to fear from a race so contemned and restricted.' These facts should be accepted as a conclusive answer to this charge. With regard to the specific accusation that the Chinese women are brought here solely for immoral purposes, the report just quoted says that this practice 'is as abhorrent to their respectable merchants as it is to us.' And in a memorial addressed to the President in 1876, by the *Six Chinese Companies of San Francisco*, these merchants state the case as follows: 'A few years ago our

Chinese merchants tried to send these prostitutes back to C., and succeeded in getting a large number on board the outgoing steamer; but a certain lawyer of your honorable nation (said to be the author and bearer of these resolutions against our people), in the employ of unprincipled Chinamen, procured a writ of *habeas corpus*, and brought all these women on shore again; and the court decided that they had a right to stay in this country if they so desired. The extent of this evil, abhorrent as it is, is greatly over-estimated. According to the Annual Report of the Bureau of Statistics, the whole number of Chinese women who came to this country during the fiscal year 1877 was only 76. These are some of the grounds on which Congress has hastily decided to reverse the established policy of the government, and abruptly break the faith of the nation, as solemnly pledged in the Burlingame Treaty of 1868. . . . As a member of this Chamber, not less than as a life-long friend of the lamented Burlingame, I should be recreant to my duty did I not enter a solemn protest against an act of injustice so monstrous, that I cannot believe it will meet with Executive approval." Other speeches were made in the same direction, and a memorial to the President was unanimously adopted by the Chamber. See HONG-KONG.

**China, China-ware.** See PORCELAIN.

**China Blue,** a pigment consisting of oxide of cobalt, melted with felspar and potash. It is chiefly used to paint pottery-ware.

**China-Blue Style,** a mode of calico-printing, in which indigo-blues are printed on the cloth, and fixed by baths of salts of iron and of alkali.

**China-Clay,** decomposed felspar of the granite, a fine potter's clay largely used in ceramic manufactures. See CLAY.

**China Crape, Canton Crape,** a very fine kind of crape.

**China Goods,** a commercial name for all goods imported from the Chinese ports, whether of native or foreign origin.

**China-Grass Cloth,** a beautiful fine fabric made from the fibre of an Indian nettle, *Bombaria nivea*, imported in this country as handkerchiefs. The finest kind is made from the fibre of several species of the genus *Sida*, and are imported from China, where they are called *hid pi* (i. e. summer cloth).

**China-Ink.** See INK.

**China-Matting.** See MATTING.

**China-Merchant** is a merchant whose business is exclusively in Chinese goods directly imported by him. — *China-Dealer* is one who keeps glass, earthen-ware, porcelain, and pottery for sale.

**China-Orange,** the sweet orange, *Citrus aurantium*, so named from the plant having been received originally from China.

**China-Root,** a large tuberose knotty root, of a dark reddish-brown color on the outside and reddish-white within, produced by *Smilax China*. It was formerly much used in medicine, but is now seldom imported. Imp. free.

**China-Wine,** a Chinese liquor, made from rice distilled with various fruits and vegetable substances to give it flavor. It contains from 25 to 28 per cent of alcohol, and is sometimes imported from Hong-Kong to San Francisco.

**Chinchew,** a name in China for sugar-candy.

**Chinchilla,** a little rodent animal, *Chinchilla lanigera*, which is about 6 inches in length from the nose to the root of the tail, with small pointed ears, a short muzzle, teeth like the house-rat, and a tail of moderate length. It lives in burrows under ground, in the open country, in the northern prov. of Chili. The C. is celebrated for the beauty of its fur, which exceeds in warmth and softness that of any other animal, and has been long known as an expensive and useful article in the dress of ladies.

**Chine,** a piece of meat cut near the back-bone of an animal. — The ridge of a cask where the ends of the staves are united. — The part of the water-way of a ship left above the deck.

**Chiné,** goods of worsted, cotton, silk, and linen, with printed warps.

**Chineing-Machine,** in coopering, is a machine used to chamfer the ends of staves on the inner surface, and form the chine.

**Chinese Balance,** a form of the *steelyard*, having four points of suspension, and as many graduated sides to the weight-arm of the lever. See STEELYARD.

**Chinese Beer,** a fermented drink made by the Chinese, from barley or wheat, with a bitter added to the wort.

**Chinese Crackers.** See FIRE-CRACKERS.

**Chinese Sugar-Cane.** See SORGHUM.

**Chinese Varnish.** See VARNISH.

**Chinese Wax,** the produce of an insect of the cochineal tribe, analogous in its chemical constitution to spermaceti. It is much valued by the Chinese.

**Chinese Yellow,** a color obtained from a very bright sulphuret of arsenic brought from China.

**Chingkei,** the Malay name for cloves.

**Chingle,** small coal.

**Chink,** a vulgar name for cash or money.

**Chinois [Fr.],** a small unripe orange, preserved in sugared brandy.

**Chinsing,** a temporary calking or stopping of the seams of a ship's deck or sides with oakum, which is thrust in with a small iron.

**Chin-Strap,** in saddlery, a strap connecting the throat-strap and nose-band of a halter.

**Chintz [Fr. indiennes; Ger. Zitz; It. indiane; Port. chitas; Sp. chites, zuzas],** a peculiar style of fast-printed calico, in which figures of many different colors are impressed upon a white or light-colored ground. Chintzes often possess great beauty of design and richness of color.

**Chintz-Pattern,** anything having a running or fancy pattern of divers colors, as cottons, paper-hangings, etc.

**Chintz-Printer,** one who forms or stamps chintz patterns or prints.

**Chinum,** a weight in Mysore of 8 grains

**Chip,** a small slip or thin cutting of wood. — A kind of straw plait, the leaves of *Thrinax argentea*, a Cuban palm prepared for hats.

**Chip Bonnet,** a lady's bonnet made of fancy straw plait, or palm leaves.

**Chip Flats** are flats made of chip plaiting. They come from Italy or France, where they are prepared for the market.

**Chip Plaiting,** prepared and twisted thin chips of the wood of the willow, used for hats and bonnets. They come from Carpi, Italy.

**Chiragon,** a writing frame for the blind.

**Chiretta,** the Indian name of the *Agathotes chiretta*; all the parts of the plant are extremely bitter, and highly esteemed as a tonic and febrifuge.

**Chirish,** a mucilaginous liquor used by the weaver in the East for saturating his yarn, said to be procured from the root of a plant of the Asphodel family.

**Chirk,** a name for chert-stone or horn-stone, used for making the grinding-stones of pottery-mills.

**Chirogymnaste,** a square board with contrivances for exercising the fingers of a pianist; an instrument of a similar kind for guiding the hands of a piano-forte player is called a *Chiroplase*.

**Chiropodist,** one who removes corns, and attends to callosities of the feet.

**Chisel,** a mechanic's sharp cutting tool for shaping or gouging wood and stone, of which there are many kinds; as *flinner* chisels, coach maker's chisels, mill-wright's chisels, long paring chisels, rip-

ping chisels, blunt chisels, best mortise chisels, sash chisels, mortise-lock chisels, socket chisels, etc.; cold chisels are stouter tools of steel, for cutting iron, etc.

**Chiselled-Work**, wood or stone shaped with the chisel; sculptured work.

**Chiselling**, the process of shaping a block of stone by a sculptor or stone-worker. — A slang name for cheating.

**Chit**. See CHITTHI.

**Chitak**, **Chittack**, the lowest denomination of the gross Indian weights; the 16th part of the seer, and equal to 1 oz. 17 dwts. and 12 grains troy; a land measure of 45 square feet, the 16th of the cottah; the fifth part of the koonkee, a small grain measure weighing about 2 oz.

**Chitarah**, a cotton and silk stuff made in Turkey.

**Chite**, a kind of Spanish cotton stuff.

**Chitterlings**, **Chitlings**, parts of the smaller intestines of some animals, cleansed and prepared for food.

**Chitthi**, **Chittie**, ordinarily abbreviated to chit, a common Indian name for a bill, bond, draft, or order for payment, note, etc.

**Chives**, an alliaceous plant, *Allium schænoprasum*, the leaves and young tops of which are used as a pot-herb.

**Chlorate of Potash**, an interesting compound of chloric acid and potash, which, when strongly triturated, crackles, throws out sparks, and becomes luminous. It forms an ingredient of the composition for tipping lucifer-matches, is used for bleaching fats and oils, and has been recently introduced into medicine as a tonic and valuable remedy for nervous complaints.

**Chloride of Lime**. See BLEACHING-POWDER.

**Chlorimetry** is the process of estimating the proportion of available chlorine in bleaching-powder, which may vary from 20 to 36 per cent.

The process depends upon the great power with which chlorine, in the act of being liberated from its compounds, causes the oxidation of many substances. The salt generally used is pure crystallized sulphate of iron, which in its ordinary state gives a deep blue color, with a drop of ferridcyanide of potassium, but ceases to do so when it has been fully oxidized, or converted from a proto-salt into a per-salt, through the influence of chlorine. It being known that 78 grains or parts of sulphate of iron are oxidized by 10 grains or parts of chlorine, the mode of procedure in *C.* is as follows:—78 grains of fine crystals of the sulphate of iron are dissolved

in water slightly acidulated with hydrochloric acid in a white porcelain basin. A given quantity of the bleaching powder—say 50 grains—is dissolved in a little tepid water, and introduced into a tall measure-glass called a *chlorimeter* or *burette* (Fig. 75), similar to an alkalimeter, which is divided into 100 parts, and water added till the solution rises to the top mark. After subsidence of the insoluble matter, the clear solution is very gradually poured into the solution of sulphate of iron in the basin, the whole being kept constantly stirred, and every now and again a drop of the iron solution is taken out and placed on a new drop of ferridcyanide of potassium placed on a white plate; and whenever the iron solution ceases to produce a deep blue, and only forms

Fig. 75. — CHLORIMETERS.

a light greenish-yellow tint, it is known that the iron has been fully oxidized by the chlorine. Suppose that at this stage the burette has been emptied to the 55th division; as we know that the liquid poured out must have contained 10 grains of chlo-

rine, we can calculate the chlorine contained in the whole; for  $55 : 10 :: 100 : 18.18$ .

Thus 50 grains of the powder contain 18.18 grains of chlorine, or 36.36 per cent.

**Chlorine**, a gas possessing a yellowish-green color, and a pungent, suffocating odor. It is a non-metallic element, and one of the heaviest substances that are gaseous at ordinary temperatures, being nearly 2½ heavier than atmospheric air; sp. gr. 1.47. It is soluble to a considerable extent in water, that liquid at 60° F. absorbing about twice its volume. It is non-inflammable, but its union with some of the elements is attended with the phenomena of combustion: thus, phosphorus, copper leaf, powdered antimony and arsenic, and several other substances, thrown into chlorine, immediately inflame. Under a pressure of 4 atmospheres it is condensed into a yellow, limpid liquid. Moist *C.* gas cooled to 32° F. condenses into yellow crystals, containing 35½ parts of chlorine and 90 parts of water. The most remarkable property of chlorine is its power of destroying almost all vegetable and animal colors, and the putrid odor of decomposing organic matter; hence its value as a bleaching agent, and as a disinfectant and fumigator. When first proposed as a bleaching agent by Berthollet, it was used much the same way as sulphur is now in bleaching woollen goods; afterwards a solution of the gas in water was employed, but the final improvement was Tennant's patent of combining the gas with lime to form *chloride of lime*. With the bases chlorine forms an important series of compounds called chlorides. — Free *C.* is readily distinguished from other gases by its color, suffocating odor, and bleaching properties. The aqueous solution dissolves gold-leaf, and with nitrate of silver gives a white, curdy precipitate.

**Chloroform** is a highly limpid, mobile, colorless liquid, which is very volatile, has a characteristic and pleasant odor, and an agreeable sweetish taste. Sp. gr. 1.48; boiling point, 140° F. It is not inflammable in the ordinary sense of the term, as it will not take fire when a light is brought down upon it; but when thrown on red-hot coals, it burns with a green flame, evolving much smoke. It is slightly soluble in water, but more readily mixes with alcohol and ether. The vapor has the remarkable property of rendering a person breathing it temporarily insensible to pain. It dissolves camphor, amber, copal, and other resins, wax, caoutchouc, black and red sealing-wax, iodine and bromine, as well as strychnine and other alkaloids. Its purity may be determined by placing some on the palm of the hand, and allowing it to evaporate, when no alcoholic or other odorous substance should be even momentarily recognized; and by agitation with oil of vitriol, when, on settling, the *C.* should readily swim on the surface of the vitriol, and the two layers of liquid remain colorless. *C.* is anodyne, antispasmodic, sedative, stimulant, and anæsthetic. In small doses (5 to 12 or 15 drops, in water, mixed with a little syrup or mucilage) it is employed in spasmodic disorders, and as a stimulant and diaphoretic. It is however chiefly used as an anæsthetic to produce insensibility to pain during surgical operations. The dose for inhalation is 1 fluid dr., which is repeated, in a few minutes, if no effect is produced, until 3 fluid dr. have been thus exhibited; the effects being carefully watched, and the source of the chloroform vapor removed as soon as a sufficient degree of anæsthesia is produced, or any unpleasant symptoms develop themselves. *C.* in large doses depresses the heart's action, and causes profound coma, and death. It is therefore dangerous in all cases com-

plicated with diseases of the heart or brain, or any visceral affections of a congestive character. The average price of *C.* in New York is for American *C.* \$0.80, for Scotch *C.* \$3.00 per lb. *Imp. duty*, \$1.00 per lb.

The remarkable anæsthetic power of *C.* has led to its preparation on a very extensive scale. The materials employed are alcohol, water, and bleaching powder, and the proportions are four parts of bleaching powder, to which sufficient water is added to make a thin paste, and thereafter one part of spirits of wine: the whole is introduced into a capacious retort, which must not be more than half filled, and, heat being applied, the *C.* accompanied by water and a little alcohol, distils over. As the *C.* is heavier than water, and is not readily miscible therewith, two layers of liquid are obtained in the receiver, — the upper being water and alcohol, and the lower being chloroform. The upper liquid being cautiously poured off, the *C.* is agitated with fused carbonate of potash, which abstracts the remaining traces of water, and on subsequent redistillation the *C.* is obtained pure and ready for use.

**Chlorometer or Chlorimeter.** See CHLORIMETRY.

**Choca**, a mixture of coffee and chocolate.

**Chock, Chuck**, a piece of wood for stopping or raising anything.

**Chock and Block**, a nautical and mining term, signifying closely wedged, or tightly filled up.

**Chock-Full, Choke-Full**, anything quite full, and into which no more can be put.

**Chocolate** [Fr. *chocolat*; Ger. *Schokolade*; It. *cioccolata*; Port. and Sp. *chocolate*], a beverage or paste made from the roasted seeds of the *Theobroma cacao*, or cocoa (see CACAO). Strictly speaking, the term *C.* is applicable to all genuine preparations of cacao, but it is now generally used to distinguish those which contain sugar, and, commonly, flavoring substances. To prepare *C.* the cacao or cocoa nibs are ground in a mill consisting of stone or metal rollers, which are usually heated either by charcoal fires or by steam, so as to soften or melt the natural fat (Butter of Cacao). The warm, smooth paste which passes from the mill is then placed in a mixing mill, and incorporated with refined sugar, and usually vanilla or other flavoring substance. The trituration is continued until the whole paste is converted into an entirely homogeneous mass, which is finally shaped, by means of suitable moulds, into various forms, as blocks, loaves, tablets, lozenges, etc. *C.* prepared as above, without the addition of aromatics, is known in the trade as *plain C.* The Spaniards flavor it with vanilla, cloves, and cinnamon, and frequently scent it with musk and ambergris. With these additions it is termed *Spanish C.* In general, they add too large a quantity of the last four articles. The Parisians, on the contrary, use little flavoring, and that principally vanilla. They employ the best kinds of cocoa, and add a considerable quantity of refined sugar. So prepared, it is called *French C.* — *C.* is used as a beverage, and for this purpose is dissolved in hot water or milk. In a pure state it soon satisfies the appetite, and is very nourishing; when it contains spices, it is also stimulating. Good *C.* is externally smooth, firm, and shining, not gritty in the fracture, easily soluble, aromatic; not viscid after having been liquefied and cooled, but oily on the surface, and leaves no sediment of foreign substances. *C.* is adulterated in many ways, by mixing it with rice-meal, oat-meal, flour, potato starch, roasted hazel-nuts or almonds, and with benzoin, storax, etc., in place of vanilla. Simple cacao or cocoa is more generally used in this country than *C.* *Imp. duty* 5 cts. per lb.; fancy, styled *london* or *C.* sweetmeats, 50 per cent.

Fig. 76 represents a *C.* mill. Upon the sole *s*, made of marble, six conical rollers *a* and *b* are made to run by the revolution of the upright axis or shaft *q*, driven by the agency of the dy-

wheel *E* and level wheels *k*. The sole *s* rests upon a strong iron plate, which is heated by a small stove, introduced at the door *u*. The wooden framework *v* forms a ledge, a few inches high, round the marble slab, to confine the cocoa in the act of trituration. *c* is the hopper of the mill through which the roasted beans are introduced to the action of the rollers, passing first into the flat vessel *d*, to be thence evenly distributed.

Fig. 76. — CHOCOLATE MILL.

After the cacao has received the first trituration, the paste is returned upon the slab, in order to be mixed with the proper quantity of sugar and vanilla, previously sliced and ground up with a little hard sugar. When the *C.* is sufficiently worked, and while it is thin with the heat and trituration, it must be put carefully into the proper moulds. If introduced too warm, it will be apt to become damp and dull on the surface; and if too cold, it will not take the proper form. It must be previously well kneaded with the hands to insure the expulsion of every air-bubble.

**Chocolate Nut**, a name given to the beans or seeds of *Theobroma cacao*. See CACAO.

**Choka**, a Hindustani name for rice.

**Choke-Damp**, a miner's name for carbonic acid and other dangerous gases.

**Choleta**, a kind of coarse linen or canvas.

**Choliah**, or **Choolia**, a native coasting vessel on the Coromandel coast.

**Chop**, a trade name in China for the entire bulk of a certain kind of tea brought to market, or the quantity made, usually comprising 600 chests of Congou, but sometimes reaching 1,000 chests. In this country the term is also used to denote a special quality, trade-mark, or brand of tea, coffee, or other goods; as, tea of the first chop, i. e. of the first quality.

**Chopper**, an edge tool or small hatchet for domestic use.

**Chopping-Block**, a large solid block of wood, used by butchers and others to chop meat, etc. upon.

**Chopping-Machine**, a rotatory machine for mincing sausage-meat.

**Chop-Sticks**, small pieces of wood used by the Chinese to convey food to the mouth, in the place of the knife and fork or spoon of other nations.

**Chorographer**, one who lays down maps or plans descriptive of a country.

**Chow**, corrupted from Chaver or Chau, the nominal weight by which pearls are valued in India, the 6th part of the grain as a weight for silver. The Chow is nominally divided into 320

fractional parts. The term has also reference to the quality and value of the gem, ascertained by the size, color, and weight. See KALLINGEE and MARIJADY.

**Chow-Chow**, a Chinese word applied to any mixture; but in trade circles usually applied to mixed pickles.

**Chowder**, a soup made with fish.

**Chowder-Beer**, an infusion of black spruce in water sweetened with molasses, used by the fishermen of Newfoundland as an antiscorbutic.

**Chowkee**, a kind of cane chair made in India of rattans, the *Calamus rotang* and *arborescens*.

**Christiania**. See NORWAY.

**Christian d'or**, a Danish gold coin, worth about \$2.54.

**Christiansand**. See NORWAY.

**Christmas-Trees**, small growing firs or artificial trees, sold to decorate with candies, fancy ornaments, etc., on festive occasions.

**Christofia** is a stomatic brandy or wine made of 1500 parts white wine, 20 parts cinnamon, 10 parts cloves, 60 parts bitter almonds, digested several days; 300 parts of sugar and 500 of spirit are then added, and the whole filtered.

**Chromacome**, for dyeing the hair black. This is said to be prepared from harmless vegetable materials, but really consists of pyrogallie acid and nitrate of silver.

**Chromate**. See CHROMIUM.

**Chrome Green**. See GREEN PIGMENTS.

**Chrome Red**. See RED PIGMENTS.

**Chrome Yellow**, the chromate of lead. See CHROMIUM.

**Chromium, Chrome**, a metal resembling iron in color, brittle, and difficult of fusion. Sp. gr. 5.9. It is rarely to be found in its metallic state, but several of its compounds are used in the arts. In commerce, it chiefly occurs in the forms of chromate of iron and chromate of lead.

*Chromate of Iron, Chrome Iron-ore*, is a compound of oxide of chrome with protoxide of iron. It is found in Shetland, in France, and in the U. States. It occurs massive, and in octahedral crystals of a blackish color and imperfect metallic lustre. Sp. gr. 4.3. It is used in the manuf. of chromate of potash.

*Chromate of Lead, Red Lead, Chrome-Yellow*, is found native in the gold mines of Beresof in Siberia, in the Ural Mountains, and in Brazil, and is easily prepared by mixing chromate of potash with a soluble salt of lead. It occurs massive and crystallized; color deep orange-red; when pulverized, orange-yellow. Sp. gr. 6. It is a valuable pigment, and is used both in oil and water colors, in calico-printing, and in dyeing. Imp. duty 25 per cent.

*Chromate of Potash* is a salt of a bitter disagreeable taste; crystals yellow. Sp. gr. 2.6 The *Bi-chromate of Potash* is prepared from the chromate; it has a bitter, penetrating metallic taste. Sp. gr. 1.93. This salt is largely manufactured in Glasgow, for the use of calico-printers. Imp. duty, 3 cts. per lb.

The other compounds chiefly in use are the *Oxide of Chromium*, employed to give a green color to glass and to porcelain, and *Chromic Acid*, which, from its property of destroying most vegetable and animal coloring-matters, is advantageously employed in calico-printing. Imp. duty of chromic acid, 15 per cent.

**Chromo-Lithography**. See LITHOGRAPHY.

**Chromo-Typography**. See PRINTING.

**Chronograph, or Time Indicator**, is a sort of clock which leaves a visible testimony to the lapse of intervals of time. In one form of the instrument an observer presses down a small key at the beginning of any astronomical observation, and another at the end. Two dots are thus made on a piece of paper coiled round a revolving cylinder; and clock-work connected with the cylinder enables the distance between the two dots to measure an extremely minute portion of time. A much simpler kind of chronograph has been

invented by Mr. Benson, to measure the duration of horse-races, etc., by two little spots of ink which the instrument is made to deposit; it will measure tenths of a second.

**Chronometer**. See WATCH.

**Chrysaniline**. See ANILINE (YELLOW).

**Chrysoberyl**, a gem much prized when transparent and free from flaws. It is a hard, aluminous stone of a green color, sometimes with a yellow or brownish tinge, and occasionally presenting internally an opalescent, bluish-white light. It occurs crystallized, and in rolled fragments. Sp. gr. 3.7. The finest specimens are procured from Brazil.

**Chrysolite**, an ornamental stone of a bright yellow color, sometimes tinged with green or brown; transparent or translucent; and possessing double the power of refraction. It is found in angular, or somewhat rounded, crystalline masses, and in prismatic crystals. Sp. gr. 3.4. The best specimens are brought from Egypt.

**Chrysoprase** is a rare pale-green chalcedony, found in Upper Silesia and in Vermont, which owes its color to the presence of nickel. It loses the delicacy of its original hue by being much handled or worn as an ornament; it is, however, much prized by jewellers, and usually cut into a convex form.

**Chuck**, a piece of wood or metal affixed to the end of the mandril of a lathe for keeping fast the body to be turned.

**Chudder**, a wrapper for a female, in India, used to envelop the upper part of the person. It is worn in loose folds, and the material may be either silk, muslin, or cambric, etc.

**Chu-lan**, a name in China for the spikes of flowers of *Chloranthus inconspicuus*, which are there used to scent tea.

**Chumbalee Oil**, an Indian name for the essential oil of jasmine.

**Chump**, a short, thick, heavy piece of wood, less than a block in size. — A bony part of the loin in meat.

**Chunam**, an Indian name for lime made from sea-shells or coral.

**Chundoo**, a small dry measure of Ceylon, about the quarter of a pound; one fourth part of a seer.

**Chupah**, a Malayan grain measure, the fourth part of a guntorig; 30 chupahs make one bushel of rice = to 56 lbs.

**Church Plate**, the utensils for the administration of the Eucharist.

**Church Regalia**. See REGALIA.

**Churka**, corrupted from the Bengalee charaki, a wheel or rotatory machine; a rude hand-mill with rollers for cleaning cotton from the seeds in India.

**Churn**, an agitating instrument for separating the butter from milk, of which there are several kinds. See BUTTER.

**Churn-Drill**, a large drill several feet long, with a chisel joint at each end, used in the mining districts.

**Churrus**, a crude, resinous exudation, obtained from the Indian-hemp plant, *Cannabis indica*.

**Chutney, or Chutnee**, a condiment or pickle made in India, compounded of sweets and acids, of which there are several local kinds, as Cashmere chutney, Madras chutney, Bengal chutney, sweet chutney, green mango chutney, etc. It is much eaten in the East with curries, stews, etc.

**Cibarious**, good for food, esculent.

**Cider** [Fr. *cidre*; Ger. *Apfelwein*; It. *cidro*; Sp. *sídra*], an alcoholic beverage obtained by the fermentation of the juice of apples. When of good

quality, and in good condition, *C.* is a wholesome, agreeable, and refreshing stimulant beverage; but it is very prone to undergo acetous fermentation, and develops a rough, sharp, vinegary taste, and in that condition its consumption readily causes diarrhoea and colic. *C.* is largely prepared and consumed in the S.W. counties of England, and the N.W. departments of France; also in Upper Austria, Wurtemberg, the districts of the Maine and the Moselle, in Holland, and in most of the Northern States of America. The best *C.* made at the present day is that of Normandy (France), Newark (U. States), and Herefordshire (England). *C.* is sold by the barrel, or in bottles. The best *C.* contains from 8 to 10% of absolute alcohol; ordinary *C.* from 4 to 6%. Imp. duty 20 per cent.

*C.* apples are classed under three heads, — bitter, sweet, and sour. The first are the best; their juice has the greatest specific gravity, is the richest in sugar, ferments the most freely, clarifies spontaneously the quickest, and keeps the best after fermentation. They contain a minute quantity of extractive matter, which is not present in other apples. The juice of sweet apples ferments tumultuously, clears with difficulty, and the resulting *C.* does not keep so well as that produced from the first variety. The juice of sour apples contains less sugar and more acid than the other two, and consequently not only produces the weakest, but the worst *C.*; it, however, "fines" well, although it "stores" badly. Sour and "rough-tasted" apples are usually preferred by farmers for making *C.* This preference may be readily accounted for. The sour and rough-tasted apples contain less sugar and more malic acid than some of the other varieties, and the presence of this acid impedes the conversion of the alcohol of the *C.* into vinegar, a change which their rude mode of operating renders otherwise inevitable. But *C.* made with such apples never equals in quality that prepared at a low temperature, from fruit abounding in sugar, provided equal skill is exercised in the manufacture as in the process of converting malt-worts into beer. The process of making *C.* varies in different places, but in every case essentially consists of the collection of the fruit, the expression and fermentation of the juice, and the storing and management of the fermented liquor. The collection of the fruit should not be commenced before it has become sufficiently mature, and should be performed with greater care than is commonly bestowed upon it. The apples, after being gathered, are usually left for 14 or 15 days in a barn or loft to mellow, during which time a considerable portion of the mucilage is decomposed, and alcohol and carbonic acid developed. If this "ripening" is allowed to go too far, loss arises notwithstanding the vulgar prejudice in its favor. The spoiled apples are then separated from the sound ones, as they not only impart a bad flavor to the *C.*, but impede its spontaneous clarification. The expression of the juice is the next step. The apples are crushed or ground in mills consisting of two fluted cylinders of hard wood or cast-iron, working against each other. The common practice is next to sprinkle the pulp with  $\frac{1}{2}$  to  $\frac{1}{3}$  of its weight of spring or river water, and then to allow it to remain in tubs or wooden cisterns for 12 or 14 hours, during which time incipient fermentation commences, and the breaking up of the cells of the membrane takes place, by which the subsequent separation of the juice is facilitated. This plan, though general among *C.* manufacturers, is prejudicial to the quality of the future liquor, as not only is a portion of the newly-formed alcohol lost, but the skins and pips often impart to it a disagreeable flavor. By employing more efficient crushing machinery this system of vatting is rendered quite unnecessary. A machine furnished with a revolving circular rasp, similar to that used in making potato starch, is admirably adapted to this purpose. The pulp of the crushed or ground apples is now placed on a kind of wicker frame, or in hair-cloth or coarse canvas bags, and, after being allowed to drain into suitable tubs or receivers, is subjected to powerful pressure, gradually applied, in the cider-press. The liquor which runs off first is the best, and is usually kept separately; whilst that which follows, especially the portion obtained by much pressure, tastes of the pips and skins. The expressed juice, or *must*, obtained as above, is next put into clean casks with large bung holes, and freely exposed to the air and the shade, where they are placed on stilts, with flat tubs under them to catch the waste. They are now constantly attended to and kept quite full, in order that the yeast, as it forms, may froth over and be carried off from the surface of the liquor. After 2 or 3 days for weak *C.*, and 8 or 10 days for strong *C.*, or as soon as the sediment has subsided, the liquor is *racked off* into clean casks, which have been (according to the common practice) previously sulphured with a cooper's match. The casks containing the racked *C.* are then stored in a cellar, shaded barn, or other cool place, where a low and regular temperature can be insured, and are left to mature or ripen. By the following spring the *C.* is commonly fit for use, and may be *re-racked for sale*. Pre-

paratory to bottling *C.* it should be examined, to see whether it is clear and sparkling. If not so, it should be clarified in a similar way to beer, and left for a fortnight. The night before it is intended to put it into bottles the bung should be taken out of the cask, and left so until the next day, and the filled bottles should not be corked down until the day after, as if this is done at once many of the bottles will burst by keeping. The best corks should alone be used. Champagne bottles are the variety generally chosen for *C.* It is usual to wire down the corks, and to cover them with tinfoil, after the manner of champagne. A few bottles at a time may be kept in a warm place to ripen. When the *C.* is wanted for immediate use, or for consumption during the cooler portion of the year, a small piece of lump sugar may be put into each bottle before corking it; or, what is the same thing in effect, the bottles may be corked within 2 or 3 hours after being filled. In summer, and for long keeping, this practice is, however, inadmissible. The bottled stock should be stored in a cool cellar, when the quality will be greatly improved by age. *C.* for bottling should be of good quality, sound and piquant, and at least a twelvemonth old. When out of condition it is unfit for bottling. Much of the excellence of *C.* depends upon the temperature at which the fermentation is conducted, a point utterly overlooked by the manufacturers of this liquor. Instead of the apple juice, as soon as it is expressed from the fruit, being placed in a cool situation, where the temperature should not exceed 50° or 62° F., it is frequently left exposed to the full heat of autumn. In this way much of the alcohol formed by the decomposition of the sugar is converted into vinegar by the absorption of atmospheric oxygen, and thus the liquor acquires that peculiar and unwholesome acidity known in the *C.* districts by the name of "roughness." When, on the contrary, the fermentation is conducted at a low temperature, nearly the whole of the sugar is converted into alcohol, and this remains in the liquor, instead of undergoing the process of acetification. The acetous fermentation, by which alcohol is converted into vinegar, proceeds most rapidly at a temperature of about 50° F., and at lower temperatures the action becomes gradually slower, until at 45° to 50° F. no such change takes place. It is therefore evident that if the saccharine juice of apples, or any other fruit, is made to undergo the vinous fermentation in a cool situation, less of the spirit resulting from the transformation of the sugar will be converted into acetic acid, and consequently more will be retained in an unaltered state in the liquor to improve its quality, and by its conservative and chemical action to preserve it from future change.

**Champagne Cider.**—This name is given to a fine, pale variety of *C.*, much used for bottling, which has a great resemblance to inferior champagne. The best variety comes from New Jersey. The following is a good form for a "made" *C.* of this class:—Good pale vinous *C.*, 1 hhd., proof spirit (pale), 3 gals.; honey or sugar, 14 lbs.; mix well, and let them remain together in a temperate situation for 1 month; then add orange flower water, 3 pints; and in a few days fine it down with skimmed milk,  $\frac{1}{2}$  gal. A similar article, bottled in champagne bottles, silvered and labelled, is often sold to the ignorant for champagne.

**Cider-Apples**, common kinds of orchard apples grown for making cider, which are usually distributed into 3 classes, the sweet, the bitter, and the sour.

**Cider-Brandy**, a liquor distilled from cider.

**Ciderist**, a maker of cider.

**Ciderkin**, a weak kind of cider.

**Cider-Vinegar**, vinegar made from refuse cider.

**Cie**, the French abbreviation for Company, synonymous with our Co.

**Cigar and Cigarette.** See Tobacco.

**Cigar-Box**, a wooden box, usually of cedar, in which cigars are packed.

**Cigar-Case**, a pouch or fancy receptacle to hold cigars for the pocket.

**Cigarette-Making Machine**, a newly invented machine by which 80 to 100 cigarettes per minute are made, and much neater than those made by hand.

**Cigarette-Paper**, a thin paper for rolling cut tobacco in for smoking, which is made largely in Spain and France.

**Cigar-Holder, Cigar-Tube**, a mouth-piece or tube for holding cigars; also, a cigar-case.

**Cigar-Machine and Cigar-Mold** are machines for making fillers of cigars and wrapping them.

**Cimolite**, or **Kimaulia-Earth**, a hydrous silicate of alumina of a grayish-white color, occurring

in the Grecian island of Cimoles. It has the property of cleaning cloth, and bleaching linen, and is used as a substitute for fullers' earth.

**Cinchona, Peruvian Bark** [Dutch *china-bast*; Fr. *quinquina*; Ger. *Kron-china*; Sp. *quina*, *quenquina*]. There are nearly 40 different known species of *C.* trees, from the bark of many of which is obtained the celebrated medicine *quinine*. The original habitat of the genus *C.* is the Andes, where it is found at a height of between 3,000 and 12,000 feet above the sea, growing mostly in patches, distributed amongst the palms, plantains, and other tropical trees that form the vast forests, for the most part clothing the eastern slopes of the Cordilleras, and extending from 10° north to about 19° south latitude. In this district there is always an abundance of moisture and a mean temperature of about 62°. In 1853 the Dutch government introduced the *C.* into Java, and in 1861 the East Indian government, following their example, introduced it into British India, where it is now acclimatized, large plantations of it growing on the Neilgherries and in the valleys of the Himalayas. The *C.*

Fig. 77. — CINCHONA CALISAYA.

is now also successfully cultivated in Ceylon and Jamaica. The department of agriculture of the U. States has tried for many years to introduce the cultivation of several species of *C.* in Southern California, and in several of the Southern States, more particularly Florida, but all the experiments made were unsuccessful, owing to adverse climatic conditions, showing that the plant will not stand the slightest degree of frost without injury. The febrifuge powers of *C.* are said to have been made known in Europe in 1640, by a Countess of Chinchon, wife of the viceroy in Lima, who had been cured by it. The bark is collected in the forests in the dry season, and sent in bundles in the green state to the nearest inhabited place, where it is dried in the sun, the utmost care being requisite to protect it from wet, as even a few hours' dew falling on the half-dried bark will give to the interior a blackish appearance, and greatly lessen its value. The finest is said to come from single trees growing in the most elevated spots, but there are many varieties; and as moisture and adulteration are also common, great experience is necessary to select the finest kinds. It is asserted that 800 to 900 trees are cut down in order to furnish 11,000 lbs. of bark, and that 25 to 50 ounces,  $1\frac{1}{2}$  to 3 per cent, are the two extremes of quinine obtained from 100 lbs. bark. *C.* bark is brought to the U. States in chests

or serous. The quantity imported varies greatly from one year to another, and prices are in consequence also greatly variable. 4,853,006 lbs., valued at \$1,417,699, were imported in 1878, from the U. States of Colombia, Brazil, Venezuela, and England. *Imp. duty*, bark and root, free; muriate of *C.*, 40 per cent.

The following varieties are distinguished by English and American druggists:—

1. **PALE OR CROWN BARK** (Sp. *Cascarilla fina de Uritusinga*), the produce of the *C. Condaminea*, *C. crispia*, and other varieties of the *C. officinalis* of Linnaeus, is the original *C.* of Peru. It is quilled, straight, 6 to 15 inches long, from the size of a crow-quill to that of the thumb in diameter, and in thickness from  $\frac{1}{10}$ th to  $\frac{1}{4}$ th of an inch. Epidermis entire, with external surface longitudinally furrowed, and crossed with fissures; it presents various tints of gray, irregularly covered with minute white lichens. Inner surface and powder of a cinnamon-brown color. Taste, bitter, somewhat acid, aromatic, and astringent; odor, faint, peculiar, and aromatic. The quills of middle size are preferred.

2. **GRAY BARK** (Sp. *Cascarilla provinciana*), also called silver bark, and Huanaco bark, procured from the *C. serobulata* of Humboldt, is exported from Lima. It occurs in quills larger than the preceding, less furrowed, more uniformly grayish-white, inside redder, fracture closer and more resinous; epidermis entire. Taste and odor nearly identical with crown bark. It is a superior kind, but it comes mixed with ash-bark and rusty bark.

3. **CALISAYA OR YELLOW BARK** (Sp. *Cascarilla Calisaya*), the source of QUININE, grows in Bolivia and the Peruvian province of S. Carabaya. It occurs partly quilled and partly flat. The quills, larger than the crown and gray, are 9 to 15 inches long, 1 to 2 inches in diameter, and  $\frac{1}{4}$  to  $\frac{1}{2}$  inch thick; generally single, with the epidermis wrinkled longitudinally, and with transverse fissures; rough; grayish-brown, mottled with lichens. Inner surface smooth, and yellower than the preceding kinds. Transverse fracture close but splintery. Taste and odor stronger than pale bark. The flat pieces, often stripped of their epidermis, are 8 to 18 inches long, and 1 to 4 inches broad. Good flat bark is preferred to the quilled; and the finest are the middle-sized pieces, dense and close in texture. Cuzco bark and Orange bark are sometimes substituted for this kind.

4. **RED BARK** (Sp. *Cascarilla colorada*), growing on the Andes, chiefly in Ecuador, in the forests of Chimborazo. It consists sometimes of quilled, but more commonly of flattish pieces, from 2 inches to 2 feet long, 1 to 5 inches broad, and  $\frac{1}{4}$  to  $\frac{1}{2}$  inch thick; generally covered with the epidermis, which is rough, wrinkled, little fissured, reddish-brown, with grayish efflorescence in the hollows, from lichens. Taste very bitter and astringent. The quills, similar in size to those of yellow bark, are paler than the flat pieces. Red bark is scarce, dear, and rarely seen genuine.

The inferior, yet still genuine kinds, are chiefly, — Ash-bark, of unknown origin, mostly used for adulterating pale; Rusty bark, imported from Lima, little esteemed; White Loxa bark differs little from Rusty. Hard Carthagena bark, and Woody Carthagena bark, both quilled and flat, are little valued, Cuzco bark, a good species, very bitter, is rare in the English trade; and Orange bark of Bogota, which resembles yellow bark, but is spongy, and feebly bitter. The spurious barks used in adulterations are chiefly species of *Exostemma*, *Buena*, and *Strychnos*.

**Cincinnati**, one of the most important commercial and manufacturing cities of the U. States, situated in the S.W. part of the State of Ohio, on the N. bank of the Ohio River, in lat. 39° 6' N., lon. 84° W., 120 m. S.W. of Columbus (cap. of the State), 340 m. E. of St. Louis, 280 m. S.E. of Chicago, and 610 m. W. by N. of Washington. It is the cap. of Hamilton Co., and in size is the first city in the State of Ohio, and the eighth in the U. States. On the opposite side of the Ohio River, in the State of Kentucky, are Covington (pop. 24,505), and Newport (pop. 15,087). Communication between these cities and *C.* is afforded by two bridges and three steam-ferries. The wire suspension bridge, which is 1,057 feet long between the towers (or, including the approaches, 2,252 feet), with a height of 100 feet above low water, was completed in 1867 at a cost of nearly \$2,000,000. *C.* covers an area of 24 sq. m., extending along the river about 10 m., with an average width of 3 m. It is a fine and wealthy city, also noted for the beauty of its suburbs and its surrounding scenery.

Founded in 1788, *C.* was incorporated as a city in 1814, and soon acquired a commercial importance which has steadily increased. Seven railroads entering the city are used by thirteen companies, and besides these two lines terminate at Covington on the opposite side of the river. About 300 passenger and freight trains arrive and leave daily on these roads. For their use are four depots near the river in different parts of the city. Communication with different parts of the city and with the suburbs is afforded by 14 lines of street railroad, with about 50 m. of track, and by numerous lines of omnibuses and stages. The top of the adjacent hills is reached by an inclined steam passenger-railway. The position of the city on the Ohio River gives it communication with the extensive river system of the Mississippi valley; while it is connected with Lake Erie by the Miami Canal, whose northern terminus is at Toledo, Ohio. The Miami is connected by a branch with the Wabash and Erie Canal, the largest in the U. States (374 m.), which extends from Toledo to Evansville, Indiana, on the Ohio River. The whole number

in 1878 was \$632,528, on which the duty paid was \$271,590. The total value of the products of manufacturing industry has increased from \$46,905,002 in 1860 to \$127,459,021 in 1870 and \$133,125,768 in 1877. The details for the last-mentioned years are as follows:—

INDUSTRIES.	1870.		1877.	
	Hands empl'd	Value of products	Hands empl'd	Value of products.

Fig. 78. — TYLER DAVIDSON FOUNTAIN.  
(Cincinnati.)

of steamboats, towboats, and barges plying between *C.* and other ports, for the year ending Aug. 1878, was 342, with an aggregate tonnage of 84,868. The number of arrivals of steamboats in 1878 was 2,942, in comparison with 2,048 in 1877, and the departures were 2,942, compared with 2,053 in the preceding year. The large steamboats of the Mississippi River are enabled to reach *C.* by means of the canal around the falls of the Ohio at Louisville, Kentucky, which was opened in 1872. About three fourths of the commerce of the city is by railroad and canal, and the remainder by river transportation. The extent of the entire commerce is indicated by the value of imports, which for the year 1878 was \$223,237,157, and of exports for the same year \$186,209,646. *C.* is one of those interior ports to which, under the act of Congress passed in 1870, foreign merchandise may be transported without appraisement and payment of duties at the port of first arrival. The value of such imports to this city during the year

The leading commercial organization in *C.* is the Chamber of Commerce and Merchants' Exchange, which has about 1,200 members, holds daily sessions, and publishes yearly reports of the highest interest. The Board of Trade has about 900 members, chiefly manufacturers. There are also a mechanics' institution, cotton exchange, a pork-packers' association, 4 commercial colleges, etc. *C.* contains 6 national banks with a capital of \$4,300,000, and 17 private banks with a capital of \$2,168,000. It has a paid fire department under the control of 5 commissioners appointed by the Mayor. The city is supplied with water obtained by pumping from the Ohio River by means of three immense reservoirs, two of which have a capacity of 100,000,000 gallons each. An industrial exhibition has been held in *C.* in the autumn of each year since 1871, and has attracted numbers of visitors to the city. The buildings are centrally situated, and occupy  $3\frac{1}{4}$  acres of ground. Pop. about 300,000.

The following cursory review of the most important branches of commerce and industry of *C.* is condensed from the Report of the Chamber of Commerce for the commercial year ending August 31, 1878:—

*Beer*.—The celebrated lager beer of *C.* goes to all parts of the U. States, and, in addition to that which is bottled in the city, is largely bottled in New York for shipment to Madras, Bombay, and Calcutta, whither it has been exported with satisfactory results. The total quantity of malt liquors manufactured in *C.* in the year was the largest in the history of the city, having been 550,518 barrels, against 475,212 in 1877, and 407,790 in 1872. In gallons, the product in *C.* aggregated 17,960,058, against 14,731,571 in the preceding year. In the production of the beer, there were consumed of malt, 1,316,741 bushels; hops, 1,122,062 lbs.; rice, 697,000 lbs. In addition to these there were consumed approximately, of coal, 6,000,000 bushels; coke, 3,750,000 bushels, and ice, 60,000 tons. The business with other localities exhibits a steady increase, as shown by the following table:—

Years.	Receipts, bbls.	Shipments, bbls.
1869.....	3,408	65,920
1870.....	6,569	86,740
1871.....	5,155	117,909
1872.....	4,610	130,825
1873.....	6,897	123,625

Years.	Receipts, bbls.	Shipments, bbls.
1874.....	4,882	121,604
1875.....	6,422	109,172
1876.....	7,913	125,360
1877.....	5,431	148,519
1878.....	7,882	184,634

**Boat Building.**—This line of business shows a decided increase over the previous year, the whole number of vessels built having been 22, of which 18 were steamers (including ferry-boats), with an aggregate tonnage of 6,704, against 14 vessels and a tonnage of 4,434 in 1877.

**Boots and Shoes.**—The aggregate business in sales, both of manufacturers and jobbers, decreased about 10% in 1878, in consequence of the general depression of trade; but the following table of imports and exports, during a period of 10 years, shows a steady progress in the manufacturing business, the demand increasing as the qualities of the C work became better known:—

Years.	Receipts. Cases.	Shipments. Cases.
1869, cases.....	51,162	21,829
1870, do.....	90,994	17,698
1871, do.....	104,907	48,134
1872, do.....	108,627	38,894
1873, do.....	79,928	42,807
1874, do.....	91,584	47,733
1875, do.....	88,049	57,548
1876, do.....	78,820	79,100
1877, do.....	117,000	100,820
1878, do.....	85,931	97,972

**Candles and Soap.**—The future of the candle business is by no means clear, the general introduction of other kinds of artificial light having made inroads on the relative demand for these goods. The fine C. candles, however, are beginning to come into successful competition in foreign countries with candles made abroad. The shipments for the year 1878 were 231,727 boxes, against 233,654 in the preceding year. While the production of candles scarcely holds its ground, the manuf. of soap exhibits a marked increase. The quantity produced in 1878 was the largest in the history of the city, the total shipments at C. aggregating 366,802 boxes, against 332,533 in the previous year. The production of soap from cotton-seed oil, which originated in this city, is yearly assuming more importance. The C. soaps go to all parts of the country. Maine, California, and Texas are all liberal customers of C. manufacturers, while in a prime grade of laundry soaps C. finds a market in the Eastern cities.

**Cotton.**—Table showing the annual receipts and shipments at C. for a period of 10 years:—

Years.	Receipts, bales.	Shipments, bales.
1869.....	137,417	137,043
1870.....	153,639	148,024
1871.....	230,411	182,556
1872.....	122,128	117,849
1873.....	137,575	127,489
1874.....	195,895	188,083
1875.....	151,980	150,550
1876.....	185,376	171,773
1877.....	175,627	171,834
1878.....	184,895	183,983

**Furniture.**—C. is making steady progress in extending the foundation of this great branch of its trade. A happy change in the style of the best class of furniture has been accomplished. The old Gothic designs and the newer Eastlake patterns have nearly all been swept away by the lower, more graceful, and lighter furniture of Queen Anne's period. The relation which this thorough change in the architecture of domestic articles sustains to the International Exhibition at Philadelphia is a very close one, and indicates the importance of such an institution as a public educator. The shipments by public conveyance in 1878 were 124,127 pkgs. furniture, and 17,761 dozen chairs.

**Grain.**—In the year 1878 the aggregate receipts of all kinds of grain reached 11,165,697 bushels, against 8,778,581 in the previous year; while the exports were 4,698,608 bushels, against 2,716,857 in 1877. Though this considerable increase is mostly traceable to the abundant crops of 1878, it yet sustains the most intimate and important relation to the enlargement of general facilities for trade. C. is the natural wheat granary for the great winter producing region of the interior, and, with her railroad system completed, it will be one of the greatest grain warehouses for the South. The

following table shows the annual receipts and shipments of corn and wheat, for a period of 10 years:—

Years.	Corn.		Wheat.	
	Receipts, bush.	Shipments, bush.	Receipts, bush.	Shipments, bush.
1869.....	1,508,509	188,784	1,075,348	702,622
1870.....	1,979,645	384,500	1,195,341	806,775
1871.....	2,068,900	672,628	866,459	409,893
1872.....	1,828,866	246,632	762,144	323,405
1873.....	2,259,544	324,183	860,454	412,722
1874.....	3,457,164	658,718	1,221,176	783,990
1875.....	3,695,561	595,915	1,135,388	600,622
1876.....	4,115,594	1,028,325	1,052,952	558,252
1877.....	4,559,506	1,317,142	1,436,851	961,754
1878.....	4,321,456	1,236,439	3,406,113	2,867,082

**Paper.**—The production for 2 years of the mills tributary to the city, according to returns made to the Superintendent of the Merchants' Exchange, will be found in the following table, which embraces the mills of 29 firms or companies:—

Kinds.	1878.		1877	
	Pounds.	Value.	Pounds.	Value.
Book.....	11,885,330	\$1,147,909	7,177,588	\$871,833
Manilla.....	9,663,257	692,257	9,443,722	769,023
News.....	8,903,453	621,422	9,919,282	716,196
Roofing.....	5,894,030	169,224	5,100,573	155,511
Wrapping.....	9,568,145	224,893	9,823,066	287,438
Writing.....	1,433,200	229,635	1,512,832	289,020
Total.....	47,347,415	\$3,085,340	42,977,068	\$3,089,021

The whole number of paper bags and paper flour-sacks manufactured in 1878 was 117,901,955, with a value of \$388,263, against 109,923,749, and a value of \$371,914, in 1877. This department of the paper manufacture has had enormous growth in a few years, and has acquired the larger distinction at the French Exposition of 1878 by the honorable mention received by the C firm that has done so much to develop this business into one of the important branches of C. industry.

**Pork Packing and Live-Stock Business.**—Prior to 1863 C. was the chief centre in the U. States for the slaughtering of swine and the packing of pork. Since that year the supremacy has been held by Chicago, C. taking the second rank. There are about 60 establishments in C. employed in this industry. The United Railroads Stock Yards for the reception of live hogs occupy about 60 acres. The whole number of hogs packed at C. in the winter season of 1877-78 was the largest number ever packed in this city, but the prices for cured meats were so much depreciated during that year, that the packing business was utterly unprofitable to the manufacturers. The following table shows the total number of hogs cut at C. for 10 consecutive years:—

Years.	Nos.	Years.	Nos.
1869.....	365,555	1874.....	581,253
1870.....	337,330	1875.....	560,164
1871.....	481,568	1876.....	563,359
1872.....	530,301	1877.....	523,576
1873.....	626,305	1878.....	632,302

Though the year 1878 was an unfortunate one, as far as the packing business is concerned, there was further evidence of the growth and concentration of the live-stock business at C., as shown by the following table of receipts and shipments of hogs, cattle, and sheep, at the United Railroads Stock Yards, for 5 years:—

Years.	Hogs.		Cattle.		Sheep.	
	Receipts.	Shipments.	Receipts.	Shipments.	Receipts.	Shipments.
1878..	798,863	175,103	142,851	62,902	274,027	207,103
1877..	633,749	143,650	149,781	63,439	172,084	123,235
1876..	680,362	144,205	144,600	62,308	190,339	127,982
1875..	725,162	130,012	133,695	44,837	159,302	91,121
1874..	873,263	259,397	112,393	30,546	139,280	83,394

**Starch.**—Among the many industries of C. there is no one exhibiting a more steady progress, prosecuted with a larger vigor, or doing more to spread the good name of C.'s productions through the world, than starch. The starch of C. is not

only widely distributed to all parts of this country, but is largely exported, nearly all the countries of Europe now taking it liberally, besides Mexico, South America, and Australia. Especially has it made a sure lodgment in Germany, its cheapness and its superior quality having immensely reduced both the demand for and production of potato starch in that country. The shipments of starch in 1878, as shown by the transportation books of the city, were 339,331 boxes, but to this should be added the shipments made directly from the manufacturing, without coming to the city, which would swell the shipments, approximately, to 485,000 boxes.

**Tobacco.**—The extraordinary strides which C. has made toward the concentration of the tobacco interest may be seen, to some extent, in noticing what has been accomplished in two decades. In 1858 the receipts of tobacco in hogsheads were only 4,476 packages, contrasted with 83,230 hogsheads in 1878. The leaf tobacco business, in 1878, was the largest the city had ever enjoyed, the sales having been 40,140 hogsheads, against 34,743 in 1877. During this year the cutting leaf tobacco, which is raised on both sides of the Ohio River, attained a notoriety for plug purposes which placed it in advance of all competitors, and nearly doubled the value of the leaf tobacco of the C. district. The whole number of cigars made in C., Covington, and Newport in 1878 was 103,020,275, against 88,792,375 in 1877. The number of cigarettes manufactured in the three cities was 1,915,000, against 705,000 in the previous year. The total production of fine-cut (chewing) and plug tobacco in C. and Covington—which commercially and industrially are substantially C.—was 4,307,129 lbs., against 4,734,339 in 1877, the reduction being in fine-cut tobacco. The production of smoking tobacco was 2,147,027 lbs., against 1,698,298 lbs. in the preceding year. The following table shows the movement of tobacco at C. for 10 years:—

Years.	Receipts.			Shipments.		
	Leaf.		Manufactured. Pkgs.	Leaf.		Manufactured. Pkgs.
	Hhds.	Boxes and bales.		Hhds.	Boxes and bales.	
1869..	39,978	4,753	21,545	36,810	6,143	36,802
1870..	46,593	9,961	53,961	42,538	6,199	88,149
1871..	56,283	9,083	61,497	50,541	2,493	110,652
1872..	45,877	11,176	59,535	39,566	1,738	146,771
1873..	61,876	5,278	89,650	59,169	4,897	174,749
1874..	73,093	4,253	123,714	66,094	4,395	255,210
1875..	45,234	5,339	114,925	43,249	8,776	217,392
1876..	61,338	13,230	150,336	59,103	12,245	237,960
1877..	71,217	8,830	190,445	68,759	17,906	365,148
1878..	88,230	14,992	195,572	85,049	15,174	422,661

**Whisky.**—The rapid growth and general introduction of continuous distillation has largely changed the aspect of the whisky business, especially in the West, so that the work of redistillation from high wines, according to the old methods, relatively, has seriously lost ground in production, and it is difficult to forecast its destiny. The definition of a rectifier is so broad, reaching rectifying, purifying, distilling, mixing, compounding, etc., and the continuous spirits, which now find their way into so many channels, by which they ultimately reach the books of the Collector as rectified spirits, that, to arrive at the extent of the production of redistilled goods, technically considered, the whole being returned under one head, is no longer possible. It is no secret that, in quantity, such goods sustain a much less important position, in their relation to the general production, than existed prior to the introduction of continuous distillation, and the signs of the time indicate a production relatively still less. So rapidly have distillers availed themselves of the continuous process, it is estimated that but one distillery in the C. district is now making high wines exclusively. The whole number of gallons of goods of all kinds returned to the Collector as rectified spirits, in C. and in Covington (none was rectified in Newport), for 1878, was 12,072,483.45 gall., compared with 11,443,880.70 gall. in 1877, and 11,559,644.99 gall. in 1876, showing an increase of 628,603.75 gall. in comparison with 1877, and an increase of 412,838.76 compared with 1876. Now these figures embrace only so much of the continuous spirits as are subjected to some such change as brings them within the range of rectified goods, so that the aggregate does not, by any means, show the whole quantity which passes beyond the stage of high wines in the city. If to the above figures were added such of the continuous spirits as are not returned to the Collector as rectified goods, it would still more largely swell this aggregate. Continuous spirits are now a leading article of commerce, and leave the city in large quantities for other markets. It is no easy matter, at present, to arrive at the real extent of the whisky business in this city. Of course, we have the figures of the revenue, which are most satisfactory data, so far as actual production in C., Covington, Newport, and Petersburg is concerned, making an aggregate in distilled spirits of 10,362,615.09 gall. for the year 1878. But in addition to this production, large quantities of spirits arrive from other districts and

enter into the manufactures and commerce of the city. The receipts by public conveyances in 1878 aggregated 155,970 barrels. Embraced in these arrivals, however, are spirits some of which have already been comprised in the returns already given in the two districts. Making due allowance for this duplication, it would make the aggregate received from points beyond the four cities named, amounting to 5,965,702 gall. If to these spirits be added the actual production in the four cities, it would make a total business in spirits, in original or tax paid packages, of 16,058,217 gall., with an approximate aggregate value of \$18,000,000. But the business in whisky is still further largely swelled by the rectifying process, to which much of the spirits after leaving the distilleries is subjected, and though the spirits already reported enter into this, it is separate business and adds material value to the goods. It will thus be seen to what proportions this business in whisky rises, towering among the other industries and trades like a giant, and steadily increasing the scope of its influence. The following table shows the receipts and shipments of whisky at C. for 10 years:—

Years.	Receipts. bbls.	Shipments. bbls.
1869.....	263,524	280,510
1870.....	444,291	441,820

1876.....	235,012	329,021
1877.....	320,877	370,684
1878.....	*119,639	351,473

\* Not including whisky manufactured in Hamilton Co. and Covington, etc., which was previously embraced.

**Cincinnati R.R. Cos.** See APPENDIX.

**Cinders**, the small refuse pieces left after the combustion of coal. See SLAG.

**Cinder-Sifter**, a perforated shovel or sieve for separating the fine coal dust or ashes from large cinders.

**Cinnabar** [Chinese *chú shí*; Fr. *cinnabre*; Ger. *Zinnober*; It. *cinabro*; Sp. *cinabrio*; Lat. *cinnabarium*], a mineral substance, red, heavy, and brilliant. It is found in various places, chiefly in quicksilver mines, being one of the ores of that metal. The C. of the Philippine Islands is said to be of the highest color; but that of Almaden, in Spain, is the richest. It is also abundant in the central and western provinces of China, and in California. The best native C. is of a high color, brilliant, and free from earthy or stony matter. It is a product of considerable importance in the arts. Generally, however, the facititious kind is employed. See VERMILION.

**Cinnamon** [Chinese *ján kwei*; Fr. *cannelle*; Ger. *Zimmet*, *Kanehl*; It. *canella*; Sp. *canela*; Lat. *cinnamomum*, *canella*], the inner bark of the C. tree (*Laurus cinnamomum*), a native of Ceylon, where it grows in great abundance, Cochin China, and perhaps of some other countries. It is brought in bags or bales weighing 92½ lbs. each; and, in stowing it, black pepper is mixed with the bales to preserve the cinnamon. The best C. is thin and rather pliable; it ought to be about the substance of royal paper, or somewhat thicker; is of a light yellowish-brown color, approaching nearly to that of Venetian gold; it is smooth and shining; fractures splintery; has an agreeable, warm, aromatic flavor, and a mild, sweetish taste; when chewed, the pieces become soft, and seem to melt in the mouth; it is not so pungent but that it may be borne on the tongue without pain, and is not succeeded by any after taste. Whatever is hard, thick as a half-crown piece, dark-colored or brown, or so hot that it cannot be borne, should be rejected. Particular care should be taken that it be not false packed, or mixed with C. of an inferior sort. The C. of Cochin China grows in the dry,

sandy districts, lying N.W. of the town of Faifoe, between 15° and 16° N. lat. It is preferred in China to the *C. of Ceylon*: the annual imports into Canton and other ports vary from 250,000 to

Fig. 79. — CINNAMON-TREE.

300,000 lbs. There are no fewer than 10 varieties of this species in the market. It is not cured, like that of Ceylon, by freeing it from the epidermis.

Besides the produce of the inner bark of the *Laurus cinnamomum*, the bark of the root affords a volatile oil which is similar in flavor to oil of *C.*, but has also a camphoraceous pungency. Another kind of oil is distilled from the leaves. The *C.-leaf* oil of commerce is of two kinds; one fatty, and probably procured from the fruit; the other volatile, and similar in taste and odor to oil of cloves or oil of pimento. The principal *C.* gardens of Ceylon are near Colombo. The seeds are planted so that the shrub should grow in clumps or clusters. The shoots which are decorticated are generally from 1 to 3 inches in diameter. The finer and thinner the bark, the more valuable is the product. The *C.* harvest lasts from May to October. *C.* is obtained from China, the Malabar coast, Manilla, Java, Cayenne, the Leeward Islands, and the Isle of France. The produce of China is called *CASSIA* (q. v.). *C.* is used in medicine as a carminative and astringent, chiefly as an adjuvant to other medicines. *Imp. duty, C.* and chips of *C.*, 20 cts. per lb.; oil of *C.*, free.

**Cinnamon-Oil.** See CINNAMON.

**Cinnamon-Stone,** a precious stone of a red color, with occasionally a brown or orange-yellow tinge; translucent, rarely transparent, lustre resinous. Sp. gr. 3.5. It is commonly found in masses, which are full of fissures, and rarely in a state fit for cutting. It is chiefly found in Ceylon and Brazil.

**Cinquefoil,** a common hedge-weed, the *Potentilla reptans*, which, having astringent, tonic, and febrifugal properties, is used medicinally.

**Cinque Ports** are five privileged and chartered ports of England on the coasts of Kent and Sussex, comprising the towns of Sandwich, Dover, Hythe, Romney, and Hastings. The Lord Warden of these ports still has special jurisdiction and important marine powers.

**Cipolino,** a variety of Italian green marble with white veins. — Also a mixture of talcose schist with white saccharoidal marble.

**Circuit,** the space traversed by a machine, etc. in moving round. — A district visited by a judge.

**Circular,** a printed or lithographed handbill, note, or advertising letter, issued by traders to customers, etc.

**Circular Bolt,** a machine used by the Nottingham lace manufacturers in making net.

**Circular Note,** a letter of credit granted by a banker for the convenience of travellers, and payable at different foreign towns.

**Circular-Saw,** a very useful machine tool, a revolving disk of steel with serrated edges or teeth, for cutting wood and metal. See SAW.

**Circulating Library,** a library from which books are sent out on loan to subscribers.

**Circulating Medium** is a term applied to all instruments of interchange by which the productions and the revenues of the country are distributed; everything which serves and is received as a mode of payment, or which constitutes the nominal money-price which appears in price-currents. — *Circulation* is the amount of such currency in use. When the term is applied to a bank, it means the amount of its paper issues.

**Circulus,** an instrument for cutting off the neck of glass.

**Circumference,** the boundary line of a circular plot; girth of a tree, etc.

**Circumferentor,** a surveyor's instrument for measuring angles.

**Circumnavigation,** the act of voyaging round the globe.

**Circumpolar,** lying around the pole.

**Circumventor,** a surveying instrument, having a compass-box at the top for taking angles.

**Circus,** a building or enclosure in which feats of horsemanship are exhibited.

**Cire,** the French name for beeswax.

**Cismatan,** the extremely bitter aromatic and somewhat mucilaginous seeds of *Cassia absus*, brought to Cairo from the interior of Africa, being regarded as the best of remedies for Egyptian ophthalmia.

**Cist,** anything for holding, as a bag, basket, case, or chest.

**Cistern.** See TANK.

**Citizens',** a Fire Insurance Co. of New York city, organized in 1857. *Statement on Jan. 1st, 1879:* — Capital stock, \$300,000; net surplus, \$503,768. Total cap. and surplus, \$803,768. Risks in force, \$42,657,046; premiums, \$239,066. Premiums received since the organization of the Co., \$5,567,781; losses paid, \$2,419,285; cash dividends paid to stockholders, \$1,367,550. Cash dividend paid in 1878, \$70,536.

**Citole,** an instrument like the dulcimer.

**Citrate,** a salt in which the hydrogen of citric acid is replaced by a metal or other basic radical.

**Citric Acid** is obtained by a chemical process from lemon or lime juice. It forms beautiful crystals, of which the primary figure is a right rhombic prism. They have a sour taste, and are soluble in somewhat less than their own weight of cold, and half their weight of boiling water. They also dissolve in alcohol. The average proportion of *C. A.* afforded by a gallon of good lemon-juice is about 8 oz. This acid is prepared upon an extensive scale. It is an agreeable acid, at once cooling and antiseptic. It is much used in medicine as a substitute for lemon-juice, and to form effervescing draughts, citrates, etc. It is much used by calico-printers, being the best known resistant for iron and alumina mordants. *Imp. duty, 10 cts. per lb.*

*C. A.* is frequently met with adulterated with tartaric acid; the fraud is easily detected by dissolving the acid in a little cold water, and adding to the solution a small quantity of acetate of potash. If tartaric acid be present, a white, crystalline precipitate of cream of tartar will be produced on agitation. When pure it is devoid of color, is entirely, or almost entirely, decomposed by heat. It is soluble in water and in spirit, and what is thrown down from its watery solution by acetate of lead is dissolved by nitric acid. No salt of potassium precipitates anything with *C. A.* except the tartrate. When a few drops of a solution of *C. A.* are added to lime-water, a clear liquid results, which, when heated, deposits a white powder, soluble in acids without effervescence. By the action of nitric acid *C. A.* is converted into oxalic acid. When the crystals of *C. A.* are very deliquescent, the presence of free sulphuric acid may be suspected. This latter may be detected with facility by dissolving the citric acid in a little water, strongly acidifying the solution with hydrochloric acid, and adding chloride of barium, when, if sulphuric acid be present, an insoluble precipitate of sulphate of barium will fall down after a short time.

**Citron** [Fr. *cédrat*; Ger. *Succade*; It. *confetti dicedro*; Sp. *acitron verde*], an agreeable fruit, resembling a lemon in color, smell, and taste. It is the *Citrus medica* of botanists (Fig. 80), and is probably a mere variety of lemon. It is much larger than the lemon, of an ovoid shape, and with a very thick rind. The juice too is less acid than that of the lemon and lime. The cuticle of the rind is full of vesicles containing an essential oil,

Fig. 80. — CITRON-TREE.

called *Oil of C.* or *Oil of Cedrat*, on which the flavor of the rind depends, and which is much used in perfumery. The candied rind of *C.* is imported from Madeira, of the finest quality. The *Citrus medica* is a native of Asia; it is now cultivated in warm climates throughout the world. *Imp.* duty, 10 per cent; preserved in sugar, 35 per cent; oil of, free.

**Citronella**, an essential oil obtained from the grass *Andropogon citratus*, and chiefly imported from Ceylon. *Imp.* free.

**Civala**, the Italian name for pulse, beans, pease, etc.

**Civanzo**, the name in Italy for interest.

**Civet** [Dutch, *civet*; Fr. *civette*; Ger. *Zibeth*; It. *zibetto*; Sp. *algual*], a valuable perfume obtained from the civet cat (*Viverra civetta*), a native of Brazil, Guinea, Madagascar, and the East Indies; but of which numbers are kept for commercial purposes in Holland. This perfume is produced by both sexes, and is contained in two cavities or pockets placed beneath the tail; these cavities are smooth internally, and covered with numerous small pores, connected with the glands from which it is secreted. It is of a clear yellowish or brownish color, about the consistence of honey, and uniform throughout. Undiluted, the smell is offensively strong; but when mixed with other substances, it becomes what some consider a fragrant perfume. *C.* was formerly in high repute, but is at present little used, excepting in the composition of some kinds of perfumery, to increase the power of other scents. When genuine, it is worth from \$7 to \$50 per oz. *Imp.*, crude and oil, free.

**Civil Engineer**, a scientific man, one who attends to the business of engineering as applied to the economic or useful purposes of civil life.

**Civita Vecchia**. See ITALY.

**Clack**, in mining phraseology the valve of a pump; clack door being the aperture through which it is fixed and removed. — A bell that gives warning of more corn being required in a mill.

**Chafter**, a name given to the fathom of 6 feet in Germany, Russia, and Switzerland; in Hamburg it is only equal to 68 inches.

**Clam**, a well known-mollusk, the *Mya arenaria*, which is very abundant on the coasts of New England and New York, especially in the gravelly mud of river mouths, between low water and half-tide mark. The shells, which are generally very hard, light-colored or sandy, and almost black on muddy bottoms, are dug up from their beds, which are exposed at low water, where they are found lying about one foot below the surface, their siphon (a retractile tube for respiratory and feeding purposes) projecting upward in the hole by which they communicate with the water at high tide. They are of importance as an article of food, and are also largely used for bait in cod and haddock fishing, for which purpose they are taken out of the shells, or "shucked," and salted down in barrels; about 5,000 barrels being put up every year, valued at from \$6 to \$7 each. As an article of food, the *C.*, excepting the soft mass called the belly, is rather indigestible, especially when cooked.

**Clamp**, a piece of wood fixed to the end of a board by mortise and tenon, or by groove and tongue, so that the fibres of the one piece, thus fixed, traverse those of the board, and by this means prevent it from casting; the piece at the end is called a *clamp*, and the board is said to be clamped. — A thick plank placed in a ship's side to support the ends of the beams. — A movable piece of lead to cover the jaws of a vice. — A kiln built above the ground, for the purpose of burning bricks in. — A mass of bricks piled up for kiln-burning. — A quantity of ore set apart for fusion.

**Clamp-Nails**, nails suited for clamp work.

**Clamp-Shoes**, heavy shoes for rough work.

**Clapboards**, a kind of thin weather-board used for the outer covering of houses. — Rough cask-staves before they are properly shaped.

**Clap-Match**, a fisherman's name for an old female seal.

**Clap-Net**, a bird-catcher's net.

**Clapper**, the tongue or striker of a bell; a mill clack.

**Clarence**, a kind of close four-wheeled carriage.

**Claret Wines** [from *clairret*, a name in France for all rose-colored wines], the name first given in England to the red wines of Medoc, in France, but, by common use, extended there and in this country to all the red Bordeaux wines, even frequently including the white wines of the Gironde. The department of the Gironde, part of the ancient province of Gascony, is rich in the produce of the vine. In the quantity produced, in the variety, in quality and value, it stands the first district of France, and in a commercial point of view it is the most important. The extent of its vineyard ground is no less than 380,000 acres, of which 127,000 appertain to the arrondissement of Bordeaux, 15,000 to the arrond. of Bazas, 46,000 to the arrond. of Blaye, 84,000 to the arrond. of Libourne, 49,000 to the arrond. of Lesparre, and 59,000 to the arrond. of La Réole. Their total product of wine is about

65,000,000 gallons; a prodigious quantity, valued at no less than \$10,000,000, of which one half in value is grown in the arrond. of Bordeaux and Lesparre alone. Of the total product of 65,000,000 gallons, 45,000,000 gallons are disposable, the rest is distilled or drank in the country. It is computed in France that a third more in quantity, beyond that grown in the Gironde, is exported from Bordeaux. This is drawn by the merchants from Spain, and from other depart. of France, and is mingled with the genuine wines of the Bordelais for the foreign market; it therefore must be added to the wines exported from the depart. The traffic in wine by sea from Bordeaux is very great, being nearly 11,000,000 gallons per annum, of which about 2,000,000 come to the U. States. An account of all the products of the vineyards of the Gironde, composing the extensive class of Bordeaux wines, is given in the following lines:—

The districts or arrondissements on the right bank of the river Garonne come first, one of which, that of Libourne, is situated on both banks of the river Dordogne, going from N.W. to S.E. Of these districts, that of *Blaye* produces deeply colored wines. The wines of the canton of *Bourg* are particularly noted. They were once esteemed above those of Medoc, though now they rank in repute only with the inferior kinds of the latter class. In a good year they have strength, a fine color, and, by keeping, lightness; together with a taste of the almond. The wines of the *Palus* are grown on an alluvial land of that name situated between the Garonne and Dordogne. The *Palus* of Dordogne produces wines superior to those of Libourne, which are from a light soil, and of light quality. These latter wines are grown at Castillon, St. Foi, Branne, Coutras, and Guitres, in that arrond. The hill wines manuf. in that neighborhood are of a superior quality to the foregoing, such as those of *Lussac*, *St. Estéphe*, *Montagne*, *St. Emilion*, *Cenon*, and *Barbe-Blanche*. Among this class, *Cenon* and *St. Emilion* are most regarded. — The age of wine is reckoned in Bordeaux by *feuilles*, or leaves, the number of times the vine has flowered since it was planted. — The *St. Estéphe* wine has an aromatic, violet-flavored perfume. That of *Cenon* is fine, light, and spirituous. *St. Emilion* has plenty of body and superior flavor, and, as well as those of *Bourg* generally, *Tourne*, and their vicinity, acquires flavor by age, and a more perfect bouquet. The prime *St. Emilion*, *Cenon*, and *Barbe-Blanche*, above their 12th year, sell for 3 to 4 francs the bottle. — The arrond. of *La Réole* and that of *Bazas* produce only common wines. — The chain of high hills which extends itself along the right bank of the Garonne, from *Ambares* to the arrond. of *La Réole*, produces wines known as *vins de côtes*, which are good ordinary wines, and little more. The best are those of *Bassens* and *Cenon*. — The district styled the *Graves* composes another wine growth on the left bank of the Garonne, thus named from the gravelly soil, which is found extending 9 m. to the S., and 4 to the W. of Bordeaux. They are generally fuller in body, and more colored and vinous, than the wines of Medoc, but the last are preferred for bouquet and flavor. These agreeable red wines are kept 6 or 8 years in the cask, according to the temperature of the year in which they are made. They keep a long while, and in 20 years lose nothing of their good quality. The best qualities are grown at *Merignac*, *Leognan*, *Pessac*, *Villeneuve-d'Ornon*, and *Talence*. The first growth of *Talence* is *Chateau Haut-Brion*, 2 m. S.W. from Bordeaux. This wine is considered equal to that of the three first growths of Medoc. The wines of *Haut-Brion* are not bottled until 6 or 7 years after the vintage, though some of the first growths may be drank at 5 years old. The flavor resembles burning sealing-wax; the bouquet savors of the violet and raspberry. *Gradignan*, *Martillac*, *La Brède*, *Beautiran*, *Castres*, *St. Selve*, and *Portets*, to the south of Bordeaux, furnish the wines known as the small red *Grave* wines (*petits vins rouges des Graves*). These are ordinary wines, some of which improve greatly by age. The merchants of Bordeaux comprehend under the foregoing name the common wines of *Cauderan*, *Bouscat*, *Bruges*, and *Eysines*, generally sold for consumption in that city. — The next and 4th district of the Bordelais is that of *Medoc*, the most important of all for its extent, and the quality of its produce. Its shape is that of a large triangle, of which the summit is acute, formed by the left bank of the Gironde close to its mouth, and the western shore of the ocean at the entrance of the gulf of *Guiscy*. The base is an oblique line, drawn from the left bank of the Garonne at *La Teste*, passing by *Blancfort*. The *Medoc* district is an immense plain, divided on the side of the Gironde by small hills, which produce the best wine. These hills are covered with a light soil, intermingled with flints in great quantity, of an oval form, about an inch in diameter, and of a whitish gray color. At the depth of 2 feet a dry and compact red earth is found, intermingled also with flints. The second species of ground occupied by vineyards is a gravelly

sand. At 18 inches from the surface, in some parts of this soil, is found a bottom of clay, or potter's earth; in other places dead sand; nowhere is the earth more varied in quality or in product. The estates are much divided. The *carbenet*, *carmenet*, *malbeck*, and *verdot* are the plants most cultivated in the plain of *Medoc*. The wine, when in perfection, should be of a rich color, a bouquet partaking of the violet, very fine, and of a very agreeable flavor. It should be strong without intoxicating; revive the stomach and not affect the head; leave the breath pure and the mouth fresh. A sea voyage, fatal to some of the best wines of France, does not alter the quality of these fine wines of the Gironde, but, on the contrary, it is observed to ameliorate those even of an inferior quality. The wines of *Medoc*, however, have their defects, one of the principal of which is, that most of them tend to decomposition in 16 or 17 years, though some growths will last 10 or 12 beyond either term. The first commune of *Medoc*, 6 m. from Bordeaux, descending the river, is *Blancfort*, producing about 1200 tons (a nominal measure of 4 casks of 60 gallons each), of which about 500 are white, generally known as white wines of the *Graves*. They are, for the most part, dry and agreeable, and do not want strength. The first growth of this district is *Dariste*, formerly *Dulamon*. The red wines have a good color, and they have a bouquet, which is not developed until they have been some time in bottle. The second commune, *Ludon*, produces 500 tons of red wine, superior to that of *Blancfort*. This superiority arises from the nature of the soil, which is gravelly for the most part. *Macau* is the next commune, situated in a plain, two thirds of which are *Graves*, and one third *Palus*. The wine produced here is neither as agreeable nor racy as that of *Ludon*. It has, however, a deeper color and good body. *Laharde*, the next commune, generally gravel or sand, produces about 400 tons of superior wine to that of *Mac-*

Fig. 81. — WINE-CUP OF THE SEVENTEENTH CENTURY.

(From the Museum of Bordeaux.)

cau, easily observable in its body, color, and bouquet. *Cantenac*, the fifth commune, is remarkable for the excellence of its wines, of which its product is about 2000 tons. These wines are of exquisite taste, rivalling the best in *Medoc*, whether for the bouquet or raciness which characterize them, besides which they have color, body, and are agreeably aromatic. *Margaux* produces from 1000 to 1200 tons. The soil of this renowned commune is gravelly, intermixed with a great number of flints. Its vines are the most esteemed in the whole tract. In this commune is grown the famous first quality, *Chateau Margaux*. In average years about 80 tons of the first growth, and 20 of the second, are all which is made. The wines of *Margaux*, when in perfection, in a favorable year, have great fineness, a rich color, and a soft bouquet, which is balmy to the palate. They have strength without being heady, and leave the mouth cool. These wines are well known in America, though the wine of the first quality is rarely met with genuine in this country. It is in *Margaux*, also, that the wine called *Roussan* is produced. *St. Julien de Reignac*, in the arrond. of *Lesparre*, is the 18th commune of the *Medoc* vine country. It produces about 1200 tons of wines, very inferior to those of *Margaux*. They have a peculiar bouquet, by which they are distinguished from all the other wines of *Medoc*. Kept 5 or 6 years in wood, they attain the character of good wines. The growths of *La Rose* and *Léoville* are the produce of this commune. The 19th commune is *St. Lambert*, producing 600 or 700 tons of good wines, of nearly the same quality as those of *St. Julien*. In this commune is made the famous wine of *Chateau Latour*. This wine is distinguished from that of

Château Lafitte by its superior body and consistence; but it should be kept in wood at least a year more than the Lafitte to attain a proper maturity. This is the favorite wine in England; it is produced on a soil of sand and gravel, and in favorable years is nearly all purchased for the British market. Barely more than 100 tuns are made in the most abundant years, at least of the first quality. It is less fine than Lafitte. Pouillac, another celebrated commune of Medoc, produces from 300 to 400 tuns of a wine racy and full of bouquet. In this commune is grown the celebrated *Château Lafitte*, a wine surpassed by none of its rivals. About 100 tuns of the first quality only are annually produced, and 20 or 30 tuns of inferior growth. It is lighter than Château Latour, and may be drunk somewhat less in age. The wine next in quality to Lafitte is that of *Mouton*, or *Branne-Mouton*, of which the produce is from 100 to 140 tuns. St. Estephe produces 4000 tuns of wine, of a different quality from all the other Medoc wines. Light, agreeable, and aromatic, they are generally bottled after being 3 years in the cask. The vineyards of St. Saurin de Calouarne furnish about 3000 tuns annually of indifferent and very unequal wines in respect to quality.

The wines of the district of Haut-Medoc are all comprehended in the foregoing list. Those called in the country *le derrière du Haut-Medoc*, are St. Laurent, St. Sauveur, Cissac, and Vertueil, generally wines of tolerable quality. — The term Bas-Medoc is applied to the wines grown in the communes of St. Bernard, Lesparre, St. Trélozy, Potensac, Blagnac, Uch, Prignac, St. Christoly, Cironac, Bégadan, Gailiau, Queyrac, Valeyac, Jau, and St. Vivien. The quantity of the most produce varies from 5000 to 6000 tuns. These wines are, for the most part, touched with an earthy taste. In good years they are reckoned agreeable wines for exportation, when well selected, as their quality improves by age. — The wines of the first class in Medoc, including that of Haut-Brion, which is considered as such, sell for about 2500 francs per tun. Those of the 2d growth for 2200; of the 3d, 1700 to 2000; and of the 4th, 1200 to 1500. The prices augment annually until the 5th year, when they are generally double the first. — The vines in Medoc and Graves are planted at a distance of 3 feet from each other every way. The main stem of the plant is only allowed to attain a foot in height, and is fastened to stakes of the same dimensions. To the stakes are joined laths or switches, 10 or 12 feet long, horizontally, on which are laid 1000 branches of each vine, left when it is pruned for that purpose. The plough is applied four times to the intervals between the rows. The grapes are thus prevented from touching the ground, when proper attention is paid to keeping the branches fastened to the laths, and they receive both the direct and reflected heat of the sun when they are properly pruned. This is considered the most perfect method known for the cultivation of the vine. — Here the account of the red wines of this fertile district must end; in *white wines*, the depart. of the Gironde is less rich. At Blaye, Libourne, and La Rivole, the white wines are of a very common quality. Bazas produces more white wine than red. The best are produced at Fargues, Langon, St. Pardou, St. Pierre de Mons, Toulence, and, above all, at *Bonmes* and *Sauterne*. The best white wines of the arrond. of Bordeaux are grown in the *Graves*, and in the southern part near Bazas, as far as the canton of Podensac in the communes of Barsac, Preignac, Cérons, Potensac, Viréale, Illats, Landiras, Pujols, to which may be added St. Croix du Mont. The white wines of a superior quality are divided into dry and luscious, and those again into first and second growths. The dry are generally the product of the Graves. The first in quality are *Carbonneux*, *St. Brice*, *Château du Lysmont*, *Pontac*, *Sauterne*, *Bonmes*, *Barsac*, and *Preignac*. The second growths are Cérons, Podensac, Viréale, Illats, Landiras, Pujols, St. Pey de Langon, St. Croix du Mont. The first growths of both kinds are sold at about 1200 francs, the second growths at 700. But the price augments with age, so that at 10 years old the wines of Sauterne, Bonmes, Barsac, and Preignac sell often at 2000 francs, and sometimes as high as 3000 or 4000 per tun. — To obtain the more luscious wines, it is requisite that the raisins be, in the language of the wine-makers, *pourris*, or rotten, or in such a state that the skin be detached from the pulp on the slightest pressure. As all the grapes on the same plant cannot be in this state at once, 4 or 5 different gatherings, or rather cuttings, of the ripe grapes take place as they reach the requisite state, for which purpose the scissors are used. — The unadulterated wines of the Gironde most held in estimation in the U. States are equalled by other varieties in the depart., some of which are rarely imported into this country. No district in the world surpasses the present in the excellence of its growths, and the variety of its products. The consequence is, that frequently the Bordeaux merchants export much larger quantities of wine of first growth than the country produces, by substituting other kinds, which nearly approach in excellence those of which they are counterfeits. Gorce, Branne, Mouton, La Rose, Rozan, and others, in good years, make very close approaches in quality to the best products of the Bordelais.

**Clarify**, to clear or fine a liquor by a chemical process.

**Clarinet**, a musical reed instrument, larger than the oboe, and like it played by holes and keys.

**Clary-Water**, a spiced and highly perfumed sweet cordial or medicinal drink, made from the flowers of the clary (*Salvia selaria*), which is a stimulant aromatic bitter.

**Clasp**, a fastening.

**Clasp-Knife**, a large folding knife for the pocket, or one to suspend by a cord to the neck.

**Clasp-Nails** are nails with small, harrow-shaped heads, so as to sink in the wood.

**Clavicembalo** [It.], the harpsichord.

**Clavier**, the key-board of an organ or piano.

**Claviole**, a finger-keyed viol.

**Clavoyon**. See **BURGUNDY WINES**.

**Clay**, an aluminous or argillaceous earth formed from the disintegration of felspathic rocks, by the combined action of air and water. Its plasticity, when moist, and its capability of being made hard by heat, are properties which render it available for many useful purposes. The purest kind of *C.* is kaolin or china *C.*, which is nearly pure silicate of alumina. It is found in China; but a precisely similar substance is obtained from deposits near St. Austell, in Cornwall, and St. Yrieix, near Limoges, in France. Such clays are obtained in this country at Brunswick, Maine, at Haddam, Connecticut, and other places. *Pipe C.* is a white clay nearly free from iron. See **SMOKING PIPES**. — Common *potter's C.* contains a considerable amount of iron. In New Jersey, near Woodbridge, and also at South Amboy, beds of clay are worked to a great extent for the manufacture of stone-ware. Similar deposits also compose the banks of the Delaware River, between Bordentown and Burlington. They all belong to the series of upper secondary rocks, underlying the green sand-beds. *Brick C.* contains varying proportions of iron; hence different countries build houses of different colors. *C.* beds found in Wisconsin, near Lake Michigan, are so free from this coloring matter, that the bricks are of a straw color. They are so much esteemed as to be transported from Milwaukee to New York City. *Imp. duty*, \$5 per ton.

**Clayed**, a term applied to sugars which have been purified or bleached by water filtered through superimposed clay.

**Claying**, a process of bleaching sugar by water passed through a layer of clay; also the operation of puddling.

**Clay-Kiln**, a stove for burning clay.

**Clay-Pipe**. See **SMOKING PIPES**.

**Clay-screening Machine**, a machine for preparing clay for the manufacture of bricks, tiles, pipes, etc.

**Clay-Stone**, a grayish mineral, a species of indurated clay, resembling calcareous marl.

**Clean Proof**, a slip or sheet of printed matter sent to an author from a printer.

**Clearance**, a document from a Custom-House officer, or other qualified person, permitting a ship to depart on her voyage.

**Clearing**, a removal, as a clearing sale; an open space in forest land.

**Clearing-Beck**. See **CALICO-PRINTING**.

**Clearing-House** is an institution whose object is to facilitate the settlement of balances and the adjustment of exchange operations between banks and bankers of the same place, who are admitted to deal with it. "The *C. H.* of London, the first of its kind, originated among the bankers of that city, whose transactions in the checks, bills, and drafts drawn upon each other became so large as to call for the daily and even hourly use of vast sums in bank-notes by all of them. Appreciating how readily the debits and credits respectively due

or held by them might be set off the one against the other, they formed the clearing-house, where up to 4 o'clock each day all drafts, bills, etc., drawn upon each individual member were taken. The system of the London *C. H.* has recently been much extended and improved, and all balances are settled by checks drawn upon the bank of England, — no bank-notes being required at all. *C. H.* exist in New York, Philadelphia, Boston, and other cities of the U. States. The system in that of Philadelphia is equal and in some respects superior to that of any other in the U. States. The clearings are made each morning at 8.30, just before which hour a messenger and a clerk from each bank are at the *C. H.* The clerks take their seats inside a series of desks arranged in the form of a hollow oval. Each messenger brings with him from his bank a sealed package for each other bank, containing all the checks or drafts on such bank. The name of the bank sending and that of the bank to which it is sent are printed on each package, and the amount sent is written thereon. The messengers take their places near the desks of their respective banks, and they have with them tabular statements of the amount sent to each bank and the aggregates. These are exhibited to the respective clerks and noted by them on the blank forms. At 8.30 precisely the manager calls to order and gives the word, when all the messengers move forward from left to right of the clerks, handing in to those clerks the packages addressed to their respective banks, and taking receipts for them on their statements. When the circuit is completed all the packages have been delivered and received, and the amounts and the aggregates, both debtor and creditor, noted by the clerks. When the clerks find all correct the messengers take the packages received, and return to bank. The several clerks then pass round a memorandum of the debits, credits, and balance, each of his respective bank. When these memoranda have made the circuit, each clerk has on his statement the debits, credits, and balance, whether debtor or creditor, of each bank. If these debits and credits and debtor and creditor balances are found to balance, the clerks now leave the *C. H.* If not, they remain until the error or errors are discovered. The balances due by the several banks are paid in to the *C. H.* that day by 11.30 A.M., and are receivable by the creditor banks by 12.30 P.M.

Fig. 82. — GAFF TOPSAIL CLEAT.  
(Patented by Bagnall & Loud, Boston.)

A second clearing of drafts, etc., received by the morning's mail, is made at the clearing-house by the messengers at 11.30 A.M. Each bank is obliged daily to furnish to the *C. H.* a statement of its condition at the end of business hours on that day;

and tables are daily furnished to the several banks of the condition of all the banks in the *C. H.* Complete records of all the transactions, of the state of the banks, etc., are preserved in the books of the *C. H.*, precisely as are the business transactions of any bank, or other corporation or mercantile firm." — *American Cyclopaedia.* The New York *C. H.* consists of 58 banks and the Assistant Treasurer of the U States. Its aggregate transactions from its organization on Oct. 11, 1853, to Jan. 1, 1879, amounted to \$51,516,058,588.94.

Statement showing the New York *C. H.* Transactions for each month, from January 1st to December 31st, 1878, with the Loans, Specie, Legal Tenders, and Liabilities of the Associated Banks, and the Per Centage of Specie and Legal Tenders to Net Liabilities.

**Clearing Nut**, a name given to the seed of *Strychnos potatorum*, from its property of clearing water.

**Clearing-Sale**, a disposal of stock, remainder, or rummage.

**Clear-Starcher**, a laundress who washes fine linens and stiffens them with starch.

**Cleat**, a short, narrow strip of wood, fastened to a piece of timber-work, to hold it in a certain position. — On board ship, a kind of belaying pin, of which there are several forms (Fig. 82), to fasten ropes to.

**Cleaver**, a name in some places for a hatchet, but principally applied to a butcher's metal axe or chopper.

**Cledge**, a mining term for the upper stratum of fuller's earth.

**Cleet**, a wedge or belaying pin.

**Cleft**, a space or opening made by a wedge, etc.  
**Clenching, Clinching**, the process of fastening securely, as in doubling over the point of a nail when it has passed through a plank.

**Clerk**, an assistant in a shop or store, who acts

as a salesman, etc.; one who attends only to a part of the business of a merchant, while the merchant himself superintends the whole; an accountant. In its primary sense, *C.* was the legal appellation of a clergyman. The clergy being exclusively the learned part of the community of the Middle Ages, the word hence came to signify an educated person; and thus acquired the sense of a scribe or writer in France and England.

**Cleveland**, a city and lake-port of the U. States, cap. of Cuyahoga Co., in the State of Ohio, and next to Cincinnati, the largest and most important city in the State, is situated at the mouth of Cuyahoga River, on the S. shore of Lake Erie, in lat. 41° 30' N., lon. 81° 47' W., 255 m. N.E. of Cincinnati, 195 m. S.W. of Buffalo, and 135 m. E.N.E. of Columbus. The city is built on both sides of the river, which is here crossed by several bridges, and chiefly on a plain from 50 to 100 feet above the lake, of which a magnificent view is thus obtained. *C.* has important commercial advantages. Five railroads pass through or terminate in the city, — including the Lake Shore and Michigan Southern, one of the great trunk lines between the East and the West; a division of the Atlantic and Great Western, a leading channel of communication between the East and the Northwest; and the Cleveland, Columbus, Cincinnati, and Indianapolis, a direct line to Cincinnati and the South. Other lines afford communications with the extensive coal and petroleum regions of Pennsylvania. *C.* is the northern terminus of the Ohio Canal, which extends southwards to Portsmouth on the Ohio River. For the accommodation of the lake commerce a capacious harbor has been formed at the mouth of Cuyahoga River by extending two piers, 200 feet apart, 1,200 feet into the lake. The city has an extensive trade in copper and iron ore shipped from the Lake Superior mining region, and in coal, petroleum, wool, and lumber, received by railroad, canal, and lake transportation. In 1878 the number of vessels entered in the coastwise trade was 2,023 (of which 1,067 were steamers), having an aggregate tonnage of 1,199,463; 2,850 vessels of 1,216,626 tons cleared. The foreign commerce, which is exclusively with Canada, is considerable, — the imports amounting in 1878 to \$146,385, and the domestic exports to \$888,265; 622 vessels of 145,131 tons entered in this trade, and 663 of 178,922 tons cleared. The total number of vessels registered, enrolled, and licensed in the district was 227 of 73,253 tons. Eight vessels of 1,933 tons were built during the year. About \$25,000,000 of capital are invested in manufactures, the most important industries being those of iron and the production of refined petroleum. There are also several pork-packing establishments and breweries. The city contains 7 national banks with a capital of \$4,400,000, 7 private banks with a capital of \$32,854, and 2 savings banks. Pop. in 1870, 72,829; actual pop. about 140,000.

**Cleveland R R. Cos.** See APPENDIX.

**Clew**, the lower corner of the sail of a ship.

**Clew-Garnets**, **Clew-Lines**, brails or rope tackle to hoist up the ends of ships' sails to the yards.

**Clicker**, in the shoe trade, a cutter-out of leather for the uppers and soles of boots and shoes. — In the printing profession, one who, under the overseer, has the charge of any particular work, making up and imposing the matter, and presenting it to the reader in a proper form for revision.

**Client**, a customer; usually applied to those who deal with bankers, brokers, and attorneys.

**Clinch**, a nautical term for a half hitch, stopped to its own part.

**Clinched-Work**, planks laid to overlap each other in the manner of slating roofs. Boats built in this manner are termed *C.*, or *clinker* built.

**Clinker**, the accumulated cake or refuse of coal, a vitreous scoria which forms in grates or furnaces. — An exceedingly hard Dutch or Flemish brick, 6 inches by 3 broad, and 1 thick, used for paving yards and stables. *C.* are more thoroughly burnt than ordinary bricks.

**Clink-Stone**, a grayish-green mineral, consisting of felspar and zeolite, yielding a metallic sound under the hammer. It occurs in volcanic districts, and is remarkable for its tendency to lamination, which is sometimes such that it affords tiles for roofing.

**Clinometer**, a surveyor's instrument for measuring the slopes of cuttings and embankments, and ascertaining the dip of strata.

**Clinquant** [Fr.], orsedew or Dutch gold-leaf.

**Clip**, the wool sheared from a sheep. — A clasp or spring-holder for letters and papers.

**Clip-Fish**, also called *Baccalau*, a name in Norway, and some other countries, for codfish, salted and dried in the manner of the Newfoundland cod.

**Clipper-Ship**, a fast sailing vessel, one built on fine, sharp lines, and adapted more for fast sailing than for carrying large cargo.

**Clit-Bur**, a common name for the burdock (*Arc-tium lappa*), all the parts of which have some medical properties.

**Clivers**, or **Cleavers**, the *Galium aparine*, sold by herbalists as a diuretic and sudorific. The root dyes red.

**Clives**, a hook with a spring to prevent its unfastening.

**Cloak**, a large, loose wrapper of cloth or other material.

**Cloaking**, a woollen dress material, of which there are plain, mixture, and fancy kinds.

**Cloak-Pin**, a brass or iron pin to hang garments on.

**Clobberer**, the lowest class of cobblers, who patch and botch up shoes and boots, rubbing in ground cinders and paste, termed "clobbered," into the crevices and breaks of the leather.

**Clock** [Fr. *horloge*; Ger. *Uhr*, *Grosse-uhr*; It. *orologio*, *oriuolo*; Sp. *reloje*], a kind of machine, put in motion by a gravitating body called a *pendulum*, and so constructed as to divide, measure, and indicate successive portions of time with great accuracy. Most *C.* mark the hour by striking or chiming. It is a highly useful instrument, and is extensively employed for domestic and philosophical purposes. *C.* are made of an endless variety of materials and models, so as to suit the different uses to which they are to be applied, and the different tastes of their purchasers. Their price consequently varies from a few dollars to more than \$500. The Germans and Dutch are particularly celebrated for their skill in the manufacture of wooden clocks, while the French, Genevese, and English have carried the art of making metallic clocks, so as to keep time with the greatest precision, to a high degree of perfection. Ornamental *C.* are imported into the U. States from France and Germany. Cheap wooden and metallic *C.* are extensively made in New York, New Jersey, Illinois, and other States, and are exported to all parts of the world, but chiefly to England and Japan. The value of *C.* exported in 1878 was \$93,003, in which total England enters for \$427,891, Japan for \$95,611, and Australia for \$63,336. *Imp. duty*, *C.* of all kinds, and parts of, 35 per cent.

The general construction of the going part of all house C. is substantially as represented in Fig. 83, which represents a pendulum or weight clock. B is the barrel with the rope coiled around it generally 16 times for eight days; the barrel is fixed to its arbor, D, which is prolonged into the winding square coming up to the face or dial of the C, which is not represented in the diagram. The great wheel, C, is part of the barrel, rides with it on the arbor, and drives by a pinion a second wheel, E. The wheel, E, drives the pinion, F, which is called the centre pinion, on the arbor of the centre-wheel, K, which goes through to the dial, and carries the long or minute-hand. This wheel always turns in an hour, and the great wheel generally in 12 hours, by having 12 times as many teeth as the centre pinion. The centre-wheel drives the wheel, G, by its pinion, H, and the scape-wheel, M, by its pinion, L. If the pinions, L and H, have each eight teeth, or leaves (as the teeth of pinions are usually called), K will have 64 teeth, and G 60, in a clock of which the scape-wheel turns in a minute, so that the second-hand may be set on its arbor prolonged to the dial. N represents the pallets of the escapement, which will be described presently, and their arbor, O, goes through a large hole in the back plate to the upper part of the crutch, S, ending in the fork,

Fig. 83. — SECTION OF PENDULUM OR WEIGHT CLOCK.

T, which embraces the pendulum, U, so that, as the pendulum vibrates, the crutch and the pallets necessarily vibrate with it. The pendulum is hung by two thin springs, X X. We may now go to the front, or left hand, of the clock, and describe the dial, or "motion-work." The minute-hand fits on to a squared end of a brass socket, which is fixed to the wheel, c, and fits close, but not tight, on the prolonged arbor of the centre-wheel. Behind this wheel is a bent spring, which is (or ought to be) set on the same arbor with a square hole in the middle, so that it must turn with the arbor. The consequence is, that there is friction enough between the spring and the wheel to carry the hand round, but not enough to resist a moderate push with the finger for the purpose of altering the time indicated. This wheel, c, is sometimes called the minute-wheel, but is better called the *hour-wheel*, as it turns in an hour. Near the wheel, c, and on the same hollow arbor, is a second wheel, d, which drives a wheel, e: the arbor of the wheel e has a pinion, f, and that pinion drives the twelve-hour wheel, g, which is also attached to a large socket, or pipe, carrying the hour-hand.

The weight, A, which drives the train and gives the impulse to the pendulum through the escapement, is generally hung by a catgut line passing through a pulley attached to the weight. It has usually been the practice to make the case of house clocks and astronomical clocks not less than 6 feet high; but that is a very unnecessary waste of space and materials; for, by either diminishing the size of the barrel, or the number of its turns, by increasing the size of the great wheel by one half, or hanging the weights by a treble instead of a double line, a case just long enough for the pendulum will also be long enough for the fall of the weights in  $7\frac{1}{2}$  or 8 days. Of course, the weights have to be increased in the same ratio, and indeed rather more, to overcome the increased friction.

**Clock-Case**, the wooden or other framing in which the clock-work or machinery is fixed; an old-fashioned tall case for enclosing a pendulum clock.

**Clock-Dial**, the face of an elevated or turret clock, on which the figures are marked, and over which the pointing hands or indicators travel.

**Clock-Face**, the enamelled dial of a house or turret clock.

**Clock-Hands**, the metal revolving pointers which traverse the clock-face.

**Clock-Making Machines**, wheel-cutting engines, and other special machines used to facilitate the manufacture, and cheapen the cost of clock-work.

**Clock-Work**, the wheels and various complicated machinery for the interior of a clock.

**Clod-Crusher**, a heavy roller for pressing down and smoothing the surface of land.

**Clodd**, a further reduction of 2 lbs. in every 3 cwt., on certain goods, after the tare and tret are taken. It is an allowance now almost obsolete.

**Clogs**, heavy wooden shoes worn in Europe, principally in tanneries and other manufactories where the feet are exposed to wet; also lighter raised supports for the feet, worn by females.

**Clog-Soles**, thick soles of wood for clogs, of which about 2½ millions are made in the northern counties of England, chiefly for workmen.

**Clos Bernardon, Clos de la Perrière, Clos du Roi**. See **BERGUNDY WINES**.

**Close-Dealing**, exacting; shrewd or tight bargaining; just within the limits of fairness or honesty, — sometimes a little over the line. — *T. McElrath*.

**Close-Hauled**, a marine term applied to a vessel with her yards brailled up, and sailing as near to the wind as possible.

**Close-Stool**, a bedroom commode for invalids.

**Closet**, a cupboard, a place for keeping articles in; also a small private room.

**Closh-Hook**, a whaler's implement for lifting blubber to be skinned.

**Closing an Account**, balancing the items by an adjustment of the debtor and creditor sides.

**Clos Pitois, Clos Tavannes, Clos Vougeot**. See **BERGUNDY WINES**.

**Cloth**, a manufactured substance, consisting of wool, hair, cotton, flax, and hemp, or other vegetable filaments. It is formed by weaving or interlacing threads, and is used for making garments or other coverings. The term cloth, when used alone, is generally employed to distinguish woollen cloth from fabrics made of any other textile material.

**Clothes, Clothing**, are general names for whatever covering is worn, or made to be worn, for de-

cency or comfort; garments; personal attire; dress; apparel; vestments.

**Clothes-Brush**, a stiff hair-brush, used for brushing garments of cloth.

**Clothes-Horse**, a wooden frame to hang garments or linen on before a fire.

**Clothes-Line**, small, strong cord used in gardens, etc., for suspending wet clothes on to dry.

**Clothes-Peg**, wooden divided pegs, used by laundresses to secure washed linen on a line to dry.

**Clothes-Press**, a wardrobe or cupboard for hanging clothes in.

**Clothes-Wringer**. See WRINGING-MACHINE.

**Clothier**, in England, a maker of, or dealer in, cloth or clothes; in the U. States, a maker or seller of clothes.

**Clothing**. See CLOTHES.

**Clothing-Wool**. See WOOL.

**Cloth-Papers**, coarse papers, glazed and unglazed, for pressing and finishing woollen cloths.

**Cloth-Shearer**, a workman employed to remove the imperfections of woollen fabrics after weaving; this is now done to a great extent by cloth-shearing machines.

**Cloud-Berry**, a name for the fruit of the *Rubus chamamorus*, which is acid and pleasant to the taste. The Scottish Highlanders and the Laplanders esteem it as one of the most grateful and useful fruits.

**Clouding**, an appearance given to ribbons and silks in the process of dyeing.

**Clough**, an engineering appliance for dividing the fall of water into two parts applicable to drains in tideways, etc.

**Clous**, the French name for nails.

**Clout**, an iron plate placed on an axletree, or on a piece of timber in a carriage, to keep the wood from being worn by taking the rubbing.

**Clouted Shoes**, heavily nailed shoes, which, in Europe, are worn by agricultural laborers, carters, etc.

**Clouterie** [Fr.], a manufactory for nails.

**Clout-Nails** are heavy nails with large head. In American manuf. they are made of 9 sizes, from  $\frac{1}{4}$  inch to 2 inches, and are sold put up in pound papers, or in bulk. A full box consists of 100 lbs.

**Clove**, an English weight for wool, equal to 7 lbs., or the half of a stone. — Also a long spike-nail.

**Clove-Bark**, a commercial name given to the barks of two different trees, — one being the *Cinnamomum culilaban*, growing in the Eastern Archipelago, and the other the *Dicypellium caryophyllatum*, found in Brazil.

**Clove-Hitch**, two half hitches round a spar or rope.

**Clove-Nutmegs**, **Madagascar-Nutmegs**, **Ravensara-Nuts**, the produce of *Agathophyllum aromaticum*, found in Madagascar, where they are used as a spice, and from thence occasionally exported to France.

**Clover** [Fr. *trèfle*, *luzerne*; Ger. *Klee*; It. *trifoglio*; Sp. *trebol*], one of the most important of artificial grasses for fodder, of which there are many varieties. The seed of the American red *C.* is an important article of commerce and export, chiefly to England.

**Cloves** [Chinese *ts'ing hiang*; Dutch *kruidnagelen*; Fr. *clous de girofle*, *girofles*; It. *chiori di garofana*, *garofani*; Port. *cravos da India*, *cravos girofles*; Sp. *clavos da especia*, *clavillos*], the unexpanded flower-buds of the clove-tree, *Caryophyllus aromaticus*, which form a well-known spice. The clove-tree is a na-

tive of the Moluccas. Though its native range was limited, it grew abundantly in all the islands; but the Dutch succeeded in extirpating the plant in all the islands, except Amboyna and Ternate, so as to secure its monopoly. A Frenchman, however, one Poirie, the governor of Mauritius and Bourbon, contrived to export several trees to the islands under his government: thence they have spread to Cayenne and the West Indies, to Brazil, to Sumatra, and Zanzibar. *C.* are shaped like a nail; whence the name, from the French *clou*, nail, about 6 lines long, plump and heavy. They are chiefly imported from the Dutch settlements; the best in chests, and an inferior kind in bags. The best variety of the Amboyna *C.* is smaller and blacker than the other varieties, very scarce, and, as a mark of pre-eminence, is termed the Royal *C.* Good *C.* have a strong, fragrant, aromatic odor, and a hot, acrid, aromatic taste, which is very permanent. They should be chosen large-sized, perfect in all parts; the color should be a dark brown, almost approaching to black; and, when handled, should leave an oily moisture upon the fingers. Good *C.* are sometimes adulterated by mixing them with those from which oil has been drawn; but these are weaker than the rest, and of a paler color; and whenever they look shrivelled, having lost the knob at the top, and are light and broken, with but little smell or taste, they should be rejected. As *C.* readily absorb moisture, it is not uncommon, when a quantity is ordered, to keep them beside a vessel of water, by which means a considerable addition is made to their weight. *C.* contain a very large amount of volatile oil, the quantity being nearly 20 per cent. They are also, it is said, very rich in tannin. Every portion of the tree is aromatic, and has been subjected to distillation. The use of *C.* in cooking is familiar to every one; but they enter, also, largely into perfumery, and are used in the Pharmacopœias of this country and England. This article, once so scarce and precious, is now very cheap, the price of *C.* in New York being about 35 cts. per lb. About 200,000 lbs. are annually imported into the U. States. *Imp.* duty, 5 cts. per lb.

*Mother of C.*, the unripe fruit of the *C.* tree. They are sometimes imported preserved, and are reported stomatic and antispasmodic.

*Oil of C.* possesses similar virtues to the unexpanded flower-buds. It is used to flavor liquors and confectionery, and also in perfumery. Sp. gr. 1.055 to 1.060. *Imp.* duty, \$2 per lb.

*C. Stalks*, or *Stems*, the dried stems bearing the flower-buds. They are used as a cheap spice, but are chiefly imported for adulterating other spices. *Imp.* duty, 3 cts. per lb.

**Club**, a short, heavy, massy stick, which is the official arm of policemen in this country and England.

**Clubbing**, uniting together for some object. — A sea term for a vessel drifting down a current with an anchor out.

**Club Compasses**, a pair of compasses having a bullet or cone on one leg to set in a hole.

**Clue**, **Clew**, the lower corner of the square sail of a ship; hence the ropes by which it is lined are called clue-garnets, or clue-lines.

**Clump-Boots**, heavy boots for rough wear, such as shooting, excavators' work, etc.

**Clunch** or **Curl-Stone**, a local name in Staffordshire, England, for a mineral substance from which tripoli is made.

**Clutch**, an apparatus for engaging or disengaging two shafts; it consists of two pieces of metal formed so, that, when placed together, pro-

Fig. 84.—CLUTCH.

**Clyster-Pipe**, a medical instrument for injecting into the rectum.

**Co.**, an abbreviation for company, as H. A. Curtin and Co.

**Coach**, a pleasure carriage, distinguished from a chariot by having seats fronting each other; a close four-wheeled vehicle, of which there are many kinds. See CARRIAGE.

**Coach-Maker**, a carriage-builder.

**Coaking**, in mast-making a process of joining or uniting timber to the inside spar. Generally the word implies a union of two pieces of wood, by letting in a small projection of one piece into the hollowed end of the other.

**Coal** [Dutch, *steenkolien*; Fr. *charbon de terre*; Ger. *Steinkohlen*; It. *carboni fossili*; Port. *carvoes de terra*; Sp. *carbones de tierra*, or *de piedra*]. There are several varieties of *C.*, all of which appear to have been formed by the action of certain chemical forces on wood or other vegetable matter; but these varieties may for the most part be arranged into two groups, the one containing no bitumen, and the other distinguished by the presence of that substance. In the first variety, or that without bitumen, is *anthracite*, also called *glance coal* and *stone coal* (see ANTHRACITE). In some varieties of anthracite, however, bitumen is present, in which case it burns with a considerable flame. Indeed, anthracite passes gradually into bituminous coal, which varies greatly according to the amount of bitumen.

The following are recognized varieties:—*Caking* or *pitching C.* breaks into small pieces when heated, but on raising the heat they unite or *cake* into a solid mass. Its color is velvet or grayish black. It burns with a lively yellow flame, but requires frequent stirring to prevent it from caking and so clogging the fire. *Cherry C.* resembles caking *C.*, but does not soften and cake; it is very brittle, and burns with a clear yellow flame. The *splint C.* is harder than cherry coal. *Cannel C.* burns readily without melting. It is of compact and even texture, little lustre, and breaks with a large conchoidal fracture. *Brown C.*, *wood C.*, and *lignite* are imperfect varieties of *C.*, usually of a brownish black color, and retaining the structure of the original wood, and burning with an empyreumatic odor. The substance termed *jet* resembles cannel *C.*, but is harder, of a deeper black color, and higher lustre. It takes a brilliant polish, and is sometimes set in jewelry. Mr. Hutton (*Proceedings of the Geological Society of London*) has given decisive proof of the vegetable origin of *C.*, by submitting to microscopic examination an extensive series of slices taken from the several varieties of *C.* found at Newcastle. He considers this *C.* to be of three kinds: the first, which is the greatest in quantity and the best in quality, is the rich *caking C.*, so generally esteemed; the second is *cannel* or *parrot C.* (*splint C.* of the miners); and the third, *slate C.*, consisting of the two former arranged in thin alternate layers with a slaty structure. In these varieties, taken indis-

criminatedly, more or less of the vegetable texture could always be discovered, thereby affording the fullest evidence of the vegetable origin of *C.* Each of these three kinds of *C.*, besides the fine distinct reticulation of the original vegetable texture, exhibits other cells which are filled with a light wine-yellow-colored matter, apparently of a bituminous nature, and which is so volatile as to be entirely expelled by heat before any change is effected in the other constituents of the coal. The number and appearance of these cells vary with each variety of *C.* In caking *C.*, the cells are comparatively few, and those which do exist are highly elongated. Their original form the author believes to have been circular, and he attributes their present figure to the distension of gas confined in a somewhat yielding material subject to perpendicular pressure. In the finest portions of this *C.*, where the crystalline structure, as indicated by the rhomboidal form of its fragments, is most developed, the cells are completely obliterated. In such parts the texture is uniform and compact; the crystalline arrangement indicates a more perfect union of the constituents, and a more entire destruction of the original texture of the plant. The slate *C.* contains two kinds of cells, both of which are filled with yellow bituminous matter. One kind is that already noticed in caking *C.*; while the other kind of cells constitute groups of smaller cells of an elongated circular figure. In those varieties which go under the name of *cannel*, *parrot*, and *splint C.*, the crystalline structure, so conspicuous in fine caking *C.*, is wholly wanting, the first kind of cells is rarely seen, and the whole surface displays an almost uniform series of the second class of cells, filled with bituminous matter, and separated from each other by their fibrous divisions. Mr. Hutton considers it highly probable that these cells are derived from the reticular texture of the parent plant, rounded and confused by the enormous pressure to which the vegetable matter has been subject. The author states that though the crystalline and uncrystalline, or perfectly and imperfectly developed varieties of *C.*, generally occur in distinct strata, yet it is easy to find specimens which in the compass of a single square inch contain both varieties. From this fact, as also from the exact similarity of position which they occupy in the mine, the differences in different varieties of *C.* are ascribed to original differences in the plants from which they are derived. Geological examinations of *C.*-fields have also afforded abundant evidence of the vegetable origin of *C.*, although the manner in which the *carboniferous strata* (as the *C.-measures*, or assemblage of rocks which include *C.*, are termed) have been deposited is by no means agreed upon. Some geologists suppose that the *C.-measures* were originally peat-bogs, and that the successive layers were occasioned by repeated subsidences of the land; others contend that the vegetable matter originated from *rafts*, like those of the Mississippi, which floated out to sea and there became engulfed; a third opinion is, that they were formed in vast inland seas or lakes, the successive beds of vegetable matter being supplied by periodical land-floods. If we trace the series of which a *C.-field* is composed, beginning with the lowermost stratum, we have:—1. a tough, argillaceous substance, which changes upon drying into a gray, friable earth; it is sometimes black, from the presence of carbonaceous matter, and contains innumerable stems of *Stigmara*; 2. then comes the coal, in which the external forms of plants, etc., are obliterated by bitumi-

zation, although the internal structure remains; 3. the *roof*, or upper bed, which generally consists of slaty clay, abounding in leaves, trunks, stems, branches, and fruits, and often containing layers of ironstone nodules, in which leaves, insects, crustacea, etc., are imbedded. Interstratified with the shale, finely-laminated clay, micaceous sand, grit and pebbles of limestone, granite, sandstone, and other rocks, often occur. In fact, this bed appears to be an accumulation of drifted materials, mingled with the dense foliage and stems of a prostrate forest. These phenomena may be explained by supposing the inundation of a thickly-wooded plain by an irruption of the sea, or a vast inland lake, occasioned by the sudden removal of some barrier, or by a subsidence of the tract of country on which the forest grew. But when we find an accumulation of strata, in which triple deposits of this kind are repeated some thirty or forty times through a thickness of many thousand feet, a satisfactory solution of the problem is very difficult. Not only subsidence after subsidence must have taken place, but the first submergence have been followed by an elevation of the land—another soil fit for the growth of forest trees been produced—another generation of vegetables of precisely the same species and genera have sprung up, and arrived at maturity—and then another subsidence, and another accumulation of drift. And these oscillations in the relative level of the

sandstone or limestone, and the middle filled up by strata superior to the *C*-measures, viz., magnesian limestone and new red sandstone. The internal upheaving force, whatever it may have been, which converted the horizontal strata into basin-shaped arrangements, probably produced at the same time certain fissures or fractures often nearly vertical, and stretching through the whole mass (Fig. 85). These rents are of great importance to the miner, and may be beneficial to him, or not, according to circumstances. They are called *dykes*, because they divide the seams or bands of coal into *fields*, and are *up-throw* or *down-throw* dykes, according as the edge of the strata appears to an observer to be higher or lower in regard to his own position. They are also called *shifts*, as the miners consider that they have *shifted* the strata on their sides; but the common term is *faults* or *troubles*, from their *troubling* or putting to *fault* the pitmen. A slip dyke of less thickness than the workable seams, and not disturbing their continuity, is called a *hitch*, as at n, Fig. 85. Other dykes, called *whin-dykes*, contain basalt, loadstone, and other rocks of igneous origin. Such dykes may, or may not, be slip dykes, or such as cause a shifting of level in the adjacent beds. Thus those at p n, Fig. 85, are not accompanied by any slip. In approaching within a few yards of these once molten streams, the operation of fire is evident in the conversion of loose grits into compact

Fig. 85. — SECTION OF THE ACCIDENTAL FEATURES OF COAL FIELDS.

sea and land must have gone on uninterruptedly, through a long period of time, not in one district of country only, but all over the world, and during the same geological period. — It will be understood from the preceding details that the series of rocks which constitute the *C*-measures consists of beds of sandstone, shale, clay, and *C*, lying one above another in repeated alternations to a great depth. The strata of *C*, technically called *seams*, are very thin compared with the other associated beds. Although they extend under large tracts of country, they are often only a few inches thick, seldom more than 6 or 8 feet. Under this series is the mountain limestone, forming various calcareous strata of various thickness, sometimes exceeding 1000 feet. This limestone rests on a bed of red sandstone, varying in thickness from 200 to 2,000 feet. The various deposits which form the *C*-measures do not occur in regular horizontal unbroken planes, as might be supposed. There is no doubt that when first deposited they were in this condition, but this horizontal position has at various times been disturbed by some upheaving force from below, whereby the *C*-measures have, in many districts, been made to assume the shape of a huge trough or *basin*, rising on all sides from a central point, the sides of the basin being composed of

quartz, and of clay or shale into slate and porcelain jasper, while the *C*-seams are diminished in thickness and completely charred, or converted into blind *C*, anthracite cinders, sooty ashes, or in some cases coke, as perfect as that obtained from a coke oven. When basaltic or other igneous dykes reach the surface, or what was the surface at the time of their protrusion, their matter is either heaped up so as to form a hill, as in n, to the left of Fig. 85, or spread out into undulating masses, as occurs with the other dyke, p, in the same figure, or sometimes into extensive strata, destroying a vast extent of coal, or converting it into anthracite. It will readily be supposed that dykes are a frequent source of difficulty and expense, by throwing the seams out of their levels and filling the mines with water. Such are the general features of *C*-measures.

Mineral *C* is widely distributed over the world. It constitutes the most important of the mineral features of Great Britain, and is one of the principal sources of American wealth. The following account of the compared produce of *C* in the world in 1870 and 1878 is taken from Mr. Fred E. Sarward's *The Coal Trade* (Edition 1879)\*:—

\* We are indebted for most of the statistical information in this article to the editor of *The Coal Trade Journal*. This weekly paper, published in New York, is, we think, in this country, the best acknowledged authority on the subject of coal.

COUNTRIES.	Sq. m. of Coal Area.	Tons—1870.	Tons—1878.
Great Britain.....	11,900	110,431,192	134,610,763
U. States.....	192,000	32,863,690	49,130,584

Japan.....	5,000	.....	500,000
Vancouver's Island.....	390	29,863	190,640
China, Chili, New Zealand, etc.....	....	3,000,000	4,000,000

This table shows that, notwithstanding its comparatively reduced C. area, Great Britain is by far the greatest C. producing country in the world. Its C. measures are variously disposed in the midland, northern, and western portions of S. England, and in a broad belt of country which traverses the centre of Scotland, from the shores of Ayrshire to those of the Frith of North. There are, also, some C. tracts of far inferior importance in Ireland. The produce of the 3,738 British collieries actually in operation for the year 1878 was as follows:—

District.	Tons.
North Durham and Northumberland.....	11,975,250
Cumberland.....	1,515,783
South Durham.....	19,235,150
Westmoreland.....	1,791
Cheshire.....	645,500
Lancashire, North and East.....	8,735,055
Lancashire, West.....	8,886,476
Yorkshire, West Riding.....	15,952,500

SCOTLAND, East.....	6,867,701
SCOTLAND, West.....	138,722
IRELAND.....	.....

The C. raised in Great Britain, as above stated, was used by the several industries in the following proportions:—

Used for steam-power.....	23.52 per cent.
Domestic consumption.....	17.20 "
In the manufacture of pig iron.....	15.21 "
In the manufacture of merchant iron and steel.....	15.00 "
Exported.....	9.27 "
Consumed in and about coal mines.....	6.25 "
For the manufacture of gas.....	5.87 "
For steam navigation.....	3.00 "
Locomotives and engines on railways.....	1.88 "
Water-works, breweries, etc.....	1.35 "
Smelting tin, copper, lead, etc.....	0.80 "
Consumed in and about metal mines.....	0.47 "
For use in army department.....	0.18 "

The exports for 1878 were 19,501,826 tons, of which the U. States took 189,596 tons of bituminous C.

*Coal Fields and Coal Trade of the U. States.*—There are in this country 4 principal C. areas, compared with which the richest deposits of other countries are comparatively insignificant. These are the Alleghany, Central, Great Western, and Tertiary C. fields.

1. THE ALLEGHANY C. FIELD extends from the middle of A. to northern Pennsylvania, and contains all the anthracite C. beds. The respective areas that this field occupies in the several States which it traverses are as follows:—

	Sq. m.		Sq. m.
Pennsylvania.....	12,650	Georgia.....	170
Maryland.....	470	Alabama.....	4,500
West Virginia.....	15,000	Eastern Kentucky.....	10,000
East Virginia.....	225	Ohio.....	7,100
Tennessee.....	3,700		
		Total area.....	53,815

*Anthracite C.* is found in an area of about 500 sq. m., in Luzerne, Carbon, Schuylkill, Northumberland, Dauphin, and Columbia Counties, in the State of Pennsylvania. There are 3 great divisions, which are named from their locations,—the first or Southern, the second or Middle, and the third or Northern C. fields. The Southern C. field lies principally in Schuylkill County, and hence it is often called the Schuylkill region. The Mahanoy (often included in the Schuylkill) and Lehigh regions constitute the Middle C. field. The Northern C. field is in Luzerne County, and embraces what is known as the Wyoming, Lackawanna, Scranton, and Wilkesbarre regions. The production is largely controlled by some great carrying and mining corporations, and it is to be regretted that individual enterprises are yearly becoming less in number, in the operations of mining and shipping the product. From the commencement of the industry in 1820, with the shipment to market of 365 tons, it is estimated that the amount marketed is upward of as many million tons. As the area in which this quality of C. is found in the U. States is limited, and the absorption of this territory is rapid and wasteful, the question as to the life of our Anthracite C. field is of importance. There can be no doubt but that the ability to produce is much less than has been calculated by many persons,—30,000,000 tons,—and that before many years the Anthracite will be sufficiently appreciated to command a better price than has ruled within a few years past. Many well-informed persons prophesy that, before 10 years shall have passed, Anthracite will be a luxury; the dependence as a source of steam supply will perforce be found in Bituminous C.

The following statement gives the comparative details of the Anthracite business for three years, in tons of 2,240 lbs.; but it must be borne in mind that these figures represent the amount carried to market by the several railroads and canals, and not the quantity used and sold at the mines:—

	1878.	1877.	1876.
<b>LEHIGH.</b>

*No. Pennsylvania semi-bituminous (or caking) C. Field.* The Blossburg district sent its first C. to market in 1840. The railway from the mines connects with the Erie R.R. at Corning, N. Y., and the N. Y. Central R.R. at Geneva and Lyons. In 1878, the Tioga Transportation Co., the Salt Co. of Onondaga,

the Morris Run C. Co., the Fall Brook C. Co., and the Blossburg C. Co., shipped from this district 652,597 tons, against 922,245 in 1877. — The *McIntire C. Co.*, whose mines are at Raiston, on the Northern Central R. R., commenced operations in 1879, and shipped 154,265 tons in 1878. The *Barkeley district*, located in Bradford County, has its outlet to market via the Sullivan and Erie R. R. The mines now operated are those of the Towanda C. Co., and the Schraeder C. Co. The former shipped 165,935 tons in 1878, and the latter 149,285 tons.

*Broad Top semi-bituminous C. Field* has an area of about 80 sq. m., in the thickest seams ranging from 5 to 19 feet in thickness, and the lesser from 1 to 3. From this region, the Huntington and Broad Top Mountain R. R. Co. transported 150,224 tons in 1878, and the East Broad Top R. R. 63,068 tons.

*Snowshoe semi-bituminous C. Field* is situated in Centre County, Pa., covers an area of about 8 m. in length and 4 m. in breadth, and is situated on both sides of Beach Creek. Prof. Rogers gives this Snowshoe C. 75.8 of fixed carbon, and 21.2 of volatile matter and ashes. The C. field finds an outlet to market via the Bellefonte and Snowshoe and Bald Eagle Valley connection of the Pennsylvania R. R. The only Co. mining in this district commenced in 1862 with 8,260 tons, reaching 95,257 tons in 1873, and from that time decreasing easily down to 23,168 tons in 1878.

*Somerset Region.* This district is in Cambria County; the coal is worked in the same vein that is mined in Clearfield county; the C. here has a heavier cover than where found in the adjoining county of Clearfield; is strong, and partakes somewhat of the nature of the gas C. found in Westmoreland County, which adjoins it on the southwest.

*Marysville district* is located in Somerset County, Pa., adjoining the Cumberland region, of Maryland, and the C. is stated to be similar to, and an extension of, the Cumberland C. basin. The C. is of the same quality, and will yield a similar quantity per acre. It is 11 m. from Frostburg, Md., and the C. finds an outlet to Baltimore and the sea-board markets over the Pittsburgh and Connellsville branch of the Baltimore and Ohio R. R. The Keystone C. Co. have been at work here since 1872, and built up a business amounting to 56,273 tons in 1878.

*Mercer Co.* The most important C. region in N. W. Pennsylvania, running over into E. Ohio, is that of Mercer County. The C. produced is what is known as the *splint or block C.*, and is used in the raw state for smelting iron. The principal location of this peculiar C. is on the line of the Erie and Pittsburgh R. R. The product finds an outlet to market by this route, and also the Shenango and Alleghany, and the Jamestown and Franklin roads and their connections. The beds vary from 2 to 5 feet in thickness, and some 600,000 tons are annually produced.

*Clearfield Region.* This C. field is located in Clearfield and Centre Counties, in the central portion of Pennsylvania. For an outlet for the products of its mines, it is dependent upon the Tyrone and Clearfield branch of the Pennsylvania R. R., extending from Tyrone on the main line (224 m. west from Philadelphia) to Clearfield, 41 m. The Pennsylvania R. R. Co. owns the railroads, the shipping wharves, and all the means of access to the markets of the Atlantic sea-board. The advantage of being connected with a railroad of such magnitude, with its wonderful ramifications and connections, gives the C. proprietors of this region great facilities for the proper conduct of their business; and it is owing to the very liberal policy of this corporation that the district has been enabled to take the rank which it has assumed, in connection with the fuel supply of the sea-board. The geological report classifies the Clearfield C. as truly bituminous. The production has been steadily increasing from 199,219 tons in 1867 to 633,530 tons in 1874, and 1,295,201 tons in 1878.

*Monongahela Region.* By means of its slack-water navigation, the Monongahela River is made navigable at all seasons of the year, and boats carrying 800 tons are passed down. The city of Pittsburgh is supplied mainly by railroad, and the larger portion of the C., by river, is run down the Ohio and Mississippi to the lower markets. In this connection, the cost of transporting C. over waterways, as from Pittsburgh to New Orleans, is of value. The distance is something like 2000 m.; the rate is about 31 cents per bu., or \$1.65 per ton of 2,240 lbs., the ordinary time being about two weeks, when all circumstances are favorable. From Pittsburgh to Louisville, Ky., the distance is 690 m.; the cost, 11 cents per bu., including return of empty craft, and the time 5 days. In 1878, the shipments by the slack-water transportation were 2,797,530 tons, while the Penn. R. R. carried 1,429,428 tons from this district.

*Westmoreland Region.* The celebrated Penn. and Westmoreland Gas Co. is mined near Penn. and Irwin stations, on the Penn. R. R., in Westmoreland County; the distance from Philadelphia is 332 m. The C. mined is the great Pittsburgh bed of bituminous C.; the companies operating in this region are large and influential, among them being the Penn. Gas C. Co., and the Westmoreland Gas C. Co. The C. is used in every sea-board city for gas purposes, and always commands the highest price; in fact, it makes the rate for all other gas-producing C. that reaches the sea-board. The shipping points are South Amboy, N. J., and Greenwich (on the Delaware River), below Philadelphia. Shipments in 1878 were 692,599 tons.

*Connellsville Coke Region.* See COKE.

*West Virginia Gas C.* This class of gas C. is mined in

Marion, Taylor, Ritchie, and Preston Counties, W. Virginia, the mines being located near to or upon the main line of the Baltimore and Ohio R. R. The trade to the sea board, which amounted to 259,158 tons in 1863, has gradually fallen down to 193,955 tons in 1877. The cause of this considerable diminution is the cheaper gas C. furnished from Great Britain, due to the low water rates. The introduction of C. from the Kanawha district, and the discriminating policy of the Baltimore and Ohio R. R., have also affected this region.

*The Cumberland Region.* The Cumberland (George's Creek) C. field, located in Allegheny County, at the W. extremity of the State of Maryland, supplies an important portion of the semi-bituminous C. reaching the sea board markets. The connections with the tide water markets are: — via the Baltimore and Ohio R. R., from the town of Cumberland, 178 m., and Piedmont, 296 m., W. from Baltimore. The Chesapeake and Ohio Canal, following the Potomac River to Georgetown, 184 m., and Alexandria, 191 m. from Cumberland. The boats carry 110 tons, and make the trip in 4 to 5 days. Steam canal boats have been introduced on this water-way with considerable success, in point of time and economy of movement. The canal is owned by the State, and is managed by a Board of Public Works. The mines of the George's Creek C. field are located near to, or upon the line of the Cumberland and Penn. branch road, extending through the region, say 2 to 20 m. from Piedmont, and from 11 to 33 m. from Cumberland. The mines are, with 1 exception (the Borden shaft), drift openings in the hillside, the C. being let down inclined planes ranging from 300 to 2,000 feet in length to the main railroad, which follows the descent of the stream towards Piedmont. The product of these mines is of superior quality, and has stood the test for 35 years. The seam of coal worked is known to be 14 feet in thickness; its full extent is seldom taken out, however, from various causes. Labor in this region has always been well remunerated, and there was no reduction in the price of mining the C. from 1899 up to 1877, while on the other hand, the price of C. at the shipping points fell off about one half within that period of time. The following statement shows the products of each Co. operating in this region for the years 1877 and 1878: —

COMPANIES.	Tons in 1878.	Tons in 1877.

*The Kanawha Region (W. Va.).* The C. measures of W. Virginia underlie nearly 16,000 sq. m. of territory, of which, what are known as the Kanawha and New River Valley, traversed by the Chesapeake & Ohio R. R., hold 8,000. Several varieties of C. occur, among which are: — Cannel, Splint, Gas, and Bituminous. The Bituminous C. is an excellent steam-raising fuel, and has been used on steamers, railways, and under stationary engines, with good results. The Gas C. seam is productive of a most excellent quality, that has been used in both the Eastern and Western markets with most satisfactory results.

2. THE CENTRAL C. FIELD extends through Indiana, Illinois, and Kentucky, embracing an area of 40,400 sq. m., of which 6,700 are in Indiana, 30,000 in Illinois, and 3,700 in W. Kentucky. This C. field is only second in importance to the vast area already described. The C. is generally bituminous C. of excellent quality for many purposes: one kind burning with much light and very freely, approaching Cannel C. in most of its properties; other kinds consist of caking C., splint C., and satin-black block C., equal to the best in Pennsylvania. Much larger portions of the C. lie below the water-level in the central field, and most of the mining is done by shafting, and is at present almost exclusively confined to the margins of the field. This is owing principally to the fact that the lower barren measures cover and conceal the beds to a great depth in its more central portions. A circle of pits and mines almost surrounds this field. Commencing at Iron City on the Ohio, in the Indiana block C. district, it extends almost directly N. to Brazil, from thence curves N. W. to Danville or Milford, Gilman, and La Salle in Illinois, and from thence W. to Rock

Island; thence down the Mississippi, in an irregular line, some distance E. of the river to Alton and Bellville; thence to the Mt. Carbon mines on the Big Muddy, Duquoin on the Illinois Central R.R., and Shawneetown on the Ohio, below Evansville. Here the bed crosses the river into Kentucky, and, making a half-circle in that State, again crosses the river to the point of starting at Iron City. The C. is mined in many localities around this entire circle. About 2,000 miners were at work in the block C. districts, producing more than 8,000 tons of C. a day. Much of this C. is used in the blast furnaces which have recently been erected near Brazil; and large shipments are made to Chicago, St. Louis, and many of the surrounding towns and cities. Both at La Salle and Rock Island extensive mining operations are conducted; while opposite St. Louis, and at Mt. Carbon, the C. mines are still more productive. The total production of this field in 1878 was about 5,400,000 tons.

3. THE GREAT WESTERN C. FIELD, though but little developed, is the largest C. field in the world. Its area, as stated by the learned author of the art. *Coal in the Am. Cyclopaedia*, is no less than 367,000 sq. m. A very limited portion, however, of this great C. field is exposed, perhaps not over 130,000 sq. m., and still less have been explored in Nebraska, Kansas, Iowa, Missouri, Arkansas, and the Indian Territory, while much the larger area is covered and concealed by the overlying formations, from 3,000 to 5,000 feet of which are piled on the C. measures.

4. THE TERTIARY C. FIELDS of the U. States are scarcely less extensive than the western field. Fully 50,000 sq. m. of this formation have been identified and partially developed, while it is estimated that no less than 250,000 sq. m. exist in the U. States and the British possessions. They include a large area within the Western C. field in Kansas, Colorado, and Dakota, but a much larger one is found outside of its limits in Wyoming, Montana, and Saskatchewan (British America), while numerous detached basins or fields are found in Colorado, New Mexico, Texas, California, Oregon, and Washington. It is not yet possible to designate all the localities of the tertiary C. in the U. States; but as far as present developments indicate, the great regions of these tertiary formations are parallel with the Rocky Mountain ranges. Immense beds are found along the Union Pacific R.R. in Wyoming Territory, and from Cheyenne, on this road, along the E. base of the mountains, through Colorado, New Mexico, and Texas, while they extend eastward into Kansas. The present most productive mines are at Carbon, Rock Springs, and Almy stations (Evanston mines), on the Union Pacific R.R., and at Boulder City, Central City, and Canon City, Colorado; and this formation is supposed to exist both E. and W. of the Black Hills of Wyoming, and those of Dakota (which are distinct mountains E. of the Rocky Mountains), extending in parallel ranges into Dakota on the E. and Montana on the W. of these mountains, and continuing into the British possessions. The more western tertiary exist along the coast ranges in California, Oregon, and Washington. The prominent localities where C. is now mined are at Bellingham, Washington Territory, Vancouver's Island, Coos Bay in Oregon, on the Columbia River, and near San Francisco at Mt. Diablo. There are many other localities in California, Oregon, and Washington where small deposits are found; in many cases these constitute only part of the more extensive formations which cannot yet be distinctly defined.

The following table shows the tonnage of the C. trade of the U. States for the year 1869, as per census reports made in 1870, together with figures for the year 1878, taken from reports of the trade in the various States:—

	1869 — Tons.	1878 — Tons.
Pennsylvania Anthracite.....	13,866,180	17,605,262
Pennsylvania Bituminous.....	7,798,517	13,500,000
Illinois.....	2,629,563	3,500,000
Ohio.....	2,527,285	5,000,000
Maryland.....	1,819,824	1,679,322
Missouri.....	621,930	900,000
West Virginia.....	608,878	1,000,000
Indiana.....	437,870	1,000,000
Iowa.....	263,487	1,500,000
Kentucky.....	150,582	900,000
Tennessee.....	133,418	375,000
Virginia.....	61,803	75,000
Kansas.....	32,938	300,000
Oregon.....	.....	200,000
Michigan.....	21,150	30,000
California.....	.....	600,000
Rhode Island.....	14,000	14,000
Alabama.....	11,000	200,000
Nebraska.....	1,425	75,000
Wyoming.....	50,000	100,000
Washington.....	17,844	150,000
Utah.....	5,800	60,000
Colorado.....	4,500	367,000
Total.....	31,116,595	49,130,584

Table of yearly prices for Schuylkill White Ash Lump C., on board vessels at Philadelphia, for 20 consecutive years:—

Years.	Prices.	Years.	Prices.
1859.....	\$3 25	1869.....	5.31
1860.....	3.40	1870.....	4.39
1861.....	3.39	1871.....	4.46
1862.....	4.14	1872.....	3.74
1863.....	6.06	1873.....	4.27
1864.....	*8.30	1874.....	4.55
1865.....	7.86	1875.....	4.39
1866.....	5.80	1876.....	3.87
1867.....	4.37	1877.....	12.59
1868.....	3.86	1878.....	3.25

† Highest average for year.

Table of the Imports and Exports of C. to and from the U. States for the years 1870 to 1878:—

Year.	Imports. Tons.	Exports. Tons.
1870.....	420,688	227,918
1871.....	443,955	277,951
1872.....	490,631	401,078
1873.....	456,015	584,633
1874.....	498,028	763,402
1875.....	441,600	519,345
1876.....	407,853	568,076
1877.....	497,290	740,456
1878.....	578,457	660,138

The imports were from Australia and British Columbia to San Francisco; from Great Britain to the Atlantic and Pacific ports; and from Nova Scotia to Atlantic coast ports. The exports were mostly to the Dominion of Canada and Cuba.

Imp. duty. The tariff from 1824 to 1843 was 6 cts. per bu., or \$1.68 per ton; from 1843 to 1846, \$1.75 per ton; 1846, 30 per cent ad valorem; 1847 to 1861, 24 per cent ad valorem; 1862-3-4, \$1.00 per ton; 1865, \$1.10; 1866 to 1872, \$1.25 per ton; since August, 1872, 75 cts. per ton.

**Coal-Barge**, a flat-bottomed river-boat for transporting coal short distances to wharves, etc.

**Coal-Box**, a scuttle to hold coals in a room.

**Coal-Breaker** is a machine for crushing lump-coal as it comes from the mine. The breaker erected near Hyde Park by the Delaware, Lackawanna, and Western R.R. Co., cost about \$250,000, and the Erie R.R. Co. has one near Carbondale which cost \$300,000. These powerful and complicated machines are of various forms, but they are all built on the principle of rollers with spikes, as shown in Fig. 86.

Fig. 86. — COAL-BREAKER.

**Coal-Bunker**, a closed room around the boiler and engine-room of a steam-vessel for keeping the fuel.

**Coal-Drop, Coal-Dumping Apparatus**, a staith or contrivance for shooting or lowering coals into the hold of a vessel.

**Coal-Dust**, the small broken or fine coal, after the large masses have been screened.

**Coal-Fish**, a name of the British coasts for the pollock.

**Coal-Gas**, the common illuminating gas made from coal. See GAS MANUFACTURE.

**Coal-Heaver**, a porter who loads and unloads coal wagons.

**Coal-Hulk**, a vessel kept as a receptacle for coal, usually on some foreign station, to supply steamers.

**Coal Oils**, a general name for mineral oils.

**Coal-Pit**, the mouth of a coal-mine, or the descent to a colliery. — Also a place where charcoal is made.

**Coal-Scoop**, a shovel for taking coals from a scuttle to throw on fire.

**Coal-Scuttle**, a portable metal receptacle for coals in a room.

**Coal-Shed**, a retailer's depository for coals.

**Coal-Shoot**, a metal scuttle or vase for holding coal.

**Coal-Shovel**, a small shovel for filling a coal-scuttle from the cellar; a larger kind is used by coal-leavers.

**Coal-Staith**, a drop or machine on an elevated wharf for shipping coal.

**Coal-Tar**, one of the products of the destructive distillation of the coal employed in the manufacture of gas, is a very complex substance, consisting of various hydrocarbons, acids, and bases, together with certain resinoid and empyreumatic substances. The quantity as well as the quality of the tar obtained from the distillation of coal varies considerably with the kind of coal used, as well as with the temperature at which the distillation is carried on, the yield of tar being smaller at very high temperatures than when lower ones are employed. *C.T.*, from its antiseptic properties (due chiefly to the carbolic acid it contains), is painted on wood to preserve the latter from decay when exposed to wind and weather. It furnishes the chief ingredient of printers' ink in the shape of lampblack. Mixed with coal-dust, saw-dust, and peat-dust, it forms a useful artificial fuel, and when incorporated with pebbles makes an excellent artificial asphalt for pavements. The chief value of *C.T.*, however, consists in its being the source of those brilliant dye-stuffs, the aniline colors. These, together with the naphtha obtained from its distillation, have converted coal-tar from a worthless and unwelcome waste product of gas manufacture—for the removal of which from their premises the gas makers were formerly only too glad to pay—into a very considerable and important branch of manufacture. The different constituents of the tar are separated from each other by distillation, the various products so obtained being further purified by various processes. See ANILINE COLORS, BENZOLE, NAPHTHA, etc.

**Coal-Wharf**, a landing pier where coals are deposited.

**Coal-Whipper**, a London porter who unloads coals from ships at the wharves, etc.

**Coamings**, raised borders of wood round the edges of hatches and scuttles of a ship, to prevent water flowing down from the deck, and to receive and support the hatches, etc.

**Coaster**, a vessel employed in the trade along shore, and which does not sail far from land.

**Coasting-Trade**, the trade or intercourse carried on by sea between two or more ports or places of the same country. In England, foreigners were formerly excluded from all participation in the *C.T.*, but by Act of 1855 (17 Viet. c. 5) the *C.T.* has been made quite free. In the U. States, that trade has been, and is still, strictly reserved for vessels built within our territory and owned by our citizens, to the exclusion of foreign-built and foreign-owned vessels. The Regulations concerning the *C.T.*, and Enrolment and License of vessels employed in that trade and also in our rivers and lakes, are embodied, under the title *L. act. 4300* of the Revised Statutes, entitled, *Regulation of Vessels in Domestic Commerce*, and are as follows, viz.:—

Vessels of 20 tons and upward, enrolled, and having a license in force, and vessels of less than 20 tons, not enrolled, but having a license in force, and no others, shall be deemed vessels of the U. States, entitled to the privileges of vessels employed in the coasting-trade and fisheries. Every vessel of 20 tons or upward (other than such as are registered) trading be-

tween district and district, or between different places in the same district, or carrying on the fishery, without being enrolled and licensed, or if of less than 20 tons, and not less than 5 tons, without a license, if laden with goods the growth or manufacture of the United States only (distilled spirits only excepted), shall pay the same fees and tonnage in every port at which she may arrive as are payable by vessels not belonging to a citizen of the U. States; and if she have on board any articles of foreign growth or manufacture, or distilled spirits, other than sea-stores, she, together with her tackle, apparel, and furniture, and lading, found on board, shall be forfeited. But if such vessel be at sea at the expiration of the time for which the license was given, and the master shall swear that such was the case, and shall also, within forty-eight hours after his arrival, deliver to the collector of the district in which he shall first arrive the license which shall have expired, she shall not be forfeited, nor shall he be liable to pay such fees and tonnage. No goods shall be imported, under forfeiture thereof, from one to another port of the U. States, in a vessel belonging wholly, or in part, to a subject of any foreign power; but such vessel may sail from one to another such port, carrying such goods only as were imported in her from some foreign port, and which shall not have been unladen.

**Enrolment and License of Vessels.** The like qualifications and requisites are necessary for the enrolment as for the registry and record of vessels, and the same duties are imposed on, and authority given to, all officers respectively, in relation to such enrolments, and the same proceedings shall be had in similar cases touching such enrolment; and vessels so enrolled, with their masters or owners, shall be subject to the same requisites as are in these respects provided for registered vessels. The record of such enrolment shall be made, and an abstract or copy thereof granted, as nearly as may be, in the form directed by law. Enrolled and licensed vessels may be registered upon the registry being given up; and registered vessels may be enrolled, upon surrendering up the enrolment and license. And when any vessel shall be in any other district than that to which she belongs, the collector, on application of the master, and on his making oath that, to the best of his knowledge and belief, the property remains as expressed in the register or enrolment, proposed to be given up, and upon his giving the bonds required for granting register, shall make such exchanges, and such collector shall transmit the register or enrolment given up to the register of the treasury. The register or enrolment and license granted in lieu thereof, shall, within ten days after the arrival of the vessel within the district to which she belongs, be delivered up to the collector of such district, and be by him cancelled. And if the master shall neglect to deliver such register or enrolment and license within the time specified, he shall forfeit one hundred dollars. In order to the licensing of any vessel for carrying on the coasting-trade or fisheries, the husband, together with the master, with one or more sureties, to the satisfaction of the collector, shall become bound to pay to the U. States, if she be of the burden of 5 tons and less than 20 tons, the sum of \$100; and if of 20 tons, and not exceeding 30 tons, the sum of \$200; and if above 30 tons, and not exceeding 60 tons, the sum of \$500; and if above 60 tons, the sum of \$1,000, in case it shall appear, within two years from the date of the bond, that she has been employed in any trade whereby the revenue of the U. States has been defrauded, during the time her license remained in force; and the master of such vessel shall also swear that he is a citizen of the U. States, and that such license shall not be used for any other vessel, or any other employment than that for which it is specially granted, or in any trade whereby the revenue may be defrauded; and if such vessel be less than twenty tons burden, her husband shall swear that she is wholly the property of a citizen or citizens of the U. States, whereupon the collector of the district whereto such vessel may belong (the duty of 6 cents per ton being first paid) shall grant a license, in the form directed by law, for carrying on the coasting-trade, whale fishery, cod fishery, or mackerel fishery. A steam-vessel, intended to be employed only in a river or bay of the U. States, owned wholly or in part by an alien, resident within the U. States, shall be enrolled and licensed as if she belonged to a citizen of the U. States except that no oath shall be required that she belongs to a citizen or citizens of the U. States. The owner of such steam-vessel, upon application for enrolment or license, shall give bond to the collector of the district, to and for the use of the U. States, in the penalty of \$1,000, with sufficient surety, conditioned that she shall not be employed in other waters than the rivers and bays of the U. States. When the master of any licensed vessel, ferry-boats excepted, shall be changed, the new master, or, in case of his absence, an owner, shall report such change to the collector residing at the port where the same may happen, if there be one, otherwise to the collector residing at any port where such vessel may next arrive, who, upon the oath of such new master, or, in case of his absence, of an owner, that he is a citizen of the U. States, and that she shall not, while such license continues in force, be employed in any manner whereby the revenue may be defrauded, shall indorse such change on the license, with the name of the new master, and when any change shall so happen, and shall not be reported, and the indorsement so made, such vessel, found carrying on the coasting-trade or fisheries, shall be subject to pay the same

fees and tonnage as a vessel of the U. States having a register, and the new master shall forfeit and pay the sum of ten dollars. Before any vessel, of the burden of 5 tons, and less than 20 tons, shall be licensed, the same admeasurement shall be made, and the same provisions observed relative thereto, as are to be observed in case of admeasuring vessels to be registered; but in all cases where such vessel, or any other licensed vessel, shall have been once admeasured, it shall not be necessary to measure her anew for the purpose of obtaining another enrolment or license, except she shall have undergone some alteration as to her burden subsequent to the time of her former license. Every licensed vessel shall have her name, and the port to which she belongs, painted on her stern, as is directed for registered vessels, and it found without such painting, the owner shall pay \$20. See MERCHANT MARINE.

*Tonnage of the U. States merchant marine employed in the Coasting-Trade, from 1859 to 1878 (not including the Cod and Whale fisheries).*

Year.	Enrolled vessels.	Licensed vessels, under 20 tons.	Total.
	Tons.	Tons.	Tons.
1859.....	2,439,320	41,609	2,480,929
1860.....	2,599,319	45,548	2,644,867

1877.....	2,488,189	52,133	2,540,322
1878.....	2,444,801	52,369	2,497,170

**Coat**, a covering of paint, varnish, or other material given to any substance; an outer garment for men.

**Coatee**, a short cut-away body coat.

**Coat-Link**, a pair of buttons or studs joined by a link to close a coat with buttonholes.

**Cob**, in Cornwall, England, the process of crushing ore with hammers to separate the worthless parts.—The hard stalk from which the grain of Indian corn has been removed. When chopped it is given as provender to live-stock.—A hazelnut.—A wicker basket for the arm.—A name given in some places to the hard dollar.—In England, a strong stiff-built pony used for carrying heavy persons in the saddle.

**Cobalt**, a mineral of a gray color, with a shade of red, and by no means brilliant. It has scarcely any taste or smell; is rather soft; specific gravity about 8.6. Sometimes it is composed of plates, sometimes of grains, and sometimes of small fibres adhering to each other. The oxide of cobalt is extensively used as a means of dyeing glass, and for glazing and coloring porcelain. The principal ores of cobalt are the arseniates, called *arsenical C.* and *gray C.* They are found in Sweden, Saxony, Saalfeld, Hessa, and in England in Cumberland and Cornwall. A very small amount of oxide is sufficient to tinge a large quantity of glass. See SMALT.

**Cobalt Bloom**, the red arseniate of cobalt; a beautiful mineral found with the ores of cobalt, and used in the manufacture of smalt.

**Cobang**, a gold coin of Japan worth about \$6.50.

**Cobbing**, a mining name for old furnace bottoms, pieces of brick, etc., thrown into a smelting furnace.

**Cobble**, a large, heavy pebble, or fragment of stone, used in paving streets.

**Cobbler**, a jobbing shoemaker, one who undertakes repairs.—A cooling drink, a mixture of wine, sugar, lemon, and ice.

**Cobbler's Wax**, a shoemaker's composition of resin and wax, for stiffening his thread.

**Cob-Crushing Machine**, a mill for breaking the cobs of Indian-corn for cattle-food. See CORN MILL.

**Cobija**. See BOLIVIA.

**Cob-Iron**, an andiron with knobs.

**Coble**, the name of a kind of pilot and fishing boat used on the northern sea-coasts, having a low square stern and little or no keel on the after body.

**Cob-Nut**, an improved variety of the common hazel-nut, of which there are several kinds cultivated.

**Cobourg**, a thin worsted fabric, a lady's dress material composed either of wool and cotton, or of wool and silk.

**Cobre**, a name for the covid in China of 14.625 inches.

**Cobres**, a European name for the finest quality of indigo made in Central America.

**Coca**, the leaves of *Erythroxylon coca*, a plant which is grown largely in Peru and Bolivia. The Bolivian *C.* is said to be much superior to the Peruvian. The best kind is believed to come from the prov. of Yungas, and the most inferior description from Peru. The consumption of *C.* in Peru, Bolivia, and in some of the prov. of the Argentine Confederation is enormous. In small doses it is supposed to act as a stimulant and to aid digestion; in large ones it is said to possess dangerous narcotic properties. The mountaineers in S. America state they are enabled to reach high elevations without difficulty of respiration, and to stave off the feeling of hunger by chewing the leaves during their ascents. Good quality *C.* should have its leaves unbroken, of a medium size, bright green color, and of an odor somewhat combining that of hay and chocolate. The taste is bitter, and when masticated, *C.* is said to yield easily to the teeth. Infused in hot water, it has a beautiful green color, which, however, is much darker from inferior leaves. An infinite number of varieties are recognized between the best and the lowest quality, which has a disagreeable smell and color resembling roasted coffee. The leaves are also bent and broken, scarcely a whole leaf being found amongst them. *Imp. free.*

**Cocculus Indicus, Indian Berry** [Fr. *cocque du Levant*; Ger. *Kokkels Körner*; It. *galla di Levante*; Malay, *tulabidgi*; Sans. *kakamari*], the fruit or berry of the *Menispermum cocculus*, a stray climbing tree found on the Malabar coast, in Ceylon, etc. The berry is kidney-shaped, dark brown, about the size of a large pea; but when dried and imported it is shrivelled and smaller. The outer layer encloses a woody shell, containing a yellowish kernel. *C. I.* is acrid and intensely bitter. In some parts of the East it is used, when formed into a paste with moistened rice, as a bait by fishermen and bird-catchers, but especially the former. Being thrown into the sea, or scattered on the ground, it is greedily devoured by the fish and birds, which it either kills or stupefies, so that they are easily captured. It is said not to render the flesh of such animals poisonous, as strychnine does. Its effects on man have not been accurately determined, but if taken in large doses it would, no doubt, be fatal. When added to malt liquors it increases their intoxicating power; and provided it be not administered in excess, or does not exceed 3 lbs. *C.* to 10

grs. malt, its use in this way is not supposed to have any injurious influence.

**Cochenilla Wood**, the heart of a tree shipped from St. Domingo, furnishing a handsome furniture wood.

**Cochi**, a grain measure of Siam of 6½ lbs.

**Cochineal** [Dutch, *cochenille*; Fr. *cochenille*; Ger. *Koschenille*; It. *cocciniglia*; Port. *cochenha*; Sp. *cochequilla*, *grana*], the dried carcasses of the female *Coccus cacti*, found in Mexico, Central America, Brazil, the Canary Islands, etc. Formerly it was in Mexico only that it was raised with care, and formed a valuable article of commerce; but its culture is now more or less attended to in many other places, and especially in the Canary Islands. It is a small insect, seldom exceeding the size of a grain of barley, which feeds on the leaves of several species of cacti of the genus *opuntia*; and was generally believed, for a considerable time after it began to be imported into Europe, to be a sort of

Fig. 87. — CACTUS COCHINILLIFER.

vegetable grain or seed. There are two sorts or varieties of *C.*: the best or domesticated, which the Spaniards call *grana fina*, or fine grain; and the wild, which they call *grana sylvestra*. The former is nearly twice as large as the latter, probably because its size has been improved by the favorable effects of human care, and of a more copious and suitable nourishment, derived solely from the *Cactus cochinillifer* (Fig. 87), during many generations. Wild *C.* is collected six times in the year; but that which is cultivated is only collected thrice during the same period. The insects, of which there are about 70,000 in a pound, being detached from the plants on which they feed by a blunt knife, are put into bags, and dipped into boiling water to kill them, after which they are dried in the sun. It is principally used in the dyeing of scarlet, crimson, and other esteemed colors. The watery infusion is of a violet crimson; the alcoholic, of a deep crimson; and the alkaline, of a deep purple, or rather violet hue. It is imported in bags, each containing about 200 lbs.; and has the appearance of small, dry, shrivelled, rugose berries or seeds, of a deep brown, purple, or mulberry color, with a white matter between the wrinkles.

In this state they suffer no change from length of keeping. The best *C.* is that which is large, plump, dry, and of a silvery-white color on the surface. The species of *C.* called *granilla*, or dust, is supposed to be principally formed of *grana sylvestra*. The insects of which it consists are smaller than those composing the fine cochineal; and it does not yield more than a third part of the coloring matter that is yielded by the latter. About 500 tons of *C.* are annually imported into the U. States, chiefly from Mexico and Honduras, while England imports about 1,500 tons. Its market value in New York is about 75 cts. per lb. *Imp. duty, C.*, free; *C. lake*, 25 per cent.

**Cochin China**, the eastern part of the Indo-Chinese peninsula, composed of the territories of Anam proper, Tong-king, and the French colony of *C. C.* It forms a long strip of country which stretches in an arc of a circle along a coast line of 1,240 m. from lat. 8° 30' to 23° N. With a breadth of 372 m. in the north of Tong-king, it is afterwards narrowed by a chain of mountains parallel to the China Sea, and has no more than 50 m. of breadth in the greater part of the kingdom of Hué; but in lower *C. C.* it widens out again to about 190 m. The boundaries are, — N. the Chinese prov. of Yun-nan and Kwang-Si, E. and S. the China Sea, W. the Gulf of Siam, the kingdom of Cambodia, and the Laos country tributary to the Siamese empire. The empire of Anam has an area of from 190,000 to 230,000 sq. m.; while the French colony occupies about 21,000. Passing along the coast from Cape Pak-hung, where the frontier commences between China and Tong-king, we find the mouth of the river Hong-kiang (Red River), which leads to Ke-cho, or Ha-nor, the chief town of Tong-king. This town and the port of *Ninh-hai*, in the prov. of Hai-Dzuong, were opened to foreign commerce by a treaty concluded between France and the government of Hué, March 15, 1874. To allow a ship to pass up the river at any season, its draught must not exceed 5½ feet, and from the end of May to the end of Nov. vessels drawing 12 feet can cross the bar. At Cape Boung-qui-hoa there is a good anchorage well sheltered by islands. In front of Cape Lay is the little Tiger Island, where the W. coast of the gulf of Tong-king terminates. On the China Sea, the coast presents successively, as we pass southward, the mouth of the river Hué, defended by a port; the Bay of Tourane, wide, deep, and well sheltered; the Bay of Quit-quit, a very good anchorage, and the safest on this coast during the N.E. monsoon; the port of *Qui-nhon*, or Binh-dinh, opened to European commerce by the treaty of March, 1874; the bay and the commodious port of Thu-yen; the port of Hon-ro, to the S. of Cape Varela, which is safe at all seasons of the year; and Cape Ba-kee, which forms the limit between lower *C. C.* and the kingdom of Anam. The whole of lower *C. C.* being formed of alluvial deposits, its coast is very low, has little irregularity of surface, and is covered with mangroves. The different mouths of the River Cambodia, or Me-kong, form a delta of more than 70 m. in extent. At the entrance of the river Don-nai, which leads to *Saigon*, rises Cape St. Jacques, a peak 920 feet above the level of the sea. At 45 sea-miles from the coast and from the mouths of the Cambodia, is the island of Pulo Condore, with a good port and a penitentiary established by the French government. On the W. coast of *C. C.*, in the Gulf of Siam, is the port of Ha-Tien, communicating by a canal with one of the arms of the Cambodia. The climate of the S. of Anam

differs much from that of the S. In Tong-king the thermometer falls to 41° to 43° in Dec. and Jan., while the summer is excessively hot; but on the whole it is a healthy country. The mean temperature of lower *C. C.* is 83° F. The greatest heat in April and May within doors is 97°. In the mornings of Dec. the temperature falls to 65°. The climate is very unhealthy for Europeans, owing to the character of the soil, which consists of recent alluvial deposits, is absolutely flat, and in some places below the level of the sea. The forests furnish several kinds of timber for building. In the plains and valleys are numerous fruit-trees,—the banana, the guava, the papaw, the medlar-tree, the orange, the citron, and, most abundant of all, the cabbage-palm and the cocoa-tree, and the cinnamon, of which Tong-king furnishes a superior quality. The people of Anam is essentially agricultural. Besides rice, which is the chief production of the country, the cultivated lands furnish cotton, mulberry, sugar-cane, Indian corn, betel-nuts, and vegetables, especially potatoes, earth-nuts, and pepper. Tea is cultivated also, but the people of Anam do not know how to prepare it. There is little industrial activity in Anam, but in Tong-king the manuf. of articles inlaid with mother-of-pearl is carried on. From China *C. C.* received a large quantity of manufactured goods, cotton and silk stuffs, porcelain, and tea. The importation from France is also very considerable. The principal exports are rice (which forms of itself half the sum total) salt-fish, salt, undyed cotton, pepper, and the skins of animals. The great commercial importance of *C. C.* arises from the excellence of its situation, as a way of communication with the rich and populous provinces of middle China. It is difficult to state the exact number of the population of the empire of Anam, and authors vary greatly in their estimates. The data which appear the most worthy of credit give a total sum of 10 or 12 millions. As to the French colony, the last official census gives 1,487,200 inhabitants, of whom 49,500 were Chinese, and 82,700 Cambodians. The Europeans numbered 1,114, exclusive of the government officials and the garrison. Hué or Plu-tua-tien, capital of the kingdom of Anam, contains about 100,000 inhabitants. The two principal ports of French *C. C.* are *Saigon*, capital of the colony, and *Mi-thô*, on one of the arms of river Cambodia.

**Cochorn**, a small brass mortar, usually about 5½ inches bore, but sometimes rather smaller.

**Cock**, to lift the hammer of the lock of a pistol or musket, etc. See **Cocks**.

**Cock-Bill**, a nautical term applied to an anchor, projecting, or hanging perpendicular by the stopper, from the cat-head.

**Cock-Boat**, a very small boat.

**Cocket**, in England a warrant from the Custom House, on entering goods, showing that the duty on them has been paid.

**Cock-Founder**, a caster in brass, one who makes metal spigots.

**Cockle**, an edible mollusk, the *Cardium edule*, extensively found in the sands of the sea-shore.

**Cocks**, **Stop-Cocks**, metal taps or escapes for gas and fluids, some of which are turned on and off by the hand; others, acted upon by a floating or air ball, are self-regulating.

**Cockspurs**, small clay wedges used in the potteries to separate articles of pottery ware, after the process of glazing, and to prevent them adhering.

**Cockswain**, **Coxswain**, the steersman of a boat.

**Cocoa**. See **CACAO**.

**Cocoa Fibre**. See **COCOA-NUT** and **COIR**.

**Cocoa-Mats**. See **COIR**.

**Cocoa-Nut**, or **Coco** [Fr. and Sp., *coco*; Ger. *Kokonüss*; It. *coccho*], the well-known edible fruit of the *Cocos nucifera* palm, (Fig. 88), many thousands of which are imported into this country from the West Indies and South America, as dunnage in ships, and sold in the streets and fruit-stands. The *C. N.* tree, common everywhere within the tropics, is extremely valuable, every part of it being appropriated to some useful purpose. It grows to the height of from 50 to 90 feet; it has no branches, but the leaves are from 12 to 14 feet in length, with a very strong middle rib. The fruit is nearly as large as a man's head; the external rind is thin, tough, and of a brownish red color. Beneath this, there is a quantity of very

Fig. 88. — COCOA-NUT TREES.

tough fibrous matter, which is used in the manufacture of cordage and coarse sail-cloth. It is buoyant, and extremely well suited for ropes of large diameter; and until the introduction of chain cables most of the ships which navigated the tropical seas were supplied with cables of this material. (See **COIR**.) Within the fibrous coating is the shell of the nut, which is nearly globular, very hard, susceptible of a high polish, and used for many domestic purposes; the kernel is white, in taste and firmness resembling that of a hazel-nut; it is hollow in the interior, the hollow being filled with a milky fluid. While the nut is green, the whole hollow of the shell is filled with fluid, which is refreshing, agreeable, and pleasant to the taste. The solid part of the ripe kernel is extremely nutritious, but rather indigestible. The kernels yield by expression a great deal of oil, which, when recent, is equal to that of sweet almonds; but it soon becomes rancid, and is then employed by painters. A tree generally yields about 100 nuts, in clusters near the top of about a dozen each. The wood of the tree is made into boats, rafters, the frames of houses, and gutters to

convey water. The leaves are used for thatching buildings, and are wrought into mats, baskets, etc., so that every part of it is applied to some useful end. If the body of the tree be bored, there exudes from the wound a white liquor, called *palm wine* or *toddy*. It is very sweet when fresh; kept a few hours, it becomes more poignant and agreeable; but next day it begins to grow sour, and in the space of 24 hours is changed into vinegar. When distilled, it produces the best species of Indian arrack; it also yields a great deal of sugar. Toddy is obtained from several species of palms, but that of the *Cocos nucifera* is the best. An improvement effected in the preparation of *cocoa oil* has made it of much importance in the arts, by rendering it available in the manufacture of candles and soap, and for various purposes to which it was not previously applicable. The palm oil met with in the market is the product of another palm (see *PALM OIL*). *Imp. duty* (fibre, leaves, shells, and oil) free.

**Cocoa-Nut Oil, Shells, and Wine.** See COCOA-NUT.

**Cod** [Fr. *morue*; Ger. *Kabljou*, *Bakalan*; It. *baccalà*; Port. *bacalhão*; Sp. *bacalao*], the *Morhua vul-*

fewer are more universally serviceable than the *C.*, of which every part is applied to some useful purpose. When fresh, its beautifully white, firm, and flaky muscles furnish our table with one of the most delicious dainties; salted, dried, or otherwise conserved for future use, it affords a substantial and wholesome article of diet, for which a substitute could not readily be found. The tongue, which is always separated from the head when the fish is first caught, even epicures consider a delicacy; and tongues, salted or pickled along with the swimming-bladders, which are highly nutritious, being almost entirely pure gelatine, are held in much estimation by housekeepers, under the title of tongues and sounds. The sound or swimming-bladder of *C.*, if rightly prepared, supplies an isinglass equal to the best Russian. The liver of the cod, when fresh, is eaten by many with satisfaction, but it is more generally reserved, by fishermen, for the sake of a large quantity of fine limpid oil which it contains. (See *COD-LIVER OIL*.) The heads of the *C.*, after the tongues are cut out, and the gills are saved for bait, are thrown overboard, on account of want of room, and because salting would not preserve them to

Fig. 89. — Cod.

*garis*, a well-known fish, possessing, in common with the other members of the genus, three dorsal and two anal fins, and a single barbel at the chin (Fig. 89). It is a widely distributed species, being found throughout the northern and temperate seas of Europe, Asia, and America, extending as far south as Gibraltar, but not entering the Mediterranean, and inhabits water from 25 to 50 fathoms deep, where it always feeds close to the bottom. It is exceedingly voracious, feeding on the smaller denizens of the ocean, — fish, crustaceans, worms, and mollusks, and greedily taking almost any bait the fisherman chooses to employ. The *C.* spawns in February and is exceedingly prolific, the roe of a single female having been known to contain upwards of eight millions of ova, and to form more than half the weight of the entire fish. Only a small proportion of these get fertilized, and still fewer ever emerge from the egg. The young are about one inch in length by the end of spring, but are not fit for the market till the second year, and it has been stated that they do not reach maturity, as shown by the forms of reproduction, till the end of the third year. They usually measure 3 feet in length, and weigh from 12 to 20 lbs., but specimens have been taken from 50 to 70 lbs. in weight. As an article of food the *C.* is in greater perfection during the three months preceding Christmas. Few members of the animal creation contribute a greater mass of subsistence to the human race; still

any advantage. Yet the head, being almost entirely composed of gelatine, is, when fresh, the richest, and perhaps the most nutritive part of the fish. The intestines of the *C.* also yield a tribute to the table; the French fishermen, especially, prepare from them a dish somewhat similar, and not far inferior to the sounds. Finally the ovaries or roes of the females are separated from their membranes, and the eggs, nicely pickled, afford an agreeable and gustful relish, far more delicate and inviting to the palate than the celebrated Russian caviare. In addition to these usual modes of employing the different parts of our fish, the Norwegians, Icelanders, and Kamtschadales pound up the backbones and other refuse parts, for the purpose of feeding their dogs and other domestic animals during the winter. Strange as such diet may appear, it is stated as a well-established fact, that cows, fed upon these pounded bones, mingled with a small quantity of vegetable matter, yield a larger supply and a better quality of milk than those supported upon more ordinary provender. — The usual mode of preserving *C.* for commercial purposes is by salting them immediately after they are caught, having first removed the head, bowels, etc. Those which are carefully selected and salted with greater attention to their whiteness, are usually called *dun-fish*, and bring a better price than such as are salted in bulk, with little regard to the discoloration caused by imper-

feet washing and draining before being packed. Where facilities are afforded for drying, by an adjacent shore, or by the construction of the vessel, cod are cured by drying alone, or with a very small quantity of salt. This process requires several days' exposure to sun and air, and, when skillfully conducted, keeps the fish, for an indefinite period, in a very desirable condition of whiteness and freshness, both peculiarly advantageous to the appearance of the fish at respectable tables. *C.* thus cured are called *stock-fish*, and, before being cooked, require to be softened, by soaking in water and pounding with a wooden mallet. — The great rendezvous of the *C.* fish is on the Banks of Newfoundland, and the other sand banks that lie off the coasts of Cape Breton, Nova Scotia, and New England. They prefer those situations, by reason of the quantity of worms produced in these sandy bottoms, which tempt them to resort there for food. But another cause of the particular attachment the fish have to these spots is their vicinity to the polar seas, where they return to spawn: there they deposit their roes in full security; but want of food forces them, as soon as the more southern seas are open, to repair thither for subsistence. Few are taken to the north of Iceland, but they abound on its south and west coasts. They swarm on the coasts of Norway, in the Baltic, and off the Orkney and Western Isles; after which their numbers decrease in proportion as they advance towards the south. Before the discovery of Newfoundland, the greater fisheries of *C.* were on the seas of Iceland, and off the Western Isles, which were the grand resort of ships from all the commercial nations; but the greatest plenty was met with near Iceland. The spawning season, on the banks of Newfoundland, begins about the month of March, and terminates in June; consequently the regular period of fishing does not commence before April, on account of the storms, ice, and fogs; and, indeed, many fishermen consider the middle of May as sufficiently early. After the month of June, *C.* commence their migrations to other quarters, and, of course, the fishing is suspended until the ensuing season. During the months of April and May, fresh *C.* of several species are caught, in considerable abundance, on the Atlantic coast of the U. States, as far south as the capes of Delaware, and perhaps still more to the southward. At this season, the markets of this country are, for a short time, supplied with this fine fish. The inhabitants of the north-eastern cities, being near to the great fisheries, and employing vessels built for the conveyance of live fish, are liberally provided with all the luxuries obtainable from this great gift of Providence. — For regulations and statistics of the *C.* fishery, see FISHERIES.

*American C. Fishing.* Of the U. States, Massachusetts is the most extensively engaged in the fishery, the principal ports being those on Cape Cod, with Plymouth, Kingston, Marblehead, Beverly, and Gloucester. Maine comes next by a long interval, the principal places engaged being Portland, Wiscasset, Boothbay, Waldoborough, Belfast, Castine (employing more vessels than any other town in the State), and the ports about Frenchman's Bay. Gloucester is the great fishing port of the country. A few vessels from this town make winter trips, from three to five weeks in length, to the Western bank, the number increasing after the beginning of February. In this month also fishing commences on Georges bank (S. E. of Massachusetts), the trips averaging three or four weeks. The Georges fleet is largest in March, begins to decrease in April, and almost disappears in June. As the weather grows milder and the Georges fleet diminishes, the Gloucester vessels commence their trips to the fishing grounds off Cape Sable and Cape North, in the Gulf of St. Lawrence, and on the Western Grand banks. The trips to the Grand bank rarely exceed 12 weeks in length, those to the Western banks 9 weeks. The Cape Cod vessels do not engage in winter fishing. About five

sixths of them sail for the banks during the first half of April, and make two trips, or "fares," arriving on their first fare early in June, sailing again the last of that month, and arriving on their second fare the latter part of August or first of September. The remaining sixth sail about the middle of May, and make but one fare, arriving in August or September. Provincetown vessels, however, all make one long trip to the Grand bank, sailing in April, and sometimes prolonging their stay until October. Marblehead and Beverly vessels that make two fares arrive on their first fare in July or August, and on their last in November. The vessels employed are schooners of from 45 to 100 tons, averaging 60 or 70. The number of the crew varies from 9 to 14, sometimes exceeding the latter number. The bank fishermen all use dories, or flat-bottomed boats, which are sent out, usually twice a day, a short distance from the vessel, which lies at anchor on the fishing ground. The larger proportion (perhaps three fourths) of the Massachusetts vessels use trawls, which are set and hauled periodically. The trawl consists of a long line anchored and buoyed at each end, with hooks, generally several hundred in number, adjusted at intervals. The trawlers use dories about 15 ft. in length, usually carrying one for every two men. The fishermen that use hand lines carry a dory 12½ ft. long for each man except the cook, and in the largest vessels the "skipper," as the captain is called. Owing to the strong tide on Georges bank, the fishermen do not use dories there, but fish directly from the vessel. The Maine vessels carry larger crews than those from Massachusetts, and use hand lines. The trawlers use fresh bait, herring, mackerel, or squid. The hand-liners use salted clams for the first of the season, but afterwards usually obtain squid. The fish when brought aboard the vessel are dressed and salted in the hold. Upon arrival home they are taken out, washed, and dried on flakes, or platforms of wicker-work, on the shore. The process of dressing them is reduced to system, and is performed with great rapidity. The throater, usually a boy, cuts the throat and rips them open; the header removes the entrails and the head; the splitter splits the fish, removing a portion of the backbone; while the salter piles them in tiers and sprinkles them with salt. There are two principal methods of employing the crew. Under one system, a portion of them, called sharesmen, take the risk of the voyage and hire the rest of the men. These shares number from one to five, three or four being the usual number. There may be whole shares or parts of shares, the latter occurring when a portion of the compensation is at the risk of the voyage and the rest is received in wages. The hired men receive from \$150 to \$250 for one fare, and from \$200 to \$300 for two fares. The cook is usually paid from \$50 to \$60 a month. In settling the voyage, as it is termed, the skipper takes a small proportion of the gross stock, generally 3 per cent. The "great general supplies," consisting of salt, bait, dories, fishing tackle, etc., are then deducted; the owners of the vessels next draw one fourth; one eighth of what remains is paid for curing the fish; the provisions are then paid for; and finally the wages of the hired men are deducted. Whatever is still left is divided among the sharesmen, the skipper drawing a share in addition to his percentage. With fair success, the sharesmen will draw about 45 per cent of the gross proceeds, though the proportion varies of course according to circumstances, and they sometimes fail to pay their expenses. This system is in use on Cape Cod, and in Plymouth, Marblehead, and Beverly. By the other method the owners equip the vessel, and buy the fish green upon her arrival, at the market price for the time being. The crew receive half the proceeds, paying only half of the bait bill and of the cook's wages, having left about 45 per cent net, which in vessels that use trawls is generally divided equally, but in the case of those that use hand lines is commonly shared among the crew according to their respective catch, or on the 'own hook lay.' This system is in vogue in Gloucester. The Maine fishermen use the same method, but do not sell their fish until cured. The Nova Scotia vessels mostly use trawls. The sharesmen, six or eight in number, hire the boys and ordinary fishermen, and divide the proceeds according to the system last described." — *American Cyclopædia*.

**Codilla**, the coarse tow of flax and hemp.

**Codiniac**, a quince marmalade.

**Cod-Line**, an eighteen-thread line.

**Codling**, a small cod-fish. — A kind of apple suited for cooking.

**Cod-Liver Oil**, a fixed oil obtained from the fresh liver of the common cod, of which large quantities are prepared upon the coasts of Newfoundland, Nova Scotia, and New England. Oil bearing this name is also produced from the haddock, the coal-fish, the ling, and the hake. The best oil is obtained by heating the livers, broken up into a mass, by means of steam, to a temperature not exceeding 180°. The livers should be as fresh as possible. This product is called *shore oil*,

and is the purest. If the livers are left till putrefaction commences, oil rises to the surface, and if rapidly taken off, is of second quality, being known as *strains oil*. The residue left to putrefy and then boiled constitutes the *lunks oil*, and is offensive both in taste and odor. Sometimes the oil is expressed, after heating the fresh livers, the product being filtered supplies a good variety of the oil. Great use is made of cod-liver oil, and especially of the coarser kinds, in the manufacture of shoe-leather, which is most conveniently dressed with this substance. But its most important economical use is as a medicine. In what manner it operates is not determined, but it is said to be one of the most valuable alteratives and restoratives in cases of scrofula and consumption. In consequence of its great value as a drug, the article is frequently adulterated with other fixed oils of animal origin, and sometimes with fixed vegetable oils. Exact chemical analysis might detect some of these adulterations, but unfortunately the process, if possible, is exceedingly delicate and uncertain. The following are, according to the best authorities, the most trustworthy tests: — The sp. gr. of genuine oil ranges between .915 and .9195 at 72°. Shark-liver oil, which is said to be substituted for the genuine article, is reported to have the sp. gr. of .866. — Genuine cod-liver oil does not congeal at 14°. — The sulphuric acid test. A drop of this acid gives a centrifugal movement to the oil, and a fine violet color, passing to a yellowish or brownish red. Sometimes the color is red at once. — The nitric acid test. This acid when agitated with the oil gives a pinkish or rose-red color, afterwards becoming brown. — The sensible qualities of odor and taste. *Imp.* duty, brown, or crude, or in barrels, or for tanners' use, 20 per cent; medical preparation, 40 per cent.

**Cod-Roes**, the melt or spawn of the cod-fish, salted and dried, which is shipped from Norway to France, to the extent of 20,000 to 30,000 barrels, and used as a ground bait, chiefly in the Bay of Biscay.

**Coffee** [Dutch, *koffy*, *koffboonen*; Ger. *Koffe*, *Koffelbohen*; It. and Port. *café*; Fr. and Sp. *café*] is the berry of the *Coffea Arabica*, an evergreen shrub, with an erect slender trunk, in height from 8 to 15 feet, and having long flexible branches. The flower resembles that of the common jasmine, and the fruit is like a small red cherry, enclosing within a soft pulp the two oval seeds familiar to every one as the coffee-bean of commerce. The shrub begins to produce fruit when about 2 years old, and yields, according to its age and size, from 1 to 4 or 5 lbs.; but the quality of the produce from young plants is inferior to that from such as are 4 or 5 years old. *C.* only 2 or 3 months from the tree is not so good as that which has been kept a year; but when older it becomes deteriorated. When of good quality, the seeds or beans are hard and heavy, sink quickly in water, are of a light yellowish-green color, sweetish taste, possess in a slight degree the peculiar odor of coffee, and are free from any damp smell. The American beans are larger than those from the East. Before being used for domestic purposes they are roasted, a process by which they are increased to nearly twice their original size, while they lose about one third of their weight. *C.* is very apt to imbibe moisture, or the flavor of any thing placed near it; much attention is therefore necessary in packing it on board ship or otherwise. The early history of *C.* as an economical product is involved in considerable obscurity. Its use as a beverage seems to have been prevalent among the Abyssinians from

the most remote period, and in Arabia the beverage when first introduced (about the beginning of the 15th century) only supplanted a preparation from the leaves of the *Celastrus edulis*. Its peculiar property of dissipating drowsiness and preventing sleep was taken advantage of in connection with the prolonged religious services of the Mahometans, and its use as a devotional antisoporific stirred up a fierce opposition on the part of the strictly orthodox and conservative section of the priests. Though all manner of devices were adopted to check its growth, the *C.*-drinking habit spread rapidly among the Arabian Mahometans, and the growth of *C.* as well as its use as a national beverage became as inseparably associated with Arabia as tea is with China. For about two centuries the entire supply of the world, which, however, was then limited, was obtained from the prov. of Yemen in S. Arabia, where the celebrated Mocha or Mokha is still cultivated. The knowledge of and taste for *C.* spread but slowly outwards from Arabia Felix, and it was not till the 16th century that *C.*-houses were established in Constantinople. After the lapse of another century *C.* reached England, a *C.*-house having been opened in London in 1652. A Turkey merchant, of the name of Edwards, having brought along with him from the Levant some bags of *C.*, and a Greek servant accustomed to make it, his house was thronged with visitors to see and taste this new sort of liquor; and, wishing to gratify his friends without putting himself to inconvenience, he allowed his servant to make and sell *C.* publicly. In consequence of this permission, the latter opened a *C.*-house in Newman's Court, Cornhill. Garraway's was the first house opened after the great fire in 1666. Charles II. attempted, by a proclamation issued in 1675, to suppress *C.*-houses, on the ground of their being resorted to by dissipated persons, who "devised and spread abroad divers false, malicious, and scandalous reports, to the defamation of his Majesty's government, and to the disturbance of the peace and quiet of the nation." The opinion of the judges having been taken as to the legality of the proceeding, they resolved, "That retailing *C.* might be an innocent trade; but as it was used to nourish sedition, spread lies, and scandalize great men, it might also be a common nuisance!" M. de la Roque mentions that the use of *C.* was introduced into France between 1640 and 1660; and he further states that the first *C.*-house for the sale of coffee in France was opened at Marseilles, in 1671. It was hardly, however, known, except to a few travellers who had visited the East, till 1669, when it was introduced to the best society in Paris by Solyman Aga, ambassador from the Grand Seigneur to Louis XIV. It immediately became fashionable; and the taste for it having been quickly diffused, a *C.*-house was opened for its sale in 1672, which, in no long time, had several competitors. Some time between 1680 and 1690 the Dutch planted in the vicinity of Batavia *C.*

Fig. 90 — COFFEE PLANT.

beans they had procured from Mocha. In 1690 they sent a plant to Europe; and it was from berries obtained from this plant that the first *C.* plantations in the West Indies and Surinam were derived. The cultivation of *C.* is now general throughout all civilized regions of the tropical world. In point of quantity Brazil heads the list of *C.*-growing countries, its annual produce probably exceeding that of all other localities combined. It is calculated that no less than 530,000,000 *C.* trees are at present flourishing throughout the empire. In 1878 more than 2,000,000 bags, each containing 160 lbs., were exported from Brazil; and the U. States alone absorb upwards of 200,000,000 lbs. of Brazilian *C.* annually. The other principal American localities for *C.*-growing are Costa Rica, Guatemala, Venezuela, Guiana, Peru, and Bolivia, with Jamaica, Cuba, Porto Rico, and the West India islands generally. In the East, the principal *C.* region, following Brazil in amount, but much superior in the quality of their produce, are Java and Ceylon. The annual produce of Java reaches to about 130,000,000 lbs.; and for Ceylon about 100,000,000 lbs. is annually exported. The culture of *C.* is an important and rapidly growing feature in S. India, and it is also prosecuted in Sumatra, Réunion, Mauritius, and S. Arabia, and on the W. coast of Africa. The present annual production of the world has been estimated to amount at no less than 1,000,000,000 lbs., principally consumed in the following countries:—

	Total import of <i>C.</i> for consumption.	Average per head.
Holland .....	72,395,800	21.00 lb.
Denmark .....	26,035,652	13.89 "
Belgium .....	49,771,000	13.48 "
Norway .....	17,635,080	9.80 "

Hamburg (Germany) .....	178,715,936	?

In the London market the established distinctions relate—first, to qualities, as "fine," "middling," "ordinary," "low," and "triage," the last being broken and damaged seeds; and secondly, to localities of production. In New York, the grades are expressed by the terms *prime*, *good*, *fair*, and *ordinary*; and the places of production (as much as can be judged from relative prices) rank as follows:—Mocha, Java (Padang)\* Singapore, Ceylon (native), Laguayra, Manila, Maracaibo, Costa Rica, Mexico, Brazil, and St. Domingo.—Shape, size, and color of seeds are the principal elements which determine the commercial value of *C.* Shape is related to the particular part of the plant upon which the seed grows; size and succulence correspond with the nature of the locality of growth; and color has reference to the degree of maturity attained by the fruit at the time of gathering. The highly-prized variety known as *peaberry* is the result of the coalescence of a single rounded seed, usually of small size, whence the name.

\* The U. States consumes about three fourths of the entire shipment of *C.* from the State of Padang (Sumatra), and comparatively little straight Java *C.* finds its way hither, the Sumatra bean being called Java throughout all branches of the trade in this country.

Regarding the famous Arabian *C.* and the English market Mr. W. G. Palgrave, in his *Central and Eastern Arabia*, has the following remarks:—"The best *C.*, let cavillers say what they will, is that of Yemen, commonly called *Mokha*, from the main port of exportation. Now I shall be sorry to incur a lawsuit for libel or defamation from our wholesale or retail tradesmen; but were the particle *not* prefixed to the countless labels in London shop windows, that bear the name of the Red Sea haven, they would be more trustworthy than they are now. Very little, so little indeed as to be quite unappreciable, of the Mokha or Yemen berry ever finds its way westward of Constantinople. Arabia itself, Syria, and Egypt, consume fully two-thirds, and the remainder is almost exclusively absorbed by Turkish and Armenian consumers. Nor do these last get for their share the best or the purest. Before reaching the harbors of Alexandria, Jaffa, Beyrout, &c., for farther importation, the northern bales have been, while yet in their way, sifted and resifted, grain by grain, and whatever they may have contained of the hard, rounded, half-transparent, greenish-brown berry, the only one really worth roasting and pounding, has been carefully picked out by experienced fingers; and it is the less generous residue of flattened, opaque, and whitish grains which alone or almost alone, goes on board the shipping. So constant is this selecting process that a gradation, regular as the degrees in a map, may be observed in the quality of Mokha, that is, Yemen *C.* even within the limits of Arabia itself, in proportion as one approaches to or recedes from Wadi Nejran and the neighborhood of Mecca, the first stage of the radiating mart."

"The successful culture of the *C.* plant in any portion of the U. States is exceedingly problematical. There is a constant demand for plants for experimental purposes, which the Department is unable to supply, owing to the difficulty of procuring fresh seed. It is barely possible that in S. California, or in S. Florida, localities may be found where it may succeed; but these are the only regions where further experiments in *C.*-culture need be made. Authorities on *C.*-production very generally coincide in the opinion that it cannot be profitably grown in any climate where the temperature falls as low as 50° F. at any period of the year. Since the introduction of *C.*-culture in Liberia, attention has been directed to the superior size of the berry produced in that country. For a time it was supposed to be one of the varieties of *Coffea Arabica*, of which several are known to exist in Abyssinia and Central Africa; but more recent investigations have placed it as a distinct species, which has been named *Coffea Liberia*. Efforts are now being made to introduce this species into *C.*-growing regions, on account of its supposed immunity from the rust, a fungoid disease that has greatly impaired the value of the *C.*-crop in some of the best plantations in various parts of the world. This Liberian species is said to be of larger and of more robust growth than any other cultivated kind. Whether it will prove to be harder, or mature its fruit in climates of lower temperature, remains to be seen." (Report of the Commissioner of Agriculture, 1876.)

The physiological and dietetic value of *C.* depends principally upon the alkaloid caffeine which it contains. Its commercial value is, however, determined by the amount of the aromatic oil, *caffeone*, which develops in it by the process of roasting. By prolonged keeping it is found that the richness of any seeds in this peculiar oil is increased, and with increased aroma the *C.* also yields blander and more mellow beverage. Stored *C.* loses weight at first with great rapidity, as much as 8 per cent having been found to dissipate in the first year of keeping, 5 per cent in the second, and 2 per cent in the third; but such loss of weight is more than compensated by improvement in quality, and consequent enhancement in value. In the process of roasting *C.*-seeds swell up by the liberation of gases within their substance,—their weight decreasing in proportion to the extent to which the operation is carried. Roasting is an operation of the greatest nicety, and one, moreover, of a crucial nature, for equally by insufficient and by excessive roasting much of the aroma of the *C.* is lost, and its infusion is neither agreeable to the palate or exhilarating in its influence. The roaster must judge of the amount of heat required for the adequate roasting of different qualities; and, while that is variable, the range of roasting temperature proper for individual kinds is only narrow. In France, it is the custom to roast in small quantities, and thus the whole charge is well under the control of the roaster; but in

America large roasts are the rule, in dealing with which much difficulty is experienced in producing uniform torrefaction, and in stopping the process at the proper moment. The roasting of *C.* should be done as short a time as practicable before the grinding for use, and as ground *C.* especially parts rapidly with its aroma, the grinding should only be done when *C.* is about to be prepared. Any ground *C.* which may be kept should be rigidly excluded from the air. The prevailing fault of the *C.* made in America is its want of strength and flavor. The *C.*-pot should be heated previously to putting in the *C.*, which may be done by means of a little boiling water. The common practice of boiling *C.* is quite unnecessary, for all its flavor and aroma is readily extracted by boiling hot water. Indeed, all the useful and agreeable matter in *C.* is very soluble, it comes off with the first waters of infusion, and needs no boiling. Should prejudice, however, induce the housewife or cook to boil her *C.* it should be only just simmered for a minute, as long or violent boiling injures it considerably. When *C.* is prepared in a common pot, the latter being first made hot, the boiling water should be poured over the powder, and not, as is commonly the plan, put in first. It should then be kept stirred for 4 or 5 minutes, when a cup should be poured out and returned again, and this operation repeated 3 or 4 times, after which, if allowed to repose for a few minutes, it will generally become fine of itself. In all cases, where a percolator is not used, the liquid should be well stirred up several times before finally covering it up to settle for use. Amongst the various description of *C.*-pots in use we may mention those of French make, consisting of two cylindrical vessels, the upper having a metal strainer, on which the ground *C.* is placed, and through which the clear infusion runs into the lower one. *C.* is sometimes clarified by adding a shred of isinglass, a small piece of clean eel or sole skin, or a spoonful of white of egg. An excellent plan, common in France, is to place the vessel containing the made *C.* upon the hearth, and to sprinkle over its surface half a cupful of cold water, which from its greater gravity descends, and carries the "foulness" with it. Another plan sometimes adopted is to wrap a cloth, previously dipped into cold water, round the *C.*-pot. This method is commonly practised by the Arabians and rapidly clarifies the liquor, unless a very large quantity of chicory is present. It should be recollected that the use of isinglass, white of egg, and all like artificial finings, remove much of the astringency and vivacity of the liquor. The French, who are remarkable for the superior quality of their *C.*, generally allow one ounce to each large *C.*-cupful of water, and they use the *C.* both newly ground and freshly roasted. A shred of saffron, or a little vanilla, is frequently added, whilst the percolating *C.*-pot is generally employed. — *C.* belongs to the medicinal or auxiliary class of food substances, being solely valuable for its stimulant effect upon the nervous and vascular system. It produces a feeling of buoyancy and exhilaration comparable to a certain stage of alcoholic intoxication, but which does not end in depression and collapse. It increases the frequency of the pulse, lightens the sensation of fatigue, and it sustains the strength under prolonged and muscular exertion. The value of its hot infusion under the rigors of arctic cold has been demonstrated in the experience of all arctic explorers, and it is scarcely less useful in tropical

regions, where it beneficially stimulates the action of the skin.

**Adulteration.** The principal substances used for the purposes of adulteration are caramel, roasted chicory, roasted locust leaves, roasted corn, &c. If you contrast *C.* with chicory, we at once see the vast superiority of the former over the latter, thus: — *C.* is the fruit of a tree, whilst chicory is the root of an herbaceous plant, and it is well known that more virtues exist in fruits and seeds than in roots. *C.* contains three active principles, viz. an essential oil, caffeine, and tannic acid, and these exercise a powerful influence on the system, retarding the waste of the tissues of the body, exciting the brain to increased activity, and exhilarating without intoxicating. Chicory contains none of these constituents. *C.* exerts on the system highly beneficial physiological effects: chicory possesses medicinal properties, which are not desirable in an article of food. Chicory, therefore, is very objectionable, and

when a dealer sells a mixture of coffee and chicory for pure *C.*, as is almost invariably the case, he is guilty of selling an adulterated article, and ought to be punished accordingly. The adulteration with caramel or chicory may readily be detected as follows: — 1. A spoonful of pure *C.* placed gently on the surface of a glass of cold water will float for some time, and scarcely color the liquid; if it contains caramel or chicory, it will rapidly absorb the water, and, sinking to the bottom of the glass, communicate a reddish-brown tint as it falls. Another method of applying this test is by expertly shaking a spoonful of the suspected *C.* with a wine-glassful of cold water, and then placing the glass upon the table. If it is pure, it will rise to the surface, and scarcely color the liquid; but if caramel or chicory is present, it will sink to the bottom, and the water will be tinged of a deep red as before. 2. The brown color of decoction or infusion of roasted *C.* becomes greenish when treated with a per-salt of iron, and a brownish-green, flocculent precipitate is formed. The color of chicory is only deepened, but not otherwise altered, and no precipitate is formed under the same treatment. A mixture of chicory and coffee retains a brownish-yellow color after the precipitate has subsided, and the liquid appears brownish yellow by refracted light. The addition of a little weak ammonia water aids the subsidence of the precipitate. 3. Under the microscope (see Cucony) the presence of chicory may be readily detected by the size, form, and ready separation of the cells of the cellular tissue, and by the presence and abundance of the pitted tissue or dotted ducts, which are absent from *C.*, and by the size of the spiral vessels which are very small in *C.* The most characteristic structure, however, and that by which chicory can be easily identified, is the lactiferous tissue. Roasted corn, and other amylaceous substances, may also be detected. In the same way, by the peculiar size and character of their starch-grains. Under the microscope the berry is seen to consist of a hard, tough tissue, that resists even long soaking. The testa covering the berry is made of lengthened cells with oblique markings resting on a thin membrane, almost structureless. These oblique markings of the cells are so characteristic as to render the cells distinguishable from every other tissue. The substance of the berry consists (Fig. 91) of angular cells, each one of which contains minute drops of oil. This oil is in some measure driven off during the process of roasting, which, however, leaves the structure unimpaired when it is not charred. — Roasted corn, beans, &c., may be detected by the cold decoction striking a blue color with tincture of iodine. Pure *C.* is merely deepened a little in color by this substance.

Fig. 91.—MICROSCOPIC APPEARANCE OF COFFEE.

**American trade.** *C.* ranks second in the order of value among imports into the U. States. There were imported during the 5 years from 1854 to 1858, inclusive, 1,019,487,445 lbs. of *C.*, and during the 5 years from 1874 to 1878, inclusive, 1,584,453,686 lbs., an increase of 564,966,241 lbs., or 55.42 per cent. The quantity imported from each foreign country in 1878, was as follows: —

COUNTRIES.	Quantities.	Per cent of total.
	Pounds.	
Brazil .....	211,654,160	68.30
Venezuela .....	38,623,291	12.46
Dutch East Indies .....	14,573,766	4.70
Central American States .....	13,868,955	4.48

All other ports in Africa .....	33,452	0.01
Spanish Possessions, all other .....	32,125	0.01
All other countries .....	55,811	0.02
Total .....	309,882,540	100.00

The exports of C. in 1878 were 12,821,426 lbs., valued \$2,086,366.

Quantities and values of C. retained in the U. States for consumption, and estimated consumption per capita of population during the years 1830, 1840, 1850, 1860, 1870 and from 1870 to 1878 inclusive:—

Year.	Retained for home consumption.		Consumption per capita.
	Pounds.	Dollars.	Pounds.
1830 .....	38,363,687	3,180,479	3.0
1840 .....	86,297,761	7,615,824	5.05
1850 .....	129,791,496	9,918,472	5.55
1860 .....	182,049,527	19,615,106	5.8
1870 .....	253,671,665	25,630,715	6.6
1871 .....	294,930,949	29,428,698	7.5
1872 .....	259,735,530	26,140,240	5.9
1873 .....	401,975,241	58,051,714	9.6
1874 .....	285,559,219	55,034,302	6.7
1875 .....	317,017,310	50,448,852	7.2
1876 .....	338,548,996	56,825,513	7.5
1877 .....	352,006,637	53,634,199	7.1
1878 .....	309,956,493	51,914,622	6.5

Statement of Stock at all Ports (not including California, for which see SAN FRANCISCO), 1st January, 1879:—

	1878.	1877.	1876.
Java (Padang) .....	\$22.48	\$23.82	\$21.57
Maracaibo and Laguayra .....	15.52	18.92	17.02
St. Domingo .....	13.34	16.40	15.18

Not many years ago it was held that the consumption of C. had very nearly, if not quite, overtaken the production, and prices in consequence advanced until they were far above anything before known since the bean became an article of commerce. The extraordinary returns received by the planter of late years were incentives to an extension of the culture of the tree; and now it seems that, with multiplied plantations in many of the C.-growing countries, production, as a whole, is again not only well abreast of consumption, but even some steps in advance of it, and a return to the extreme values, such as ruled for the lustrum ending with 1877, cannot be expected in the immediate future, or until the consuming world again overtakes and outstrips the yield of the producing countries. At the same time there is even less probability of a return to the low level of market values that ruled in the decade ending with 1850. — *Imp. duty.* C. was taken from the free list August 6, 1861, and a duty imposed of 4 cents per lb.; duty increased Dec. 25, 1861, to 5 cents per lb.; duty reduced Jan. 1, 1871, from 5 cents to 3 cents per lb.; and duty abolished July 1, 1872.

**Coffee-Biggin**, a coffee-pot with a flannel bag (now generally replaced by a wire-strainer) to contain the ground-coffee through which the boiling water is poured.

**Coffee-Canister**, a tinned receptacle for holding ground roasted coffee.

**Coffee-Filter**, a straining machine for clearing coffee when prepared as a beverage. See PERCOLATOR.

**Coffee (Essence of)**, a highly concentrated infusion of coffee, prepared by percolation with boiling water, gently and quickly evaporated to about  $\frac{1}{4}$  or  $\frac{1}{2}$  of its bulk, and mixed with a thick aqueous extract of chickory and syrup of burnt sugar, so as to give the whole the consistence of treacle. The proportions of the dry ingredients should be,—coffee, 4 parts; chickory, 2 parts; burnt sugar (caramel) 1 part. It should be kept in well-corked bottles in a cool place. This preparation is very convenient for making extemporaneous coffee; but the beverage so made, though superior to much of that sold at coffee-houses, is inferior in flavor, aroma, and piquancy, to that we are accustomed to drink at home. Much of the so-called “Essence of Coffee” is simply treacle and burnt sugar, flavored with coffee.

**Coffee-Leaves**. The leaves of the coffee-tree contain caffeine in larger proportion than the seeds themselves, and their use as a substitute for tea has frequently been suggested. Its leaves are actually so used at Sumatra, but being destitute of any attractive aroma such as is possessed by both tea and coffee the infusion is not palatable.

**Coffee-Mill**, a hand-mill in which roasted coffee-berries are ground by passing between the serrated surfaces of opposed steel rollers.

**Coffee-Pot**, a metal vessel in which ground coffee is boiled or infused.

**Coffee-Pulper**, a machine for preparing coffee-berries for shipment, by removing the pulp and parchment.

**Coffee-Roaster**, a tradesman who prepares the raw coffee-berries for use.—Also the revolving machine in which coffee is roasted.

**Coffer**, a chest. — A lock for receiving a barge.

**Coffer-Dam** [Fr. *batardeau*; Ger. *Fangdamm*], a water-tight enclosure, within which the construction of hydraulic works, such as the foundations of bridges, pier, or quay, can be securely carried on.

**Coffin** [Fr. *cercueil*; Ger. *Sarg*], a wooden or other shell or receptacle for the dead. Although usually made of wood or lead, C. have been made of glass and slate. — In printing, the wooden frame

enclosing the composing-stone. — In milling, one of the sockets in the eye of the runner, which receives the ends of the driver.

**Coffin-Furniture**, the handles, metal ornaments, etc., affixed to a coffin for decoration, which are usually white or black, though occasionally gilt.

**Cog-Wheel** is a toothed wheel whose teeth, consisting of *cogs* or pieces of wood inserted into

Fig 92.—Cog and Lantern Wheels.

mortises in the face of the wheel, mesh into the teeth of another wheel, so as to receive or impart motion. There are many varieties of *C. W.* The one represented in Fig. 92, usually called *ray* or *sprocket* wheel, communicates motion to another wheel perpendicular to it, and which, from its peculiar form, is called *lantern* wheel.

**Cognac.** See BRANDY.

**Cog-Wood**, a name for the *Laur*

*chloroxylon*, which from its durability in water is used in the West Indies for mill-framing and cog-wheels.

**Cohong**, the Chinese name for a company.

**Coiffure**, the French name for head-dress, *coif* being a hair-dresser.

**Coil**, lead pipe, rope, chain, etc., curled or wound up in a series of rings, for convenience of handling or packing.

**Coin**, a piece of metal, most commonly gold, silver, copper, or nickel, stamped by authority, and made current as money. See MONEY.

**Coinage.** See MINT.

**Coining-Press**, a powerful lever screw, for impressing devices, legends, etc., on current coin, medals, etc.

**Coir**, the commercial name of the short fibre obtained from the dry husk or covering of the cocoa-nut, which is largely used in the manuf. of cordage, matting, etc., and to stuff beds, chair-bottoms, etc. From Ceylon alone more than 60,000 cwt. is shipped annually. The varieties of *C.* entering the market are *C. yarn*, *C. junk*, and *C. fibre*. The goodness of *C.* depends on the fineness of the filaments, and on their being of a bright yellow color. *C. cables* are much used in merchant vessels, the *C. rope* having been employed in India for ages. The rope is so light that it floats on the water; and a *C. hawser* ought to be kept in every vessel, since if a small boat is attached to it, and let down when a man falls overboard, it gives him greater facilities for saving life than any other means. Fresh water is said to rot *C.*, and the rope snaps easily in frosty weather. *C. ropes* are therefore unsuitable for low latitudes. The rope, however, in sea water and high latitudes is actually strengthened and rendered more elastic by exposure. *Imp. duty*, *C.* and *C. yarn*, free. See MAT and TANNING.

**Coke**, the carbonaceous residue produced when coal is subjected to a strong red heat, out of contact with the air, until the volatile constituents are driven off. It consists essentially of carbon, the so-called fixed carbon, together with the incom-

bustible matters or ash contained in the coal from which it is derived. In addition to these it almost invariably contains small quantities of hydrogen, oxygen, and nitrogen, the whole, however, not exceeding 2 or 3 per cent. It also contains water, the amount of which may vary considerably according to the method of manufacture. When produced rapidly and at a low heat, as in gas-making, it is of a dull black color, and a loose spongy or pumice-like texture, and ignites with comparative ease, though less readily than bituminous coal, so that it may be burnt in open fire-places; but when a long-continued heat is used, as in the preparation of *C.* for iron and steel melting, the product is hard and dense, is often prismatic in structure, has a brilliant semi-metallic lustre and silvery-gray color, is a good conductor of heat and electricity, and can only be burnt in furnaces provided with a strong chimney-draught or an artificial blast. The strength and cohesive properties are also intimately related to the nature and composition of the coals employed, which are said to be caking or non-caking according to the compact or fragmentary character of the *C.* produced. *C.* is used for all purposes where a smokeless fire is required, as, for instance, in drying malt or hops, or in raising steam in locomotives within the limits of towns, also for producing strong local heat, as in melting metals (gold, silver, brass, or steel) in crucibles in air furnaces. In blast furnaces its value depends upon the difficulty of combustion, so that the particles keep their own form until they reach the proper places of combustion at the point of entry of the blast in the lower part of the furnace. Fine ground *C.* is used mixed with clay for making crucibles for steel melting, and also for filling the hearths of blast furnaces in many German smelting-works. Apart from its convenience for special purposes, *C.* is not an economical fuel, the useful heating effect being about the same as that of an equal weight of coal. This circumstance has led to the nearly general abandonment of *C.* and the substitution of raw coal as fuel in locomotive engines on railways. *Imp. duty*, 25 per cent.

**The Connellsville Coke Region.** Of the coking coal fields of the U. States, the most important is the Connellsville. It is situated in the S.W. of Pennsylvania, lying mainly in the counties of Westmoreland and Fayette, and some 50 to 60 m. from Pittsburgh. The field occupies a triangle some 3 in. wide and 50 m. long, almost without a fault, the beds yielding from 8 to 9 feet of workable coal. The continuation of the Pittsburgh area of the bed with the Connellsville area is broken off by the Youghiogheny, the bed taking an upward course and descending again, the intermediate portion being swept away. This has led to a popular belief that the bed at Connellsville is different from the bed at Pittsburgh, but careful surveys have established their identity. It is a fact, however, that at Pittsburgh this bed is not in the best condition, while at Connellsville it is at its largest size and finest quality. In the Connellsville basin, the coal ranges from 8 to 11 feet in thickness, with one small slate parting the "bearing in slate" 18 inches above the floor. The roof is only passable; rooms can only be run 12 feet wide, and the pillars left will average 10 feet, a large amount of which is lost in drawing. The floor is even and quiet, and the coal of a remarkably good and uniform character, soft and easily mined. The coal is bituminous, with generally a dull resinous lustre, alternating with seams of bright, shining crystalline coal, coated with a yellowish silt. It contains numerous particles of slate, and some crystals of pyrites. It is compact, with a tendency to break up into cubes. Such a coal, from the mines of Messrs. H. C. Frick & Co. at Broad Ford, is taken by the Pennsylvania Geological Survey as the typical coal of the Connellsville basin. The *C.* from this region is of a silvery lustre, cellular, with a metallic ring, tenacious, comparatively free from impurities, and capable of bearing a heavy burden in the furnace. Its porosity and ability to "stand up" in the furnace are what have given it such a reputation for a blast-furnace fuel, and has created such demand for it for mixing with Anthracite and bituminous coal in the East and West, especially where an open iron, such as is used in the Bessemer process, is needed.

In *coking the coal*, the beehive oven is in universal use in the Connellsville region. These ovens vary, at the different works, from 11 to 12 feet in diameter, and from 5 to 6 feet in height. The working is very simple. The coal is dumped through an opening in the crown of the furnace, and spread evenly on the floor, to the average depth of 2 feet for 48-hour *C.*, and 2½ feet for 72-hour. The front opening, through which the *C.* is discharged, is at first nearly closed with brick, luted with loam. The heat of the oven from the previous coking fires the charge, and as the coking progresses the air is more and more shut off by luting the openings, and finally closing the roof openings. The average charge is 100 bushels of coal at 76 lbs., and the yield in *C.*, 120 bushels at 40 lbs., making the percentage yield 63, or 1.6 tons of coal to 1 ton of *C.* The average time of coking is 48 hours, with 72 hours for that burned over Sunday; 24-hour *C.* is sometimes made. The 72-hour *C.* is firmer *C.* than either of the others, but it is questionable whether it is a better furnace *C.* When the *C.* is thoroughly burned, the door is removed, and the *C.* is cooled by water thrown in from a hose, and then drawn.

The statistics of this trade are surprising. The manufacture began in the winter of 1841-2. According to the latest information we have, there are 3,668 ovens in the Connellsville region, and nearly all are in operation. The annual product at present is about 1,500,000 tons.

**Coke-Oven.** See COKE.

**Coker-Canvas**, a kind of sail-cloth made in Crewkerne, Somersetshire, England.

**Coker-Nut**, a modern mode of spelling cocoa-nut, in commercial circles, in order to make a broader distinction between the numerous articles spelt much in the same manner.

**Colaga**, a variable Eastern grain-measure; that used in Canara is nearly equal to a bushel; in Seringapatam it is 11 bushels; in Bangalore it is but 11 lbs. 13 oz. 6¼ drachms. It is also called a coodom, and is divided into four bullahs.

**Colander**, a metal or earthenware strainer.

**Colchester.** See GREAT BRITAIN.

**Colchicum, Meadow Saffron**, the dried corms or bulbs, and also the seeds of *C. autumnale*, used in medicine, and forming the base of almost all the advertised gout-nostums. It is, however, an active poison, and its administration requires care.

**Colcothar**, a chemical preparation from oxide of iron, the brown peroxide. See ROUGE.

**Cold-Chisel**, a strong iron tool for cutting metal.

**Cold-Cream**, a snow-white, bland ointment, about the consistence of good lard, and an admirable substitute for that exipient where expense is no object, especially for applications about the face. It is commonly sold as a lip-salve, and as a healing application to abraded and chapped surfaces generally.

**Cold-Drawn**, a term applied to oil expressed from nuts or seeds which have not been previously heated, to distinguish it from oil expressed from heated nuts or seeds, which last is inferior in quality.

**Cold-Short**, a term applied to a metal, as iron containing phosphorus, which, being brittle when cold, becomes malleable when heated. — In casting, a void or seam caused by the metal failing to fill perfectly the mould, in consequence of its too rapid congelation.

**Cole-Seed.** See COLZA.

**Colewort**, a kind of cabbage.

**ColiJeerah**, a native name in India for black cummin seed.

**Colis** [Fr.], a package or bale of goods.

**Collar**, a circlet for the neck. There are *C.* of various kinds manufactured, — horse *C.*, which are iron frames covered with leather, and padded or stuffed; men's *C.* of stitched linen, also of paper; ladies' lace, muslin, and other worked *C.* The part of a garment which fits close round the throat is called the *C.* — In turning, a ring inserted in the puppet for holding the end of the mandril

next the chuck, in order to make the spindle run freely and exactly. — In machinery, a plate of metal screwed down upon the stuffing-box of a steam-engine, with a hole to allow the piston-rod to pass through. — In mining, the timber and boarding used to secure the uppermost part of a shaft in loose rubble from falling in. — On ship-board, an eye in the end or bight of a shroud or stay, to go over the mast-head; also a strap formed of rope, to which the dead-eyes are secured.

**Collar-Check**, a rough cross-barred woollen material for saddlery purposes, made either broad or narrow.

**Collate**, to collect and examine the sheets of book-work, etc., before being sent out, or previously to their being arranged for binding.

**Collation**, an afternoon luncheon.

**Colle**, the French name for glue, size, paste.

**Colle de Poisson** [Fr.], isinglass.

**Collector**, an authorized receiver who applies for or is paid certain moneys, whether for individuals, societies, corporations, or the State; as of customs, city dues, market revenues and toll, gas and water rates, etc. Sometimes collectors are paid fixed salaries; at other times they are paid a commission or poundage on the sums received. In the U. States, "the chief officer of a collection district, or custom-house, known as *C.* of Customs, receives his appointment from the President and Senate. It is an office of great responsibility, respectable salary, large perquisites, and extensive patronage. Hence, it is considered a political office, and hardly any *C.* holds office long enough to become even tolerably well acquainted with its complicated duties. Fortunately, however, at the larger ports especially, much of the responsibility and most of the labor is performed by deputy collectors, who, from their experience and knowledge of the business, and their very moderate salaries, are less liable to be affected by the political changes of the government." — *T. McElrath*.

**Collet**, in jewelry, the part of a ring containing the bezel in which the stone is set.

**Collier**, a miner, one engaged in a coal mine; also the name for a vessel which carries coals.

**Collier Bead**, a large bead, usually white, a principal article of trade on some parts of the coast of Western Africa. They are sometimes called Bokola beads.

**Colliery**, a seat of coal seams; a coal mine, with all buildings, machinery, and all appurtenances belonging thereto. See COAL.

**Collision at Sea** [Fr. *abordage*], in commercial navigation, the shock of two ships coming into sudden and violent contact at sea, by which one or both may be more or less injured. At common law, every master of a ship is bound to keep a proper watch at sea, especially in channels much frequented by shipping, and to use every precaution to avoid coming into contact with other vessels. This matter, however, was judged too important to be left wholly to depend on the good sense and care of individuals; and with a view to the securing of attention to the subject, and to the obviating of the confusion that would unavoidably arise were shipmasters left to follow their own ideas with respect to it, rules and regulations have been laid down in England in regard to the courses to be steered when ships are passing each other, the signals to be made during fogs, the number and description of the lights to be exhibited at night, and other particulars. There is no especial statute law in the U. States on this subject, and the American courts of admiralty follow, in a

measure, the English law embodied in the Merchant Shipping, etc., Amendment Act of 1862, the 25 and 26 Vict. c. 63, and are governed by the precedents there have established. The conditions under which cases of collision take place differ extremely. Thus:—1. It may be merely accidental, or be occasioned by circumstances beyond the power of control, as by the violence of the wind or waves dashing or impelling the ships together, without blame being imputable to either party; or 2. It may be owing to the culpable negligence or misconduct of one party; or 3. Both parties may be to blame. In adjudicating upon losses growing out of collisions that have taken place under such different circumstances, the conclusions must also be very different.

With respect to the first class of cases, there is little apparent difficulty: wherever a loss is occasioned by a storm, a fog, or other accidental circumstance, without any blame being ascribable to either party, it would appear to be equitable that it should be borne by the sufferer. And this principle having been embodied in the Roman law, was subsequently ingrafted into that of England. (Marshall *On Insurance*, ch. xii., sec. 2.) But other authorities, to whom the greatest deference is due, contend that the loss arising from accidental collisions, however it may affect the parties, should be equally divided between them; and this, in fact, is the rule followed in most maritime States. (*Ordonnance* of 1681, lib. iii., tit. xii., art. 10, with the observations of Valin.) It also is the rule sanctioned by the law of England in cases where both parties are to blame, but where the blame cannot be discriminated. Those cases in which the blame is clearly ascribable to either party present no difficulty. In apportioning the damage in cases where both parties have been in fault, the question occurs whether the damage done to the cargo shall be taken into account or left out in the estimate on which the apportionment is to be made. This knotty point has been differently decided in different countries. But the rule which limits the liability of owners to the value of the ship and freight applies to cases of damage by collision. See OWNERS.

**REGULATIONS FOR PREVENTING COLLISIONS AT SEA**, appended to the English Order in Council, dated Jan. 3, 1863, which apply to all ships belonging to the following countries and places, whether within British jurisdiction or not:—Austria, Argentine Republic, Belgium, Brazil, Bremen, Chili, Denmark Proper, France, Germany, Great Britain, Greece, Hawaiian Islands, Hayti, Italy, Morocco, Netherlands, Norway, Peru, Portugal, Russia, Spain, Sweden, Turkey, United States (sea-going ships and inland waters). *Preliminary.*—Art. 1. In the following rules, every steam-ship which is under sail, and not under steam, is to be considered a sailing ship; and every steam-ship which is under steam, whether under sail or not, is to be considered a ship under steam.

**Rules concerning Lights.**—Art. 2. The lights mentioned in the following articles, numbered 3, 4, 5, 6, 7, 8, and 9, and no others, shall be carried in all weathers, from sunset to sunrise.—Art. 3. Sea-going steam-ships, when under weigh, shall carry:—*a.* At the foremast-head, a bright white light, so fixed as to show an uniform and unbroken light over an arc of the horizon of 20 points of the compass; so fixed as to throw the light 10 points on each side of the ship, viz., from right ahead to 2 points abaft the beam on either side; and of such a character as to be visible on a dark night, with a clear atmosphere, at a distance of at least 5 miles:—*b.* On the starboard side, a green light, so constructed as to show an uniform and unbroken light over an arc of the horizon of 10 points of the compass; so fixed as to throw the light from right ahead to 2 points abaft the beam on the starboard side; and of such a character as to be visible on a dark night, with a clear atmosphere, at a distance of at least 2 miles:—*c.* On the port side, a red light, so constructed as to show an uniform and unbroken light over an arc of the horizon of 10 points of the compass; so fixed as to throw the light from right ahead to two points abaft the beam on the port side; and of such a character as to be visible on a dark night, with a clear atmosphere, at a distance of at

least 2 miles.—*d.* The said green and red side-lights shall be fitted with inboard screens, projecting at least 3 feet forward from the light, so as to prevent these lights from being seen across the bow.—Art. 4. Steam-ships, when towing other ships, shall carry 2 bright white mast-head lights vertically, in addition to their side lights, so as to distinguish them from other steam-ships. Each of these mast-head lights shall be of the same construction and character as the mast-head lights which other steam-ships are required to carry.—Art. 5. Sailing ships under weigh, or being towed, shall carry the same lights as steam-ships under weigh, with the exception of the white mast-head lights, which they shall never carry.—Art. 6. Whenever, as in the case of small vessels during bad weather, the green and red lights cannot be fixed, these lights shall be kept on deck, on their respective sides of the vessel, ready for instant exhibition; and shall, on the approach of or to other vessels, be exhibited on their respective sides in sufficient time to prevent collision, in such manner as to make them most visible, and so that the green light shall not be seen on the port side, nor the red light on the starboard side.—To make the use of these portable lights more certain and easy, the lanterns containing them shall each be painted outside with the color of the light they respectively contain, and shall be provided with suitable screens.—Art. 7. Ships, whether steam-ships or sailing ships, when at anchor in roadsteads or fairways, shall exhibit, where it can best be seen, but at a height not exceeding 20 feet above the hull, a white light, in a globular lantern of 8 inches in diameter, and so constructed as to show a clear, uniform, and unbroken light, visible all around the horizon, and at a distance of at least 1 mile.—Art. 8. Sailing pilot vessels shall not carry the lights required for other sailing vessels, but shall carry a white light at the mast head, visible all round the horizon, and shall also exhibit a flare-up light every 15 minutes.—Art. 9. Open fishing boats, and other open boats, shall not be required to carry the side lights required for other vessels; but shall, if they do not carry such lights, carry a lantern having a green slide on the one side and a red slide on the other side; and on the approach of or to other vessels, such lantern shall be exhibited in sufficient time to prevent collision, so that the green light shall not be seen on the port side, nor the red light on the starboard side.—Fishing vessels and open boats when at anchor, or attached to their nets and stationary, shall exhibit a bright white light.—Fishing vessels and open boats shall, however, not be prevented from using a flare-up in addition, if considered expedient.

**Rules concerning Fog Signals.**—Art. 10. Whenever there is fog, whether by day or night, the fog signals described below shall be carried and used, and shall be sounded at least every 5 minutes, viz.:—*a.* Steamships under weigh shall use a steam-whistle placed before the funnel, not less than 8 feet from the deck:—*b.* Sailing ships under weigh shall use a fog horn:—*c.* Steam-ships and sailing ships when not under weigh shall use a bell.

**Steering and Sailing Rules.**—Art. 11. If two sailing ships are meeting end on, or nearly end on, so as to involve risk of collision, the helms of both shall be put to port, so that each may pass on the port side of the other.—Art. 12. When two sailing ships are crossing, so as to involve risk of collision, then, if they have the wind on different sides, the ship with the wind on the port side shall keep out of the way of the ship with the wind on the starboard side, except in the case in which the ship with the wind on the port side is close-hauled and the other ship free, in which case the latter ship shall keep out of the way; but if they have the wind on the same side, or if one of them has the wind aft, the ship which is to windward shall keep out of the way of the ship which is to leeward.—Art. 13. If two ships under steam are meeting end on, or nearly end on, so as to involve risk of collision the helms of both shall be put to port, so that each may pass on the port side of the other.—Art. 14. If two ships under steam are crossing, so as to involve risk of collision the ship which has the other on her own starboard side shall keep out of the way of the other.—Art. 15. If two ships, one of which is a sailing ship and the other a steam-ship, are proceeding in such directions as to involve risk of collision, the steam-ship shall keep out of the way of the sailing ship.—Art. 16. Every steam-ship, when approaching another ship, so as to involve risk of collision shall slacken her speed, or, if necessary, stop and reverse; and every steam-ship shall, when in a fog, go at a moderate speed.—Art. 17. Every vessel overtaking any other vessel shall keep out of the way of the said last-mentioned vessel.—Art. 18. Where by the above rules one of two ships is to keep out of the way, the other shall keep her course, subject to the qualifications contained in the following article.—Art. 19. In obeying and construing these rules, due regard must be had to all dangers of navigation, and due regard must also be had to any special circumstances which may exist in any particular case, rendering a departure from the above rules necessary in order to avoid immediate danger.—Art. 20. Nothing in these rules shall exonerate any ship, or the owner, or master, or crew thereof, from the consequences of any neglect to carry lights or signals, or of any neglect to keep a proper lookout, or of the neglect of any precaution which may be required by the ordinary practice of seamen, or by the special circumstances of the case.

It may, however, be proper to state that neither these nor any rules of the sort are to be regarded as inflexible, or to be followed at all hazards. The safety of the ship is the paramount consideration, and no master is justified in abiding by a rule when by doing so he plainly incurs danger. A. may be in his proper course; but if by pursuing it he will run a great risk of coming into collision with B., who is upon a wrong course, he is bound to alter his course so as to avoid a collision. The fact of one master being ignorant, careless, or in fault, is no reason why another should not use every means in his power to provide for the safety of his ship, and consequently of the lives and property entrusted to his care.

**Collis**, a package.

**Collish**, a shoemakers' tool to polish the edge of a sole.

**Collodion**, a colorless, viscid fluid, made by dissolving gun-cotton and the other varieties of pyroxylin, in a mixture of alcohol and ether. The quality of the *C.* differs according to the proportions of alcohol and ether and the nature of the pyroxylin it contains. *C.* in which there is a great excess of ether gives by its evaporation a very tough film; the film left by *C.* containing a large quantity of alcohol is soft and easily torn, but in hot climates the presence of an excess of alcohol is an advantage, as it prevents the rapid evaporation of the ether. Pyroxylin for the making of *C.* for photographic purposes is prepared by immersing cotton-wool ten minutes in a mixture of nitric and sulphuric acids at the temperature of 140 F. When tolerably strong acids at a low temperature are employed, the nitric acid being in by far the larger quantity, the pyroxylin made requires an amount of alcohol equal to only about  $\frac{1}{2}$  or  $\frac{1}{3}$  that of the ether in bulk. According to M. Miallie, the most explosive kinds of gun-cotton are not the best adapted for the preparation of *C.*; a pyroxylin very soluble in ether is in this process made from 2 parts by weight of carded cotton to 40 parts of nitre and 60 of concentrated sulphuric acid. Under the microscope the film produced by *C.* of good quality appears translucent and colorless, the cotton being perfectly dissolved; old *C.* that does not give good photographic impressions sufficiently quickly exhibits liquid globules of modified ether. The film from *C.* which is too alcoholic has the microscopic appearance of cellular tissue; and when water has been present the fibrillæ of the cotton become apparent as amorphous flocks. To preserve *C.*, it should be kept cool, and out of the action of the light. Iodized *C.* that has been discolored by the development of free iodine may be purified by the immersion in it of a strip of silver foil. For the iodizing of *C.*, ammonium bromide and iodine and the iodides of calcium and cadmium are the agents employed. In surgery *C.* is used in its usual condition or combined with elastic and other substances, for the protection of inflamed surfaces, as are erysipelas and small-pox. Small balloons are manufactured from *C.* by coating the interior of glass globes with the liquid; the film when dry is removed from the glass by applying suction to the mouth of the vessel. *Imp.* duty (fluid *C.*), \$1 per lb.

**Collodion Process.** See PHOTOGRAPHY.

**Collop**, a cutlet or small slice of meat. — A term for four or five sheep.

**Colocynth, Bitter Apple, Bitter Cucumber, Bitter Gourd** [Arab. *Hunzil*; Fr. *coloquinte*; Ger. *Coloquint*; It. *coloquintida*], the fruit of an annual plant of the gourd kind (*cucumis colocynthis*), found

in Turkey and Nubia. It is about the size of an orange, smooth and yellow, but is peeled and dried before being imported, when it becomes whitish, very light, dry, and spongy with a weak and disagreeable smell, and an intensely bitter nauseous taste. The medullary part, freed from the seeds, furnishes an extract used as a purgative. *Imp.* free.

**Cologne Earth**, a bituminous earth of a violet-brown hue, used in water-color painting.

**Cologne Water.** See EAU DE COLOGNE.

**Colombia (United States of)**, a confederation in S. America, consisting of 9 states and comprising a considerable portion of the territory of the old Spanish colony of New Granada. It is bounded N. by the Caribbean Sea, E. by Venezuela, S. by Ecuador and Brazil, and W. by the Pacific. It thus extends from 12° 20' N. to 2° 30' S. lat., and from 65° 50' to 83° 5' W. lon. The area of the republic is estimated to embrace 504,773 sq. m., of which 330,756 sq. m. are N. of the equator, and the remainder S. of the equator. According to a rough estimation taken in 1871, the population at that date was 2,913, 343, divided as follows:—

STATES.	Area : sq. m.	Popula- tion.	Capital.	Pop. of capitals.
Antioquia.....	22,316	365,974	Medellin.....	30,000
Bolívar.....	21,345	247,100	Cartagena.....	7,800
Boyacá.....	33,351	482,874	Tunja.....	8,000
Cauca.....	257,462	435,978	Popayan.....	16,000
Cundinamarca.....	79,810	409,602	Bogotá.....	50,000
Magdalena.....	24,440	85,255	Santa Marta.....	4,500
Panama.....	31,571	220,542	Panama.....	18,378
Santander.....	16,409	425,427	Socorro.....	20,000
Tolima.....	18,069	230,891	Guamo.....	7,000

There are in *C.* about 120,000 uncivilized Indians. The rest of the pop. is about as follows:—1,530,000 Spanish creoles and white crossbreeds; 450,000 crossbreeds in which the Indian blood is more distinctly present, 90,000 Africans, and 450,000 crossbreeds in which the Negro or Indian blood is plainly predominant. A constitution, bearing date May 8, 1863, vests the executive authority in a president elected for two years, while the legislative power rests with a Congress of two Houses called the Senate and the House of Representatives. The Senate, numbering 27 members, is composed of representatives of the nine states, each deputed three senators; the House of Representatives, numbering 66 members, is elected by universal suffrage, each state forming a constituency and returning one member for 50,000 inhabitants, and a second for every additional 20,000. Besides the central government thus created, each of the nine states has its own legislature and chief executive officer, the latter called Governor in all except Panama, which gives him the title of President. The President of *C.* has at his side a Vice-President, acting as chairman of the Senate, and his executive functions must be exercised through four ministers, or secretaries, responsible to Congress. The most important of the states of *C.*, that of Panama, comprises the whole isthmus of that name, known historically as the *Isthmus of Darien*. The extreme length of the state from E. to W. is about 360 geographical miles, but the sinuosities of the coast give about 400 m. on the Atlantic and 600 on the Pacific Ocean. Bogotá (or Santa Fe de Bogotá) capital of *C.*, is a fine city, situated in lat. 4° 6' N., lon. 78° 30' W., at the base of the mountains La Guadalupe and Montserrato. It has 3 endowed

colleges, a school of chemistry and mineralogy, a national academy, a public library, a botanical garden, a military school, a mint, &c. There are manuf. of soap, cloth, leather, and the precious metals. The surrounding country is exceedingly fertile, producing abundant crops of wheat and barley, and the leguminous plants cultivated in temperate countries.

C possesses on the Atlantic a coast line of upwards of 1,000 m. richly furnished with bays and natural harbors. Proceeding westward from Calabozo Creek, in the Gulf of Maracaibo, the first inlet of real importance which we discover is the Bahía Honda, which is well protected from the strong winds of the E. and N., but is rendered unsuitable for the establishment of a port by its lack of drinkable water. Passing by the Bay of El Portete, we next reach the ports of *Riohacha* and *Dibulla*, of which the former is of considerable commercial importance

Fig. 93. — PALMITA DEL AZUFRA.

as a centre of exportation, though it is greatly surpassed by that of *Santa Marta*, which is the next to break the coast-line. *Santa Marta* is situated at the side of the *Pienega Lagoon*, which stretches 25 m. from S. to N., with a breadth of 11 from E. to W., has communication with the lakes of *Pajara* and *Cuadro Boas*, and, though rather shallow, can be navigated by flat-bottomed steamboats. At the mouth of the Magdalena lies the port of *Barranquilla*, and a short distance to the W. that of *Subanilla*, one of the most active along the whole coast. After these comes the splendid Bay of *Cartagena*, known for centuries to all navigators of the Caribbean; and still further to the W. the coast is broken by the port of *Zapote*, the Bay of *Zilepata*, the Gulf of *Morcosquillo*, and finally by the noble Gulf of *Darien*, with the estuary of the *Atrato* and the ports *Turbo*, *Guanabá*, *Candelaria*, etc. Along the isthmus are the *Mandinga Creek*; the Bay of *Portobello*, so famous in the history of Spanish America; the modern port of *Colon*, or *Aspinwall*, at the entrance of *Navy Bay*; and the now decadent port of *Chagres*. The coast-line of the Pacific is hardly so important as that of the Atlantic, except along the isthmus, where it forms the great bay of *Panama*, with the subordinate inlets of *Parita Bay* on the W. and the Gulf of *San Miguel* on the E. Along the remainder of the line are *Cupica*, *San Francisco*, *Solano*, *Palmar* and *Charambira* (the last obstructed by a bar), the large Bay of *Malaga*, protected by the *Isla de Palmas*, with the harbors of *Guaqui* and *Iscuande*, the Bay of *Pasa Caballos*, the harbor of *Tumaco*, and in the island of *Gorgona* the fine harbor of *Trinidad*. The W. part of C. is one of the most mountainous districts in the world, its E. ex-

tension belongs to the great plains of the Orinoco and the Amazon. The two most important rivers are the Magdalena or *Rio Grande* and the Cauca, which both flow from S. to N. the entire length of the country, — the former occupying the valley between the Eastern and the Central Cordilleras, and the latter that between the Central and the Western. They unite about 130 m. before reaching the sea, but they so long maintain an independent course that neither can fairly be regarded as a mere tributary of the other. The *llanos* or plains of the Orinoco extend eastward from the slopes of the Cordillera de la *Suma Paz*. As far S. as the *Yichada* they form an almost complete level destitute of trees, and affording abundant pasturage, while further S. they are covered with forests, in which timber of gigantic proportions wait for the settler's axe. Besides several of the common species of palm trees, there are two remarkable species the *Crotylon andicola*, *Palma de Cera*, or Wax-palm, and the *Oriwozia regia*, or *Palmita del Azufra* (Fig. 93), which in company with the oak, frequently clothe the Cordilleras to a height of 1000 or 8000 feet. They are both of extreme beauty, and the former shoots up to about 180 or 200 feet. From the Sierra Nevada and other districts are obtained log-wood, Brazil wood, and jute; and the *Myrozylon toluifera*, from which the balsam of Tolu is collected, grows luxuriantly on the banks of the *Rio Negro*. Excellent India-rubber is obtained from the *Castilloa elastica*, a lofty and luxuriant tree, which occurs in considerable abundance in *Panama*, *Cauca*, and other states. The quantity and quality of the material might be greatly increased and improved, as the collection is still in the hands of a very rude and careless class of men. Cluchons of six or seven different varieties is common throughout the country, — the elevation most favorable for its growth being between 1800 and 9000 feet above the sea. Of other medicinal plants there may be mentioned the aloe, the *sarsaparilla*, the *albatague*, and the vine of the cross. The cotton plant grows wild in many parts and yields an excellent fibre; indigo is indigenous; and an almost endless variety of fruits is found throughout the country. C. is distinctively a mineral country, its productions including gold, silver, platinum, copper, lead, iron, mercury, and antimony, limestone, potash, soda, magnesite, alum, salt, coal, and asphalt, and emeralds, garnets, and amber. Many of the most important deposits are as yet untouched, owing mainly to the defective state of internal communication, and even those that have been worked have proved much less remunerative from the same cause. Gold especially is very widely diffused; it was freely used by the natives before the arrival of Europeans, and formed a valuable source of revenue to the Spanish Government, who employed thousands of negroes and Indians in the task of collection. It is principally obtained from alluvial deposits; and in some districts there is hardly a stream that would not furnish its quota. Hydraulic appliances were introduced about 1870 in some of the workings; and a more systematic treatment is being gradually adopted. Antioquia is the most important gold-producing state in the confederation; total value of gold and silver exported from the capital in 1878 was \$2,935,762; there were upwards of 80 lode mines at work in 1878; and 15,000 men and women are employed in the mining. The silver frequently occurs in very rich lodes; but, owing it would seem to various economical causes, many of the mining operations have been unsuccessful. The "Santa Anna" mines in Tolima, which were worked from 1826 to 1873, yielded during that period about \$3,500,000 worth of ore, but ultimately proved a failure. The "Frias" silver mine, belonging to the Tolima Mining Co. of London, yielded in 1877 320 tons of ore valued at \$300 per ton. The emerald mines, situated at Muzo, in the state of Boyacá, in the Central Cordillera, are remarkable as being the only known source of the genuine stone. The finest stones may be worked up to a value of \$100 a carat; the worst sorts are only worth about \$1.25. Coal is pretty generally distributed throughout the republic. Rock-salt is obtained in the table-lands of *Legata*, *Tunja*, and *Pamplona*, and forms an important Government monopoly. — *Climate*. Though C. is situated within the tropics, its great irregularity of surface and its extensive coast-lines develop a great variety of climatic conditions. A comparatively short journey transports the traveller from the sultry valley of the Magdalena, where the water grows tepid and the stones burning hot in the sun's rays, to the summits of a mountain where the snow lies cold from year to year. In the table-lands and valleys of the E. and W. Cordilleras at a height of 800 to 9500 feet above sea level, there are two dry seasons and two rainy, the former commencing at the solstices and the latter at the equinoxes, while in the lowlands both of the Pacific and the Atlantic seaboard there is only one dry and one rainy of six months each. In the Gulf of *Darien* and the isthmus of *Panama* there is no such distinction, and rain occurs in any part of the year. The greatest mean temperature in the country is about 86° Fahr., and the lowest in the inhabited parts of the Cordilleras is about 44°. At *Honda*, which is about 1000 feet above sea-level, the daily range of the thermometer is only from 82° to 122°, and the annual not more than 20". "The hottest place," says Mosquera, to whom we are largely indebted, "which I have found in New Granada, is the port of *Ocaña*, where I have on several occasions seen the thermometer in the shade at 104° Fahr." In the *llanos* of the Orinoco the mean annual temperature is about 80° Fahr.,

while in the forest district to the south the average is about 8° higher. In the latter the rain is distributed throughout the year, while in the former the seasons are distinctly marked, and from November till April the rains fall in torrents accompanied with dreadful thunder-storms. — *Agriculture and Commerce.* Agriculture holds the first place among the industries of *C.*; but the methods employed are still of a very rude description. Maize, wheat, and other cereals are cultivated on the elevated plains; rice, cotton, tobacco, sugar, coffee, cocoa, yams, arracacha, and bananas in the coast region. Tobacco is especially successful in Ambalema, Carmén, Palmira, Jirón, and Morales, and it forms an important export. In the plains of the Orinoco and the undulating savannas of Panamá the breeding of cattle and horses is largely carried on by the creole inhabitants, and several of the Indian tribes are also in possession of valuable herds. Beyond such common (almost domestic) trades as hand-weaving, dyeing, tanning, and basket-making, there is almost no manufacturing industry in the country, though the basis for future development has been laid by the establishment in Bogotá of glass-works, distilleries, a cigar-factory, and a sulphuric acid factory. — *Foreign Commerce.* One product of the domestic industry alone finds its place in the list of exports, — namely, straw hats, usually known as Jipijapa or Panamá hats. The raw produce, however, is largely exported; the principal articles being cinchona bark, indigo, coffee, cotton, tobacco, silver ore, hides; and the minor items, — ivory-nuts, ipecacuanha, and balsam of Tolu. For the year 1878, the total imports amounted to \$9,737,636 and the exports to \$15,696,574. Far more important than the direct commerce is the transit trade, passing through the two ports of Panamá and of Aspinwall, which, united by railway, connect the Atlantic with the Pacific Ocean. The transit trade across the Isthmus of Panamá is of the estimated value of \$85,000,000 per annum, about two-thirds representing the trade from the Pacific to the Atlantic, and one-third that in the opposite direction. The foreign trade of *C.* is mainly with the U. States and England. The imports of British produce into *C.* have been gradually diminishing from \$15,751,685 in 1872 to \$3,616,315 in 1878; while the U. States, which are now learning to manufacture articles with reference to the wants of particular localities, and with all the cheapness and durability of European products, have increased during the same period their trade with *C.* in a very large proportion.

For the year 1878 the trade of *C.* with the U. States was as follows: *Imports*, \$4,559,226, consisting chiefly of beer, \$11,030; books, \$29,538; wheat flour, \$221,175; candles, \$16,587; carriages, \$26,831; cars (railroad), \$31,747; clocks, \$11,599; coal, \$63,073; cordage, etc., \$20,731; cotton (manufactured), \$545,017; drugs, chemicals, etc., \$330,431; fancy articles, \$12,637; canned fruits, \$13,323; glass and glassware, \$79,509; gold coin, \$175,975; iron (machinery, nails, etc.), \$547,868; edge-tools, \$171,443; fire-arms, \$177,702; boots and shoes, \$28,693; matches, \$40,012; piano-fortes, \$14,771; petroleum, \$13,891; cartridges, \$61,141; paintings, \$21,035; paper and stationery, \$71,831; perfumery, \$12,121; plated ware, \$12,392; salted beef, \$19,711; butter, \$35,903; cured fish, \$16,641; lard, \$534,471; preserved meats, \$31,751; pork, \$10,512; scales, \$12,373; sewing machines, \$93,800; soap (perfumed), \$11,787; (others) \$101,610; spirits, \$34,599; sugar (refined), \$123,633; tobacco, \$111,587; wood (board, deals, etc.), \$51,634; household furniture, \$97,059. *Exports*, \$3,504,099, chiefly consisting of cinchona bark, \$900,370; cocoa, \$116,972; cochineal, \$144,931; coffee, \$1,022,216; gold and silver (bullion and coin), \$43,437; gums, \$79,782; hides and skins, \$1,401,347; india-rubber, \$1,006,521; indigo, \$33,868; nuts, \$133,151; straw hats, etc., \$20,034; sugar (brown), \$68,737.

*Finances, etc.* The national income for 1878 was 4,833,800 pesos. The taxes are very light, — by far the greater part of the revenue accruing from the custom-houses established at Buenaventura, Carosama, Cartagena, Cucuta, Rio Hacha, Sabanilla, Santa Marta, Jumaco, and Turbo. The customs would yield a still greater return were it not for smuggling, which prevails largely, especially at Cartagena. The tariff hitherto in use divides articles into classes, which pay so much per kilogramme; and thus the burden of the duty falls most on inferior goods. The postal service is still in a very backward state, and the charges are very high; but this cannot be otherwise till the road system of the country has been developed. Rapid progress, however, is being made by several of the states in this preliminary undertaking. In Jan. 1879, there were upwards of 1,500 m. of telegraph, the principal lines stretching from Honda to Bogotá, and from Ambalema to Manizales. In 1878, the total number of telegraphic messages amounted to 97,325. In the less populous districts the maintenance of the lines is very costly, as not only are the wires stolen by thieves, but they are frequently damaged by the monkeys, who use them for gymnastic purposes. The only two railways actually in operation are the Panamá line (46 m.), and the line between Sabanilla and Baranquilla (17 m.); but great efforts are being made, both by the central government and by the separate states, to construct lines throughout the country, and contracts have already been made for some of the most important. The public debt amounted, in 1878, to 53,035,644 pesos.

Of the ports above enumerated, the principal are,

*Aspinwall*, or *Colon*, a free port of the N. coast of Panamá, built on the well-wooded coral island of Manzanilla, in lat. 9° 22' 53" N., lon. 79° 52' 58" W. In spite of the unhealthiness of its situation, — now, indeed, largely diminished, — and the dangerous winds from the N. to which it is at some seasons exposed, it has quite superseded the neighboring port of *Chagres*, and become the centre of a considerable local trade. The banana, especially, is cultivated in the neighborhood, and largely exported to New York. A railway, constructed by a joint-stock Co. of New York, and completed in 1864, connects Aspinwall with Panamá. Trains take about 3 hours in passing from sea to sea. Aspinwall is the principal commercial entrepôt between the Eastern States and California, and connects with New York (distance 1,980 m.) by the steamers of the Pacific Mail Co., leaving New York on the 10th, 20th, and 30th of each month.

*Cartagena* or *Carthagena* is situated in lat. 10° 25' 48" N. lon. 75° 34' W., on a low sandy island, which, with the island S. of it, Terra Bomba, forms the harbor of Cartagena. The mean temperature of *C.* is about 83° F. In the summer the heat is excessive, and yellow fever often commits great ravages. The harbor affords complete security to ships in all weathers, and great facilities for loading and unloading. It is divided into 3 sections, Boca Grande and Pascaballo, and the Caldera, which have a depth of 15 fathoms; and Boca Chica, which is deeper. The narrowness of the entrance of Boca Chica, the shallowness of its mouth, and the irregularity of the tides, render a pilot necessary for ships passing through it. The roadstead for large vessels is about 3 m. from the city. A chain of salt lakes, which open into the bay of Cartagena to the S.W., and extend towards the river Magdalena, was taken advantage of by the Spaniards in former times for the construction of a canal. During the War of Independence the old channel became choked up; it was reopened in 1846, after which the flooding of the valley rendered the channel once more unnavigable, except for barges of light draught. On account of the closing of the Digue, the rival port of *Baranquilla* has been created, and a great amount of commerce has been transferred to *Santa Martha*. The rapidly-increasing requirements of trade in *C.*, and the great superiority of Cartagena as a shipping depot, cannot fail, however, of securing before long the reopening of the route by the Digue. Pop. 7,800.

PANAMÁ, on the Pacific, in lat. 8° 56' N., lon. 79° 13' 2" W., stands on a rocky peninsula, projecting into the Bay of Panamá, and has an imposing aspect from the sea. Its roadstead is one of the finest in the world. There are a number of islands a short distance from the main land, which afford secure anchorage for ships, and from which supplies of provisions, including excellent water, may easily be obtained. The tides daily rise and fall from 20 to 27 feet, so that it is peculiarly well fitted for the repair and building of ships. Great numbers of steamers are employed in the trade between Panamá and San Francisco. Pop. 20,000.

*Money.* The peso, or dollar, of 10 reals = 0.935. The currency is almost entirely imported, the gold coin consisting of doubloons of Spain, equal to 16 dollars, of British sovereigns, condors and half condors, and the silver pesos, reals, half reals, and quarter reals. There are no home-struck copper coins. In foreign mercantile transactions, the French five-franc piece, equal to one peso, is most generally in use.

*Weights and Measures.* The metric system of France was introduced in 1857, and the only weights and measures recognized by the Government are the French. In custom-house business the *kilogramme*, equal to 2,205 lbs. avoirdupois, is the standard. In ordinary commerce, the *arroba*, of 25 lbs., the *quintal*, of 100 lbs., and the *carga*, of 250 lbs., are generally used. The Colombian libra is equal to 1.102 lbs. avoirdupois. As regards measures of length, the English yard is mostly employed, but in liquid measure the French *litre* is the legal standard.

**Colombier**, a large-sized paper, 23½ inches by 34.

**Colombine** [Fr.], pigeons' dung, or the dung of fowls.

**Colombo.** See CEYLON.

**Colombo-Root.** See CALUMBA-ROOT.

**Colonial Agent**, a merchant who transacts business connected with the colonies, or acts as agent for colonists.

**Colonist**, a native of, or resident in, a colony or dependency.

**Colony**, a term commonly used to express an outlying part of the population of the mother-country, or an outlying territory belonging to it, either in conjunction, or any of the two by itself. In both ancient and modern times colonization has proceeded from the same causes, namely, commercial enterprise, political commotion, the desire

of conquest, or the natural overflowing of population. The spirit of colonial enterprise, dormant in the Middle Ages, was revived in the 13th century by the Italian republics, Genoa, Pisa, and Venice, which formed settlements in various parts of the Mediterranean and Levant. The modern European *C.*, however, owe their origin to the ambition of the maritime states to participate in the Indian commerce formerly conducted by way of the Red Sea, and monopolized by the Venetians. The discovery of the compass prompted navigators to attempt this by new channels. The Portuguese ascertained the eastern passage in 1497, when the Cape was doubled by Vasco de Gama; the Spaniards attempted a westerly course which led to the discovery, by Columbus, of the West Indies in 1492, and of S. America in 1498; while the English despatched Cabot by the N.W., a route which led him to Newfoundland and N. America, in 1497. In S. America, Columbus's discoveries were followed by the conquest of Mexico in 1519 by Cortez, and of Peru by Pizarro and others in 1531. Brazil was settled by the Portuguese in 1500. The West Indian Islands, notwithstanding the papal grant in favor of Spain, were occupied by various nations; Hispaniola or Hayti in 1496; Jamaica, about 1510; Cuba, 1511; Porto Rico, 1514; Barbadoes, 1605; and the others at later periods. The progress of colonization was much slower in N. America; Virginia was taken possession of by Raleigh in 1583, but soon after abandoned; and the first permanent English settlement, which was at Jamestown in the same State, was not formed until 1607. The colonization of N. America afterwards proceeded rapidly, particularly during the disturbances in England which attended and followed the dethronement of Charles I.; the cavaliers emigrating to Virginia, the Puritans to New England, and the Quakers to Pennsylvania. The English, after repeated failures, at length reached the Indian continent in 1612. In 1776, the attempt of Great Britain to tax the American colonists for the purposes of the general government led to the political separation of the U. States from the mother-country; and in 1810, revolutionary movements occurred in S. America which resulted in the emancipation of the Spanish colonies on that continent.

The existing *C.* and dependencies of Great Britain cover about one sixth of the land surface of the globe, and nearly the same proportion of its population. They possess:—In Europe; Gibraltar, Malta, Gozo, Heligoland, and Cyprus: N. America; Dominion of Canada and Newfoundland, together with the Falkland group off S. America: West Indies; Jamaica; the Windward Islands, Barbadoes, St. Vincent, Granada, Tobago, St. Lucia, and Trinidad; the Leeward Islands, Antigua, St. Christopher's, Montserrat, Nevis, Anguilla, Dominica, and Virgin Isles; Bahama Islands; Bermuda Islands; Demerara, Berbice, and Essequibo in Guiana; and the settlement of Honduras in Central America: Africa; Cape Colony; settlements in Guinea and Senegambia, including Bathurst, Sierra Leone, and Cape Coast Castle; the islands of Fernando Po, St. Helena, Ascension, and Tristan d'Acunha; the Mauritius, and other small islands in the Madagascar Archipelago: Australasia; Australia; Tasmania; and New Zealand: Oceania; Fiji: Asia; India; Ceylon; Aden and Perim; Straits settlements; Labuan (Borneo); and Hong Kong (China).

The foreign possessions of Spain at present consist of Cuba, Porto Rico, the Philippines, the

Canaries, and settlements in Morocco. Portugal has the Madeiras and the Cape de Verde Islands; Angola, Benguela, Loango, and Mozambique in Africa; Goa in India; Macao in China; and a settlement in the island of Timor: France has the West India Islands Guadaloupe, Martinique, Marie-Galante, and Desadea; Cayenne in Guiana; the small islands of St. Pierre and Miquelon in the vicinity of the Newfoundland fishing-ground; Algiers, Senegal, and Goree in Africa; the isle of Bourbon; St. Marie in Madagascar; Pondicherry, Chandernagore, and Coclin-China in Asia; New Caledonia and Loyalty Islands; and Marquesas in Oceania. Holland possesses Java, the Moluccas, and settlements in Sumatra, Celebes, Borneo, Banda, and other eastern islands; the West India Islands Curaçao, St. Eustatius, Saba, and part of St. Martin; and Dutch Guiana: Denmark has Iceland, settlements in Greenland, the West India Islands St. Croix, St. Thomas, and St. John; Christiansburg and other possessions in Guinea; and Tranquebar and Serampore in India: Sweden has the West India Island of St. Bartholomew. The U. States have no *C.* The vast unoccupied territories at the West relieve her citizens and the immigrants who join them from seeking scope for their enterprise beyond the recognized limits of the Republic; but the method according to which the national government provides for the continuous westward advance of new settlements is essentially a system of colonization. The newly-occupied lands are governed as a territory by the Federal Government, till the population reaches a fixed limit high enough to justify a demand to be admitted to the Union on an equal footing with the other States. The American Colonization Society has made an interesting philanthropic experiment for the establishment of negro freedom in Africa; the result is the existing independent republic of Liberia.

**Colophony.** See RESIN.

**Color**, commercially, any substance employed as paint or dye and for other coloring purposes in the arts. *C.* used by artists and house-painters are called *pigments*; those employed for staining textile fabrics are called *dyes*, and the substances used to produce them are called *dye-stuffs*. In the dry-goods trade the white and the black fabrics are not classed as goods in colors. The makers of *C.* take the whole range of the animal, vegetable, and mineral kingdoms in their search for materials; and the substances so used may be counted literally by hundreds. For notices of dyes, pigments, etc., refer to the principal *C.*, and to the particular names of the coloring substances.

White light from the sun is of a compound nature, and may be decomposed into rays of different colors: Newton distinguished seven primitive *C.*, namely, violet, indigo, blue, green, yellow, orange, and red. Other scientists are disposed to think that four of these *C.* are really compound, and that three, namely, blue, yellow, and red, alone deserve the name of primitive. The *C.* of natural objects are supposed to result from the power possessed by their surfaces of absorbing some of the colored rays of light, while they reflect or transmit, as the case may be, the remainder of the rays. Thus, an object appears red because it absorbs or causes to disappear the yellow and blue rays composing the white light by which it is illuminated. Black and white are not *C.*, strictly speaking. A body is said to be black when it absorbs or quenches a large proportion of all the rays of white light falling upon it. A body is said to be white when it receives the white light, and reflects all the rays with moderate strength. Gray may be regarded as a luminous black or dark white. The names given to *C.* are far from being satisfactory, for although many thousand shades may be distinguished by a practised eye, it is a question whether there are fifty names which would convey the same idea of shade to any ten colorists in the world. The names taken from natural colored objects, as indigo, violet, orange, lilac, amber, emerald, etc., are the least objectionable.—*C.* are said to be *complementary* or *accidental* to each other which, by blending together,

produce the perception of whiteness. All *C.* are produced by the admixture of red, yellow, and blue light, in certain proportions; and by intercepting either one or more of these colored rays in a beam of light, those which meet the eye will consist of the remaining colored rays of the spectrum. Thus, by intercepting the red rays in a beam of white light, the remaining yellow and blue rays will produce a green *C.*; by intercepting the blue rays, the remaining yellow and red will give an orange; and so on of other cases; so that red and green, blue and orange, are complementary *C.* If we look for some time, with one eye, on a bright-colored object, as a wafer placed on a piece of paper, and subsequently turn the same eye to another part of the paper, a similarly shaped spot or mark will be seen, but the *C.* will vary, though it will be always the same under like circumstances. Thus, if the original spot or wafer be of a red *C.*, the imaginary one will be green; if black, it will be white; the imaginary *C.* being always complementary of that first gazed upon. The *C.* so perceived is often called an *accidental C.*, to distinguish it from the real *C.* It is a general maxim in design that "*C.* look brightest when near their complementary colors."

Artists' *C.* or *Cake C.* are made by grinding, by means of a glass muller and a slab, the respective pigments previously reduced to powder, into a smooth paste with equal parts of isinglass size, and thin gum-water. The paste is then compressed into squares as tightly as possible, and dried with a very gentle heat. Old crumbling cake *C.* should be powdered very finely in a biscuit-ware mortar, sifted through fine muslin, and ground up as above, the gum-water being omitted. The powders rubbed up with honey to the consistence of cream constitute moist *C.*

**Colorado**, a W. State of the U. States, bounded N. by Wyoming and Nebraska; E. by Nebraska and Kansas; S. by the Indian Territory and New Mexico; and W. by Utah. This State lies between lat. 37° and 41° N., lon. 102° and 109° W. Breadth N. to S. about 280 m., length E. to W. about 380. Area 103,475 sq. m., or 67,723,250 acres. Population, 150,000. *C.* is traversed from N. to S. by the great continental chain of the Rocky Mountains, and may be divided into a mountain district, a hill district, and a plain district. The principal range of these mountains bears the name of Sawatch Range. It consists of a solid

Fig. 94. — SEAL OF COLORADO.

mass of granite, has an average elevation of 13,500 feet, a mean breadth of 15 to 20 m., and up to about lat. 40° N. forms the dividing line between the Atlantic and the Pacific versants. One of the most remarkable features of the orography of *C.* is the unusual development of its upland valleys, or *park*s, to use the term that has become distinctly their own. The four most extensive are known respectively as the North, the Middle, the South, and the San Luis; the last is by far the finest of the four. They stretch almost in a line from the S. to the N. boundary of the State, just on the W. side of the Front Range, and occupy an average breadth of 50 m. The San Luis Park is, as it were, an "immense elliptical bowl," with an area of 9,400 sq. m., bounded E. by the West Mountains and the Sangre de Cristo range, and W. by the Sierra de San Juan, which is part of the great Sierra Miembres. Its surface is nearly as flat as a lake. The centre of the N. part, which bears the distinctive title of the Rincon, is occupied by a considerable sheet of water, fed by 19 mountain streams, and accustomed in the winter to overflow a large stretch of the neighboring savanna. The river which gives its name to the State belongs to it only by some of its most important tributaries, of which it is sufficient to mention the Bear River, and the Gunnison and Grand River, which unite before they pass into the Terri-

tory of Utah. Of the rivers of the Atlantic versant, the most important are the South Plate, the Arkansas, and the Rio Grande del Norte. *C.* is pre-eminently a mineral district, and to this fact it owes its colonization. It possesses extensive deposits of gold and silver ore, and between the years 1859 and 1878 it furnished to the U. States Mint \$29,984,158.59 worth of the former metal and \$15,846,879.20 of the latter. Iron is pretty widely diffused, and zinc and copper occur in many of the mines. Coal is also found extensively on both sides of the main range of mountains; the area occupied by the Tertiary deposits being no less than 7,200 sq. m. The mining districts are five in number, and are distinguished as the district of the northern mines, the mines of the eastern base, the Conejos County mines, the southern mines, and the mines of Summit County. At Murphy's mine, about twelve miles from Denver, the stratum is about 16 feet thick, and the percentage of fixed carbon is found to be 55.31. The total yield of these mines for the year 1878 was 367,000 tons. Leadville, a new city only two years old, with a population of 10,000, situated 10,200 feet above the sea-level, near the head-waters of the Arkansas River, owes its foundation, and its development into a permanent mining region, to the discovery there made of rich silver-mines, whose product for the year 1879 is estimated at \$10,000,000. The climate of *C.* is remarkable for its regularity and salubrity. During the day the thermometer not unfrequently rises to 90° in summer, but the nights are always cool and dewless. In winter the weather is generally mild,—the lowest thermometric marking being only 7° below zero, in Middle Park 15°, and in Denver 13°. Snow often lies deep in the higher inhabited districts, but in the lowlands it is never more than 10 or 12 inches, and it disappears again almost immediately. Between July and Oct. there is very little rain, day after day bringing a bright and cloudless sky. "An air more delicious to breathe," says the late Bayard Taylor, "cannot anywhere be found; it is neither too sedative nor too exciting, but has that pure, sweet, flexible quality which seems to support all one's happiest and healthiest moods." The only flaw in the climate of *C.* is its violent storms of wind, and in some parts of the country heavy falls of hail. Among the hygienic advantages of which *C.* can boast, the mineral wells hold an important place. They occur in various parts of the country, and belong to different classes. Chalybeate waters are found at Manitou, Carlisle, and Red Creek; soda springs at Manitou, Trinidad, and Cañon City; sulphur springs at Fairplay, on the Navajo River, and at Idaho Springs, and thermal springs, partly sulphur and partly soda, exist at Pagosa, in the Middle Park, in Seguahe County, at Wagon-Wheel Gap, and at Del Norte. Manitou is already becoming a fashionable watering-place; the fountains and the surrounding land were purchased by a company in 1870; and in 1878 there were several large hotels and numerous private residences erected round the spot. In the lowland districts water for drinking is very scarce; but supplies can frequently be obtained by the sinking of artesian wells. The mountains of *C.* were, till a comparatively recent date, richly clothed with forest; but owing partly to natural causes, and still more to the lavish consumption and reckless destruction of the early settlers, the quantity of growing timber in the State is exceedingly small, and before long, if restorative measures are not adopted, the Colorado demand for wood will require to be

supplied from without. The principal trees, after the pine, are the so-called hemlock and cedar, the cotton-wood, and the aspen (or *Populus tremuloides*). The minor flora of the country is exceedingly rich; and especially in the plain region the abundance of flowers is amazing. Wherever irrigation can be obtained the soil of eastern C. is well fitted for agriculture. Wheat, oats, and barley afford heavy crops; potatoes succeed except in the extreme S., and owing to the dryness of the atmosphere are easily kept; and almost all the garden products of the same latitude in the East can be satisfactorily cultivated. The wheat affords a very white dry flour, and competes with the finest in the markets of the world. The yield often reaches 40 to 50 bushels per acre, and in exceptional cases considerably exceeds this amount. In the higher districts — the parks and the mountain-valleys — a greater proportion of ground is devoted to pasture, either of sheep or cattle. The native grasses are of excellent quality as fodder; and during the winter the natural hay that has withered where it grew is preferred by the cattle to the best that can be furnished by the labors of the husbandman. In certain districts the pastoral departments of husbandry have had to be abandoned, owing to the presence of poisonous plants, the most important of which seems to be *Oxytropis Lambertii*; but these districts are of very limited extent. The cost of pasturing is merely nominal, as the cattle can be driven over extensive districts, under the charge of Mexican or Indian herdsmen. Wool can be produced for ten cents per lb., and a four-year-old steer for ten dollars. The chief plague of the agriculturist is the grasshopper. This insect is usually hatched in the month of June, when the cereals are well advanced; but occasionally in dryer and warmer seasons it appears as early as April and does great damage to the young crops. Another insect, the *Doryphora decemlineata*, popularly known as the C. beetle, has become famous for its attacks on the potato, not only in this State but as far east as the Atlantic States. — **Denver**, the capital and principal commercial town of the State, is situate on the S. Plate River, about 580 m. W. of the Mississippi River, and 15 m. E. of the Rocky Mountains; lat. 39° 45' N., lon. 104° 50' W. This fine city has 4 National Banks, and its commercial and manufacturing interests are rapidly progressing. Six railroads are diverging from D., the Denver and South Park and Pacific R.R. connecting it with Leadville. Pop. about 35,000. Pop. of State, 150,000.

**Color-Box**, a box with cakes of water-colors.

**Color-Printing** consists not merely in printing with colored ink or paint instead of black, but in combining many different colors on the same sheet of paper. If printed in *one* color, it might certainly be designated color-printing; but the technical meaning of the term is usually *polychrome*, or many-colored. There must be a distinct plate, form of type, or stone (according to the kind of printing), for each color; and they must all be so *registered*, or adjusted, that each will come exactly in its proper place. The preparation of the plate, block, or stone is a matter of nicety, in order that the color should touch that particular one only which is to give the desired tint. Many ornamental productions are printed in gold as well as colors. In this case the plate is wetted with a kind of Japan gold-size, a layer of which is thence transferred upon the paper; leaf gold is placed upon the gold-size, to which it adheres; and a bit of cotton-wool suffices to rub off the surplus gold from those parts of the paper which had not been wetted by the

gold-size. Inferior articles, such as the labels attached to spun and woven cottons, are printed with bronze-powder instead of with leaf-gold.

**Colored Fires**, compositions used in pyrotechny for making *stars, lights, lances*, and other ornamental fire-works.

**Colored Glass**, stained glass for windows; also Bohemian or fancy glass articles.

**Colored Goods**, cotton, linen, or worsted fabrics, printed, stained, or dyed. In commerce, this term does not apply to black goods; but in revenue laws' phraseology it includes all goods that are not white.

**Colporteur**, the French term for a news-hawker, a pedler or itinerant vender or distributor of wares.

**Colrake**, a shovel used to stir lead ore when it is being washed.

**Colter or Culter**, the sharp iron cutting-knife of a plough, fixed over the share, to prevent, or remove, the accumulation of grass or rubbish. In fen lands it is in the form of a wheel.

**Colt's Foot**, a name for the *Tussilago farfara*, a wild herb, the leaves of which are emollient, demulcent, and tonic. They were formerly smoked in troublesome coughs, but are now used in decoction. *Imp. free.*

**Columba-Root**. See CALUMBA-ROOT.

**Columbia**. See SOUTH CAROLINA.

**Columbia**, a fire Insurance Co. of New York City, organized in 1853. *Statement* on Jan. 1, 1879: — Capital stock, \$300,000; net surplus, \$10,702; total cap. and surplus, \$310,702. Risks in force, \$8,241,858; premiums, \$72,168. Premiums received since the organization of the Co., \$3,048,798; losses paid, \$1,834,385. Cash dividends paid to stockholders, \$455,000.

**Columbia (British)**. See CANADA.

**Columbia (District of)**. See WASHINGTON.

**Columbo or Colombo**. See CEYLON.

**Columbus**. See OHIO.

**Column Rules**, thin pieces of brass used in printing-offices to separate longitudinally the columns of type.

**Colza Oil**, a valuable oil manufactured to a large extent in Europe, by expression of the ungutious seeds of the common rape (*Brassica napus sativa*), and the navew (*B. campestris*). It is much used for lubricating machinery, for burning in the carcel, moderator, and other similar lamps, and in the French lighthouses it is preferred to any other oil in use, on account of its greater brilliancy and steadier flame, with less charring of the wick, as well as for its greater cheapness. *Imp. duty*, 20 per cent.

**Comb** [Fr. *peigne*; Ger. *Kamm*; It. *pettino*; Port. *peite*; Sp. *peine*], a toothed instrument for cleaning and adjusting the hair, made from a considerable variety of materials, the most common being the horns and hoofs of cattle, tortoise-shell, ivory, box-wood, and vulcanite, or hardened india-rubber. Metallic C. are used for carding or cleaning wool, cotton, and other fibres, and for rubbing down the coat of horses. — A steel tooth with teeth corresponding to those of a screw, used for chasing screws on work which is rotated in a lathe. — The projection on the top of the hammer of a gun-lock. — The notched scale of a wire-micrometer. — In hat-making, the former on which a *plume* or fibre is taken up and hardened into a *bat*. — The wax-cell of bees.

**Hair C. manuf.** Of all the materials from which C. are made, horn is by far the most extensively employed, and the working of that substance illustrates all the peculiarities of the craft. The industry is one still extensively prosecuted on a small scale, with all the disadvantages of manual labor and watchful and tedious processes; but in several large factories very ingenious labor and material-saving machinery is brought

into operation. When the horn is brought to the factory, it is first assorted into sizes, preparatory to being cut up into pieces. From an ordinary horn two cross-sections are taken for *C*-making, called, first, the head or root cut, and, second, the screw or tip cut. The solid tips remaining are disposed of either for button-making or for being formed into knife and other handles. Other scraps and cuttings are of great value to makers of prussiate of potash for artificial manure. The sections to be used for *C* are taken to the opening department, where they are wetted in water and heated over an open fire till the horny substance becomes quite soft. The head cut is slit longitudinally once, or, if it is a large horn, it may be slit into two. The screw cut is so termed on account of the peculiar spiral direction in which it is slit, the cut being so directed that the piece when opened out may form an oblong rectangular plate, with as little waste of horn as practicable. After slitting, the cuts are opened out between tongs, and inserted between screw-plates, where they are pressed quite flat. Plates which are intended for staining in imitation of tortoise-shell are at this stage inserted in strong iron frames between heated and oiled iron plates, in which they are submitted for some time to enormous pressure. After this pressure the plates are found to have a translucent appearance, and a uniform greenish hue. The pressure, however, operates injuriously on the fibre or grain of the horn, rendering it liable to split. When, therefore, the horn is of good natural color, it is preferable to finish it in that condition. The prepared plates of horn are laid aside to dry in a room where a high temperature is maintained by steam-pipes. Subsequently they are squared and trimmed on circular-saw benches, and assorted into sizes suitable for the various kinds of *C* manufactured. — In the manufacture of ordinary dressing-*C*, two distinct processes of tooth-cutting are followed. The first method, which is applied to all fine combs, consists of cutting out the teeth by means of circular saws; and this is the only process applicable to the preparation of small-toothed *C*, and all *C* made of ivory and box-wood. Saw-cutting is, moreover, the only process formerly adopted; but instead of a circular saw, the *C*-maker used a gauged hand-saw, called a *stadla* or *steady*. The saws now employed are of small diameter, and, according to the work they have to perform, they are fine-toothed and thin, some of them being constructed to cut from 70 to 80 teeth per lineal inch. The saws are mounted on a spindle, which revolves with great rapidity, and the plate or plates of horn to be toothed are clamped up in a holder, which, by a cam motion, is alternately raised and depressed, bringing the horn each time against the saw, which cuts out one tooth to its full depth. After each cut, an automatic arrangement moves the horn forward the breadth of a tooth, the gearing being so mounted that the teeth may be cut fine or coarse at pleasure. The second method of cutting the teeth is known as *twinning*, from the fact that a pair of combs are cut out of a single plate. The process of *twinning* consists in so cutting a plate of horn that the whole material is utilized, what is removed to form the teeth of one *C* being exactly sufficient for the teeth of a corresponding opposite *C*. When the cutting of twinned *C* is complete, the plate presents the appearance of a pair of *C* with their teeth exactly insculcating or dovetailing into each other. The *twinning*-machine, by which this is accomplished, is a complex and beautiful piece of mechanism. The plates of horn to be twinned are softened by heat, and secured in a bed-plate, which travels under a pair of cutting-chisels, fast or slow, as the teeth are to be cut coarse or fine. The chisels, having cutting edges equal to the length of the teeth to be formed, descend alternately, and cut through the plate; but as their cutting edges are at a small angle in relation to each other, the cuts are wedge-formed or tapering, and thus the pointed ends of one comb are taken out of the roots or head of another. With the aid of this apparatus, a man and boy can cut more than 2000 *C* per day, while an old-fashioned *C*-maker, working with his hand-saw, can only cut from 2 to 3 dozen *C* daily, and that with almost double the material required in the *twinning* process. After the *C* are formed either by circle saw or by *twinning*, they are next thinned or tapered to their outer edges on grindstones. They then pass to the *grailing* department, where, by means of special forms of files or rasps, known as *grails* and *topers*, the individual teeth are rounded or bevelled, tapered, and smoothed. If the *C* are to be finished in their natural colors, they are then smoothed with sand-paper, buffed on leather wheels, and polished on wheels built up of disks of soft calico. If, as is frequently the case, the *C* are to be finished as imitation tortoise-shell, they are, in the translucent state before alluded to, treated with dilute nitric acid, which communicates a light yellow tinge like the ground-color of tortoise-shell. The deep, semi-opaque orange spotting is next produced by dropping over the surface spots of a composition containing caustic soda, litharge, and dragon's blood. After some time this composition is washed off, and the parts to which it was applied are found to be a little swollen up, and stained a deep orange tinge. The *C* are then polished as above stated. The elaborate pierced patterns of ornamental back *C* are cut out by small ribbon saws; and the work is generally finished by hand-carving with proper tools. Plain and less artistic work is done by embossing in heated dies, and ordinary pierced work is also produced by cutting dies. Formerly, the wide-set teeth of back *C* were fro-

quently stamped out. In order to economize tortoise-shell, and to obtain large and thick *C* out of the comparatively small and thin plates in which that substance usually occurs, a process of cementing or soldering is resorted to. The joining of two plates of tortoise-shell is very perfectly accomplished by first carefully scraping and cleaning the surfaces to be united. They are then applied to each other, heated, and strongly pressed between pinners, — this being sufficient to cause a perfect amalgamation of the two surfaces. After cementation, tortoise-shell is treated in every respect as a piece of fine white or buffalo horn.

Hair *C* are not manuf. on a large scale in the U. States; they are generally imported from Germany, France, and England. *Imp. duty* for all kinds, 35 per cent.

**Comb-Brouch**, the tooth of a wool-comb.

**Combed Wool**. See COMBING.

**Combining-Wool**. See WOOL.

**Combination**, in chemistry, the union of two or more substances in such a manner as to form a new compound. — In trade, an illegal union of workmen on strike to prevent others taking the places they have quitted. See STRIKE.

**Combing**, an operation in the worsted or long-wool manufacture. The operation of straightening and disentangling wool; corresponding in purpose with *carding* of short wool. — In hand-*C*, the work is done between two combs, one held stationary and the other drawn over it, to comb out the lock of wool placed between them. The combs have a number of steel spikes fixed into a back, and are occasionally heated in a *comb-pot*. The short fibres which are combed out are called *noyls*. — In machine-*C*, the locks are fastened to two toothed cylinders, which revolve in apposition to each other, and are heated by steam within. The teeth of one cylinder comb the fibres on the other one. — *Knight*.

**Combustible**, any thing that will ignite, but properly applicable to those dangerous substances which consume spontaneously, with the emission of heat and light, and which railway companies, carriers, and vessels therefore refuse to carry.

**Combustion**, the act of taking fire and burning. A substance which, like coal or wood, cheaply answers the purpose of producing great heat and light is called fuel, and the phenomenon of that production is called *C*. Now, modern discovery has ascertained that, in every instance, *C* is merely an appearance which accompanies the mutual action, when very intense, of two substances in the act of forming an intimate or chemical union. Where that act is less energetic, the heat produced is less intense, and there is no light. Thus, water and sulphuric acid when mixing produce great heat, but no light. Water and quick-lime produce still greater heat; sufficient, it is known, to set fire to a ship in which the mixture unfortunately occurs. It is an occurrence of the same kind when heat is evolved from an acid dissolving a metal; and it is still of the same kind when a mass of coal or wood in a fire-grate is, with the appearance of *C*, undergoing solution in the oxygen of the atmosphere. In this last case, however, the temperature of the fuel is, by the very intense action, raised so much that the fuel becomes incandescent or luminous; an appearance assumed by every substance, whether burning or not, — of a stone, for instance, or piece of metal, — when heated beyond the temperature indicated by 800° F. The inferior degrees of such incandescence are called *red heat*; the superior degrees, *white heat*. The reason why any strongly heated body throws out light we cannot yet explain. When a quantity of wood or coal has been burned to ash in a confined portion of air, the whole of the fuel, vanished from view, is held in solution by the air, as salt is held in water, and

is again recoverable by the art of the chemist. The phenomenon of common fire, or *C.*, then, is merely the fuel being chemically dissolved in the air of the atmosphere. If the fuel has nothing volatile in it, as is true of pure carbon, and nearly true of coke and charcoal, it burns with the appearance of red-hot stones; but if there be an ingredient, as hydrogen, which, on being heated, readily assumes the form of air, that ingredient dilates before burning, and in the act produces the more bulky incandescence called flame.

**Comedian**, one who plays other than tragic parts.

**Comestibles**, the French general term for provisions, eatables.

**Comfit**, a dry sweetmeat; seeds coated or crusted with sugar.

**Comfrey**, the root of the common comfrey (*Symphytum officinale*) has been used medicinally; that of the prickly comfrey (*S. asperinum*), a gigantic species, is favorably spoken of as a green food for cattle.

**Commandery**. See CYPRUS WINES.

**Commanditaire**, a dormant or sleeping partner in a French joint-stock company; one who supplies the capital requisite to carry on business, but is only liable for the sum he invests.

**Commandite** (*Société en*), a French partnership or company, consisting of a number of individuals, of whom one or more undertake the management, and are held indefinitely responsible for all engagements, as in the case of ordinary partnerships; and the others are mere shareholders, responsible only to the amount of their contributions, either paid up or contracted to be paid into the joint-stock of the association. — The first, called the *commandités*, may be designated managing partners; and the second, called *commanditaires*, non-responsible partners, or simply shareholders. The managing partners are liable in their whole fortunes; the others only in a limited sum.

**Commassee**, a small Arabian coin, about the size of a sixpence, consisting of 7 carats; it contains little silver, and may be taken to be worth 2 cents. From 40 to 60 commassees generally pass for a dollar at Mocha.

**Commedador Balsam**, a compound tincture of benzoin used in Brazil.

**Commerçant**, the French general term for merchant, trader, and dealer.

**Commerce** [Lat. *commutatio mercium*], as its name implies, is the exchange of one commodity or production for another, thus including the domestic and the foreign trades. In its general acceptation, however, *C.* is the international traffic in goods, or what constitutes the foreign trade of all countries as distinct from their domestic trade. All subjects and questions relating to *C.* being treated, in this work, under the various titles to which they refer, our present object is merely to show the nature, influence, and actual condition of *C.* in general. *C.* is only productive of wealth in an indirect manner. The merchant produces no alteration on the articles which he buys or sells; he merely exchanges one commodity for another; and, in general, what is given is the exact equivalent to what is received. The advantage of *C.* — and it is difficult to overestimate its importance — consists in the uninterrupted scope and efficiency which it gives to the division and distribution of labor, by placing it in the power of individuals to prosecute continuously such employments as suit their taste and capacities. While the exchange of different products is carried on by the producers themselves, they must unavoidably lose a great deal of time,

and experience many inconveniences. Were there no merchants, a farmer wishing to sell his crop would be obliged, in the first place, to seek for customers, and to dispose of his corn as nearly as possible in such quantities as might suit the demands of the various individuals inclined to buy it; and after getting its price, he would next be obliged to send to 10 or 20 different and, perhaps, remote places, for the commodities he wanted to get in its stead. So that, besides being exposed to a world of trouble and inconvenience, his attention would be continually diverted from the labors of his farm. Under such a state of things, the work of production, in every different employment, would be meeting with perpetual interruptions, and many branches of industry that are successfully carried on in a commercial country would not be undertaken. The establishment of a distinct mercantile class effectually obviates these inconveniences. When a set of dealers erect warehouses and stores for the purchase and sale of all descriptions of commodities, every producer, relieved from the necessity of seeking customers, and knowing beforehand where he may at all times be supplied with such products as he requires, devotes his whole time and energies to his proper business. The intervention of merchants gives a continuous and uninterrupted motion to the plough and the loom. Were the class of traders annihilated, all the springs of industry would be paralyzed. The numberless difficulties that would then occur in effecting exchanges would lead each particular family to endeavor to produce all the articles they had occasion for: society would thus be thrown back into primeval barbarism and ignorance; the divisions of labor would be relinquished; and the desire to rise in the world and improve our condition would decline, according as it became more difficult to gratify. What sort of agricultural management could be expected from farmers who had to manufacture their own wool, and make their own shoes? And what sort of manufacturers would those be who were every now and then obliged to leave the shuttle for the plough, or the needle for the anvil? A society without that distinction of employments and professions resulting from the division of labor, that is, without *C.*, would be totally destitute of arts or sciences of any sort. It is by the assistance each individual renders to and receives from his neighbors, by every one applying himself in preference to some peculiar task, and combining, though probably without intending it, his efforts with those of others, that civilized man becomes equal to the most gigantic efforts, and appears endowed with almost omnipotent power. The mercantile class has generally been divided into two subordinate classes, — the wholesale dealers and the retail dealers. The former purchase the various products of art and industry in the places where they are produced, or are least valuable, and carry them to those where they are more valuable, or where they are more in demand; and the latter, having purchased the commodities of the wholesale dealers or the producers, collect them in stores, and sell them in such quantities and at such times as may best suit the public demand. These classes of dealers are alike useful; and the separation that has been effected between their employments is one of the most advantageous divisions of labor. The operations of the wholesale merchant are analogous to those of the miner. Neither the one nor the other makes any change on the bodies which he carries from place to place. All the difference between them consists in this, — that the miner carries

them from below ground to the surface of the earth, while the merchant carries them from one point to another on its surface. Hence it follows that the value given to commodities by the operations of the wholesale merchant may frequently exceed that given to them by the producers. The labor or expense required to dig a quantity of coal from the mine does not exceed what is required for its conveyance from Pittsburg to New York; and it is a far more difficult and costly affair to fetch a piece of timber from a remote forest to Philadelphia than to cut down the tree. In this respect there is no difference between commerce and agriculture and manufactures. The latter give utility to matter by bestowing on it such a shape as may best fit it for ministering to our wants and comforts; and the former gives additional utility to the products of the agriculturist and manufacturer by bringing them from where they are of comparatively little use, or are in excess, to where they are of comparatively great use, or are deficient. If the wholesale merchant were himself to retail the goods he has brought from different places, he would require a proportional increase of capital; and it would be impossible for him to give that exclusive attention to any department of his business which is indispensable to its being carried on in the best manner. It is for the interest of each dealer, as of each workman, to confine himself to some one business. By this means each trade is better understood, better cultivated, and carried on in the cheapest possible manner. But whether carried on by a separate class of individuals or not, it is obvious that the retailing of commodities is indispensable. It is not enough that a cargo of tea should be imported from China, or a cargo of sugar from Cuba. Most individuals have some demand for these articles; but there is not, perhaps, a single private person requiring so large a supply for his own consumption. It is clear, therefore, that they must be *retailed*; that is, they must be sold in such quantities and at such times as may be most suitable for all classes of consumers. And since it is admitted, on all hands, that this necessary business will be best conducted by a class of traders distinct from the wholesale dealers, it is impossible to doubt that their employment is equally conducive as that of the others to the public interest, or that it tends equally to augment national wealth and comfort. The observations already made serve to show the influence of the home trade in allowing individuals to confine their attention to some one employment, and to prosecute it without interruption. But it is not in this respect only that the establishment of the home trade is advantageous. It is so in a still greater degree by its allowing the inhabitants of the different districts of the country to turn their labor into those channels in which it will be most productive. The different soils, different minerals, and different climates of different districts fit them for being appropriated, in preference, to certain species of industry. Hence it follows that the inhabitants of different districts, by confining themselves to those branches of industry for the successful prosecution of which they have some peculiar capability, and exchanging their surplus produce for that of others, will obtain an incomparably larger supply of all sorts of useful and desirable products than they could do were they to apply themselves indiscriminately to every different business. The territorial division of labor is, if possible, even more advantageous than its division among individuals. The inhabi-

tants of the richest and most extensive country, provided it were divided into small districts without any intercourse with each other or with foreigners, could not, how well soever labor might be divided among themselves, be otherwise than poor and miserable. Some of them might have a superabundance of corn, at the same time that they were wholly destitute of coal and iron; while others might have the largest supplies of the latter articles, with but very little grain. But in commercial countries no such anomalies can exist. Opulence and comfort are there universally diffused. The labors of the mercantile class enable the inhabitants of each district to apply themselves principally to those employments that are naturally best suited to them. This superadding of the division of labor among different states to its division among different individuals renders the productive powers of industry immeasurably greater; and augments the mass of necessities, conveniences, and enjoyments in a degree that could not previously have been conceived possible, and which cannot be exceeded except by the introduction of foreign *C*. The roads and canals that intersect a country, and open an easy communication between its remotest extremities, render the greatest service to internal *C*., and also to agriculture and manufacture. A diminution of the expense of freight has, in fact, the same effect as a diminution of the direct cost of production. If coal brought into a city sell at \$4 a ton, of which the freight amounts to a half, or \$2, it is plain that, in the event of an improved communication, such as a railroad or a canal, permitting to import it for half the previous expense, its price will immediately fall to \$3 a ton; just as it would have done had the expense of extracting it from the mine been reduced a half. In other respects, the advantages resulting from improved communication are probably even more striking. They give the same common interest to every different part of the most widely extended country; and put down, or rather prevent, any attempt to monopoly on the part of the dealers of particular districts, by bringing them into competition with those of all the others. Nothing in a country enjoying great facilities of communication is separate and unconnected. All is mutual, reciprocal, and dependent. Every man naturally gets into the precise situation that he is best fitted to fill; and each, co-operating with every one else, contributes to the utmost of his power to extend the limits of production and civilization. — What the home trade is to the different regions of the same country, *foreign trade* is to all the countries of the world. Particular countries produce only particular commodities, and, were it not for foreign *C*., would be entirely destitute of all but such as are indigenous to their own soil. It is difficult for those who have not reflected on the subject to imagine what a vast deduction would be made, not only from the comforts, but even from the necessities, of every commercial people, were its intercourse with strangers stopped. One country has peculiar capacities for raising corn and cotton, but is at the same time destitute of coffee, tea, and sugar; another, again, has peculiar facilities for raising the latter, but is destitute of the former; and it is impossible to point out a single country which is abundantly supplied with any considerable variety of commodities of domestic growth. Providence, by giving to each particular nation something which the others want, has evidently intended that they should be mutually dependent upon one another. What has been already stated is suffi-

cient to expose the utter fallacy of the opinion that has sometimes been maintained, that whatever one nation may gain by her foreign commerce must be lost by some one else. *C. is not directly productive*, nor is the good derived from it to be estimated by its immediate effects. What commercial nations give is uniformly the fair equivalent of what they get. In their dealings they do not prey upon each other, but are benefited alike. The advantage of *C.* consists in its enabling labor to be divided, and giving each people the power of supplying themselves with the various articles for which they have a demand, at the lowest price required for their production in those countries and places where they are raised with the greatest facility. *C.* gives no advantage to any one people over any other people; but it increases the wealth and enjoyments of *all* in a degree that could not previously have been conceived possible. But the influence of foreign *C.* in multiplying and cheapening conveniences and enjoyments, vast as it most certainly is, is perhaps inferior to its indirect influence,—that is, to its influence on industry, by adding immeasurably to the mass of desirable articles, by inspiring new tastes, and stimulating enterprise and invention by bringing each people into competition with foreigners, making them acquainted with their arts and institutions, and giving to each particular country the means of protecting by the inventions and discoveries of others as much as by those of her own citizens. “*C.* has acquired in our time,” says R. Somers, “a security and extension, in all its most essential conditions, of which it was void in any previous age. It can hardly ever again exhibit that wandering course from route to route, and from one solitary centre to another, which is so characteristic of its ancient history, because it is established in every quarter of the globe, and all the seas and ways are open to it on terms fair and equal to every nation. Wherever there is population, industry, resource, art, and skill, there will be international trade. *C.* will have many centres, and one may relatively rise or relatively fall; but such decay and ruin as have smitten many once proud seats of wealth into dust cannot again occur without such cataclysms of war, violence, and disorder as the growing civilization and reason of mankind and the power of law, right, and common interest forbid us to anticipate. But with all these advantages, it must not be supposed that the future course of trade is free of difficulty. The very magnitude of *C.* now suggests what serious work devolves on all who are engaged in it. If in the older times it was thought that a foreign merchant requires to be not only a good man of business, but even a statesman, it is evident that all the higher faculties of the mercantile profession must still more be called into request when imports and exports are reckoned by hundreds instead of fives or tens of millions, when the markets are so much larger and more numerous, the competition so much more keen and varied, the problems to be solved in every course of transaction so much more complex, the whole range of affairs to be overseen so immensely widened. It is not a company of merchants, having a monopoly, and doing whatever they please, whether right or wrong, that now hold the *C.* of the world in their hands, but large communities of free merchants in all parts of the world, affiliated to manufacturers and producers equally free, each under strong temptation to do what may be wrong in the pursuit of his own interest, and the only security of doing right being to follow steady lights of infor-

mation and economic science common to all. Easy transport of goods by land and sea, prompt intelligence from every point of the compass, general prevalence of mercantile law and safety, have all been accomplished; and the world is opened to trade. But intellectual grasp of principles and details, and the moral integrity which is the root of all commercial success, have to be severely tested in this vaster sphere.” See *BALANCE OF TRADE, EXCHANGE, IMPORTS AND EXPORTS, PROTECTION AND FREE TRADE*, etc.

**Commerce**, a fire insurance Co. of Albany, New York, organized in 1859. *Statement on Jan. 1, 1879*:—Capital stock, \$200,000; net surplus, \$163,805; total cap. and surpl. \$363,805. Risks in force, \$9,263,820; premiums, \$86,236. Premiums received since the organization of the Co., \$2,966,470; losses paid, \$2,076,107; cash dividends paid to stockholders, \$474,000; cash dividend paid in 1878, \$32,000.

**Commercial**, pertaining to commerce or trade; mercantile trading; according to the rules or usages of commerce.

**Commercial**, a fire insurance Co. of New York City organized in 1850. *Statement on Jan. 1, 1879*:—Capital stock, \$200,000; net surplus, \$170,523; total cap. and surplus, 370,523. Risks in force, \$34,848,029; premiums, \$228,953. Premiums received since the organization of the Co., \$3,579,521; losses paid, \$1,920,594; cash dividends paid to stockholders, \$776,000. Cash dividend paid in 1878, \$35,846.

**Commercial Agent**, an officer appointed to act in the capacity of a consul in a foreign port.

**Commercial College**, a school for the instruction of young men in the rudiments of commercial knowledge.

**Commercial Law**, such customs and usages of trade as are so well established as to become fixed in the public mind, and acquiesced in by the trading community; usages of trade recognized by courts of justice; judicial decisions on commercial contracts or transactions. *McElrath*.

**Commercial Paper**, promissory notes, bills of exchange, or drafts, made and given for merchandise.

**Commercially**, in a commercial manner or view.

**Committant** [Fr.] a principal or constituent; one who employs.

**Commings**, a malster's name for the shoot of the barley after being kiln-dried.

**Commis**, a clerk or shopman in France.

**Commissariat**, the provisioning department of an army or other large body.

**Commissary**, an officer charged with the supply of provisions, medical stores, and clothing for troops, bodies of travellers, etc.

**Commission**, order or authority by which one person trades for another: as, a *commission* to buy cotton. — Brokerage, allowance, or compensation made to a factor, agent, etc., for transacting the business of another. It is usually charged at so much per cent, the amount being regulated either by stipulation or the usage of trade. A *C. del credere* is a higher rate charged in those cases where the agent guarantees his dealings, or, in other words, engages to be answerable, as if he himself were the proper debtor. See *DEL CREDERE*.

*Rates of C. on general Business, recommended by the Chamber of Commerce of New York, to be charged where no express agreement to the contrary exists*:—On sales of sugar, coffee, tea, and general merchandise, usually sold in large quantities, and on credit under six months, or for cash, 5%. — On sales of manufactured goods, and other articles usually sold on long credits, for commissions and guarantee, 7½%. — On sales of

manufactured goods, and other articles usually sold on long credits, for commissions and guarantee, for cash, 5% — On purchase and shipment of merchandise with funds in hand, on cost and charges, 2½% — Collecting delayed and litigated accounts, 5% — Effecting marine insurance, on amount insured, ½% — No charge to be made for effecting insurance on property consigned — Landing and re-shipping of goods from vessels in distress — on value of invoice, 2½% — Landing and re-shipping of goods from vessels in distress — on specie and bullion ¼% — Receiving and forwarding merchandise entered at Custom House, on invoice value one per cent, and on expenses incurred, 2½% — On consignments of merchandise withdrawn or re-shipped, full commissions are to be charged, to the extent of advances or responsibilities incurred, and one half commission on the residue of the value. — The risk of loss by robbery, fire (unless insurance be ordered), theft, popular tumult, and all other unavoidable occurrences, is, in all cases, to be borne by the owners of the goods, provided due diligence has been exercised in the care of them.

**Commission-Merchant**, *C.-broker, C.-agent*, a merchant, broker, or agent who transacts business for others, at a certain percentage; as commission and recompense for his services.

**Commissionnaire**, a French factor or merchant who buys and sells goods for others; one who attends to the transport of goods; a messenger.

**Committee**, a delegated or selected body of persons appointed to act for a society or company; and which may be either provisional or permanent.

**Commitment**, a warrant of committal to prison.

**Commode**, a piece of bedroom furniture; a night-stool; a set of drawers.

**Commodities**, merchandise; wares; goods; produce of land and manufactures.

**Common**, a public unenclosed ground.

**Commonage**, the right of feeding cattle on a common.

**Common Carrier**, one who conveys the goods of another for hire. In its mere colloquial use the term was applied to the class of men, now rendered comparatively obsolete by the railroad system, who conveyed goods in carts or wagons on the public roads. In jurisprudence, however, the term is collectively applied to all conveyers of property, whether by land or water, and in this sense the late changes and enlargements of the system of transit throughout the world have given additional importance to the subject. The law recognizes a distinction between a *common* and a *private* carrier. The former is one who holds himself out to the public as ready to carry for hire from place to place the goods of such persons as choose to employ him. The owner of a stage coach, a railroad company, the master of a general ship, are common carriers. It has been held, however, that a person who carries only passengers is not a common carrier; nor of course is a person who merely engages to carry the goods of particular individuals. If a man undertakes to carry goods safely, although he is not a common carrier, and is to have nothing for the carriage, he is responsible for damage sustained by his negligence. A common carrier is subject at law to peculiar liabilities. He is bound to carry the goods of any person who offers to pay his hire, unless there is a good reason to the contrary, as, for example, when his carriage is full, or the article is not such as he is in the habit of conveying. He ought to carry the goods in the usual course without unnecessary deviation or delay. To make him liable there must be a due delivery of the goods to him in the known course of his business. His charge must be reasonable; and he must not give undue preference to any customer or class of customers. The latter principle has come to be of great importance in the law of railroad companies. In respect of goods entrusted to him, the

carrier's liability, unless limited by a special contract, is, as already stated, that of an insurer. There is no question of negligence as in the case of injury to passengers, for the warrant is simply to carry safely and securely. The law, however, excepts losses or injuries occasioned immediately "by the act of God or the enemies of the U. States" — words which have long had a strict technical signification. It would appear that concealment without fraud, on the part of the customer, will relieve the carrier from his liability for negligence, but not for actual *misfeasance*. Fraud or deceit by the customer, (*e.g.*, in misrepresenting the real value of the goods) will relieve the carrier from his liability. The responsibility of the carrier ceases only with the delivery of the goods to the proper consignee. Should the article or parcel exceed \$50 in value, the carrier is not to be liable for loss unless such value is declared by the customer, and the carrier's increased charge paid. Where the value is thus declared, the carrier may, by public notice, demand an increased charge, for which he must, if required, sign a receipt. Failing such receipt or notice, the carrier must refund the increased charge and remain liable as at common law. Except as above no mere notice or declaration shall affect a carrier's liability, but he may make special contracts with his customers. The carriage of goods by railroad or canal, or by sea, is subject to special regulations. (See RAILROADS and CHARTER PARTY.) A carrier of passengers is responsible for personal injuries only when they have been occasioned by his negligence or want of skill. Where there has been contributory negligence on the part of the plaintiff, — *i.e.*, where he might, by the exercise of ordinary care, have avoided the consequences of the defendant's negligence, — he is not entitled to recover. When a person's death has been caused by such negligence as would have entitled him to an action had he survived, an action may be maintained against the party responsible for the negligence on behalf of the wife, husband, parent, or child of the deceased.

**Common-Council**, a body of councillors selected by citizens to represent and attend to municipal interests.

**Common-Hall**, the hall or meeting-place of a town council, or corporate body.

**Common-Pitch**, a building term implying that the length of the rafter is  $\frac{1}{2}$  of the span.

**Common-place Book**, a memorandum or jotting book.

**Common State**, a term for the grade of flour made of spring wheat, with nothing but the bran bolted out.

**Commonwealth**, a fire insurance Co. of Boston, Mass., organized in 1875. *Statement on Jan. 1, 1879*: — Capital stock paid up, \$500,000; net surplus, \$13,215; total cap. and surplus, \$513,215. Risks in force, \$22,236,075; premiums, \$241,415. Premiums received since the organization of the Co., \$688,625; losses paid, \$230,569; cash dividends paid to stockholders, \$55,000. Cash dividend paid in 1878, \$25,000.

**Communion-Table**, a piece of church furniture at the east end of a church, within the railed altar.

**Compadore**, in India, a butler or purveyor.

**Companion**, the wooden covering or hood of the ladder-way leading to the cabin in a merchant ship. — An associate, fellow-traveller, or workman.

**Companion-Ladder**, the steps leading from the poop to the main deck, or from the deck to the cabin of a ship.

**Company**, an association of persons for the prosecution of a common undertaking. In carrying on those costly enterprises in which the capital of a commercial country is employed, the resources and the mind of one person are often inadequate. They require the combined capital and industry of many, with the unity of purpose and of person which belongs to an individual. Hence the origin of *C.*, of which the following kinds may be distinguished: — *Private C.*, or voluntary associations of two or more persons for the acquisition of profit, with a contribution for that end, of stipulated shares of property and industry; accompanied by an unlimited mandate to each partner to bind the *C.* in the line of its employment, and a guarantee to third parties of all the engagements undertaken in the social name. *C.* of this kind may be subdivided into *partnership* and *joint-adventure*, under which heads, respectively, these contracts are fully described. — *Joint-Stock C.* differ from the preceding in respect, — 1st, That the credit is placed on the joint-stock of the *C.*, as indicated by a descriptive name, instead of being personal, as indicated by a firm; 2d, That the management is delegated by the partners to a body of directors; and, 3d, That the shares are transferable. — *Public or Chartered C.* are of different kinds. A State charter enables a joint-stock *C.* to enjoy the privileges of a corporation, and trade under a limited responsibility; the shares of such a *C.* are transferable; the *C.* itself undissolved by the death or bankruptcy of partners; and the management and title to pursue are vested in the officers appointed according to the charter. — See CORPORATION, JOINT-ADVENTURE, JOINT-STOCK COMPANY, LIMITED LIABILITY, and PARTNERSHIP.

**Comparateur**, a German instrument for accurately ascertaining the length of measures after Bessel's mode. The micrometers are placed on a strong mahogany beam; and the slide, which carries the two measures to be compared, is so arranged that it moves them exactly behind one another in the micrometer line, and there retains them.

**Compartment**, a specific division of the intermediate spaces. Warehouses are frequently built in *C.* for precaution against fire. Ships are often built with water-tight *C.* for greater security against accidents.

**Compass (The Mariner's)** {Dutch, *zee-kompass*; Fr. *boussole*, *compas de mer*; Ger. *ein Kompass*;

Fig. 95. — MARINER'S COMPASS.

It. *bussola*; Port. *compasso de marear*; Sp. *aguja de marear*], an instrument employed in directing the course of vessels at sea. It consists of a circular card, having a magnetized needle attached to the

back of it, so as to form one of its diameters; this diameter being supported on a point, and exactly balanced on its centre, turns freely round with the card, which by a particular contrivance is so suspended within a cylindrical box (Fig. 95) that it remains perfectly horizontal, notwithstanding the irregular motions to which a ship is liable at sea: it is the property of the needle, when thus balanced, to point *nearly* to the North Pole, whence, by simply looking at the position of the needle, the mariner can see the direction in which the vessel is sailing, and regulate his steering accordingly. The course indicated by the needle, however, is only the *magnetic* bearing, which is seldom the true direction, for the magnet rarely points exactly north, being subject to two errors from different causes, called the *variation* and the *deviation*. The former is the result of a slow progressive alteration in the position of the magnetic pole, which, within certain limits, moves from east to west, and back again from west to east. The variation of the *C.* is very different in different parts of the globe, and must therefore be determined at sea by comparing the true bearing of a celestial object with its bearing by *C.* which is done by a finer instrument called an *azimuth C.* (Fig. 96) which is graduated in degrees instead of being divided by

Fig. 96. — AZIMUTH COMPASS

*thumbs* like the mariner's *C.*, and has sights to allow the angles to be taken more accurately. The sight-plates ascend perpendicularly, and their slits are bisected by a perpendicular thread or wire, serving as sights. The cause of the variation of the compass has hitherto eluded the researches of philosophers. Captain Parry discovered that when he had passed to the north of a certain spot westward of Hudson's Strait, the needle, which had been previously varying to an extreme degree, absolutely went half round the compass, and this continued to be the case until he had sailed considerably farther north. Whether this peculiar attraction had any reference to the real magnetic pole, further observations will perhaps determine. — The *deviation* of the compass is a local error, occasioned by the attraction of iron on board ship. It has been the cause of numerous shipwrecks before the invention of the ingenious method of discovering its amount. The *dip* of the needle is a deviation from its horizontal line; it is different in different places, and, like the variation, undergoes slow changes; its diurnal change is not perceptible. The inventor of the mariner's *C.* is not known. It was employed in Europe in navigation, about the middle of the 13th century, but the exact date of its introduction is matter of doubt. The Chinese, however, are said to have been acquainted with it much earlier.

The attractive power of the loadstone was known to the ancient Egyptians, but was not by them applied to any practical purpose.

**Compass-Board**, an upright board of the fancy-weaving loom, through which pass the neck-twines.

**Compass-Brick**, a kind of brick with a curved face, used for forming the walls of wells.

**Compass-Card**, the suspended card on which the points of the compass are drawn.

**Compasses**, a two-legged instrument or tool for making arcs and circles, and for measuring distances. There are several varieties of *C.*, as wing, rack, club, millwright's, drawing, curb, and proportionate *C.*, and *C.* with cutting-leg for paper.

**Compass-Plane**, a plane which has a curved face, used to work on concave surfaces.

**Compass Saw**, a saw with narrow blade for cutting circles.

**Compensation**, a remuneration or reward; a recompense for injury, breach of agreement, etc.

**Compensation-Balance**, a spring or other contrivance to equalize temperature, or to recover error from inequality of movement.

**Compensation-Pendulum**. See PENDULUM.

**Compera**, the Italian for purchase or bargain.

**Competition**, a rivalry, the contention for a contract, for business, for supremacy in workmanship, etc.

**Compilation**, a collection of laws; a selection of passages, etc.

**Complaisance**, the French word for accommodation; *billet de C.* is an accommodation note or bill.

**Complement**, the full amount; a complete set of any thing.

**Compo.**, Roman cement; concrete or mortar.

**Component**, a constituent part; an ingredient.

**Composer**, a musical author.

**Composing**, the practical business of picking up and arranging the letter-types for printing, spacing, and justifying the lines, etc.

**Composing-Draught**, an opiate or soothing draught.

**Composing-Frame**, a printer's elevated working-frame, on which the cases of type are rested obliquely.

**Composing-Machine**, an ingenious and complicated machine, invented for setting and arranging type, which is worked by keys like a piano-forte. These machines, however, have always some practical defects, the spacing and making up into lines still requiring to be performed by hand.

**Composing-Rule**, a printer's adjusting measure.

**Composing-Stick**, an iron, brass, or wooden frame, held in the hand by a compositor or type-setter, in which he arranges the letters and words into lines for book or newspaper work.

**Composition**, the union of several substances or parts.—A musical production.—In printing, the art of setting up type.—The commercial name for an arrangement or legal compromise with creditors, made by a debtor who is unable to pay his liabilities in full, a portion of the debt being taken in lieu of the full demand; in French, this is called *concordat*. See INSOLVENCY.

**Composition Candles**, stearine or other hard candles which do not waste or burn too freely.

**Composition Cloth**, a material made from long flax, and dressed with a solution which renders it waterproof. It is used for trunk-covers, etc.

**Compositor**, a type-setter engaged in picking up, arranging, and distributing letters or type in a printing-office.

**Compost**, a manure in which the dung of animals, or other organic matter, is mixed largely with earth, mould, lime, and other inorganic matter.

**Compote** [Fr.], fruits prepared in syrup.

**Compound**, a mass or body composed or formed of two or more elements, ingredients, or different substances; as, a chemical *compound*.

**Compounder**, a distiller or rectifier; a preparer of sweetened cordials.

**Compounding**, mixing.—A composition or arrangement made with creditors. See COMPOSITION.

**Compound Interest**. See INTEREST.

**Compound Steam-Engine**. See STEAM-ENGINE.

**Compress**, to condense or squeeze into a small compass.—A linen pad.

**Compressed Air-Engine**, a machine driven by the elastic force of compressed air. Its construction is usually like that of a steam-engine, the force of the expanding air being exerted against a piston in a cylinder.

**Compressed Yeast**, the trade name of a kind of yeast made expressly for baking purposes from selected grain and the purest spring water, and then pressed to free it from all watery substances. This valuable preparation was introduced and first manufactured in this country a few years ago by Messrs. Gaff, Fleischmann, & Co., but it has been known and used in Europe for the last century, and to it the well-known excellence of the white Vienna bread is in great part attributed. It is well known that the preparation of bread is essentially based upon the fact that, by the act of fermentation, which is caused by the yeast, the gluten of the flour forms a cellular tissue by which the escape of the carbonic acid is arrested, thus rendering the bread porous and spongy, and increasing its digestibility; but the fungoid character of yeast, and its action in inducing fermentation, are not generally well understood. Yeast and other ferments differ from the other lower organisms only in possessing the faculty of living and multiplying regularly and continuously without contact with the atmosphere. Instead of requiring free oxygen to burn the materials which serve for their nutrition, they obtain the necessary vital heat by living upon oxygenated bodies like sugar, which evolve caloric in their decomposition. This property appears to explain the mystery of fermentation, which, according to the French chemists, Pasteur and Dumas, is the chemical decomposition of sugar by the vital force of yeast cells. In its first stage of growth, the yeast plant consists entirely of sporules, which vary in size and form, but generally contain one or two nuclei, the germs of future sporules. After the lapse of some days, and under favorable circumstances, the sporules become much elongated, and form roots from which vertical threads spring up. These, when the plant has reached its complete development, become branched, each branch bearing at its extremity a row of rounded and bearded corpuscles which are about the size of the sporules, but differ from the latter in their darker and firmer texture. The yeast plant is remarkably delicate; if not kept free from any deleterious substances or impurities, its sporules die or lose the vigor necessary to good fermentation. This delicacy renders it most important that the yeast used should be as fresh as possible; for if it is kept any length of time it loses its essential properties for making light and sweet bread. Compressed yeast, however, can be kept by dissolving it in pure water, placing it in a glass

bottle, and lowering it by a string into a well. When required for use, the water should be poured off, and the yeast will be found to have settled at the bottom. When enough has been taken from the bottle, fresh water should be added and the process repeated. In this manner it is said it will keep for a long time, or as long as the temperature is kept under 56° F.

**Compromise**, an adjustment of differences between parties by individual or mutual concession; an arrangement with creditors.

**Comptant**, the French term for ready money, cash, specie.

**Comptoir** [Fr.], a counting-house, a store-counter or general factory.

**Comquat**, a curious small nutmeg-shaped orange, the *Citrus olivoformis* of China, occasionally imported into this country preserved.

**Concentrated Milk**. See MILK.

**Concern**, persons connected in business, or their affairs in general; as, a solvent *concern*.

**Concertina**, a small hexagonal musical instrument, the bellows of which are usually of an octagonal shape, and the reeds and keys are contained in both boards, so as to be played on by pressing the fingers of each hand. See MELODEON.

**Concession**, the act of conceding, granting, or yielding. — The thing yielded; a grant. — In France, a right or privilege granted by government to some company engaged in the formation or construction of a public work.

**Concessionnaire** [Fr.], the grantee to whom a privilege or concession has been made.

**Conchologist**, one versed in the natural history of shells and their inhabitants; a dealer in ornamental shells.

**Conch-Shell**, a common name in the West Indies for the helmet or casket shells, which are there used (a mouth-hole having been made at the spiral end) to blow as trumpets, to call in the laborers from work. Hence, the term "shell-blow" there implies a period for refreshment, or a withdrawal from labor. See CHANKS.

**Conchum**, a dry measure in Mysore of 8 lbs.

**Concordat** [Fr.]. See COMPOSITION.

**Concrete**, an artificial cement formed of lime, sand, pebbles, or other materials, frequently used for the foundations of buildings. See BOSTON.

**Condenser**, any apparatus used for cooling heated vapors and reducing them to a liquid form. In ordinary distillation, the worm-tub (D, Fig. 98) is the condenser most generally adopted. It consists of a spiral tube, which passes through a tub constantly filled with cold water. The vapor enters the tube at the top, and being condensed in its passage, runs out as liquid at the bottom. The C. of a steam-engine is that part attached to the cylinder where the steam is condensed. The *pneumatic C.* is a syringe worked on the same principle as the force-pump, by which a large quantity of air can be forced into a given space. See DISTILLING, STEAM-ENGINE.

**Conder**, a person at the herring fishery, who, from an elevated position, by signal, directs the course of the boats, so that they may enclose the schools of fish in their nets.

**Condiment**, seasoning or flavoring substances for food, as mustard, pepper, vinegar, sugar, salt, etc.

**Condit** [Fr.], sweetmeats, preserves, pickles.

**Conditioning Silk**, a trade term for the assaying of silk in order to test the proportions of moisture it contains.

**Conditions of Sale**, certain stipulations and agreements which are usually stated on catalogues of property to be disposed of by auction, and which are frequently read out previous to the sale, and considered binding on the bidders, purchaser, and vendor.

**Conditor** [Ger.], a confectioner.

**Condongo**, a long kind of Spanish raw silk of low quality.

**Condorin**, a Japanese and Chinese coin, the tenth part of a mass, and worth about ¼d.

**Conducta**, a convoy or caravan of mules or horses in Mexico, etc., conveying money or the precious metals from one place to another inland, or to a seaport for shipment.

**Conductor**, one who has charge of a public travelling carriage, as a car, or train of cars, on a railroad. — A metallic rod affixed to any great elevation, to carry off the lightning fluid without doing damage to the ship or building; any substance which attracts electricity, and transmits it.

**Conduit, Conduct**, a pipe or channel for conveying water; the term was formerly applied to stone buildings erected in some central place over a fountain to supply water to the inhabitants.

**Cones**, the seeds of pine-trees. — Beautiful and very valuable species of shells (Fig. 97), some being exceedingly scarce.

**Conessi Bark**, the bark of *Wrightia antidysenterica*, which is astringent and bitter, and also deemed febrifuge, in India.

**Coney Skins**, the commercial name for the dressed skins of rabbits. They are often dyed in imitation of more costly furs. C. plates are parts of C. skins sewed together and used for linings and for manufacture of children's cloaks. Imp. duty, 35 per cent.

**Confect**, a comfit.

**Confection**, a sweetmeat, a preserve; also a medicinal conserve or hard electuary, of which there are many kinds, as opiate confection, aromatic confection, confection of senna, etc. Saccha-

Fig. 97. CONE SHELL.

Fig. 98. — STILL-CONDENSER.

rine matter enters into the composition in different proportions for various objects.

**Confectioner**, a maker of sweetmeats or confections.

**Confectionery** may be regarded as the art of imparting color, form, and fragrance to sweet substances. The forms which the confections take

are *lozenges*, *drops*, *candies*, *syrups*, *rocks*, *balls*, *but-tons*, *comfits*, *cakes*, *sticks*, *jupubes*, *pastils*, *bonnons*, *jel-lies*, *jams*, *preserves*, *ices*, *essences*, *liqueurs*, *ratafias*, etc. The substances employed are *sugar*, *treacle*, *honey*, *fruits*, *seeds*, *flowers*, *spices*, together with coloring and fragrant substances in large variety. As a general rule, the confections require only very simple apparatus in making them; but there are two varieties worthy of a few words of separate notice. *Caraway comfits*, or *sugar-plums*, each contain a caraway or some other small seed. The seeds are thrown into a copper pan with a mixture of syrup and starch; heat is applied underneath, and the pan is rolled about in such a way that every seed takes up its own coating of mixture to such a thickness as may be determined. Sometimes the motion of the pan is brought about by machinery. Only comfits of one color can be made at a time. *Lozenges* are made of sugar flavored with peppermint or other essences, and colored according to taste. The mixture is worked up like a dough, rolled out flat and thin, and stamped into separate lozenges by cutters of various shapes.

**Confettatore**, an Italian confectioner.

**Confetti**, preserves, sweetmeats, comfits, in Italy.

**Confit**, [Fr.], dogs' excrements prepared for dressing leather; in English termed puer.

**Confiture**, the French term for preserves.

**Confortino**, the Italian name for gingerbread.

**Congie**, an Indian name for boiled rice.

**Congius**, the pharmaceutical name for a gallon.

**Congou**, black tea, a superior kind of Bohea, larger leaf and less dusty, and that which is most extensively imported from China, the consumption exceeding 50 million pounds per annum.

**Congreve Lights**. See MATCHES.

**Congreve Rocket**. See ROCKET.

**Conicopoly**, the name for an accountant or clerk in some of the Indian provinces.

**Connaissance**, the French name for bill of lading.

**Connecticut**, a State of New England, one of the smallest of the U. States; but one of the most important for the variety and value of its manufactured products. It lies between lat. 40° 58' and 42° 21' N., lon. 71° 53' and 73° 50' W.; being bounded N. by Massachusetts, E. by Rhode Island, S. by Long Island Sound, and W. by New York. Its length E. to W. is 90 m.; and its average breadth about 52 m. Area 4,730 sq. m. The surface of C. is much diversified, but there is no land above 1,000 feet in elevation. The three principal rivers are the Connecticut, the Housatonic, and the Thames. The Connecticut is the

Fig. 99.—SEAL OF CONNECTICUT.

largest river in New England. It rises on the N. border of New Hampshire, 1600 feet above the sea, and falls into the Sound at Saybrook, after a course of about 400 m. It is navigable to Middletown (30 m.) for vessels drawing 10 feet, and to Hartford (50 m.) for those drawing 8 feet. The E. part of the State is drained by the Thames, which is navigable to Norwich for the Sound steamers and West India trading-vessels. In the W. part of the State is the Housatonic, navigable for small vessels to Derby, where the Naugatuck

joins it. C. is very rich in mineral resources; it has 20 extensive quarries and mines opened when the last census was taken. Copper is found in the Simsbury mines at Granby and at Bristol; but these mines have lost their former importance since the working of the abundant and purer ores of Lake Superior. Iron ore is very abundant in Salisbury, Kent, Sharon, Cornwall, and Canaan. Limestone and marble of the very best quality are found at Canaan, Washington, and Milford. At Portland and Cromwell, on both sides of Connecticut River, are the well-known immense quarries of freestone largely in demand for building. The excellent slate flagging from Bolton and Haddam is abundant in supply, and in great demand. Granite, gneiss, hydraulic lime, tiling slates, clay (fire, potters', and caolin), and sulphates of baryte are found in great quantities. C. has over 100 m. of deeply indented coast, affording excellent harbors. The chief of these are Stonington, New London, Saybrook, New Haven, Bridgeport, and Fairfield. The harbor at New London is one of the best in the country, capacious, and never frozen over. The climate of the State, while very changeable, is very healthful; the mean temperature for the year is 48° F. The vegetation is rich and varied. The forests have been recklessly cut away and only patches of woodland remain; but the people are waking up to the importance of tree-planting. Chestnut is the most abundant tree. There is very little soil that can be called good, except in the river valleys, and agriculture is as backward as in other parts of New England. The hills through the State furnish excellent pasturage and cheap fuel. The chief cultivated fruits are apples, pears, grapes, and the numerous kinds of berries. The principal crops are hay, oats, rye, corn, potatoes, and tobacco; and in the Connecticut River valley, farming is very productive. The tobacco raised in the valley is said to be superior to any other. In the uplands dairy products and cattle raising are the chief resources of the farmer. There were in 1879, 25,508 farms, having 1,046,762 acres of improved land, and 717,664 acres unimproved, of which 577,333 were woodland. The value of these farms was \$124,241,382. There were in the State 51,100 horses, 110,900 milk-cows, 114,100 oxen and other cattle, 92,500 sheep, and 57,900 hogs. Notwithstanding the extensive sea-coast and fine harbors, the foreign commerce is not heavy,—the coast-trade and fisheries being more important. There are in the State five custom districts of which the ports of entry are Fairfield, Middletown, New Haven, New London, and Stonington. The imports from foreign countries and domestic exports for the year 1878, were as follows:—

Ports.	Imports.	Exports.
Fairfield .....	\$6,191	\$1,890
Middletown .....	58,654	none.
New Haven .....	1,053,141	3,560,741
New London .....	261,264	71,787
Stonington .....	631	none.
Total .....	\$1,379,881	\$3,634,418

The chief articles of export were fire-arms, carriages, shot, machinery, grain, lard, and pork. In 1879 the vessels enrolled, registered and licensed in the several ports of C. numbered 840, of which 769 were sailing vessels, with a tonnage of 52,872, and 91 were steam vessels, with a tonnage of 27,028. The fisheries are carried on from New London and Stonington. In 1879 there were 201 vessels engaged in the cod and mackerel fisheries, with a tonnage of 4,665; and in the whale fishery (all belonging to New London) 11 vessels with a

tonnage of 1,552. Engaged in coastwise trade and fisheries, there entered 2,562 vessels and cleared 1,981. In foreign trade there entered 63 and cleared 31. Ship-building is a considerable industry. In 1878 44 vessels were built of 3,263 tons. Pop. in 1870, 537,454. Actual pop. about 600,000. See HARTFORD and NEW HAVEN.

C. owes its importance chiefly to its manufactures. It ranks first among the States in the production of clocks, India-rubber goods, and hardware, in eighth in the total value of all manufactured products. When the last census was taken, the chief industries of C. were as follows:—

	Establishments.	Steam-engines. Horse-power.	Water-wheels. Horse-power.	Mills.	Capital.	Annual Product.
Cotton goods of all sorts	111	800	10,840	12,086	12,710,700	14,095,534
Woolen goods	103	2,254	6,110	7,285	12,491,400	17,955,348
Hardware	145	2,940	1,771	7,446	9,855,235	12,111,404
Iron work all sorts	121	7,721	1,483	3,446	5,216,620	7,552,755
Machinery all sorts	198	1,434	728	2,570	4,244,541	5,019,729
Paper (all sorts)	65	567	5,047	1,467	2,888,946	4,874,291
Sewing-machines						
and fixtures	9	815	35	2,325	2,192,000	3,919,000
Printed ware	32	653	490	2,106	2,337,549	4,066,805
Carriages and wagons	205	185	401	2,341	2,242,810	4,164,469
India-rubber and elastic goods	13	1,183	981	1,916	2,345,000	4,239,729
Silk goods	21	401	340	1,703	1,111,120	3,314,845
Fire-arms	8	651	224	1,467	1,791,770	2,222,673
Cutlery and edge tools	41	374	1,046	1,788	1,705,520	2,069,805
Hats and caps	33	534	56	2,664	1,154,200	3,749,671
Clocks; also materials and cases	28	441	430	1,171	1,003,620	7,133
Boots and shoes	281	19	30	2,417	580,800	9,546
Bleaching and dyeing	18	13	238	188	150,100	9,743
Total (the above and all others)	5,128	25,379	54,795	80,521	18,281,278	161,065,474

**Railroads and Steamboat lines.** In 1878, C. had 1 mile of railway to 5.16 square miles of territory, and to 553 inhabitants. (Massachusetts had 1 mile to 4.29 square miles and 909 inhabitants.) There were 24 railroad companies, with 1195 m. of single track. The cost of these was \$79,023,557; receipts for the year, \$10,806,494 (54 per cent from passengers); net earnings, \$2,813,004, being 4 per cent on the cost of the roads. The capital stock of all the companies was \$43,439,133 (paid in), and debt, \$18,011,570. The amount paid in dividends (only seven companies make any) was 4.3 per cent on the entire capital of all the roads, but 9.33 on the capital of the dividend-paying ones. There is an elaborate system of State inspection of the roads and their accounts. There is a State tax of one per cent on the market value of stock and bonds after deducting cash on hand. The principal lines are those running N. and S., connecting the shore with the valleys of the interior, and forming highways between the important cities of New England and New York City. Connected with these are important steamboat lines (passenger and freight) from Stonington, New London, and New Haven to New York.

**Banks.** The banking interest of the State is commensurate with its large business, and shows a steadily increasing prosperity. At January 1, 1879, there were 79 national banks in the State, with a capital of \$25,687,520; 4 State banks, with a capital of \$1,450,000, and assets \$3,917,953; 19 trust companies, with a capital of \$2,725,000, and assets \$6,183,913. The savings banks numbered 86 with a deposit of \$72,515,468. The average income during 1875 was 6.54 per cent, nearly all of which is paid to depositors, there being no capital stock. The management is very strictly controlled by law, and about three-quarters of the assets are lent on real estate in the State.

**Fire and Marine Insurance.** The whole number of fire and marine insurance companies doing business in the State in 1875 was 103, of which 31 were C. companies (11 stock and 20 mutual). The assets of these last were \$17,554,915, of which over 16 millions were held by 19 companies (mostly in Hartford). The premiums received by C. companies from their entire business were \$6,623,178, and corresponding losses, \$3,434,171.

**Life Insurance.** The life and accident companies doing business numbered 21, of which 9 were C. companies; the assets of the last were \$102,264,114. There were 2,169 life policies issued in Connecticut in 1878, insuring \$2,592,150. The life premium paid amounted to \$1,315,229. The policies in force in the State numbered 21,762 insuring \$85,821,577.

**Connecticut, a fire insurance Co. of Hartford, Conn., organized in 1850. Statement on Jan. 1, 1879:** Capital stock paid up in cash, \$1,000,000;

net surplus, \$180,943; total cap. and surplus, \$1,180,943. Risks in force, \$37,042,514; premiums, \$426,348. Premiums received since the reorganization of the Co. \$2,348,308; losses paid, \$1,103,921; cash dividends paid to stockholders, \$415. Cash dividends paid in 1878, \$100,000.

**Connecticut Central R. R. Co.,** chartered in 1871. Main line (opened 1876) from East Hartford, Conn., to Springfield, Mass., and Melrose branch, 31.45 m. Offices in Hartford. *Financial statement:* Cap. stock, \$437,000; bonds of 1st mortgage, due in 1895, interest 7% (April 1), \$312,500. Net earnings for 1878, \$14,189.

**Connecticut General,** a life insurance Co. of Hartford, Conn., organized in 1865. *Statement on Jan. 1, 1879:* Cap. stock paid up, \$250,000; net assets, \$1,323,311. Policies issued in 1878, 494, amounting to \$613,503; premiums received, \$194,380; paid for losses and matured endowments, \$124,637. Policies remaining in force, 3,382, amounting to \$5,453,000.

**Connecticut Leaf,** the trade name for a kind of tobacco first cultivated in the State of Connecticut, and much used for cigar-wrappers.

**Connecticut Mutual,** a life insurance Co. of Hartford, Conn., organized in 1846. *Statement on Jan. 1, 1879:* Net or ledger assets, \$46,225,182. Premiums received in 1878, \$6,249,133; paid for losses and matured endowments, \$3,407,533; new policies issued, 4,377, amounting to \$8,914,400; total policies remaining in force, 61,979, amounting to \$170,319,164. Real estate owned by the Co. in several cities, \$7,515,066.

**Connecticut Valley R. R.,** from Hartford to Fenwick, Conn., 46.20 m. This Co. was chartered in 1868. Offices at Hartford. This road was opened by the Trustees of the 2d mortgage bondholders till Jan. 9, 1878, when it was surrendered to the Trustees of the 1st mortgage bondholders. *Financial Statement:* Cap. stock, \$1,060,000; 1st mortgage bonds, \$1,000,000; 2d mortgage bonds, \$1,250,000. Cost of construction and equipments, \$3,064,388. Net earnings for 1878, \$22,597.

**Connecticut Western R. R.,** from Hartford to Millerton, Conn., 69 m. This Co., chartered in 1868, is located at Hartford. *Financial Statement:* Cap. stock, \$1,892,000; 1st mortgage bonds, due 1900, interest 7% (was paid to Jan. 1, 1876 only). Net earnings for 1878, \$52,684.

**Connecting-Rod,** the rod which connects the piston-rod or cross-head of a locomotive engine with the crank of the driving-wheel axle.—Also the coupling-rod by which driving-wheels on the same side of a locomotive are connected.

**Conossement** [Ger.], a bill of lading.

**Conquin,** the fruit of a species of *Diospyros*; a jam is made of it in Natal.

**Conservatoire,** a public school of music in France.

**Conservatory,** a large glazed greenhouse for exotics.

**Conserve** [Fr.], a preserve; in pharmacy, a confection or electuary, a sweetened pulp containing the virtues of flowers, herbs, or fruits.

**Consideration,** a bonus or sum given on account or for any thing; the motive or material cause of a bargain or contract, expressed or implied.

**Consign,** to send goods to an agent or correspondent for sale.

**Consignature,** a joint signature.

**Consignment** is an expression employed to designate any transaction by which an individual in one place transmits or consigns goods to an individual in another place, to be at his disposal

under conditions expressed or implied. The person who transmits the goods is called the *consigner*, — he who receives them the *consignee*. Consigner and consignee are used by merchants to express generally the shipper of merchandise, and the person to whom they are addressed, by bill of lading or otherwise. The most ordinary description of *C.* is that to a commission merchant, who has to traffic with the goods for the use of his principal, and who may deal with third parties not warned of limitations to his power, as if he were the principal. Cargoes are sometimes consigned from debtors to creditors in satisfaction of debt, and sometimes as a fund of credit for advances, the consigner being entitled to draw on the consignee to a certain amount, or the latter advancing cash to the former. On failure of the consigner, the consignee has a lien on the goods in his hand for his advances.

**Console**, an elbow truss or projecting shoulder-piece; a bracket or support mostly fixed between two windows in a building; a small fancy side-table for a sitting-room with bracket-shaped projecting legs.

**Consols** [an abbreviation of *Consolidated annuities*], a familiar term used to denote the portion of the national debt of Great Britain forming the three per cent consolidated annuities. In the progress of the English national debt it was deemed expedient, on grounds which have been much questioned, instead of borrowing at various rates of interest, according to the state of the market or the need and credit of the government, to offer a fixed rate of interest, usually three or three and a half per cent, and, as the market required, to give the lenders an advantage in the principal funded. Thus subscribers of £100 would sometimes receive £150 of three per cent stock. In 1815, at the close of the French wars, a large loan was raised at as much as £174 three per cent and £10 four per cent stock for £100. The low rate of interest was thus purely nominal, while the principal of the debt was increased beyond all due proportion. This practice began in the reign of George II., when some portions of the debt on which the interest had been successfully reduced were consolidated into three per cent annuities, and consols, as the annuities were called, and other stocks of nominally low interest, rapidly increased under the same practice during the great wars. In times of peace, when the rate of money has enabled portions of the debt at a higher interest to be commuted into stock of lower interest, it has usually been into *C.* that the conversion has been effected. Temporary deficits of the revenue have been covered by an issue of *C.*; exchequer bills when funded have taken the same form, though not constantly or exclusively; and some loans of the Government in recent times for special purposes, such as the relief of the Irish famine and the expenditure in the Crimean war, have been wholly or partly raised in *C.* The consequence has been to give this stock a pre-eminence in the amount of the funded debt. It appears from a recent parliamentary return that of £773,313,229 (\$3,866,566,145) of funded debt of Great Britain, £398,147,075 (\$1,990,735,375) consisted of *C.*, £107,227,854 (\$536,139,270) of three per cent reduced annuities, and £225,256,099 (\$1,126,280,495) of new threes. The funds of the savings' banks have been applied to the absorption of reduced annuities and new threes in larger proportion than of *C.* The characteristics of this large portion of the debt, though it would seem almost indistinguishable from the three per cent reduced, which originated about

the same period as the consolidated threes, are that the interest has never varied; no attempt has been made to convert it to a lower interest or into another form of stock; and not only from its larger amount than other stock is it most convenient to dealers, but from the great number and variety of its holders it is believed to express with the greatest nicety the state of monetary affairs. The price of *C.*, however, does not in ordinary times vary much. It has a tendency, indeed, to rise when all other securities are most shaken. In periods of panic and extreme pressure for money it has gone down for a few days between 80 and 90; its most customary range may be said to be 95 to 97; and it has occasionally touched par.

**Consols-Market**, the London Stock Exchange, where sales of public securities are transacted.

**Consort**, a partner. — A ship sailing with another.

**Constantia**. See CAPE WINES.

**Constantinople**. See TURKEY.

**Constant White**, a white coloring substance, — carbonate and sulphate of barytes.

**Constructor**, a builder.

**Consul**, an officer appointed by a government to reside in some foreign country for the purpose of facilitating and protecting the commerce of the citizens of such government. *C.* are not in general reckoned among diplomatic ministers; but in some particular cases (such as that of the *C.* sent to some of the semi-barbarous states of Africa), having diplomatic duties to perform, they are accredited and treated as ministers. France is distinguished among nations for an organization of trained *C.* who have intimate relations with the diplomatic corps. The establishment of *C.* is one of the most useful of modern commercial institutions. They were appointed about the twelfth century in the opulent states of Italy, such as Pisa, Lucca, Genoa, and Venice, and their origin has been ascribed to the necessity for extraordinary assistance in those branches of commerce formerly carried on with barbarous and uncivilized nations. The utility of such a mercantile officer has been perceived and felt by all trading nations. *C.* have been multiplied and sent to every part of the world where navigation and commerce can successfully penetrate; and their duties and privileges are now generally limited and defined by treaties of commerce, or by the statute regulations of the country which they represent. The right of sending *C.* to reside in foreign countries depends either upon a tacit or express convention. Hence their powers differ very widely in different states. In some they exercise a very extensive jurisdiction over the citizens of the state which appoints them; but the extent of this jurisdiction is not discretionary, and must, in all cases, be regulated either by an express convention between the state appointing and the state receiving the *C.*, or by custom. *C.* established in the U. States have no judicial power; and our government has rarely stipulated with other powers for much judicial authority for its *C.* The duties of a *C.*, even in the confined sense in which they are commonly understood, are important and multifarious. It is his business to be always on the spot, to watch over the commercial interests of the citizens of the state whose servant he is; to be ready to assist them with advice on all doubtful occasions; to see that the conditions in commercial treaties are properly observed; that those he is appointed to protect are subjected to no unnecessary or unjustifiable demands in conducting their business;

to represent their grievances to the authorities at the place where they reside; in a word, to exert himself to render the condition of the citizens of the country employing him, within the limits of his consulship, as comfortable, and their transactions as advantageous and secure, as possible. The laws of the U. States, on the subject of *C.* and vice-*C.*, especially authorize them to receive the protests of masters and others in relation to American commerce, and they declare that consular certificates under seal shall receive credit in the courts of the U. States. It is likewise made their duty, where the laws of the country permit, to administer the personal estates of American citizens dying within their consulates, and leaving no legal representative; and to take charge of and secure the effects of stranded American vessels in the absence of the master, owner, or consignee; and they are bound to provide for destitute seamen within their consulates, and to send them at the public expense to the U. States. It is made the duty of American *C.* and commercial agents to reclaim deserters and to discountenance insubordination, and to lend their aid to the local authorities for that purpose, and to discharge the seamen cruelly treated. It is also made the duty of masters of American vessels on arrival at a foreign port, to deposit their registers, sea-letters, and passports, with the *C.*, vice-*C.*, or commercial agent, if any, at the port. These particular powers and duties are in accordance with the usages of nations, and are not to be construed to the exclusion of others, resulting from the nature of the consular appointment. The doctrine of our courts is, that a foreign *C.*, duly recognized by our government, may assert and defend, as a competent party, the rights of property of the individuals of his nation in the courts of the U. States, and may institute suits for that purpose without any special authority from that party for whose benefit he acts. No nation is bound to receive a foreign *C.* unless it has agreed to do so by treaty, and the refusal is no violation of the peace and amity between the nations. *C.* are to be approved and admitted in the usual form; and if any *C.* be guilty of illegal or improper conduct, he is liable to have his *exequatur* (a written recognition of his character) revoked, and to be punished according to the laws of the country in which he is *C.*; or he may be sent back to his own country, at the discretion of the government which he has offended. Though the functions of a *C.* would seem to require that he should not be a subject of the state in which he resides, yet the practice of the maritime powers is quite lax on this point; and it is sometimes found useful, and thought most convenient, to appoint subjects of the foreign country to be *C.* at its ports. *C.* are entitled to privileges to a certain extent, such as for safe-conduct, but they do not enjoy the protection of the law of nations any more than other persons who enter the country under a safe-conduct. In civil and criminal cases they are equally subject to the laws of the country in which they reside. Consular privileges are much more extensive in Mohammedan countries, where they cannot be imprisoned for any cause whatever, except by demanding justice against them of the Porte, and they partake very considerably of the character of resident ministers. They are diplomatic agents under the name of *C.*, and enjoy the rights and privileges which the Ottoman Porte recognizes in relation to the foreign ministers resident at Constantinople. Considering the importance of the consular functions, and the activity which is required of them in all great maritime

ports, and the approach which consuls make to the efficacy and dignity of diplomatic characters, it was a wise provision in the Constitution of the U. States, which gave to the Supreme Court original jurisdiction in all cases affecting *C.* as well as ambassadors and other public ministers; and the federal jurisdiction is understood to be exclusive of the state courts. — American *C.* are nominated by the President to the Senate, and by the Senate confirmed or rejected. Their powers and duties are described in the Regulation of Oct. 1, 1870, which permits them to transact business, or prohibits them from doing so, in certain places; fixes the rate of tariff of fees for consular services; forbids consular officers to be absent from their posts, or to hold correspondence in regard to the public affairs of any foreign government with the press, or private persons, or otherwise than with the proper officers of the U. States; forbids consular officers being pecuniarily interested in the receipt or disbursement of the wages of seamen, or in expenditures made for their relief or transportation; provides that no compensation shall be paid to consular officers, unless they shall be citizens of the United States; requires all consular officers to send annually to the Secretary of State a return of the trade at the ports within their consulate, etc.

By the law of the U. States the consular officers are classified under the names of *consuls-general*, *consuls*, *vice-consuls*, *deputy-consuls*, *commercial agents*, *vice-commercial agents*, and *consular agents*. It is provided, that these official designations shall be deemed to have the respective meanings therein assigned to them, namely: *C.-general*, *C.*, and commercial agent, shall be taken to denote full, principal, and permanent consular officers, as distinguished from subordinates and substitutes; deputy-*C.* and consular agent to denote consular officers subordinate to such principals, exercising the powers and performing the duties within the limits of their consulates or commercial agencies respectively, — the former at the same ports or places, and the latter at ports or places different from those at which such principals are located respectively; and vice-*C.* and vice-commercial agents to denote consular officers who shall be substituted, temporarily, to fill the places of *C.-general*, *C.*, or commercial agents, when they shall be temporarily absent or relieved from duty; and the term *consular officer* to include all such officers as are mentioned above, and none others.

The statutes of the U. States classify the Consulates-General, Consulates, and Commercial Agencies into three classes: — 1. Those embraced in a schedule known as Schedule B, the incumbents of which receive a fixed salary, and are not allowed to transact business. 2. Those embraced in a schedule known as Schedule C, the incumbents of which receive a fixed salary, and are allowed to transact business. 3. All other Consulates, the incumbents of which are compensated by the fees collected in their offices, and are allowed to transact business. Under the Act of June 11, 1874, the Consulates in Schedules B and C are subdivided into seven classes, according to salary, Schedule C embracing all of Class 7. The classification is indicated by the number annexed to each Consulate.

## SCHEDULE B. (CLASS 1.)

CONSULATES-GENERAL.		
Berlin.	Montreal.	5. Amoor River.
Cairo.	Paris.	2. Amoy.
Calcutta.	Rio Janeiro.	6. Amsterdam.
Constantinople.	Rome.	4. Antwerp.
Frankfort-on-the-Main.	Shanghai.	3. Apinwall.
Havana.	St. Petersburg.	6. Auckland.
Kanagawa.	Tampico.	3. Bahia.
London.	Vienna.	2. Bangkok.
Melbourne.		6. Barbadoes.
Mexico.	CONSULATES.	6. Barcelona.
	5. Acapulco.	5. Barmen.
	5. Aix-la-Chapelle.	5. Basle.
	6. Algiers.	5. Beirut.

CONSULATES. — *Continued.*

4. Belfast.	6. Jerusalem. [ca]	5. Prague.
6. Bermuda.	5. Kingston, Jam.	6. Prescott.
6. Birmingham.	6. Kingston, Canada.	6. Quebec.
6. Bordeaux.	6. La Rochelle.	5. Rotterdam.
3. Bradford.	6. Laguayra.	6. San Domingo.
4. Bremen.	5. Leeds.	5. San Juan, Porto
6. Bristol.	6. Leghorn.	[Rico.]
4. Brussels.	5. Leipsic.	4. Santiago de Cuba.
3. Buenos Ayres.	5. Leith.	6. Santa Cruz, West
6. Cadiz.	6. Liege.	[Indies.]
2. Callao.	5. Lisbon.	6. Seychelles.
2. Canton.	*Liverpool.	4. Sheffield.
6. Cape Town.	4. Lyons.	4. Singapore.

Victoria.	Medellin.	Sydney.
Warsaw.	Mier.	Tetuan.
	Nuevo Laredo.	

**Consumption**, a using up; the quantity consumed, or to be consumed, as when goods are withdrawn from a bonded warehouse for consumption.

**Contango**, a stock exchange term, signifying a sum of money paid for accommodating either a buyer or seller by carrying the engagement to pay money or deliver shares over to the next account-day.

**Contents**, what is contained in bales, casks, or packages of merchandise.

**Contest**, to dispute or litigate.

**Continental**, a fire insurance Co. of New York City, organized in 1853. Statement on Jan. 1, 1879: Capital stock paid up in cash, \$1,000,000; net surplus, \$1,038,422; total cap. and surplus, \$2,038,422. Risks in force, \$255,360,875; premiums, \$2,020,110. Premiums received since the organization of the Co., \$19,004,567; losses paid, \$10,118,110; cash dividends paid to stockholders, \$3,014,497. Cash dividends paid in 1878, \$134,176.

**Continental**, a life insurance Co. of Hartford, Conn., organized in 1864. Statement on Jan. 1, 1879: Capital stock paid up in cash, \$300,000; net assets, \$2,681,373. Policies issued in 1878, 559, amounting to \$315,737; premiums received, \$429,966; paid for losses, matured endowments, and surrendered policies, \$324,996. Policies remaining in force, 8,798, amounting to \$9,284,720.

**Contingent**, a share or portion arising from an adventure or partnership in trade; the quota which each is to furnish or receive.

**Continuation**, a connection; the carrying over of stock, etc., by a stock broker or dealer.

**Conto**, a Portuguese word for million; a conto of reis (1000 milreis) is usually expressed thus, 1000 \$000; and is worth about \$562.50.

**Contra** [Lat.], on the other side. *Per contra* in commercial phraseology means a credit or writing-off on the opposite page.

**Contraband**, from the Italian *contrabando*, contrary to proclamation, is applied in one sense to the goods which are prohibited to be exported or imported, on the ground of theories regarding national policy, or protection of home produce. When goods or effects are smuggled in, or put on the market without payment of the customs or excise duty to which they are subject, they are *C.*, and are, on seizure, liable to be forfeited. *C. of war* is applied by belligerent powers to the furnishing of arms, provisions, and other assistance to powers with which they are at war, by neutral states, or their own subjects. See NEUTRALITY.

**Contract**, a covenant or agreement between parties for a lawful consideration as in the case of a sale, the acceptance of a tender for the supply of goods or work to be executed, letting, etc. See AGREEMENT, CHARTER PARTY, etc.

**Contractor**, one who contracts; one of the

parties to a covenant or bargain; an undertaker of work upon contract.

**Contrate-Wheel.** See FACE-WHEEL.

**Contrayerva,** a South American plant, the *Dorstenia contrayerva*; the rhizoma are stimulant, sudorific, and tonic, also emetic. It has a Spanish reputation for being an antidote to poisons.

**Contrebandier** [Fr.], a smuggler.

**Contrefaçon, Contrefaction,** the French term for pirating or counterfeiting.

**Contribution,** a joint payment of money to an undertaking; the individual proportion of a general average.

**Contributory,** one called upon to pay in his share to the common stock, as a call in the winding up of a company.

**Controle,** a French term applied to stamped silver or gold.

**Conversation-Tube,** a conducting elastic pipe for conveying sound or for delivering messages to distant parts of a building. At one end is a mouth-pipe about two inches in diameter, and at the other end an ear-piece. The neck, which is a yard or more in length, is made of spiral wire covered with india-rubber and overspun with mohair or silk.

**Convertible-Carriage,** a vehicle which can be used either open or closed.

**Converting-Furnace,** a furnace used for converting wrought-iron into steel; a cementing furnace. See CEMENTATION.

**Conveyance,** the transport of goods or passengers by land or sea.

**Conveyor,** a name for various mechanical contrivances for carrying objects; but more usually applied to adaptations of spirals or hand-buckets, which convey grain, flour, etc., in elevators, thrashers, and grinding-mills.

**Convoy,** a term applied, in the law of shipping, to a naval force appointed by the government for the protection of vessels flying between certain ports in time of war. Individuals have not always been left to themselves to judge as to the expediency of sailing with or without *C.* The governments of most maritime states have thought proper, when they were engaged in hostilities, to oblige their subjects to place themselves under an escort of this sort, that an enemy might not be enriched by their capture. It is very common, during periods of war, to make *sailing or departing with C.* a condition in policies of insurance. This, like other warranties in a policy, must be *strictly* performed. And if a ship warranted to sail with *C.* sail without it, the policy becomes void, whether this be imputable to any negligence on the part of the insured, or the refusal of government to appoint a *C.* There are five things essential to sailing with *C.*: viz. *first*, it must be with a regular *C.*, under an officer appointed by government; *secondly*, it must be from the place of rendezvous appointed by government; *thirdly*, it must be a *C.* for the voyage; *fourthly*, the master of the ship must have sailing instructions from the commanding officer of the *C.*; and *fifthly*, the ship must depart and continue with the *C.* till the end of the voyage unless separated by necessity.

**Cooking-Accounts,** a term applied to falsely represented accounts; statements prepared for deceptive purposes.

**Cooking-Range,** a cooking arrangement in which the devices—grate, oven, boiler, etc.—are placed in a row (range), and set in brickwork within the fireplace, so called. Portable ranges are not so built in, but are cooking-stoves. A

*Cooking-Stove*, usually built of iron, contains a fuel-chamber and ovens, with holes into which pots may be set to boil the contents. Stoves are comparatively uncommon in England, where the open fireplace for apartments and the range for kitchens are preferred—*E. H. Knight*.

**Cooking-Stove.** See COOKING-RANGE.

**Cool,** a tub cut in two, in which butter is sometimes sent to market by farmers.

**Cooler,** in the West Indies, a flat wooden receiver for cane juice after boiling to settle and granulate. A vessel used in breweries and distilleries to cool the wort in. The name is also frequently applied to an ice-chest. See REFRIGERATOR.

**Coolie,** an Asiatic laborer not belonging to the skilled or artisan class. Of late, however, the word is almost exclusively used to designate those natives of China, India, etc., who leave their native country under contracts of service to work as field-hands or laborers in foreign plantations and elsewhere. The organization, partly official and partly voluntary, by means of which these Eastern laborers are collected, engaged, and conveyed to their respective destinations, has, within recent times, developed itself into a regular trade. The first recognition of the traffic was in 1844, when the British colony of Guiana made provision for the encouragement of Chinese immigration. About the same time the Peruvian planters, who since their separation from the mother country had restricted slavery within the narrowest limits, also looked to China as being likely to furnish an efficient substitute for the negro bondsman. Agents armed with consular commissions from Peru began to appear in Chinese ports, where they collected and sent away ship-loads of *C.* Each one was bound to serve the Peruvian planter to whom he might be assigned for 7 or 8 years, at fixed wages, generally about \$4.25 a month,—food, clothes, and lodging being provided. Cuba, profiting by the example of Peru, also engaged in the traffic. From 1847 to 1856 the trade went on briskly without attracting much notice. Gradually, however, ugly reports as to the treatment the *C.* received, both on their voyage to and after their arrival in Peru and Cuba, began to attract general attention; and still more painful rumors were set afloat regarding the thievish devices used to induce Chinese emigrants to leave their native land. In March, 1860, the representatives of the governments of France, England, and China drew up a convention enacting that every *C.* must at the end of a five years' engagement have his return passage-money paid to him. The West Indian colonies at once objected to this. They wanted permanent, not temporary settlers. They could not afford to burden the *C.*'s expensive contract with return-money, so they declined to accept immigrants on these terms. Thus a legalized *C.* trade between the West Indies and China was extinguished. In the U. States the *C. trade*, so called, is forbidden under penalties of forfeiture and imprisonment by laws of Feb. 9, 1862, and March 3, 1875 (*Revised Statutes*, Sect. 2158–2161), and the Oriental immigration is regularized by the following section of the same laws:—

*Sect. 2162.* Nothing herein contained shall be deemed to apply to any voluntary emigration of the subjects of China, Japan, or of any other Oriental country, or to any vessel carrying such person as passenger on board the same, but a certificate shall be prepared and signed by the consul or consular agent of the U. States residing at the port from which such vessel may take her departure, containing the name of such person, and setting forth the fact of his voluntary emigration from such port, which certificate shall be given to the master of such vessel; and the same shall not be given until such consul or con-

sular agent is first personally satisfied by evidence of the truth of the facts therein contained.— *Sect. 2163.* The President is empowered, in such way and at such time as he may judge proper, to direct the vessels of the U. States, and the masters and commanders thereof, to examine all vessels navigated or owned in whole or in part by citizens of the U. States, whenever in the judgment of such master or commanding officer reasonable cause exists to believe that such vessel has on board any subject of China, Japan, or other Oriental country, known as "C. "; and upon sufficient proof that such vessel is employed in violation of the preceding provisions, to cause her to be carried, with her officers and crew, into any port or district within the U. States, and delivered to the marshal of such district, to be held and disposed of according to law.— *Sect. 2164.* No tax or charge shall be imposed or enforced by any State upon any person immigrating thereto from a foreign country, which is not equally imposed and enforced upon every person immigrating to such State from any other foreign country.

**Cooling Apparatus.** See REFRIGERATOR and FREEZING MACHINE.

**Coom,** a term for soot, smoke-black, coal-dust, and other similar refuse matters; also the mould which forms on certain liquids, the matter that works out of the reaves or boxes of carriage-wheels, etc.

**Coomb,** an English grain-measure containing 4 bushels.

**Coomie,** an extensive present in the shape of customs duty, demanded by the king and chiefs from supercargoes in the Bonny and other rivers of W. Africa for permission to trade with the natives.

**Coon,** an abbreviated name for the racoon.

**Coop,** a wooden pen for poultry on board ships.

**Cooper,** one who makes casks, barrels, &c., with staves bound by hoops (see COOPERING); name in London for a mixture of stout and porter.

**Cooperage,** money paid to a cooper for repairing casks, opening them for sampling, etc.

**Coopering,** the art of making vats, backs, tuns, casks, and barrels. Technically, a *wet* or *tight* cooper makes the vessels intended to hold liquids; the *dry* cooper makes the looser and cheaper work for holding dry goods; while the *white* cooper makes churns and other kinds of highly-finished work. Wet or tight work is made of oak; many other kinds of wood are employed for inferior cooperage. The *staves*, being curved both in length and in width, are the most difficult parts of a cask to produce. To insure accuracy of workmanship, *cask-making machinery* has been invented to fashion all the pieces with undeviating accuracy; but the handwork system is still the one most usually adopted. The largest and strongest examples of coopers' work are the enormous vats and backs used by brewers.

**Co-operation,** in its specific and technical sense, implies the association of any number of individuals or societies for mutual profit, whether in the purchase and distribution of commodities for consumption, or in the production of commodities, or in the borrowing and lending of capital among workmen. The most powerful co-operative force in the individual system is what economists have termed "the division of labor;" but that is really also a union and graduation of labor towards productive ends, and has its counterpart in the multimform divisions of capital in its application to maintenance and extension of industry. *C.*, as technically understood, occupies a middle position between the doctrines of the communists and socialists on the one hand, and the private property and freedom of individual labor and enterprise on the other. It takes its departure from communism at a very definite and significant point. While the latter would extinguish the motive of

individual gain and possession in the sentiment of a universal happiness or good, and remodel all the existing rights, laws, and arrangements of society on a basis deemed consonant to this end, *C.* seeks, in consistency with the fundamental institutes of society as hitherto developed, to ameliorate the social condition by a concurrence of increasing numbers of associates in a common interest. The co-operative societies, springing from this idea, though attended with the most varied fortune, have greatly increased in number and in amount of business in recent years in Europe. The form, particular objects, and organic rules of these associations are by no means uniform. But as we find them in the principal countries of Europe, they may be divided into three general classes:— 1. *Societies of Consumption*, the object of which is to buy and sell to members alone, or to members and non-members under differing conditions, the necessities of life or the raw materials of their industry; 2. *Societies of Production*, the object of which is to sell the collective or individual work of the members; 3. *Credit-unions*, or societies of credit or banking, the object of which is to open accounts of credit with their members, and advance them loans for industrial purposes. There are numerous modifications of the principle, such as friendly societies, burial societies, societies of workmen which undertake the execution of work by contract, arrangements of private firms by which the workmen share in the profits of the employers, and building societies, now rife in most large towns in this country, the object of which is to enable members to become owners of dwelling-houses. But the above three categories define the distinguishing characteristics of the co-operative society proper; and it is somewhat remarkable that the three kinds of association have attained marked success in three different European countries. England stands at the head in societies of consumption; France, in societies of production; Germany, in societies of credit. With reference to this variety of result, it may be observed that the social equality resulting from the great Revolution, in connection with the character of much of the manufacturing industry of France, has given that country a larger number of artisans who work in their own houses, and have a passion for independence in their handicraft, than is to be found in any other country. On the other hand, the masses of operatives in the factories and other great works of England, while retaining their position as wage-earners, have put forth most energy and attained their highest co-operative success in societies for the purchase, and in some degree the production, of their own immediate necessities of life. The less abundant capital, and the want of banks and other institutions of credit in the smaller towns and remoter parts of Germany, may explain in some measure the notable development of societies of credit in that country. But no account of the phenomena in Germany would be satisfactory without placing at the head of influences the personal agency of one man,— M. Schulze, of Delitzsch (a town of only 6,000 inhabitants),— who had the sagacity to perceive that societies of credit were the necessary foundation of the co-operative system, and who reasoned out principles, planned, and labored with a skill, disinterestedness, and perseverance which have crowned his idea with remarkable success. The Credit Society of M. Schulze is practically a bank, but a bank organized on principles specially adapted to the working classes within certain limits of transaction, to which it

is strictly confined. The members of the society must be men of "self-help," able to work and in regular employment, and they must hold each one equal share of the stock capital of the society, which may be paid up in full, or by regular instalment. Dividends are only paid to the members who have paid in full, the profits due on the partly-paid shares being added to these till they reach their full amount. It follows from the principle of the society,—"in proportion to the chance of gain the risk of loss,"—that when the share-capital has to be called upon to liquidate the debts, it is the capital actually paid in that loses. Equality of shares and equality of advantages and risks are thus attained. But in addition to the share-capital there is a reserve fund formed out of entrance fees and a percentage of the net profits. The order of liability for deficits in the balance-sheet is thus, (1) reserve fund, (2) paid-in capital, and (3) private property of the members,—the final principle being that of unlimited liability. Every member is responsible for the debts of the society, and the society for the debts of every member. It is obvious that a company thus constituted, and composed of the most saving and industrious workmen of a town or district, offers a solid security, and consequently the share-capital is supplemented by loans for given periods of time, debentures, and savings deposits, the last having to be guarded by conditions as to notice of withdrawal. At the beginning of a society the paid-up share-capital may not be more than the proportion of 10 to 90 of borrowed funds, but it has to be brought up as rapidly as possible to 25 per cent, and should reach a maximum of 50 per cent. The share-capital, as originally fixed, has also to be increased as the business, and the amount of funds necessary for its transaction, increase; so that the amount of each share has thus to be supplemented *plus* the increase of business *minus* the increase of members. By these means the society is protected from too small a share-capital for its liabilities, and from the temptation of appropriating large dividends out of the surplus profit, accruing from borrowed funds. Another peculiarity of the German credit-union is that it makes advances of the funds of which it is possessed to its own members only. The two great ends to be secured being the minimum of risk and the maximum of responsibility, the first is promoted by advancing money only for industrial purposes, within due limits, among borrowers whose requirements and circumstances are or may be thoroughly known to the society, and the second by the fact that every member of the society is unlimitedly liable for any errors or losses that may arise in the administration. The advances are made in the usual forms of promissory notes with the indorsation of sureties, ordinary bills of exchange, and occasionally mortgages over real property in current accounts. Advances are not made for longer periods than the society can itself borrow; partial repayment at dates is sometimes conditioned within the period of advance; and the interest charged follows the public money-market rate. It is thus that M. Schulze, through a series of skilful regulations beyond our space to follow, solved the problem, which vexed and puzzled the socialists of a past generation, of bringing capital direct to the workman or "immediate producer." When the little credit-union of Delitzsch was fully organized in 1852, popular opinion was so well prepared and enlightened on the subject by M. Schulze's efforts in the Prussian Congress and on the platform, that similar societies were rapidly

organized in other parts of the country. While each society had full powers of self-regulation, they were all much on the Delitzsch model, and a general affiliation was brought about for mutual counsel and encouragement. In 1865, he established a central credit bank at Berlin, by which the societies, while depending mainly on local credit supplies, might have access, in case of need, to the general loan market. The credit-unions, though now numerous, are only a section of the co-operative movement in Germany. The law of the Prussian Congress granting corporate rights to loan and credit associations extends the same privileges to "raw material and store unions," "unions for the production and sale of finished wares on a common account," "unions for the purchase of the necessities of life wholesale and the selling of them retail," and "unions for providing their members with dwelling-houses."—The history of the co-operative movement in France is much too extensive to be traced here. The *society of production*, of which there are at least forty examples in Paris alone, is found in nearly all the French provinces, and has proved the capacity of workmen by union to carve out business for themselves and be their own masters, while, in many cases, employing other workmen or auxiliaries at wages, who have no share in the profits. There are also in France more examples, probably, than in any other country, of workmen sharing in the profits of the firms by which they are employed, under arrangements offered and regulated by the employers or capitalists themselves.—Of the *society of consumption* there are innumerable examples in Great Britain, the chief being the Rochdale, Leeds, and Halifax societies, embracing nearly the whole working population of a large manufacturing district, and carrying out their operations, from the wholesale and retail stores to dairies, flour-mills, and other auxiliary branches, including libraries and news-rooms. The supply associations in London organized by members of the government civil service have also attained much importance; but, as these trade with the public, and divide large profits among privileged holders of shares, it has been questioned whether they can be properly regarded as co-operative societies. Nearly every town of the kingdom has a *co-operative store*; and when these are numerous in a district they usually affiliate, and open a common wholesale department in Liverpool, Glasgow, or some other emporium. The advantages in many cases may not be great, and after a brief existence the societies not unfrequently wind up. But when properly conducted and supported, they secure wholesome commodities, encourage among their members ready-money payments, and as the goods are sold at a fair margin of profit, there is every quarter or half year a dividend at the rate of 5 to 10 or more per cent to the members on their share-capital, and a bonus to non-members on the amount of their purchases. One of the indirect advantages of the co-operative store, when established in a community, is its influence as a formidable rival on private grocers and dealers. The numerous cotton factories in Lancashire, England, on a basis of small joint-stock shares, yielding in some cases large dividends, might almost be considered as great an example of co-operative production as any effort of the kind in France. The operatives have a large stake and much advantage in these factories; but since the spinner or weaver does not necessarily work in the factory of which he has a small proprietary share, these joint-stock

establishments are probably to be regarded more as investments of the savings of operatives than as co-operative societies. The co-operative idea, as would probably be held by its most staunch propounders, requires identity of purpose and interest, with community of advantages and risks, though not necessarily absolute equality or uniformity of individual relation, among the co-operatives. When the association passes into a mere investment and trading company, the idea would seem to be lost. Down to this day the *C.* system has not been received with marked favor in the U. States. Many co-operative stores have been established in almost all parts of the country; but, excepting Massachusetts, where their management seems to be better understood, relatively few of them have met with a decided and durable success. — *R. Somers.*

**Cop, Coppin**, in spinning, a conical ball of thread or yarn formed on a spindle.

**Copaiba, or Copaiva** [Fr. *baume de copahu*; Ger. *Kopaiva balsam*; Sp. *copayva*], commonly called a balsam, but properly an oleo-resin or turpentine,

Fig. 100. — *COPAIFERA OFFICINALIS*.

is a drug obtained from the *Copaifera officinalis* (Fig. 100), a native of South America, and from other species of the same tree. Two kinds are sometimes distinguished, and named from the countries in which they are produced, the Brazilian (chiefly from the province of Para), and the West Indian. The former is thin, clear, of a pale color, pleasant aromatic smell, and of an acrid bitter taste; while the latter is thick, golden yellow, not transparent, and of less agreeable smell, even resembling turpentine. Sp. gr. .980. It is often adulterated with castor-oil and the finer sorts of turpentine. When good it should be completely soluble in alcohol of the strength of 90 per cent; but the simplest test of its purity is to heat a small quantity in a watch-glass, when, if good, a hard brittle resin remains. This drug is celebrated for its action as a stimulant to the mucous surfaces. Numerous preparations of this article are sold under such names as *soluble C.*, *specific solution*, *salt of C.*, etc.; none of these appear to possess equal activity and certainty of operation to the natural balsam. As the whole virtue of *C.*

as a medicine depends on the essential oil it contains, the value of any of these preparations may be estimated by the quantity of that article which is found in them. In the case of the first two articles above named the quantity is very small indeed, and in the last it is wholly deficient. *Imp. free.*

**Copal**, a valuable and peculiar kind of resin (improperly called Gum *C.*), that naturally exudes from a large tree (*Rhus copallinum*) found in various tropical countries. It is imported from Africa, the Philippine Islands, Sierra Leone, Portugal, and Bombay. The best *C.* is hard and brittle, in rounded lumps of a moderate size, easily reducible to a fine powder, of a light lemon yellow color, beautifully transparent, but often, like amber, containing parts of insects and other small extraneous bodies in its substance. Sp. gr. from 1.045 to 1.139. It has neither the solubility in water common to gums, nor the solubility in alcohol common to resins, at least in any considerable degree. It may be dissolved by digestion in drying linseed oil, and other volatile menstrua. This solution forms a beautiful transparent varnish, which, when properly applied and slowly dried, is very hard and very durable. *C. varnish* was first discovered in France, and was long known by the name of *verniss martin*. It is applied to snuff-boxes, tea-boards, and other utensils. It preserves and gives lustre to paintings; and contributes to restore the decayed colors of old pictures, by filling up cracks, and rendering the surface capable of reflecting light more uniformly. *C.* is liable to be confounded with *gum anime*, when the latter is very clear and good. But it is of importance to distinguish between them, as the *anime*, though valuable as a varnish, is much less so than the finest *C.*; the varnish with the former being darker colored, and not so hard. Besides the external appearance of each, which is pretty distinct to a practised eye, the solubility in alcohol furnishes a useful test, — the *anime* being readily soluble in this fluid, while the *C.* is hardly affected by it; *C.* is also brittle between the teeth, whereas *anime* softens in the mouth. *C.* is also dug from the earth on the coast of Africa, a few miles inland, opposite the island of Zanzibar. The supply is supposed to be inexhaustible, and the production only limited by the indolence of the negroes, who will merely dig up enough to supply their daily wants. *Imp. free.*

**Copalche Bark**, an aromatic bitter medicinal bark, the produce of *Croton pseudochina*, a Mexican bark.

**Copal-Varnish.** See **COPAL**.

**Copang**, a money of account and weight in some parts of the Eastern Archipelago; the fourth part of a mace. In Sumatra the *C.* is  $2\frac{1}{2}$  grains, in other parts 7 to 10 grains.

**Copartner**, one who is united in partnership with another.

**Cope**, the most magnificent vestment of Catholic priests. In form it is a semicircle, without sleeves, and with a hood. It is fastened across the breast with a clasp or morse, and is ornamented with embroidery, and even with jewels. — The outer part or case of a large loam mould, used in casting metals. — To cope, is to barter or change away.

**Copeck, Kopecck**, a Russian copper coin, the hundredth part of the rouble, worth about  $\frac{1}{4}$  of a cent. The coined copper money is in pieces of 10, 5, 2, 1, and half *C.* There are silver pieces current of 5, 10, 15, 20, 25, 30, 50, 75, and 150 *C.*

**Copeman**, a merchant; one who barter.

**Copenhagen.** See DENMARK.

**Coper,** in lead-mining, one who contracts to get ore at an agreed sum per dish or load, etc.

**Copey,** a dye-wood, obtained in Cuba from *Clusia rosea*.

**Cop-House,** a place where tools are kept.

**Coping,** the upper course of masonry on a wall or parapet, etc., which forms a projecting or covering course.

**Coping-Stones,** long plats of stone laid on a wall, and projecting a few inches beyond the wall to carry off rain.

**Copper** [Dutch, *koper*; Fr. *cuivre*; Ger. *Kupfer*; It. *rame*; Port. and Sp.  *cobre*], a metal of a beautiful red color, and considerable lustre. Its taste is styptic and nauseous; and the hands, when rubbed for some time on it, acquire a peculiar and disagreeable odor. It is harder than silver; its sp. gr. varies according to its state, being, when quite pure, near 9.000. Its malleability is great; it may be hammered out into leaves so thin as to be blown about by the slightest breeze. Its ductility is also considerable. Its tenacity is so great, that a C. wire 0.078 of an inch in diameter is capable of supporting 302.26 lbs. avoirdupois without breaking. Its liability to oxidation from exposure to air or damp is its greatest defect. The rust with which it is then covered is known by the name of verdigris, and is one of the most active poisons. C. is found in the metallic state in nature, sometimes in very great masses, as on the south shores of Lake Superior, where pieces of 150 tons weight have sometimes been obtained. The great source of its supply is an ore in which the metal is found combined with sulphur. In both states it is obtained in almost every mineral district in the world, in beds, or more commonly in veins in primitive and secondary mountains, accompanied by several other mineral substances. C. is found in many parts of the U. States; but the C. region of Lake Superior contains the mines which, hitherto, have been the most profitably worked in this country, their product being about 3,000 tons annually. In a commercial point of view, the C. mines of Cornwall (England), Lake Superior (U. States), Chili, Cuba, Spain, and Australia are by far the most important. Several salts of C. possess considerable industrial value, chiefly for the formation of blue and green pigments, in dyeing and calico-printing, and for the deposition of metallic C. by electro-metallurgy. The principal salts of C. are the *acetate* (see VERDIGRIS), the *carbonate* (see VERDITER), and the *sulphate* (see VITRIOL). C. unites with facility with almost all other metals, and a large number of its compounds are of the highest importance in the arts. Indeed C. is much more important and valuable as a constituent element in numerous alloys than it is as pure metal. For the principal alloys in which it forms a leading ingredient, see BELL-METAL, BRASS, BRONZE, GERMAN-SILVER, PITCHMEK, etc. The foreign C. trade of the U. States for the year 1878 was as follows: C. ore, *Exp.* to England and Germany, 32,947 cwt., valued at \$169,920; *Imp.* 7,838 cwt., valued at \$4,359; C. in pigs, bars, and sheets, *Exp.* 11,297,879 lbs., valued at \$2,102,455; *Imp.* 379,596 lbs., valued at \$49,100; *Manuf.* C., value of *Exp.* \$217,446; of *Imp.* \$322,418.

*Imp. duty:* Copper-ore, on all fine copper contained therein . . . . . 3 cents per lb.  
 " " " old, taken from the bottom of American vessels compelled by marine disaster to repair in foreign ports Free.  
 " " " old, fit for manufacture only . . . . . 4 cents per lb.

"	"	pigs, bars, ingots, or plates, 5 cents per lb.
"	"	braziers' sheets (rolled plates) . . . . . 45 per cent.
"	"	Copper, other sheets . . . . . 45 per cent.
"	"	bolts, nails, spikes, rods, etc. . . . . 45 per cent.
"	"	bottoms (still bottoms) . . . . . 45 per cent.
"	"	manufactures, n. o. p. of copper, or of which copper is component of chief value . . . . . 45 per cent.
"	"	regulus of, and black or coarse . . . . . 4 cents per lb.
"	"	sheeting, 48 inches long, 14 inches wide, weight from 14 to 34 ounces per square foot . . . . . 45 per cent.
"	"	sulphate of (blue vitriol) . . . . . 4 cents per lb.
"	"	chafing-dishes . . . . . 45 per cent.

**C.-smelting.** The mixture of ores, being selected as noticed under ORE-DRESSING, is wheeled (fig. 101) to a trainway, *t*, situated over the roasting or calcining furnaces, and the charge is thrown into two large hoppers of plate-iron, *h h*. These are closed at the bottom by means of a plate, on withdrawing which the charge falls upon the sole of the furnace, *s*, composed of bricks. The vault of the furnace descends by a rapid slope from the fire to *u*, the entrance of the flue, *f*. Two sides of the furnace contain each two doors which allow the men to spread the charge, and work, or *rubble*, it from time to time; a hole situated near the bridge, *b*, admits a quantity of air, which can be regulated by means of a register plate. There are four oblong openings, *aa*, in the sole, closed during the roasting with iron plates, on withdrawing which the charge can be raked out into the reservoir, *R*. The fuel is a mixture of anthracite with small bituminous coal. Roasting furnaces,

Fig. 101. — COPPER CALCINING FURNACE.

however, are now very commonly provided with Siemens' regenerators, and heated with gas. There can be different kinds of ore mixed together but none of the fragments are larger than a nut. The roasting or calcining goes on for about 12 hours, at a temperature which drives off much of the sulphur. — **Melting for Coarse Metal.** Roasted ore and a little C. slag, with some kind of flux metal, and anthracite and bituminous coal as fuel, are thrown into the *coarse melting furnace*, which is maintained at a fierce heat. The result of the process is, that nearly the whole of the C. is collected into a mass called *matt*, or *coarse metal*, combined with the residue of the sulphur and iron. — **Calcining the Coarse Metal.** The *matt* obtained by the last process is in small brownish fragments, containing about one third their weight of pure C. The calcining of this substance does not differ much from the roasting of the ore. More of the sulphur is driven off by this process; the substance is reduced to small black grains; and it now becomes *calcined coarse metal*. — **Melting for White Metal.** The coarse metal just described is mixed with about an equal weight of rich C. ore, copper slag, and waste C. of various kinds. These are exposed to a dazzling white heat; and the result of the process is, that two fifths of the weight assume the form of *white metal*. The white metal has a granulated texture and a grayish-white color; it contains about three fourths pure C. — **Melting for Fine Metal.** This is another advance towards pure C., certain oxides being driven off by heat. The *blue metal* produced is more compact than the white; it has a deep gray color, and exhibits exceedingly fine particles of metallic C. diffused through the mass. — **Making Coarse C.** A good deal of sulphur still remains, together with a little arsenic, iron, tin, nickel, and cobalt; and a further purification is now needed. The chief result is *coarse or blistered C.*, which presents a deep red color when fractured; it is run from the furnace into sand-moulds, where it forms pigs or slabs 3 feet long by 1½ feet wide. — **Refining and Toughening.** At length we come to the end of the processes. The coarse C. is thrown into large furnaces, in charges of 7 tons at a time. Almost

all the remaining sulphur and arsenic are driven off, and the metal gradually assumes various conditions, becoming more and more pure as it proceeds. When ready, it is ladled out of the furnace, and cast into cakes of *ordinary C.*, about 18 inches by 12. The cake *C.* sent into the market obtains the name of *best selected, tough, common, tile, etc.*, according to its quality. The *best selected* differs very little from absolutely pure *C.* A great variety of improvements in *C.*-smelting have been prepared and patented, one or two of which have been usefully applied. Several modifications of the various processes are also adapted to suit the quality of the ores and the kind of *C.* to be produced. *C.* is also obtained from its ores by the *wet method*, which is substantially the precipitation of metallic *C.* from the solution of its chloride. This method is chiefly practised with ores containing less than 4 per cent of *C.*

**C. Manufacturing.** The fashioning of *C.* into useful and ornamental articles does not comprise so many processes as that of iron, because the metal is neither *welded* nor *forged*. The *C.* — in tiles 9 or 10 inches square by 1 inch thick, or in cakes somewhat larger — is cast into ingots of various sizes and shapes, and most of it rolled into sheets; but some articles are cast without the metal undergoing any rolling. The malleability of *C.* permits of its being hammered into form with great facility. Thus, a mass shaped like a double convex lens can be hammered into a hemispherical vessel, such as those used in the sugar manufacture; the heavy blows which thin out the central thicker portion make the edge gradually turn up. The riveting of joints; the planishing or condensing of surface by repeated hammering; the cooling and drawing of strips into the forms of tubes and pipes; the soldering or brazing of two pieces together; the casting in moulds of loam or sand, — these are the chief processes, besides rolling into sheets and hammering with hammers, by which the countless articles in *C.* are made.

**Copperah, Copra**, an Eastern name for the dried oily pulp of the cocoa-nut, used for expressing oil from.

**Copperas** [Fr. *couperose*; Latin *cupri rosa*, the flower of copper], the familiar but unsuitable name for a substance which contains no copper whatever, the *sulphate of iron*, or green vitriol. See VITRIOL.

**Copper-Bit**, a tool used for soldering. It consists of a pointed piece of copper with a wooden handle, riveted to an iron shank.

**Copper-Bottomed**, a term applied to vessels sheathed with copper sheets or yellow composition metal below the water-mark.

**Copper Coinage**, the term most generally applied to the petty coinage for mercantile transactions, and for the convenience of small traders. The total value of the minor coins of the U. States, coined from 1793 down to the close of the fiscal year 1878, is \$12,915,397.55, of which the following is a detailed account:—

*Five-cent (nickel)*, authorized to be coined, act of May 16, 1863; weight, 77.16 grains, composed of 75 per cent copper and 25 per cent nickel; total amount coined, \$5,773,170.

*Three-cent (nickel)*, authorized to be coined, act of March 3, 1865; weight, 30 grains, composed of 75 per cent copper and 25 per cent nickel; total amount coined, \$855,138.

*Two-cent (bronze)*, authorized to be coined, act of April 22, 1864; weight, 93 grains, composed of 95 per cent copper and 5 per cent tin and zinc; coinage discontinued, act of February 12, 1873; total amount coined, \$912,020.

*Cent (copper)*, authorized to be coined, act of April 2, 1792; weight, 204 grains; weight changed, act of January 14, 1793, to 208 grains; weight changed by proclamation of the President, January 26, 1793, in conformity with act of March 3, 1795, to 168 grains; coinage discontinued, act of February 21, 1857; total amount coined, \$1,562,887.44.

*Cent (nickel)*, authorized to be coined, act of February 21, 1857; weight, 72 grains, composed of 88 per cent copper and 12 per cent nickel; coinage discontinued, act of April 22, 1864; total amount coined, \$2,007,720.

*Cent (bronze)*, coinage authorized, act of April 22, 1864; weight, 43 grains, composed of 95 per cent copper and 5 per cent tin and zinc; total amount coined, \$1,704,546.

*Half-cent (copper)*, authorized to be coined, act of April 2, 1792; weight, 132 grains; weight changed, act of January 14, 1793, to 104 grains, and by proclamation of the President, January 26, 1795, to 84 grains; coinage discontinued, act of February 21, 1857; total amount coined, \$39,926.10.

The exact amount of minor coins actually in circulation is unknown; but it may be inferred that it is beyond the wants of the country, from its accumulation in the various offices of the Treasury, which, from \$157,000 in 1876, increased

to \$877,000 in 1877, and \$1,410,898.50 in 1878, representing at least 150 tons metal. Of this total, \$1,036,422.55 consisted of five-cent nickel coins, and it may be anticipated that in a very short time the whole emission of this coin, of merely nominal value, will have entered the vaults of the Treasury.

**Copper-Fastened**, a term applied to vessels or boats which have rivets and bolts of copper to secure the timber and planks, etc.

**Copper-Founder**, one who casts copper-metal into moulds and shapes.

**Coppering.** This is a mode of coating iron with a thin film of copper, which is made by cleansing the iron with dilute acid, and dipping it into a bath of oxide of copper, nitric acid, ale, and water, when a film of copper is deposited. Electro-coppering is, however, a more perfect plan. See ELECTRO-METALLURGY.

**Copper-Nickel**, an ore found in France, etc., which consists of a compound of arsenic with nickel.

**Copper-Ore.** See COPPER.

**Copper-Plate Engraving.** The delicate work which the copper-plate engraver has to do is just the reverse of that described under wood engraving. The plate is first brought to a very smooth surface. The engraver employs many fine and sharp tools, called *gravers*, *scrapers*, *dry-points*, and *burnishers*, to cut away the copper, and to leave clear and smooth edges to every incision. If nearly the whole picture is presented in incised lines, straight and curved, it is called *line engraving*. If the plate is hacked or notched all over with a toothed instrument called a *cradle*, and the device produced by scrapers and burnishers on this surface, it is called *mezzotint engraving*. If the plate is coated with a solution of resin in spirit of wine, and aquafortis be made to act on this in a peculiar way, it is *aquatint engraving*, somewhat resembling an Indian ink drawing. See, also, ETCHING. Steel-engraving differs little from copper-plate, except in the hardness of the metal, and the time required to cut into it. It is coming more and more in use, owing to the large number of impressions that can be taken before the plate is worn out.

**Copper-Plate Maker**, one who shapes, smooths, and prepares metal plates for engraving.

Fig. 102. — ROLLING-PRESS.

**Copper-Plate Printing** differs from ordinary letterpress printing in this, that whereas in the latter the ink is on the surface, and avoids the hollows, in the former it is in the hollows, and avoids

the surface. The *rolling-press* (Fig. 102) for copper-plate printing has two rollers; a flat board or table can pass between them, and by working the rollers the table receives a horizontal movement to and fro. The copper-plate, having been finished by the engraver, is heated to 180° F., and then coated with ink by means of a linen rubber or pad, so repeatedly and carefully applied as to insure that every line of the device shall receive a supply of ink. The surplus ink that covers the whole of the surface is wiped off, first with a cloth, and then with the hand. The plate thus inked is placed face uppermost on the table; a sheet of paper is placed on it; three or four folds of flannel or blanket cover the paper; the rollers are worked by a kind of lever winch; the table is brought between the two rollers; and a pressure is exerted sufficiently to produce a clear print from the plate. — *Steel-plate printing* is executed in the same way as *copper-plate*.

**Copper-Pyrites**, the most important and ordinary ores of copper, which are sulphurets of copper and iron.

**Copper-Sheathing**, thin sheets of copper for nailing on ships' bottoms to preserve the timber.

**Copper-Smelter**, one who melts copper ore.

**Copper-Smith**, a worker in copper, who frequently combines the trade of brazier and tin-plate worker.

**Copper-Wire**, fine drawn wire of copper, used for various purposes. Copper-wire is now largely in demand for electric telegraphs.

**Copice-Wood**, small brushwood; under-wood.

**Coplin**. See *Cop*.

**Coppo**, a measure for oil at Lucca, containing nearly 200 lbs. avoirdupois.

**Copra**. See *COPPERAH*.

**Coprolites**, the fossil excrements of extinct animals, which, from the large quantity of phosphate of lime they contain (50 to 55 per cent) when digested with sulphuric acid, form a valuable fertilizer for land. Considerable deposits of *C.* are found in the upper green sand in Cambridgeshire, England.

**Copy**, a printer's term for anything furnished him to compose in type, whether manuscript or printed matter.

**Copy-Book**, a ruled book for practising writing in.

**Copy-Hold**, a legal term for manorial lands held on a tenure by copy of court-roll.

**Copying**, taking a facsimile or impression; hence the terms copying-clerks, copying-machine, copying-paper, etc.

**Copying-Clerk**, a clerk in a merchant's, lawyer's, or other office, whose duty it is to make transcripts of letters and other documents.

**Copying-Ink**, adhesive ink prepared with gum and other substances for taking one or more impressions or copies from the manuscript.

**Copying-Machine**. See *COPYING-PRESS*.

**Copying-Paper**, thin unsized paper used damp for making impressions from writings.

**Copying-Press**, a machine by which duplicates of letters and manuscripts may be produced without having recourse to transcription. A copying-machine generally consists of a flat bed, upon which rests the letter to be copied, and the paper for the duplicate. Above these is a flat plate, called a *platen*, which, by means of a screw or lever, is made to produce the necessary pressure. The ink with which the letter is written contains a certain amount of sugar or treacle, which is transferred to the paper laid upon it by the pressure exerted.

The copy made is, of course, reversed, but the paper is purposely made thin, in order that the writing may be read through it. Various contrivances have been invented for procuring the necessary amount of pressure, but the simple screw and lever appears to be the best of them all.

**Copyright** is the exclusive right of multiplying for sale copies of works of literature or art, allowed to the author thereof or his assigns. All statutes relating to *C.* in this country were repealed by act of Congress, July 8, 1870, which, with an amendment of June 18, 1874, now regulate the entire subject. This law is here given in full, as taken from the *Revised Statutes of the U. States Edition*, 1878:—

*Sec. 4952.* Any citizen of the U. States or resident therein, who shall be the author, inventor, designer, or proprietor of any book, map, chart, dramatic or musical composition, engraving, cut, print, or photograph or negative thereof, or of a painting, drawing, chromo, statue, statuary, and of models or designs intended to be perfected as works of the fine arts, and the executors, administrators, or assignees of any such person shall, upon complying with the provisions of this chapter, have the sole liberty of printing, reprinting, publishing, completing, copying, executing, finishing, and vending the same; and, in the case of a dramatic composition, of publicly performing or representing it, or causing it to be performed or represented by others. Any author may reserve the right to dramatize or to translate their own works.

*Sec. 4953.* *C.* shall be granted for the term of 28 years from the time of recording the title thereof, in the manner hereinafter directed.

*Sec. 4954.* The author, inventor, or designer, if he be still living and a citizen of the U. States or resident therein, or his widow or children, if he be dead, shall have the same exclusive right continued for the further term of 14 years, upon recording the title of the work or description of the article so secured a second time, and complying with all other regulations in regard to original *C.*, within 6 months before the expiration of the first term. And such person shall, within 2 months from the date of said renewal, cause a copy of the record thereof to be published in one or more newspapers, printed in the U. States, for the space of 4 weeks.

*Sec. 4955.* *C.* shall be assignable in law, by any instrument of writing, and such assignment shall be recorded in the office of the Librarian of Congress within 60 days after its execution; in default of which it shall be void as against any subsequent purchaser or mortgagee for a valuable consideration, without notice.

*Sec. 4956.* No person shall be entitled to a *C.* unless he shall, before publication, deliver at the office of the Librarian of Congress, or deposit in the mail addressed to the Librarian of Congress, at Washington, District of Columbia, a printed copy of the title of the book or other article, or a description of the painting, drawing, chromo, statue, statuary, or a model or design for a work of the fine arts, for which he desires a copyright, nor unless he shall also, within ten days from the publication thereof, deliver at the office of the Librarian of Congress, or deposit in the mail addressed to the Librarian of Congress, at Washington, District of Columbia, two copies of such copyright book or other article, or, in case of a painting, drawing, statue, statuary, model, or design for a work of the fine arts, a photograph of the same.

*Sec. 4957.* The Librarian of Congress shall record the name of such *C.* book or other article, forthwith, in a book to be kept for that purpose, in the words following:—“Library of Congress, to wit: Be it remembered that on the \_\_\_\_ day of \_\_\_\_, A. D. of \_\_\_\_, hath deposited in this office the title of a book (map, chart, or otherwise, as the case may be, or description of the article), the title or description of which is in the following words, to wit: (here insert the title or description) the right whereof he claims as author (originator or proprietor, as the case may be), in conformity with the laws of the U. States respecting copyrights. C. D., Librarian of Congress.” And he shall give a copy of the title or description, under the seal of the Librarian of Congress, to the proprietor, whenever he shall require it.

*Sec. 4958.* The Librarian of Congress shall receive, from the persons to whom the services designated are rendered, the following fees:—1st. For recording the title or description of any copyright book or other article, 50 cents; 2d. For every copy under seal of such record actually given to the person claiming the copyright, or his assigns, 50 cents; 3d. For recording any instrument of writing for the assignment of a copyright, 15 cents for every 100 words; 4th. For every copy of an assignment, 10 cents for every 100 words. All fees so received shall be paid into the Treasury of the U. States.

*Sec. 4959.* The proprietor of every *C.* book or other article shall deliver at the office of the Librarian of Congress, or deposit in the mail addressed to the Librarian of Congress, at Washington, District of Columbia, within 10 days after its

publication, two complete printed copies thereof, of the best edition issued, or description or photograph of such article as heretofore required, and a copy of every subsequent edition wherein any substantial changes shall be made.

*Sect. 4930.* For every failure on the part of the proprietor of any *C.* to deliver or deposit in the mail either of the published copies or description or photograph, required by sections 4956 and 4959, the proprietor of the *C.* shall be liable to a penalty of \$25, to be recovered by the Librarian of Congress, in the name of the U. States, in an action in the nature of an action of debt, in any district court of the U. States within the jurisdiction of which the delinquent may reside or be found.

*Sect. 4961.* The postmaster to whom such *C.* book, title, or other article is delivered, shall, if requested, give a receipt therefor; and when so delivered he shall mail it to its destination.

*Sect. 4962.* No person shall maintain an action for the infringement of his *C.* unless he shall give notice thereof by inserting in the several copies of every edition published, on the title-page or the page immediately following, if it be a book; or if a map, chart, musical composition, print, cut, engraving, photograph, painting, drawing, chromo, statue, statuery, or model or design intended to be perfected and completed as a work of the fine arts, by inscribing upon some portion of the face or front thereof, or on the face of the substance on which the same shall be mounted, the following words: "Entered according to act of Congress, in the year —, by A. B., in the office of the Librarian of Congress, at Washington."

*Sect. 4963.* Every person who shall insert or impress such notice, or words of the same purport, in or upon any book, map, chart, musical composition, print, cut, engraving, or photograph, or other article, for which he has not obtained a *C.*, shall be liable to a penalty of \$100, recoverable one half for the person who shall sue for such penalty, and one half to the use of the U. States.

*Sect. 4964.* Every person who, after the recording of the title of any book as provided by this chapter, shall, within the term limited, and without the consent of the proprietor of the *C.* first obtained in writing, signed in presence of two or more witnesses, print, publish, or import, or knowing the same to be so printed, published, or imported, shall sell or expose to sale any copy of such book, shall forfeit every copy thereof to such proprietor, and shall also forfeit and pay such damages as may be recovered in a civil action by such proprietor in any court of competent jurisdiction.

*Sect. 4965.* If any person, after the recording of the title of any map, chart, musical composition, print, cut, engraving, or photograph, or chromo, or of the description of any painting, drawing, statue, statuery, or model or design intended to be perfected and executed as a work of the fine arts, as provided by this chapter, shall, within the term limited, and without the consent of the proprietor of the *C.* first obtained in writing, signed in presence of two or more witnesses, engrave, etch, work, copy, print, publish, or import, either in whole or in part, or by varying the main design with intent to evade the law, or knowing the same to be so printed, published, or imported, shall sell or expose to sale any copy of such map or other article, as aforesaid, he shall forfeit to the proprietor all the plates on which the same shall be copied, and every sheet thereof, either copied or printed, and shall further forfeit \$1 for every sheet of the same found in his possession, either printing, printed, copied, published, imported, or exposed for sale; and in case of a painting, statue, or statuery, he shall forfeit \$10 for every copy of the same in his possession, or by him sold or exposed for sale; one half thereof to the proprietor, and the other half to the use of the U. States.

*Sect. 4966.* Any person publicly performing or representing any dramatic composition for which a *C.* has been obtained, without the consent of the proprietor thereof, or his heirs or assigns, shall be liable for damages therefor, such damages in all cases to be assessed at such sum, not less than \$100 for the first, and \$50 for every subsequent performance, as to the court shall appear to be just.

*Sect. 4967.* Every person who shall print or publish any manuscript whatever, without the consent of the author or proprietor first obtained, if such author or proprietor is a citizen of the U. States, or resident therein, shall be liable to the author or proprietor for all damages occasioned by such injury.

*Sect. 4968.* No action shall be maintained in any case of forfeiture or penalty under the *C.* laws, unless the same is commenced within two years after the cause of action has arisen.

*Sect. 4969.* In all actions arising under the laws respecting *C.*, the defendant may plead the general issue, and give the special matter in evidence.

*Sect. 4970.* The circuit courts, and district courts having the jurisdiction of circuit courts, shall have power, upon bill in equity, filed by any party aggrieved, to grant injunctions to prevent the violation of any right secured by the laws respecting *C.*, according to the course and principles of courts of equity, on such terms as the court may deem reasonable.

*Sect. 4971.* Nothing in this chapter shall be construed to prohibit the printing, publishing, importation, or sale of any book, map, chart, dramatic or musical composition, print, cut, engraving, or photograph, written, composed, or made by any person not a citizen of the U. States nor resident therein.

*International C.* "The question of international *C.* between the U. States and England has been for some time the subject of active discussion among the authors and publishers of both countries. The chief opposition to a convention proceeds from various sections of the publishing trade in America. At present a sort of customary *C.* in English books is recognized by certain leading firms. When one of them has, by arrangement with the author, obtained the advance sheets of an English work, there is a tacit understanding that the others are not to reprint that particular work; but this arrangement is practically confined to those who are able to retaliate when the trade courtesy is violated. Thus great publishers have a monopoly of the English trade, and other publishers, who would gladly become their competitors, oppose any International *C.* Act which does not aid them to break down that monopoly."—*E. S. Drone.*

**Coquilla-Nut**, the fruit of the *Attalea funifera*, a S. American palm (Fig. 103). These hard mot-

Fig. 103. — COQUILLA NUT PALM.

tled nuts, which take a fine polish, are largely imported for the purposes of the turner, who shapes them into various small ornamental and useful articles, especially the handles of bell-pulls, the knobs of walking-sticks, umbrellas, etc. The same palm furnishes the piassaba fibre of commerce.

**Coquito Palm**, the *Jubaea spectabilis* of Chili, which produces minute cocoa-nuts.

**Coracle**, a rude boat made of wicker-work and hide, used for salmon-fishing in the rivers of Wales, England.

**Corah**, a measure of length in the East, varying for different goods from 41 to 52½ inches.—An Indian pattern silk handkerchief.

**Corah-Grass**, **Coray**, a species of *Cyperus*, probably *C. teretis*, from which the corah matting of Madras is made.

**Corah Print**, printed imitation Indian handkerchiefs.

**Coral** [Arab. *besed*; Fr. *corail*; Ger. *Korallen*; It. *corale*; Sp. and Port. *coral*], a submarine production, composed of the cells of minute creatures. It grows on rocks, and it is necessary to its production that it shall remain fixed to its place. It is found at different depths; and it is remarked that light exerts a powerful influence on its growth as well as its color,—the tint being darker in proportion to the deepness of the sea. As an ornament, black *C.* is much esteemed; but the red and the pink are also very highly prized. Its value depends on its color, solidity, and size; and while some are worth \$2 an oz., others do not sell at 25 cts. per lb. *C.* is an important branch of industry and commerce in Italy. Genoa, Leghorn, and Naples have been from old times the three great entrepôts to which

Fig. 104. — STEM OF CORAL.  
(With its living Polyps.)

the raw material has been carried, and where skillful artificers have established themselves in order to work at its transformation. *C.* is obtained in large quantities in the Mediterranean, and at considerable depths, of from 200 to 600 feet. Four varieties are distinguished:—1st, red, which is subdivided into deep crimson red, paler red, and vermillion, which is very rare; 2d, black; 3d, clear white; 4th, veiled white, which is the most common. The produce of the fishery varies from one year to another, and even in the richest spots the fishery should only be carried on at fixed intervals. The coasts where this precious zoophyte is found in the greatest abundance are those of Corsica, Sardinia, Provence, Africa, the vicinage of Trapani, the Straits of Messina, and the coasts of Algeria, where its artificial propagation is favored by the French government. In the Eastern seas, it is chiefly found in the Arabian Gulf, the west coast of Sumatra, and in Japan. Some kinds of coralline bodies increase to an extraordinary size, forming immense banks or masses of submarine rocks, which are frequently dangerous to navigators. *Imp. unmanuf. C.*, free.

The manner of fishing *C.* is nearly the same everywhere. That which is most commonly practised in the Mediterranean is as follows:—7 or 8 men go in a boat, commanded by the proprietor; the caster throws his net, if we may so call the machine which he uses to tear up the *C.* from the bottom of the sea, and the rest work the boat, and help to draw in the net. This is composed of two beams of wood, tied crosswise, with leads fixed to them to sink them; to these beams is fastened a quantity of hemp, twisted loosely round, and intermingled with some loose netting. In this condition the machine is let down into the sea; and when the coral is pretty strongly entwined in the hemp and nets, they draw it up with a rope, which they unwind according to the depth, and which it sometimes requires half a dozen boats to draw. If this rope happens to break, the fishermen run the hazard of being lost. Before the fishers go to sea, they agree for the price of the coral, and the produce of the fishery is divided, at the end of the season, into 13 parts, of which the proprietor has 4, the caster 2, and the other 6 men 1 each; the 13th belongs to the company for payment of boat-hire, etc.

**Coral Berry**, the Missouri Indian currant.

**Coralline**, a name given to a coral shade of the aniline colors.

**Coral Wood**, a hard, fine red cabinet wood, easily polished.

**Coratch**, a sauce made of ketchup, soy, and essence of anchovies.

**Corawa**, a strong silky fibre, obtained from a species of *Bramelia*, used by the Indians of Demerara to make bow-strings, nets, fishing lines, cordage, etc.

**Corbel**, a stone or other projection from the face of a wall, to sustain some superincumbent object; a bolster or support to shorten the bearings on a bridge.

**Corbling**, in building, a projection of stones "oversailing" or overlapping each other, out of the vertical direction, the centre of gravity being, however, still preserved.

**Cord**, a measure for firewood, equal to 1,000 billets, or four loads; so called because it was formerly measured by a cord. The dimensions of a *C.* of wood are stated to be eight feet long, four feet high, and four feet broad; the weight being about half a ton. The French cord for measuring wood is replaced by the stère. See **CORDAGE**.

**Cordage** [Fr. *cordage*, *manuvres*; Ger. *Tauwerk*; It. *caulame*; Sp. *jarcia*, *cordaje*], a term used to denote all manner of cords or ropes, how much soever they may differ in size, but especially those used in the rigging of ships. The term *cord* is usually employed to distinguish *C.* of small size, that is, of small circumference; *rope*, to distinguish the larger descriptions of *C.*; and *cable*, to distinguish the largest of all, or the *C.* used in the anchoring of ships. *C.* may be made of an infinite variety of materials,—of everything, in fact, which is slender,

Fig. 105. — CORDAGE.

flexible, and moderately tenacious, such as the fibres of various descriptions of vegetables; hair, wool, and silk; leather thongs, wire, etc. In Europe it has been mostly formed of the fibres of hemp and flax, particularly the former. But in this country coir, or the fibres of the husk of the cocoa nut, manilla, hemp, etc., are extensively used in the manufacture of the larger descriptions of *C.* The best *C.*

is that, of course, which is made of the best material and in the most approved manner. It must neither be too much nor too little twisted. Ropes consist of more or fewer yarns according to their thickness. At an average the fibres of hemp used in making ropes lose about  $\frac{1}{3}$  of their length by twisting; but in the case of cables the loss is greater. Ropes are sometimes made of iron wire; and when properly manufactured they have been found to answer much better than might have been anticipated. Chains are now also frequently substituted for various descriptions of ropes; and everybody knows that hempen cables have been all but wholly superseded by iron chains. In 1878 our imports of *C.* rope and twine (chiefly for England, Canada, and Russia) were 1,154,262 lbs., valued at \$129,663; while our exports to all countries, but chiefly to Cuba and S. America, amounted to 3,411,413 lbs., valued at \$389,004. *Imp.* duty, manilla, untarred,  $2\frac{1}{2}$  cts. per lb.; all other, untarred,  $3\frac{1}{2}$  cts. per lb.; tarred *C.*, 3 cts per lb. — See CABLE, COIR, etc. See also ROPE-MAKING.

**Cordeline** [Fr.], the edge or lisiere of silk stuff.

**Cordelle**, tape, ribbons, and small cords.

**Cordial Gin**, sweetened gin.

**Cordials** are warm, stimulating medicines, that tend to raise the spirits and promote the circulation. Those which are articles of commerce are noticed under their specific names. — Also aromatized and sweetened spirits used as beverages. See LIQUEUR.

**Cordies**, a kind of woollen felt hat, or one covered by camel or goat hair.

**Cordillas**, a kind of kersey.

**Cording-Quires**, the outside of a ream of paper.

Fig. 106. — CORK-TREE (*Quercus suber*).

**Cordon**, a band or wreath. — A guarded line or circuit kept by appointed officers, to prevent the breaking of quarantine, blockade, smuggling, etc.

**Cordonnet** [Fr.], coarse silk.

**Cordonnier**, the French name for shoemaker.

**Cordovan** [From Cordova, a city of Spain], a Spanish leather made from goat-skin, and finished as black morocco. The term in England is applied to leather made from horse-hide.

**Cords**. See TASSELS.

**Corduroy**, a kind of fustian or stout cotton fabric. The common kind is of a plain body, a better is twilled in the back, and the best is twilled on both sides; but there is of each kind a variety of qualities. The usual colors are olive, drab, slate, fawn, and white. It is in pieces varying in length from 40 to 70 yards.

**Core**, the interior of any thing. — The loose internal part of a mould used in casting to form a hollow or recess, and intercept the flow of the metal.

**Corea**, a kingdom of Eastern Asia, the greater part of which occupies a peninsula stretching S. from the northern portion of the Chinese empire. It extends from about 34° to 42° 25' N. lat., and from 124° 35' to 130° 50' E. lon. Area about 79,000 sq. m. The king of *C.*, though a vassal of China, is an absolute monarch, and is the object of almost divine honors. The industrial arts are but slightly developed, the only manuf. in which *C.* ranks really high being that of paper, a material employed, as in Japan, in a great variety of ways. Only one kind of coin, a small piece of copper known as a *saepke*, is recognized, and even this is not recognized in the N. provinces, where barter alone is in vogue. Foreign commerce there is none. The Chinese and Japanese ships are allowed to fish for trepang along the coast of Pieng-an, and for herring on that of Hoang-hai; but they are prohibited not only from landing, but from holding any communication with the Coreans at sea. Estimated pop. 12,000,000.

**Corer and Slicer**, an implement for cutting the core out of a peeled apple, and at the same time cutting into pieces for cooking or drying. — *Knight*.

**Corf**, a basket used in coal-mines for carrying coals; a square frame of wood to load the coals on; a sledge to carry ore from the miners to the shaft bottom, to be raised to the surface.

**Corfu**. See GREECE

**Corge**, the common East Indian name for a score by which many kinds of dry goods are vended in the bazaars.

**Coriander**, the globular fruit, improperly called seed, of an annual umbelliferous plant (*Coriandrum sativum*), a native of Italy, but cultivated in many countries. It is used in medicine as an aromatic and carminative, and on account of its pleasant and pungent flavor it is a favorite ingredient in hot curries and sauces. The fruit is also used in confectionery, and as a flavoring ingredient in various *liqueurs*. The essential oil on which its aroma depends is obtained from it by distillation. The tender leaves and shoots of the young plant are used in soups and salads. *Imp.* free.

**Cork** [Fr. (the bark) *liège*, (the stopper) *bouchon de liège*; Ger. *Kork*; It. *sughero*, *suvero*; Port. *cortica de sorreiro*; Sp. *corcho*], the thick and spongy bark of a species of oak (*Quercus suber*, Fig. 106), abundant in dry mountainous districts in the south of France, and in Spain, Portugal, Italy, and Barbary. The tree grows to the height of 30 feet or more, has a striking resemblance to the *Quercus ilex*, or evergreen oak, and attains to a great age. After arriving at a certain state of maturity, it periodically sheds its bark; but this valuable product is found to be of a much better quality when it is artificially removed from the tree, which may be effected without any injury to the latter. After a tree has attained to the age of from 26 to 30

years, it may be barked; and the operation may be subsequently repeated once every 8 or 10 years, the quality of the *C.* improving with the increasing age of the tree. The bark is taken off in July and August; and trees that are regularly stripped are said to live for 150 years or more. *C.* is light, porous, readily compressible, and wonderfully elastic. It may be cut into any sort of figure, and, notwithstanding its porosity, is nearly impervious to any common liquor. These qualities make it superior to all other substances for stoppers for bottles, in the manufacture of which it is principally made use of. It is also employed as buoys to float nets, in the construction of life-boats, the making of inside soles of shoes, on account of its slow conductivity of heat, and in various other ways. The best white *C.* is grown in France, but this country is chiefly supplied from Spain. — *C.* is also the name commonly given to the stopper or plug for a bottle or jar cut from the above substance. The common practice of employing inferior *C.* for the purpose of stopping the mouths of bottles is often productive of considerable loss, from the air being only partially excluded, and the contents suffering in consequence. The best *C.* are those called *exlet C.*, and of these the finest qualities come from France. Common *C.* are generally imported from Barcelona, Spain. In 1878, the value of imports of manuf. *C.* was \$61,127; of unmanuf. *C.* \$12,406, against \$636,163 in 1877. *Imp.* duty (the bark, or cut in small squares) free; all manuf. of *C.*, 30 per cent.

**Manuf.** — Before being manufactured into stoppers, the *C.* is charred on each side; this makes it contract, lessens its porosity, and consequently fits it better for cutting off all communication between the external air and the liquid in the bottle. Soft and pliable as *C.* is, its cutting, nevertheless, requires much tact to get the edge of the knife to bite well into the substance. For making ordinary bottle-*C.*, the *C.* is cut into small square pieces. The knife has a thin and sharp blade, which requires to be sharpened almost every instant to preserve the proper condition of edge. The workman holds the piece of *C.* down on a board or bench with his left hand, and cuts with the knife held in his right; and much tact is required to give the proper curvature to the *C.* It may be a *cork*, a *bung* or a *tap*; and its length may be *short*, *long*, or *full long*; but the mode of cutting remains nearly uniform. Machines of great ingenuity have been introduced into this manufacture; but hand made *C.* continue to be those most in use. It is said that a skilful *C.*-cutter will so manage his material as to obtain a greater number of *C.* from a given quantity than a machine, seeing that he can accommodate the movements of his knife to any variations in the thickness or quality of the *C.* The cuttings form an excellent stuffing for beds and cushions; while the refuse prings, when burned, yield *Synalbi* black.

**Cork**, a seaport of Ireland. See GREAT BRITAIN.

**Cork-Cutter**, a manufacturer of cork bark for commercial purposes.

**Corker**, a wedge used to stretch women's boots and shoes.

**Corking-Machine** is a machine for driving corks into bottles.

**Cork-Jacket**, a belt of corks, worn to float the person in water.

**Cork-Screw**, a lever for extracting the cork from a bottle, which is either simple or complicated.

**Cork-Sole**, a thin slice of cork bark, used for the inside of slippers and shoes, and sometimes between the soles of walking-boots, to keep the feet dry. *C.-S.* are also now frequently placed between the iron shoe and frog of a horse.

**Corn** [Dutch, *graanen*, *koren*; Fr. *Meds*, *grains*; Ger. *Korn*, *Getreide*; It. *biade*, *grani*; Latin, *frumentum*; Port. *grãos*; Sp. *granos*] means strictly "grain in the ear," or "grain unthrashed;" but in Europe, and frequently also in this country, the term is

applied in a more comprehensive sense to all kinds of grain or pulse fit for food, in whatever state of preparation. Commercially the name *C.* applies specially in the U. States to Indian *C.* or maize; while in England the bread *C.* is chiefly wheat; in Scotland the name is given to oats before they are ground; in Sweden, Iceland, etc., it denotes barley; hence it may be inferred that the term is generally applied to that species of grain which is most commonly used for food in any particular region. See BARLEY, INDIAN CORN, OATS, RYE, WHEAT, etc.

**Cornamusa** [It.], the bagpipe.

**Corn-Bagging**, sacking suited for grain bags.

**Corne**, the French name for horn.

**Corned Meat**, flesh slightly salted, intended for early use, and not for keeping for any time.

**Cornel**, the cornelian cherry, *Cornus mas* (Fig. 107), a common tree furnishing a durable wood, used for wheel-work, wedges, pins, etc. The aus-

Fig. 107 — CORNEL-TREE.

tere subacid fruit was formerly fermented for a beverage.

**Cornelian**. See CARNELIAN.

**Corneo**, a Spanish ore of quicksilver.

**Corneous**, horny, resembling horn in color or texture.

**Corner**, a term used in reference to certain kinds of transactions between stock brokers; or applied to transactions between speculators in stocks, grain, or other commodities, sold under a contract to deliver at a future day, and when the time for delivery arrives, the seller finds that the buyer, or a combination or clique, have control of the market, so that he is unable to make the delivery except upon such terms as the buyer chooses to exact; or in other words, he is driven into a *corner*, — a position of difficulty — *T. McElath*.

**Corner-Stone**, the union stone of the two angles of a wall; the first or foundation stone laid of a building.

**Cornet**, a paper bag or cap used by retailers to enclose small wares. — A musical wind instrument resembling a trumpet, and used in brass bands. — An organ stop.

**Cornet-a-Piston**, a brass musical wind instrument of the French horn class, furnished with valves and stoppers (pistons).

**Corn-Exchange**, a place of meeting for dealers in grain and flour, where business is transacted by samplers.

**Corney**, a grain measure in Ceylon, of 4½ seers, about 94 lbs.

**Corn-Field**, a space of land devoted to the culture of grain.

**Corn-Husk**, the sheaths of the ears of Indian corn. They are torn into long shreds by a splitting machine for stuffing for mattresses, etc.

**Cornice**, an upper moulding, or finished ornamental projection. — A gilded or other ornamental work within which window-curtains are suspended.

**Cornichon** [Fr.], a gherkin.

**Corning**, a name given to the process of granulating gunpowder. — The salting and curing meat.

**Corning, Cowanesque, and Antrim R.R.** runs from Corning, N. Y., to Antrim, Pa., with branch 64 m. This Co., whose offices are in Watkins, N. Y., was formed by the consolidation, on Jan., 1873, of the Blossburg and Corning and the Wellsboro' and Lawrenceville R.R. Cos., to which was added in 1874 the Cowanesque Valley R.R. Financial statement, Jan. 1, 1879: — Common stock, \$1,400,000; preferred stock, \$500,000; funded debt, 1st mortgage, C. C. & A. 7% gold, 20 year bonds, payable July 1, 1885, \$500,000. Total, stocks and bonds, \$2,400,000. The bonds are redeemable by annual instalments of \$20,000, commencing in 1880.

**Corn-Lift**, an elevator or contrivance for raising grain to the upper floors of a granary or mill.

**Corn-Mill**, an iron farm or plantation mill, for

Fig. 108. — CORN-MILL.

grinding Indian corn on the cob for stock. Fig. 108 represents the *C.-M.* manufactured by the Metropolitan Agricultural Works of New York. It is worked by a horse, and can grind corn fine enough for family use.

**Corno** [It.], a horn.

**Cornoepan**, a musical wind instrument with valves of the horn kind.

**Corn-Planter**. See **PLANTER**.

**Corn-Sheller**, a machine, of which there are many kinds, for removing the grain of maize from

Fig. 109. — CORN-SHELLER.

the cob or stalk. Fig. 109 represents the smallest size of *C.-S.* made by the Sandwich Manufacturing Co., Illinois.

**Corn-Starch**. See **STARCH**.

**Coromandel-Wood**, the wood of a tree of great size (*Dyospyros hirsuta*), used in cabinet-work, like zebra and rose wood. But it is inferior to the last in the brilliancy and division of its colors, having a dingy ground, and sometimes running into white streaks. It is chiefly imported from Madras.

**Corozo-Nuts**. See **VEGETABLE IVORY**.

**Corporation** is an association of persons which the common law treats in many respects as if it were itself a person. It has rights and duties of its own which are not the rights and duties of the individual members thereof. Thus a *C.* may own land, but the individual members of the *C.* have no rights therein. A *C.* may owe money, but the corporators as individuals are under no obligation to pay the debt. The rights and duties descend to the successive members of the *C.* This capacity of perpetual succession is regarded as the distinguishing feature of *C.* as compared with other societies. *Business C.*, however, are now governed in most of the U. States by new and special statutes, very similar in their principal enactments, which exclude or modify the operation of the common-law principles.

The *General Act for Organizing Business Corporations* in the State of New York, passed June 21, 1875, is as follows: —

**Sec. 1.** *C.* may be organized under the provisions of this act for the carrying on of any lawful business except banking, insurance, the construction and operation of railroads or aiding in the construction thereof, and the business of savings banks, trust companies, or *C.* intending to derive profit from the loan or use of money, or safe-deposit companies, including the renting of safes in burglar and fire-proof vaults.

**Sec. 2.** When so organized, every such *C.* shall possess the following general powers: 1. To have succession by its corporate name for the period limited in its certificate of incorporation; 2. To sue and be sued; to complain and defend in any court; 3. To make and use a common seal and alter the same at pleasure; 4. To appoint such subordinate officers and agents as the business of the *C.* shall require, and its by-laws shall provide for; 5. To make by-laws for the management of its property, the regulation of its affairs, for the transfer of its stock and defining the duties of its officers, and from time to time to amend the same; 6. To purchase, hold, and possess so much real and personal estate as shall be necessary for the transaction of its business, and sell and convey the same when not required for the use of the *C.*; provided, however, that all real estate acquired in satisfaction of any liability or indebtedness, unless the same be necessary and suitable for the uses and business of the *C.*, shall be sold within three years after becoming the property of the *C.*, but such time may be extended to a period not exceeding five years in all, by an order of the Supreme Court made in the district in which the principal business office of such *C.* is located, on the verified petition of such *C.*, stating the reasons for such extension.

**Sec. 3.** Whenever five or more persons, a majority of whom shall be citizens and residents of the State, shall propose to form a *C.* under the provisions of this act, they shall make a certificate to that effect, which certificate shall be signed by each of such persons and duly acknowledged by them before some officer authorized to take acknowledgments under laws of this State. Such certificate shall set forth: 1. The name of the proposed *C.*; 2. The object for which it is to be formed, including the nature and locality of its business; 3. The amount and description of the capital stock; 4. The number of shares of which such capital stock shall consist; 5. The location of the principal business office; 6. The duration of the *C.*, which, however, shall not exceed fifty years.

**Sec. 4.** Such certificate shall be filed in the office of the Sec. of State; and the Sec. of State shall thereupon issue a license to the persons making such certificate, empowering them as commissioners to open books for subscriptions to the capital stock of such *C.* at such times and places as they may determine; but no license shall be issued in the case of a proposed *C.* having the same name as an existing *C.* in this State, or a name so nearly resembling that of an existing *C.* as to be calculated to deceive.

**Sec. 5.** Said commissioners shall proceed to open books for subscriptions to the capital stock of such *C.*, and no such subscription shall be received, unless at the time of making it the person so subscribing shall pay to said commissioners ten per cent of the par value of the stock subscribed for in cash. When one half of the capital stock has been subscribed, said commissioners shall call a meeting of the subscribers for the purpose of adopting by-laws for such *C.* and electing directors thereof. Notice of such meeting shall be given to every sub-

scriber by depositing in the post-office, properly addressed to his last known place of residence, and postage prepaid, at least five days before the time fixed, a written or printed notice, stating the time, place, and object of such meeting.

Sec. 6. The by-laws of every *C*. created under the provisions of this act, shall be deemed and taken to be its law, and shall provide:—1. The number of directors of the *C*.; 2. The term of office of such directors, which shall not exceed one year; 3. The manner of filling vacancies among directors and officers; 4. The time and place of the annual meeting; 5. The manner of calling and holding special meetings of the stockholders; 6. The number of stockholders who shall attend, either in person or by proxy, at every meeting, in order to constitute a quorum; 7. The officers of the *C*., the manner of their election by and among the directors, and their powers and duties; but such officers shall always include a president, a secretary, and a treasurer; 8. The manner of electing or appointing inspectors of election; 9. The manner of amending the by-laws.

Sec. 7. Within ten days after the said subscribers' meeting, said commissioners shall file, in the office of the Sec. of State, a verified record of the proceedings thereof, containing a copy of the subscription list, a copy of the by-laws adopted, and the names of the directors chosen. Thereupon the Sec. of State shall issue to said directors a certificate, setting forth that said *C*. is fully organized in accordance with this act. Such certificate shall include a copy of the original certificate provided for in sect. 3 of this act, the date and place of the subscribers' meeting, the names of the directors elected, and a statement that all the provisions of this act have been duly observed in the organization of such *C*. A copy of such certificate shall, within ten days after the issuing thereof by the Sec. of State, be filed in the office of the clerk of the county in which the principal business office of such *C*. is situated. Such certificate shall be recorded at length in a book to be kept in the office of the Sec. of State, to be known as the record of incorporations, and also in a similar book in the office of the county clerk aforesaid. Such certificate, or a copy thereof duly certified by the Sec. of State or his deputy, shall be presumptive evidence of the incorporation of the *C*. named therein, in all courts and proceedings in this State. The Sec. of State shall receive for the filing and issuing of all the necessary documents, in and about the organization of a *C*. under this act, the sum of \$10; and for each certified copy of certificate of incorporation the sum of \$3, which sum shall be paid into the treasury of the State; and county clerks shall receive the fees now allowed by law. Upon every amendment of the by-laws of any such *C*. a copy of the amended by-laws shall be filed in the office of the Sec. of State and of such county clerk, and shall not take effect until so filed; and a copy thereof, certified by the Sec. of State or his deputy, shall be received as presumptive evidence of such amended by-law in all courts and proceedings.

Sec. 8. Unless such *C*. shall be fully organized as provided in the last preceding section, within one year after the issuing of the license to commissioners to open books, such license shall be deemed to be revoked, and all proceedings thereunder shall be void.

Sec. 9. The Sec. of State shall publish, as an appendix to the session laws of each year, a statement of all the *C*. organized under this act during the preceding year, containing in each case the name of the *C*., its principal business, the location of its principal business office, the amount of capital stock, the date of the filing of the preliminary certificate, and of the granting of the final certificate of incorporation by the Sec. of State, and any change of location or capital of any such *C*. made during the preceding year.

Sec. 10. The business of every *C*. created hereunder shall be managed by a board of directors (the members of which, at their election, and throughout their term of office, shall be stockholders in such *C*. to at least the extent of five shares, and shall hold their offices until their successors are chosen), and by such officers to be elected by and from among said directors as the by-laws shall prescribe. The number of directors shall be not less than five nor more than thirteen; and the number thereof may be changed by a meeting of the owners of a majority of the whole amount of the stock of any *C*., and pursuant to notice specifying the purpose of such meeting, and served as provided in sect. 5 of this act, in person or by attorney duly authorized, shall be necessary to such change. A majority of the whole number of directors shall be necessary to constitute a quorum. The secretary shall record all the votes of the *C*. and the minutes of its transactions in a book to be kept for that purpose. The treasurer shall give bonds in such sums and with such sureties as are required by the by-laws for the faithful discharge of his duties.

Sec. 11. The capital stock of every *C*. found under this act shall be divided into shares of not less than \$25 nor more than \$100 each; and shall in no case exceed \$2,000,000. All subscriptions therefor shall be made payable to the *C*. in such installments and at such time or times as shall be fixed by the by-laws or by the directors acting under the by-laws; and if default be made in any payment, an action may be maintained in the name of the *C*. to recover any installment which shall remain due and unpaid for the period of 30 days after the time so fixed for the payment thereof; and no stockholder

shall be entitled to vote at any election or at any meeting of the stockholders on whose share or shares any installments or arrearages may have been due and unpaid for the period of 30 days immediately preceding such election or meeting. The *C*. may, by by-law, prescribe other penalties for a failure to pay the installments that from time to time become due, not exceeding forfeiture of the stock, and the amount paid thereon, but no such forfeiture shall be declared against any stockholder before demand shall have been made for the amount due thereon either in person or by a written or printed notice duly mailed to such stockholder, at his last known place of residence, at least 30 days prior to the time when such forfeiture is to take effect, and provided further, that upon such forfeiture the shares of stock held by such delinquent stockholder or subscriber shall be sold at public auction at the office of the said *C*. after 10 days' notice thereof shall be conspicuously posted up in said office, and the proceeds of such sale, over and above the amount due on said shares, and after deducting the expenses of such sale, if any, shall be paid to the delinquent stockholder or subscriber.

Sec. 12. The directors of such *C*. shall prepare certificates of stock, and shall deliver them, signed by the president and treasurer, and sealed with the seal of the *C*., to each person entitled to receive the same, according to the number of shares held, which certificates of stock shall be transferable at the pleasure of the holder, in person or by attorney duly authorized, subject, however, to all payments due or to become due thereon; and the assignee to whom the same has been so transferred shall be a member of said *C*., and have and enjoy all the immunities, privileges, and franchises, and be subject to all liabilities, conditions, and penalties incident thereto, in the same manner as the original holder would have been; but no certificate shall be transferred so long as the holder thereof is indebted to such *C*., unless the board of directors shall consent thereto.

Sec. 13. It shall be lawful for all such *C*. to borrow money for the legitimate purposes of such *C*., and for such purpose to issue bonds with or without coupons attached thereto, and bearing interest not exceeding 7 per cent per annum; but the amount of such bonds outstanding at any time shall not exceed one half of the value of the corporate property of such *C*. Any issue of bonds beyond the amount herein specified shall render every director voting for the same personally liable to any bondholder for any damage caused by such over-issue to such bondholder.

Sec. 14. No *C*. organized under this act shall issue either stock or bonds except for money, labor done, or property actually received for the use and legitimate purposes of such *C*. at its fair value, and all fictitious increase of stock or indebtedness in any form shall be void.

Sec. 15. The capital stock of any *C*. organized under this act may be increased to an amount not to exceed in the aggregate \$2,000,000, or reduced by a vote of a majority of the stockholders in number, and representing a majority of the stock of such *C*., at any meeting thereof convened for that purpose, pursuant to notice thereof specifying the object of such meeting, and served pursuant to the provisions of sect. 5. A statement of such increase or reduction shall be filed in the office of the Sec. of State, and of the clerk of the county in which the principal business office of such *C*. is situated, within 10 days after such action. But before any *C*. shall be entitled to diminish the amount of its capital stock, if the amount of its debts and liabilities shall exceed the amount of capital to which it is proposed to be reduced, such amount of debts and liabilities shall be first satisfied and reduced so as not to exceed such diminished amount of capital.

Sec. 16. It shall be the duty of the directors of every such *C*. to cause to be kept at its principal office, or place of business, correct books of account of all its business and transactions, and every stockholder in such *C*. shall have the right at all reasonable times by himself or his attorney to examine the records and books of account of such *C*.

Sec. 17. It shall be the duty of the directors of every such *C*. to cause a book to be kept by the treasurer or clerk thereof containing the names of all persons, alphabetically arranged, who are or shall, within 6 years, have been stockholders of such *C*., and showing their places of residence, the number of shares of stock held by them respectively, and the time when they respectively became the owners of such shares, and the amount actually paid thereon; which book shall, during the usual business hours of the day, on every day except Sundays and legal holidays, be open for the inspection of stockholders and creditors of the *C*., and their personal representatives, at the principal business office of such *C*.; and any and every such stockholder, creditor, or representative shall have a right to make extracts from such book; and no transfer of stock shall be valid for any purpose whatever, except to render the person to whom it shall be transferred liable for the debts of the *C*., according to the provisions of this act, until it shall have been entered therein as required by this section, by an entry showing from and to whom transferred. Such book shall be presumptive evidence of the facts therein stated, in favor of the plaintiff in any suit or proceeding against such *C*., or against any one or more stockholders. Every officer or agent of any such *C*. who shall neglect to make any proper entry in such book, or

shall refuse or neglect to exhibit the same, or allow the same to be inspected, and extracts to be taken therefrom, as provided by this section, shall be deemed guilty of a misdemeanor; and the *C.* shall forfeit and pay to the party injured a penalty of \$50 for every such neglect or refusal, and all the damages resulting therefrom. And every *C.* that shall neglect to keep such book open for inspection as aforesaid shall forfeit to the People the sum of \$50 for every day it shall so neglect, to be sued for and recovered in the name of the People of the State, by the district attorney of the county in which the principal business office of such *C.* is located, and the amount so recovered shall be paid to the proper authorities for the support of the poor of such county.

*Sect. 18.* Every such *C.* shall annually, within twenty days after the first day of January, make a report, which shall state the amount of capital, and the proportion actually paid in, the amount and, in general terms, the nature of its existing assets and debts, and the dividends, if any, declared since the last report, which report shall be signed by the president and a majority of the directors, and shall be verified by oath of the president or secretary of such *C.*, and filed in the office of the Sec. of State, and if any such *C.* shall fail so to do, all the directors thereof shall be jointly and severally liable for all the debts of the *C.* then existing, and for all that shall be contracted before such report shall be made. Provided that if any director shall file with the Sec. of State, at any time within thirty days after such first of January, a certificate, verified by the oath of such director, stating that he has endeavored to have such report made and signed as aforesaid, but that the officers or a majority of the directors have refused or neglected to make and file such report; and shall append to such certificate a report containing the items aforesaid, so far as they are within his knowledge or are obtainable from sources of information open to him, which report shall be verified by him as being true to the best of his knowledge, information, and belief, in that case such director shall not be liable on account of such failure to make and file such report upon making proof of such facts in any action which may be commenced against him, upon the trial thereof. Whenever, under this section, a judgment shall be recovered against a director, severally, all the directors of the *C.* shall contribute a ratable share of the amount paid by such director on such judgment, and such director shall have a right of action against his co-directors, jointly or severally, to recover from them the proportion of the amount so paid on such judgment.

*Sect. 19.* If the directors of any such *C.* shall declare and pay any dividend when the *C.* is insolvent, or any dividend the payment of which would render it insolvent or which would diminish the amount of its capital stock, the directors voting in favor of declaring such dividend shall be jointly and severally liable for all the debts of the *C.* then existing, and for all that shall be thereafter contracted while they shall respectively continue in office.

*Sect. 20.* No loan of money shall be made by any such *C.* to any stockholder therein, and if any such loan shall be made to a stockholder, the officers who shall make it, or who shall assent thereto, shall be jointly and severally liable to the extent of such loan and interest for all the debts of the *C.* contracted before the repayment of the sum so loaned.

*Sect. 21.* If any certificate or report made, or public notice given, by the officers of any such *C.*, shall be false in any material representation, all the officers who shall have signed the same shall be jointly and severally liable for all the debts of the *C.* contracted while they are officers thereof.

*Sect. 22.* If the indebtedness of any such *C.* shall at any time exceed the amount of its capital stock, the directors of such *C.* creating such indebtedness shall be personally and individually liable for such excess to the creditors of such *C.*

*Sect. 23.* No person holding stock in any such *C.*, as executor, administrator, guardian, or trustee, and no person holding such stock as collateral security, shall be personally subject to any liability as stockholder of such *C.*; but the person pledging such stock shall be considered as holding the same, and shall be liable as a stockholder accordingly; and the estates and funds in the hands of such executor, administrator, guardian, or trustee, shall be liable in like manner, and to the same extent, as the testator or intestate, or the ward or person interested in such trust fund would have been, if he had been living and competent to act, and held the same stock in his own name.

*Sect. 24.* Every such executor, administrator, guardian, or trustee shall represent the share or shares of stock in his hands at all meetings of the *C.*, and may vote accordingly as a stockholder, and every person who shall pledge his stock as aforesaid may nevertheless represent the same at all such meetings, and may vote accordingly as a stockholder.

*Sect. 25.* No stockholder shall be personally liable for the payment of any debt contracted by any *C.* formed under this act, which is not to be paid within two years from the time the debt is contracted, nor unless an action for the collection of such debt shall be brought against such *C.* within two years after the debt shall become due; and no action shall be brought against any stockholder who shall cease to be a stockholder in any such *C.* for any debt so contracted, unless the same shall be commenced within two years from the time he shall have ceased to be a stockholder in such *C.*

*Sect. 26.* The annual election of directors shall be held at such time and place as shall be designated by the laws of the *C.*, and public notice of such time and place shall be published not less than ten days previous thereto in a newspaper published in a city or town in which the principal business office of the *C.* is situated, if a newspaper be published therein, and otherwise in the newspaper published nearest to said office; and the election shall be made by such of the stockholders as shall attend for that purpose, either in person or by proxy. No person shall be permitted to vote upon the proxy of a stockholder in any such *C.* after the lapse of eleven months from the date thereof, unless the stockholder shall have specified therein that it is to continue in force for some longer and limited time. All elections shall be by ballot, and each stockholder shall be entitled to as many votes as shall equal the number of his shares multiplied by the number of directors to be elected, and he may distribute his votes among those to be voted for as he sees fit; and the persons receiving the greatest number of votes shall be directors; and when any vacancy shall occur among the directors by death, resignation, or otherwise, it shall be filled for the remainder of the year in such manner as may be provided for by the by-laws of the said corporation.

*Sect. 27.* In case it shall happen at any time that an election of directors shall not be made on the day designated by the by-laws of said *C.*, when it ought to have been made, the *C.*, for that reason, shall not be dissolved, but it shall be lawful, on any other day within three months thereafter, to hold an election for directors, upon service of notice upon the stockholders thereof respectively in the manner provided in *sect. 5* of this act; and all acts of directors shall be valid and binding as against such *C.* until their successors shall be elected.

*Sect. 28.* Every person acting as an inspector of election in any such *C.* shall, before entering upon the duties of his office, take and subscribe an oath or affirmation before some officer authorized to administer the same, that he will discharge the duties of his office with fidelity, and that he will not receive any vote but such as he believes to be legal, nor reject any which he believes to be legal; and if any such inspector shall violate this oath or affirmation, he shall be subject to all the penalties imposed by law upon inspectors of general State elections in this State violating their duty, and shall be proceeded against in like manner and with like effect.

*Sect. 29.* Whenever any *C.* organized under this act has fixed the duration of its corporate existence for a less period than fifty years, it may, at any time, extend the term of its existence beyond the time mentioned in the original certificate of incorporation by the consent of the stockholders owning two thirds in amount of the capital stock of such *C.*, in and by a certificate, to be signed by such stockholders, in person or by attorney duly authorized and acknowledged or proved, so as to enable it to be recorded, which certificate shall be filed in the office of the Sec. of State, and of the clerk of the county in which the principal business office of such *C.* is situated; and the said Sec. of State and the county clerk respectively upon such filing shall record the same in the record of *C.* kept in this office, and make a memorandum of such record in the margin of the original certificate in such record book; and thereupon the time of existence of such *C.* shall be extended, as designated in such certificate, for a term which, with the term originally fixed, will not exceed fifty years.

*Sect. 30.* Every *C.* organized under this act shall be taxed on all of its property, except its real estate in the town, city, or village where its principal business office is situated, and on its real estate in the town, city, or village where such real estate is situated shall be taxed therein.

*Sect. 31.* Such *C.* may change its principal place of business by the consent of the stockholders owning two thirds in amount of the capital stock of such *C.*, in and by a certificate to be signed by such stockholders in person or by attorney duly authorized and acknowledged or proved, which certificate shall be filed in the office of the Sec. of State, and of the clerk of the county in which the principal business office of such *C.* is situated, and the Sec. of State, and county clerk respectively shall, upon such filing, record the same in the record of *C.* kept in his office, and make a memorandum of such record in the margin of the record of the original certificate recorded in such office, and thereupon the principal business office of such *C.* shall be deemed to be changed as stated in said certificate.

*Sect. 32.* Any existing business *C.*, heretofore organized under the general laws of this State, or by special charter, may come under and avail itself of the privileges and provisions of this act, by complying with the following provisions: The directors of such *C.* shall publish a notice, signed by at least a majority of them, in a newspaper in the county in which the principal business office thereof is situated, for at least three successive weeks, and to deposit a written or printed copy thereof in the post office, postage prepaid, addressed to each stockholder at his last known place of residence, at least three weeks previous to the day fixed upon for holding such meeting, specifying the object of the meeting, and the time and place when and where such meeting shall be held. At the time and place specified in the notice, the stockholders shall organize by choosing one of the directors chairman of the meeting, and also a suitable person for secretary, and proceed to a vote of those present, in person or by proxy; and if

votes representing a majority of all the stock of the company shall be given in favor of availing itself of the provisions of this act; the said officers shall make a certificate of the proceedings showing a compliance therewith, duly acknowledged and stating: 1. The name of the C; 2. The object for which it is formed, including the nature and locality of its business; 3. The amount and description of the capital stock; 4. The number of shares of which such capital stock consists; 5. The location of the principal business office; 6. The duration of the C, which, however, shall not exceed fifty years; 7. The names of directors. Which certificate, with a copy of the by-laws of such C, shall be filed in the office of the Sec. of State, and of the clerk of the county in which the principal business office of such C is situated. From the time of such filing, such C shall be deemed to be a C organized under this act; but no such change or proceedings shall in any way affect the existing liabilities of the C so availing itself of the provisions of this act.

*Sect. 33. The C formed under this act shall be of two classes, to be known respectively, as: 1. Full liability companies. 2. Limited liability companies.*

*Sect. 34. In "full liability companies," all the stockholders shall be severally individually liable to the creditors of the company in which they are stockholders, for all debts and liabilities of such company, and may be joined as defendants in any action against the company. No execution shall issue against any stockholder individually, until execution has been issued against the company and been returned unsatisfied; and whenever a judgment shall be recovered against a stockholder individually, all the stockholders shall contribute a proportionate share of the amount paid by such stockholder on such judgment, proportioned to the number of shares of stock owned by each of such stockholders, and such stockholder shall have a right of action against the other stockholders in such C, jointly or severally, to recover from them and each of them, the proper portion due by them and each of them of the amount so paid on such judgment.*

*Sect. 35. In "limited liability companies," the name of the company shall in every case have as its last word, the word "limited," and every such C shall print or affix, and shall keep printed or affixed, its name on the outside of every office or place in which the business of the company is carried on, in a conspicuous position in letters easily legible, and shall have its full name stated in legible characters in all notices, advertisements, and other official publications of such company, and in all its bills of exchange, promissory notes, checks, orders for money, bills of lading, invoices, receipts, letters, and other writings used in the transaction of the business of the C.*

*Sect. 36. Every omission of the word "limited" in the use of the name of such company shall render each and every officer or director in such company personally liable for any indebtedness, damage, or liability incurred during such omission. If any limited liability company under this act does not print or affix, and keep printed or affixed, its name, in the manner above set forth, it shall be liable to a penalty of not exceeding \$25 for such omission, for every day during which such name is not so kept printed or affixed; and every director or officer of such company who shall authorize or permit such omission, shall be liable to a like penalty; and if any director or officer of such company, or any person on its behalf, shall use or authorize the use of any seal, purporting to be a seal of the company, on which its name is not so engraved as aforesaid, or shall use or authorize the issue of any notice, advertisement, or other official publication of such company, or shall sign, or authorize to be signed, on behalf of such company, any bill of exchange, promissory note, indorsement, check, order for money or goods, invoice, bill receipt, letter of credit, or other writing of the company, wherein its name is not mentioned as aforesaid, he shall be liable to a penalty of \$100. The penalties in this section provided shall be sued for in the name of the People of the State of New York by the district attorney of the county in which the principal office of such corporation is located, and the amounts recovered shall be paid over to the proper authorities for the support of the poor of such county.*

*Sect. 37. In limited liability companies, all the stockholders shall be severally individually liable to the creditors of the company in which they are stockholders, to an amount equal to the amount of stock held by them respectively, for all debts and contracts made by such company, until the whole amount of capital stock fixed and limited by such company has been paid in, and a certificate thereof has been made and recorded as hereinafter prescribed. The term stockholder as used herein shall apply, not only to such persons as appear by the books of the C or association to be such, but also to every equitable owner of stock, although the same may appear on such books in the name of another person, and also to every person who shall have advanced the installments or purchase-money of any stock in the name of any person under 21 years of age, and while such person remains a minor to the extent of such advance; and also to every guardian or other trustee who shall voluntarily invest any trust funds in such stock; and no trust funds in the hands of such guardian or trustee shall be in any way liable under the provisions of this act, by reason of any such investment, nor shall the person for whose benefit*

any such investment may be made be responsible in respect to such stock, until thirty days after the time when such persons respectively become competent and able to control and dispose of the same, but the guardian or other trustee making such investment as aforesaid, shall continue responsible as a stockholder until such responsibility devolves upon the person beneficially interested therein; and in respect to stock held by a guardian or other trustee under a transfer of the same by a third person, or under positive directions by a third person for such investment, the person making such transfer or giving such directions, and his executors and administrators shall, for the purposes of this act, be deemed a stockholder; and the estate of such person, if he be deceased, shall be responsible for the debts and liabilities chargeable on such stock, according to the provisions of this act. No execution shall issue against any stockholder individually, until execution has been issued against the corporation and returned unsatisfied; and whenever a judgment shall be recovered against a stockholder individually, all the stockholders shall contribute a proportionate share of the amount paid by such stockholder on such judgment proportioned to the number of shares of stock owned by each of such stockholders, and such stockholder shall have a right of action against the other stockholders in such C, jointly or severally, to recover from them, and each of them, the proportion due by them and each of them of the amount so paid on such judgment. The capital stock of every such limited liability company shall be paid in, one half thereof within one year, and the other half thereof within two years from the incorporation of said company, or such C shall be dissolved. The directors of every such company, within thirty days after the payment of the last installment of the capital stock, shall make a certificate stating the amount of the capital so paid in, which certificate shall be signed and sworn to by the president and a majority of the directors, and they shall, within the said thirty days, record the same in the office of the Sec. of State, and of the county in which the principal business office of such corporation is situated.

*Sect. 38. The dissolution for any cause whatever, of any C created as aforesaid, shall not take away or impair any remedy given against such C, its stockholders or officers, for any liabilities incurred previous to its dissolution.*

#### 1. FORM OF CERTIFICATE OF INCORPORATION — (*Business to be carried on within the State*)

State of New York,  
Town of Brooklyn, )  
King's County. ) ss:

We, the undersigned citizens of the State of New York, do hereby certify that we have associated together as a manufacturing corporation, to continue in existence for the period of thirty years from the date hereof, for the purpose of carrying on and conducting the manufacture of india-rubber goods.

That the corporate name of said corporation is the "East Brooklyn Manufacturing Company."

That the amount of the capital stock thereof is one hundred thousand dollars, and is divided into one thousand shares of one hundred dollars each.

That the number of trustees of said corporation is seven.

And that the following are the names of the trustees who will manage its concerns for the first year, to wit: A. B., etc.

And we do further certify, that the manufacturing operations of the said corporation are to be carried on in the town of Brooklyn aforesaid.

(Signed) A. B., etc.

Dated August 10, 1879.

#### 2. FORM OF CERTIFICATE OF INCORPORATION — (*Part of the business to be done out of the State*)

(As in form No 1; adding before signing)

The said corporation is formed for the purpose of carrying on some part of its business out of the State of New York at (insert name of place), but the principal part of the business of said company is to be transacted at said Brooklyn.

(Signed) A. B., etc.

Dated August 10, 1879.

#### 3. FORM OF ACKNOWLEDGMENT ANNEXED TO CERTIFICATE OF INCORPORATION.

State of New York,  
King's County.

On the tenth day of August, 1879, before me came the within named A. B., etc., to me known to be the persons described in, and who executed the within instrument, and specially acknowledged the execution thereof.

J. J.  
Justice of the Peace.

#### 4. FORM OF PROXY TO VOTE.

Know all men by these presents, that I, A. B., of Chicago, do hereby constitute and appoint C. D. to be my lawful attorney, substitute, and proxy, for me and in my name, to vote on all the stock held by me in the East Brooklyn Manufacturing Company, at any election for directors, as fully as I might or could do, were I personally present at such election.

In witness whereof, I have hereunto set my hand and seal this 10th day of August, 1879.

In presence of (Signed) A. B. [L. S.]

## 5. FORM OF AFFIDAVIT ANNEXED TO PROXY.

I, A. B., of Chicago, do swear, that the shares in the capital stock of the East Brooklyn Manufacturing Company, for which I have given the above power or proxy to vote, do not belong and are not hypothecated to the said C. D., and that they are not hypothecated or pledged to any other corporation, or any person or persons whatever; that such shares have not been transferred to him for the purpose of enabling him to vote thereon, and that I have not contracted to sell or transfer them upon any condition, agreement, or understanding, in relation to the manner of voting at any election.

A. B.

Sworn before me this 10th }  
day of August, 1879.

P. M., Justice, etc.

## 6. FORM OF POWER OF ATTORNEY FOR TRANSFER OF STOCK.

Know all men by these presents, that I, A. B., for value received, have bargained, sold, and assigned, and by these presents do bargain, sell, and assign unto R. S., the following described stock, to wit, (describe the kind of stock) unto me, belonging and held by certificate No. 103, in my name, and hereunto annexed, and do hereby constitute and appoint G. T., the treasurer of said company, my true and lawful attorney, irrevocably, for me and in my name and stead, to assign and transfer the said stock unto the said R. S., and for that purpose to make and execute the necessary acts of assignment and transfer, and an attorney or attorneys under him for that purpose to make and substitute, and to do all other lawful acts requisite for effecting the premises, hereby ratifying and confirming the same.

In witness whereof, I have hereunto set my hand and seal in the city of Boston, the tenth day of August, in the year of our Lord, one thousand eight hundred and seventy-nine.

(Signed) A. B. [L. S.]

## 7. FORM OF ACKNOWLEDGMENT ANNEXED TO No. 6.

State of Massachusetts, } ss:  
City of Boston,

On the 10th of August, 1879, personally appeared before me, A. B., to me known to be the person described in, and who executed the within instrument, and acknowledged the execution of the same for the uses and purposes therein mentioned.

E. F.

Commissioner of Deeds.

**Correspondent**, one at a distance who carries on commercial intercourse with another.

**Corroi** [Fr.], a coating stuff for paying a ship's bottom.

**Corrosive**, having the power to eat away.

**Corrosive-Sublimate**, the old name for bichloride of mercury. See MERCURY.

**Corrugated Iron**. Corrugation is a convenient mode of imparting strength to thin iron sheets, by bending them into a series of alternate convex and concave curves, whereby they become wrinkled, puckered, gauffered, or crimped. The corrugation is effected by passing the sheets between rollers peculiarly shaped. The sheets thus prepared are largely used for roofs, railway sheds, temporary churches, stores and warehouses, and even boats.

**Corsage** [Fr.], a lady's waist-dress or bodice.

**Corsair**, a piratical vessel which cruises about, attacking and plundering merchant ships.

**Corset Jeans**, twilled cotton cloth for corsets, having sometimes a kind of satin face.

**Corsets** [Fr.], stays or supports for the waist, worn by females.

*Imp. duty* : C., or manuf. cloth, woven, or made in patterns of such size, shape, and form, or cut in such manner as to be fit for C., valued at not over \$6 per doz., \$2 per doz. The same, valued at over \$6 per doz., 35 per cent.

**Corsica** [Fr. *Corse*], a large island of the Mediterranean, belonging to France, is situated immediately to the N. of Sardinia (from which it is separated by the narrow strait of Bonifacio, between lat. 41° 20' and 41° 43' N., lon. 8° 30' and 9° 30' E.; area, 3,376 sq. m.). It lies within 54 m. W. of the coast of Tuscany, 98 m. S. of Genoa, and 106 m. S.E. of the French coast of Nice. The greatest part of C. is occupied by lofty and rugged mountains. Agriculture is in a very backward

state, owing principally to the minute subdivision of the land, a system which perpetuates the social evils of hereditary feuds and jealousies, by which C. has long been distracted. A large proportion of the exports of the island consists of honey and wax, which are procured from the forests. The principal harbors are on the W. side, Ajaccio (cap. of the island, pop. 16,545) and Calvi, and on the E. side, Bastia and Porto Vecchio. At the extreme S. is the harbor and town of Bonifacio. Pop., 258,507.

**Corsican Moss**, a nutritious, strong-scented sea-weed, the *Plocaria helminthochortos*, found on the coasts of the Mediterranean, recommended medicinally for removing worms. As found in commerce, this moss consists of various marine productions, with a very little *Plocaria* intermixed.

**Cortical**, belonging to the bark.

**Corton**. See BURGUNDY WINES.

**Corundum**, a mineral, composed of crystalline alumina, in great request for grinding and polishing machinery, plate glass, pebbles, etc. There are several kinds, as common C., or adamantite spar, obtained in the East, the sapphire and ruby, which are termed precious C., and emery.

**Corvette**, one of the smallest vessels of war, rarely carrying more than 26 guns. It has flush decks, and three square-rigged masts.

**Cosagues**, a French fancy paper for wrapping sweetmeats.

**Cos-Lettuce**, an esteemed variety of lettuce, with leaves of an oblong shape.

**Cosmetics**, an external application employed for the purpose of preserving or restoring personal beauty. The term is generally understood to refer to substances applied to the cuticle, to improve the color and clearness of the complexion; but some writers have included under this head every topical application used with the like intention. Hence, cosmetics may be divided into *cutaneous C.*, or those applied to the skin; *hair C.*, or such as are employed to promote the growth and beauty of the hair; and *teeth C.*, or such as are used to cleanse and beautify the teeth. See COSMETIQUE, DENTIFRICE, DEPILOYATORY, HAIR-DYE, POMADE, TOOTH-POWDER, etc. For internal revenue regulations, see MEDICINE; and for *Imp. duty*, see TOILET ARTICLES.

**Cosmetique** [Fr.], a hard and scented pomatum, formed into a cake or stick, for the toilet. It is sometimes colored black or brown, the pigments being added in the state of an impalpable powder. It is used to color mustaches, eyebrows, whiskers, etc., as well as to keep the hair in its place.

To make *Black C. (C. noir)*, take good lard, 5 parts; wax, 2 parts (or, hard pomatum, 7 parts); melt; stir in levigated ivory black, 2 parts; and pour it into moulds of tinfoil, which are afterwards to be placed in paper sheaths.—*Brown C. (C. brun)*, as the last, but using levigated umber for "plain brown," and levigated terra di Sienna for "auburn" and "chestnut"—*White C. (C. blanc)* is the same, without coloring matter.

**Coss**, a corrupted term for the karo or krossah, an Indian itinerary or road measure, which varies in different places, averaging, however, about 1½ mile. It is generally distinguished into the standard C., which ranges from 35 to 45 to the degree, and the common C., from 1 to 2½ miles. The Bengal C. of 1,000 fathoms is 1 mile, 1 furlong, 3 poles, and ¾ yards.

**Cossas**, a kind of plain Indian muslin.

**Costa Rica**, the most southern of the five republics of Central America, occupies the isthmus between about lat. 8° and 11° N., and lon. 82° and

86° W. It is bounded N. by Nicaragua, S. by the Colombian State of Panamá, N.E. by the Caribbean Sea, and S.W. by the Pacific Ocean. The population, which consists mainly of people of Spanish descent, little mixed with foreign elements, is officially estimated at 175,000, including about 5,000 civilized Indians of pure blood, 1,200 negroes, and 600 Chinese; but besides these there are from 10,000 to 12,000 uncivilized Indians within the limits of the republic. San José, the capital (pop. 15,000), is situated among the mountains, midway between the Pacific Ocean and the Caribbean Sea. The country is governed under a constitution bearing date Dec. 22, 1871. By its terms the legislative power is vested in a congress, called the *Congreso Constitucional*, chosen in electoral assemblies, the members of which are returned by universal suffrage. The members of the Congress are elected for the term of 4 years. The executive authority is in the hands of a president, elected in the same manner as the Congress for the term of 4 years. There have been constant changes in the executive in recent years, owing to civil wars and insurrections, which did not allow many presidents to serve the full term of office.

The Atlantic coastland of C. R. is generally low, and is characterized by numerous lagoons, which have been formed by the prevailing currents opposite the river mouths, the chief break in its extent being the great Lagoon or Gulf of Chiriquí. The Pacific coast rises higher, and is marked by the two large peninsulas which enclose the Gulfs of Nicoya and Dulce. Inland the surface of the country is much diversified, but is chiefly occupied by mountains, plateaus, and valleys. In contrast to the S.W. descent, the Atlantic slope is covered with dense, impenetrable forest, and has remained almost closed to traffic and civilization from the earliest times of colonization. Indians, still living in a savage state, occupy some portions of this wild forest country. They are perfectly uncivilized, hunters with bow and arrow, and are independent of the government; they trade a little with adventurers from Jamaica, bartering sarsaparilla, hiles, and turtle-shells for arms and powder, cotton stuffs, and tobacco. The Mosquito Indians come annually in canoes to the Atlantic coast in May and June to fish for turtle in the Lagoon of Chiriquí. The Pacific slope, on the other hand, is characterized by wide savannas or llanuras, bordered by forest, and is much more accessible. The climate varies with the elevation, from the tropical heat of the coast, which is often fever stricken, to the temperate and healthy air of the plateau, and the cold of the mountain heights. In the plateau of San José, the N.E. trade wind, prevailing from October to April, brings dry weather; from April to October, the S.W. monsoon, blowing up from the Pacific, brings almost daily rain, excepting within a remarkable period of about a fortnight of dry weather in June, called the "Veranillo de San Juan." The rainfall at San José (3,872 feet above the sea) averages from 49 to 60 inches annually; the average temperature here is about 68° F., rising to 76° in the hottest month of summer and falling to 55° F. in the coldest. The country is subject to earthquakes; a very severe one, occurring in 1841, destroyed the town of Cartago. C. R. is exceedingly fertile, its forests being filled with an immense variety of timber trees and useful dye-woods, such as mahogany, ebony, India-rubber, Brazil-wood, and oak; almost all the fruits of the tropical and temperate zones are found to thrive, and flowering plants are in rich profusion. Coffee is the staple cultivated product of the country, and is grown chiefly on the plateau lands of San José and Cartago,—the special adaptability of these to the growth of this plant being attributed to the nature of the soil, which consists of layers of black or dark-brown volcanic ash of from 1 to 6 yards in depth. Rice, maize, barley, potatoes, beans, bananas, and yucca are also cultivated to some extent in the interior; coconuts, vanilla, sugar-cane, tobacco, cotton, and indigo, on the warm coast lands, but as yet only for home consumption. About 1,150 sq. m. of the country are under cultivation. As yet the chief highway of C. R. is the wagon-road from Punta Arenas on the Gulf of Nicoya, virtually the only port of the country, to the capital of San José, and thence to Cartago on the central plateau. Mule-tracks lead N.W. from Punta Arenas through the prov. of Guanacaste to Nicaragua, from San José N.E. by the valley of the Sarapiquí to Grey Town on the Atlantic, from Cartago E. to Puerto Limón, also on the Atlantic, and S. over the W. spur of the Montaña Dota to the plains of Terraba. A railroad from Alajuela to the capital and through Cartago to Puerto Limón, part of a proposed inter-oceanic highway, was begun in 1871, and in December, 1873, the portion between Alajuela and Cartago, 42 miles, had been completed. Owing to financial difficulties, however, the work ceased in 1874, and only sufficient hands were em-

ployed to keep the part finished in working order. 200 m. of telegraph line had been completed in 1878. There are no manufacturing industries in C. R. The country is rich in minerals,—gold, silver, copper, iron, nickel, zinc, lead, marble,—but up the present time gold, silver, and copper are the only ores that have been worked. The principal gold mines are (1) those of Trinidad, 4 leagues inland from Punta Arenas, 1,200 feet above the sea, worked on a small scale by a C. R. company,—the quartz yields gold of a fineness of about 174 carats; and (2) the mines of the Cerro del Aguacate, one of which is worked by the native "Compañía de la Montaña del Aguacate," also in an imperfect manner, but with good results. Another, called the "Sacra Familia," lies a little N. of the Aguacate mine, at an elevation of 3,000 feet above the sea; it has two chief veins, one containing galena and zinc blend, with silver, and gray copper ore also yielding silver, and a second, with a lode of gold quartz similar to that of Trinidad. This mine is also worked on a small scale by private individuals, and gives gold of about 15½ carats fine. Gold is said, also, to exist in the wild Indian country of the Atlantic slope, but the position of the supposed mines is uncertain.

The total exports of C. R. for the year 1877 amounted to \$5,317,406, of which \$5,007,496 were shipped from Punta Arenas (pop. 1,800) on the Pacific. Only a small part of the trade of the republic passes through Puerto Limón on the Atlantic, to which there is a mule-track, the bulk of goods being carried round to the Pacific port of Punta Arenas, whence there is a highway to the interior. The chief articles shipped from the former port were:—coffee, 24,340,000 lbs., worth \$4,539,154, deerkins, \$64,533; india-rubber, \$26,530, and farina, \$15,421. The commercial intercourse of C. R. is chiefly with England; but trade with the U. States is slowly increasing, notwithstanding the great facilities afforded to the English trade by the Royal Mail Steamship Co., whose steamers touch at Atlantic Central American ports. San Francisco is doing an extensive trade with Central America, chiefly with C. R., that city being, next to London, the most favorable market for the C. R. coffee. But for this trade between California and Central America, the commercial intercourse of the U. States with that part of America would sink into utter insignificance. Our trade with C. R. is not reported on in the "Annual Statements," published by the Chief of the Bureau of Statistics of the U. States, which throws the statistics of C. R. together with other States, under the general heading of "Central America." For the value of imports and exports thus given, see *Guatemala*.

**Finances.** The revenue of the republic, derived from customs, monopolies of spirits, and tobacco, from the national bank, sales of land, and various taxes, chiefly that on the exportation of coffee, amounted in 1877 to \$2,379,432; the expenditure in the same year was \$2,512,972, showing a deficit of \$133,540. In 1871 the government contracted in London a loan of \$5,000,000, and in 1872 another of \$12,000,000 for the construction of an inter-oceanic railway. In 1877 the external debt from this source was \$12,543,000. Of this sum \$5,580,000 had been spent on the railroad previous to the close of 1873, when the further execution of the work ceased. The interest and sinking-fund of this loan are far in arrears; the country is bankrupt, and the government has made no attempt to pay even part of its liabilities.

**Money, Weights, and Measures.** See *GUATEMALA*.

**Costermonger**, the English name for an itinerant hawk or street dealer; originally costardmonger, one who sold apples, but now applied indiscriminately to hawkers of fruit, vegetables, fish, etc.

**Costume**, a term usually applied to a fancy or character dress.

**Costumier**, a dealer in fancy dresses.

**Costus**, a name for the patchroot, a kind of Indian orris, obtained from *C. Arabicus*, used in China as an incense.

**Cote** [Fr.], the quotation in a prices-current.

**Cote-Rotie**, a red wine grown near Lyons, which ranks as one of the best in France. The quantity produced of the very best quality is small, rarely exceeding 250 hectolitres. It is remarkable for the excellence of its color, for clearness, strength, and perfume; at the nose it has the sweet odor of the violet. It is very slightly bitter. When not aged, it is a little heady, and is much improved by a voyage. Its alcohol is about 12.32 per cent.

**Cotgare**, refuse wool, hemp, or flax.

**Cotillon**, a woollen material, made of various colors, for ladies' skirts.

**Cotogno** [It.], the quince-tree.

**Cotswold-Sheep**, a long-wooled breed of English sheep, so named from the cots or sheds in which they were housed, which at one time were peculiar to the counties of Gloucester, Hereford, and Worcester.

**Cottah**, an Indian land measure, the 20th part of the beegah or bigah; equal in Bengal to 720 sq. feet.

**Cotton** [Fr. *coton*; Ger. *Baumwolle*; Hindus. *rûhi*; It. *bambagia*, *cotone*; Port. *algodao*; Sp. *algodon*], a vegetable hair, or filamentous down, enveloping the seeds of different species of *Gossypium*, a plant growing in warm climates, and indigenous to India and America. It is produced within pods which protect it from injury by dust or weather, until it is ripe and fit to be gathered, when the heat of the sun causes it to expand and burst open the pod. It is of a white or yellowish-white hue, possesses downy softness and warmth, and its delicate fibres are sufficiently long, flexible, and tenacious to admit of being spun into a fine thread. The usual distinctions of the plant are, 1st, *Tree C.*; 2d, *Shrub C.*; 3d, *Herbaceous C.*; of each of which there are several kinds, — the plant having a great tendency to run out into varieties. — 1st, *Tree C.* (*G. arboreum*) (Fig. 110) is found in India,

Fig. 110. — COTTON-TREE.

China, Egypt, the western coast of Africa, and in some parts of America. It only attains the height of from 12 to 20 feet; but another cotton-bearing tree (*Bombax ceiba*), seen in the West Indies and elsewhere, called familiarly the *umbrella tree*, attains the height of 100 feet. The produce of the latter, however, is of so short and brittle a fibre, that it is unfit for spinning or any other purpose, except stuffing pillows and beds. — 2d, *Shrub C.* (*G. religiosum*) occurs in one or other of its varieties throughout the tropical parts of Asia, Africa, and America. In appearance it resembles a currant-bush. Its duration varies according to the climate; in the hottest countries it is a perennial, while in cooler places it becomes an annual. In the former, two crops a year are gathered, one from October to December, the other from February to April. The Guiana, Brazil, and most of the West India *C.* is of this kind; the whole being also long-stapled. — 3d, *Herbaceous C.* (*G. herbaceum*), by far the most useful and important of the

three kinds we have noticed, is an annual plant cultivated in the United States, India, China, and many other countries. It attains the height of 18 or 24 inches. The seed is usually planted in rows in March, April, and May; and the cotton is gathered by hand, within a few days after the opening of the pods, in August, September, and October. It is to this kind that the planters confine their attention in this country. In places where *C.* is most extensively cultivated, the following varieties are commonly distinguished: 1st, *Nankeen C.*, abundant in produce, the seed covered with down, the wool of a dirty yellow color, and usually low priced. 2d, *Green-seeded C.*, which, as well as the former, is grown in the upland and middle districts, whence the latter is called *upland*, also *short-staple*, and, from the mode in which it was formerly cleaned, *bowed Georgia C.* This kind was at first chiefly raised in Georgia and S. Carolina, but in later years it has been very greatly extended in Alabama, Mobile, and the Valley of the Mississippi. 3d, *Sea-island* or *Long-staple C.*, the finest of all, is distinguished by the black color of its seed, and the fine yellowish-white, strong, and silky long-staple by which it is surrounded; it is grown in the lower parts of Georgia and S. Carolina, near the sea, between Charleston and Savannah, and on small islands adjoining the shore. Owing to the peculiar combination of circumstances requisite for the production of this kind, it forms only a trifling proportion of the *C.* grown in the U. States; nor is the quantity on the increase. — All the varieties of the plant require a dry and sandy soil. Marshy ground is wholly unfit for it, and a wet season is destructive to the crops, which are besides precarious from the diseases to which the plant is subject, particularly blight produced by wetness at the roots. In general, it flourishes most luxuriantly, and yields produce of the best quality, on the coast, as is proved by the growth of the sea-island *C.*, which is mostly exposed to the action of the ocean's spray; and a manure of salt mud is known to impart a healthful action to the plant, and to produce a staple at once strong and silky. To this rule, however, the fine Pernambuco *C.* is an exception; also the Egyptian, the growth of the upper provinces being greatly superior to that of the Delta. In the U. States, the average yield of *C.* is about one bale for three acres, this rate of yield being sustained in the East by fertilization, while it is kept up in the West by opening fresh land.

There is no portion of the world occupied by civilized nations, and probably no equal extent of the earth's surface, so peculiarly suited to *C.*-culture as the States of the Gulf coast. There are large areas with the requisite soil and the high temperature required, but with these essentials the necessary degree of humidity is rarely combined in so complete equilibrium. It constitutes an advantage which virtually gives the monopoly of *C.*-production to the U. States. The policy of Great Britain has ever been to obtain a controlling proportion of raw material for her manufacturers from her own colonies, and to this end her Cotton Supply Association has searched the world over for *C.*-fields that would make her independent of this country. This is a natural and laudable ambition, a means of self-protection, and the highest measure of "protection" she could institute; for while she commends free trade to other nations, she finds in it the highest form of protection, precisely as she built up her manufacturing system by restrictive duties up to a period when the opposite policy tended to secure a continuance

of the superiority thus wisely gained. When debarred from our *C.* fields by civil war, the receipts from India were increasing under the stimulus of this self-protecting effort; yet with a *C.* famine in Manchester, and starvation threatening the spinners, the increase from 369,000,000 lbs. in 1861 to 506,000,000 lbs. in 1864 was less than the advance from 1857 to 1861. In the very first year of peace in this country these imports declined one eighth, though they rallied in 1863 to 615,000,000, the highest figures ever attained, and rapidly declined afterward to less than half that quantity. In 1858 and 1860 the receipts from America constituted four fifths of the British imports. In 1863 they amounted to a fraction of 1 per cent; in 1864,  $1\frac{1}{2}$  per cent, and in 1862 but  $2\frac{1}{2}$  per cent. Starting at 37 per cent in 1866, in 1876 the proportion reached 62 per cent, and the proportion of India cotton had fallen to 18½ per cent. The price, as an index of quality, tells the story of India's inability to compete with the U. States. The average value per pound, in pence, of British imports, is thus given:—

	1872.	1873.	1874.	1875.	1876.
Cotton of the U. States....	9 9	9 1	8	7 7	6 4
Cotton of India .....	7	6 4	6	5 7	5 1

American seed and American planters have in vain been introduced into India; the fibre inevi-

tably deteriorates, becomes short, dry, harsh, and brittle, with a low rate of yield.

The progress in *C.* production, like that of many other industries in this country, is westward. In 1849 Alabama stood in the front rank, with 22 8 per cent of the crop, and Georgia ranked next, with Mississippi following closely. Scarcely an eighth of the crop was produced west of the Mississippi. In 1869 about three tenths of the product came from beyond the Mississippi. N. Carolina had declined from 2.9 to 2.7 per cent, S. Carolina had fallen from 12 to 6.4, and Georgia from 19.8 to 13. Louisiana had advanced from 7.2 to 14.4, and Arkansas from 2.2 to 6.8. At the present time more than three eighths of the crop is grown W. of the Mississippi, Texas making rapid strides, evidently destined soon to lead the column of *C.* States. The following statement gives the percentages of the crop produced by each State, as deduced from the census, with the estimated proportion in 1878:—

STATES	1849.	1859.	1869.	1878.
North Carolina .....	2.9	2.7	4.8	4.7
South Carolina .....	12	6.4	7.4	7.0

The manufacture of *C.* has been carried on in Hindostan from the remotest antiquity, but the employment of *C.* for textile fabrics obtained no footing worth mentioning in Europe till last century. From the first introduction of the *C.* manuf. in England (probably in the early part of the 17th cent.) down to 1773, the weft or transverse threads of the web, only, were of *C.*; the warp, or longitudinal threads, consisting wholly of linen yarn, was principally imported from Germany and Ireland. In the first stage of the manuf. the weavers, dispersed in cottages throughout the country, furnished themselves as well as they could with the warp and weft for their webs, and carried them to market when they were finished; but about 1760 a new system was introduced. The Manchester merchants began about that time to send agents into the country, who employed weavers, whom they supplied with foreign or Irish linen yarn for warp, and with raw *C.*, which being carded and spun, by means of a common spindle or distaff, in the weaver's own family, was then used for weft. A system of manuf. was thus established; the junior branches of the family being employed in the carding and spinning of the *C.*, while its head was employed in weaving the linen and *C.* yarn into cloth. This system, by relieving the weaver from the necessity of providing himself with linen yarn for warp and raw *C.* for weft, and of seeking customers for his cloth when finished, and enabling him to prosecute his employment with greater regularity, was an obvious improvement on the system that had been previously followed; but it is at the same time clear that the impossibility of making any considerable division among the different branches of a manufacture so conducted, or of prosecuting them on a large scale, added to the interruption given to the proper business of the weavers by the necessity of attending to the cultivation of the patches of ground which they generally occupied, opposed invincible obstacles to its progress, so long as it was conducted in this mode. In 1767, however, James Hargreaves invented the *spinning-jenny*. At first this admirable machine enabled 16 to 30 threads to be spun

with the same facility as 1; and it was subsequently brought to such perfection, that a little girl was enabled to work no fewer than from 80 to 120 spindles. The jenny was applicable only to the spinning of cotton for weft, being unable to give to the yarn that degree of firmness and hardness which is required for the longitudinal threads, or warp; but this deficiency was soon after supplied by the introduction of the *spinning-frame* (1769-1775), — that wonderful piece of machinery which spins a vast number of threads of any degree of fineness and hardness, leaving to man merely to feed the machine with cotton, and to join the threads when they happen to break. Sir Richard Arkwright gave his machine the name of the *water-frame*; but it has since become known as the *spinning-frame*. Nearly at the same time that the spinning department was thus wonderfully improved, Dr. Cartwright, a clergyman of Kent, invented the *power-loom* (in 1787), a machine which has already gone far to supersede weaving by the hand. While these extraordinary inventions were being made, Watt was perfecting the steam-engine, and was thus not only supplying the manufacturers with a new power applicable to every purpose, and easy of control, but with one that might be placed in the most convenient situations, and in the midst of a population trained to industrious habits. Still, something remained to complete this astonishing career of discovery. Without a vastly increased supply of the raw material at a lower price than it had previously brought, the inventions of Hargreaves, Arkwright, and Watt would have been of comparatively little value. Luckily, what they did for the manufacturers, Mr. Eli Whitney, originally of Massachusetts, and afterwards a citizen of New Haven, Connecticut, did for the American *C.*-growers. His invention of the *saw-gin*, which came into operation in 1793, forms an important era in the history of the *C.* trade. This invention, by which one man can separate 3 cwt. of *C.* in a day, has been the main cause of the cheapness of the short-stapled American *C.*, and thus has powerfully contributed to the extension of its cul-

tivation. In consequence of these and innumerable other inventions and improvements, the prices of C. cloth and yarn have gone on progressively diminishing. But as the demand for C. has been, owing to its extraordinary cheapness, extended in a still greater degree, the value of the goods produced, and the number of persons employed in the manufacture, have been steadily increasing. The first machines set up in the U. States were at East Bridgewater, Mass., in 1786, by two Scotchmen, employed by Mr. Orr of that place. The manufacture, however, languished for want of competent machinery until 1790, when a person named Slater, who had been employed in the English cotton-mills in Derbyshire, and had there acquired a knowledge of the Arkwright processes, established himself, in conjunction with partners, at Providence, R. I. In 1806, Slater's brother came over from England, and joined him; when they at once started business at the village of Slatersville in the same State, and gave an extraordinary impetus to the manufacture, which, by 1816, had increased to the consumption of about 100,000 bales of the raw article, turning out 81,000,000

ern States, especially in Alabama, Georgia, N. and S. Carolina, Mississippi, Virginia, etc., the manuf. as well as the growth of C. has become an important industry. The number of spindles, which was 5,235,727 in 1860, and 7,432,415 in 1870, is now estimated at 10,100,000. The amount of capital invested in the trade was \$98,000,000 in 1860, \$141,000,000 in 1870, and \$208,000,000 (estimated) in 1878. Our exports of manufactured C. for the 9 years, 1870 to 1878, were as follows:—

	Colored.		Uncolored.		(other manuf.)	Total
	Yards	Dollars	Yards	Dollars	Dollars	
1870.	6,004,715	1,035,497	8,257,384	1,343,988	1,490,925	3,870,410

Of the total exports for the year 1878, 22.40 per cent was exported to China, 13.75 per cent to Great Britain, 11.39 per cent to Mexico, 10.82 per cent to the Dominion of Canada, and 11.64 per cent to almost all other countries of the world.

The value of imports of C. goods into the U. States (mostly from England and France) for the year 1878 was as follows:—

Bleached and unbleached (9,675,594 sq. yds.)	\$1,076,142
Printed, painted, or colored (8,335,123 sq. yds.)	1,086,426
Hosiery, shirts, and drawers (almost all from England)	4,682,246
Jeans, denims, drillings, etc. (325,328 sq. yds.)	104,633
Other manufactures	12,131,580
<b>Total</b>	<b>\$19,081,087</b>

It is a noticeable fact that English commercial writers, in commenting upon our exports of C. manuf., have congratulated themselves that, so far as they were concerned, nothing was to be feared from our C. manufacturing industry in competition with theirs, in supplying the great markets of the world; their reasons being based upon the theory that all of the increased exports of C. goods from American ports were owing to the depressed state of the home demand for those goods. That this was in great part the truth cannot be denied. But it is every day becoming apparent that the movement to relieve the home market by forcing, so to say, our goods upon foreign markets, is now resulting in creating a large and legitimate demand for the products of our looms and spindles. We grow the C. on our own soil; and we have the genius, capital, skill, labor, and machinery to weave it into fabrics that will cause them, by their intrinsic merit and excellence, to become the staple goods of other lands as they are now in our own. We are therefore fully prepared to compete with England, in all respects, in supplying the world with C. manufactures. And the results of past years show that American C. can be sold over the counters of London, and even at Manchester, at the very doors of English spinners. It is a well-known fact that our calicoes and gray cloths are sent to Manchester and continental points, and from there are transhipped to other countries under English and German brands. It is well known, also, that our C. goods are sent to Liverpool in large quantities, and from there are sent to Cuba and the West Indies. Mexico and the S. American countries are developing an increased trade with us in these goods, with a fair promise that it will ultimately become of great magnitude. China and Japan prefer C. of American manuf. to those of English make, because of their superior fabric and quality, and for their freedom from clay sizing, an adulteration

Fig. 111. — THE THROSTLE.

yards of cloth, employing 100,000 operatives, and engaging a working capital of \$10,000,000. The invention of the power-loom, in England, still, however, checked the progress of the American manufacture, by enabling the former country to import into the U. States vast quantities of the fabricated article at a far lower rate of productive cost than could be attained by American spinners. In 1824, 1828, and 1832, however, the U. States government somewhat counteracted the influx of English cottons upon this market, by the imposition of an *ad valorem* duty of 25 per cent upon the foreign commodity. In 1812, Mr. Francis C. Lowell of Boston, who had in Great Britain acquired some knowledge of Mr. Cartwright's power-loom, returned to this country, and immediately set about introducing its operations, on an extensive scale, at Lowell, Mass. The first C-mill on the power-loom principle was established there in 1822, — the nucleus of a system of manufacturing operations, which, in 1852, had accumulated to 51 mills, giving employment to 12,633 hands. The manuf. is no longer confined to the State of New York and the New England States, though in these it has been greatly extended. In other Northern States, such as New Jersey, Pennsylvania, Delaware, Maryland, Ohio, and Indiana, new mills have been erected; whilst in the South-

for which the English manufactures are noted. From 1868 to 1875 probably 40 per cent of the *C.* machinery set up anew was imported, the capacity of the home machine shops being not then sufficient to supply the sudden demand for new and enlarging mills. During the following years 75 per cent, or more, has been made at home. The home shops build all kinds of machinery used in cotton-mills, and can put any portions of it, except perhaps mules and roving frames, into the home mills at a cost less than the cost of importation from England. Home-built machinery of nearly all kinds is preferred to that from England as better adapted to American operatives and management.

**C. Manufacture.** When the pods have been collected from the plants, they comprise seeds as well as fibres; and as the latter cannot be spun into thread until the former have been removed, this removal is practically the first stage in the manuf. It is always done, more or less completely, in the country where the *C.* is grown, and is called *ginning*. In India the natives have for ages used a single machine called a *churka*, consisting of two small wooden rollers so placed as to revolve in contact. The dirty *C.* is put in at one side between the rollers, the seeds fall down in front, because they cannot pass through; and then the comparatively clean fibres are pushed out at the other side. The want of care in weeding the crop while growing, in picking it when ripe, and in ginning

thinner, and more and more even and regular, at each movement. This thinning of the layer or fleece results from the last pair of cylinders revolving more rapidly than the first. Processes of *willowing* and *battling* are sometimes employed instead of *opening* and *scutching*. — *Lapping*. Sometimes in the same machine as the opening, sometimes in a subsidiary apparatus called the *lapping-machine*, or *lapper*, the *C.* is converted from the form of a fleece to that of a roller, or lap; the fleece, subjected to three or four compressions by rollers, is narrowed and coiled up on a sort of flat roll. — *Carding*. The *carding-engine* has cylinders clothed with fine wire teeth, so arranged that when the laps of *C.* are drawn between them, the teeth drag opposite ways, comb and straighten the fibres, and rub off some of the impurities which attach to them. The best engines of this kind have an apparatus for cleaning the teeth and carrying off the dirt and fragments. The fleece becomes a ribbon or sliver of fine downy substance. — *Drawing*. Several slivers are passed through four pairs of rollers in the *drawing-frame*; they all become combined into one, and are at the same time drawn out or attenuated. The *C.* is now a loose porous cord of parallel fibres. — *Slubbing*. The *slubbing-frame* contains numerous upright steel spindles, on which rotate steel arms or flyers and wooden bobbins; and it has also a set of rollers. The apparatus is so contrived that the porous cord, as received from the drawing-frame, is still further elongated and attenuated, partially spun or twisted, and wound upon the wooden bobbins. — *Roving*. The *roving-frame* so far resembles the *slubbing-frame* as to have rollers, spindles, and bobbins; and the object of the roving process is to combine two or more slubbings together by further rolling, twisting, and winding upon smaller bobbins. The *C.* assumes more and more the condition of a thread, though still having very

little hardness or compactness. — *Spinning*. The bobbins full of prepared roving are placed on the top of the *throstle-spinning* (Fig. 111). Rollers and bobbins and flyers draw out the fibres, elongating and attenuating them, and at the same time twisting them tightly into a compact yarn, well adapted for the warp or long threads of woven goods. In the technical language of a *C.* mill, the *throstle* is used for the hard coarse yarns up to about No. 40. For fine work, the *mule-jenny* (Fig. 112) is used. In this mule action the bobbins containing the rovings are on a fixed frame; the spindles by which the rovings are to be twisted into yarn are on a movable frame; the movable frame, by travelling 4 or 5 feet outward, then an equal distance backward, and so on alternately, stretches and attenuates the threads. The two sets of operations, elongating and spinning, succeed each other with exquisite regularity; 600 or 700 threads, all arranged parallel, being managed by self-regulating mechanism. *Mule* yarn, as it is technically

Fig. 112. — MULE-JENNY.

called, being twisted more softly and carefully than *throstle* yarn, is suitable for the warp or cross-threads of coarse goods, and for both warp and weft of fine goods. — *Reeling*. The *C.* having been spun, we have next to follow the yarns through the various processes incident to weaving into calico, muslin, etc. The first of these is *reeling*. The reel is a sort of six-sided frame, several feet long, revolving on a horizontal axis. The bobbins and cops are so placed in rows that the yarn unwinds from them, and winds itself upon the reel. 120 yards thus wound are called a *rap*, and 7 raps, or 840 yards, make a *hank*. Each hank is removed as wound, and tied so as to keep in place. — *Bundling*. In order that the hanks may be conveniently packed for sending to market, they are squeezed in a *bundling-press*. All hanks are the same length, 840 yards; all are weighed by the same unit of weight, 1 lb.; and the number attached to each kind denotes the number of hanks of that kind which go to a pound. Usually about 10 lbs., of whatever number or fineness, are pressed together to form a *bundle*; and from thirty to forty of these bundles are pressed together into a *bale*, which then weighs from 300 to 500 lbs. — *Winding*. But the yarn may be woven into cloth in the same mill where it has been spun. In this case the reeling and bundling are dispensed with, and the yarn goes at once to the *winding-machine*. This is an assemblage of rollers and other mechanism by which the yarn is unwound from the spindles and cops, passed through minute slits or openings that will scrape off roughnesses and inequalities of surface, then passed under the action of brushes which clear it of dirt, and finally wound on bobbins. — *Warping*. The yarn is now, for the first time, to be brought into parallel threads, the first germs of the *warp* of cloth. The *warping-machine* employed is so constructed as to unwind the yarn from the bobbins, and wind it round a large roller, with as much parallelism as possible and an equable degree of tension. — *Sizing* or *Dressing*.

it when picked, is one of the reasons why Indian *C.* never commands so good a price in the market as American. In this country long-stapled *C.* used to be *bowed*, or struck with a kind of bowstring plucked with the fingers, to open the tufts. It is now more usually subjected to the action of a wooden roller and a kind of comb. But short-styled *C.* requires to be *ginned*, or torn open with some degree of force, to extricate the seeds. Whitney's *saw-gin* is a vast improvement on the Hindoo *churka*. It comprises a series of circular saws, mounted on a frame, and turned by a fly-wheel; nearly in contact with it rotates another cylinder, mounted with brushes; and the *C.*, drawn in between the two, is deprived of its seed by the action of the saw-teeth against the brushes. The improved *Marshall gin* is by far the most complete machine for this purpose. After travelling along an endless apron, the *C.* is seized by a spike roller, partially opened, and transferred by a vibrating comb to other rollers studded with blades. So numerous are the novelties introduced every year into *C.* machinery that we will not here attempt even a summary description of them. The following will, however, give a fair notion of the order of processes now generally followed, varied in detail in different establishments. — *Sorting*. An experienced sorter, as soon as the bags are opened, examines and separates, classifies and mixes, according as the cotton is wanted for coarse or for fine yarns. Much of the success of the manufacture depends upon this sorting. — *Opening*. The *C.*, after sorting, is spread out upon an endless apron of narrow wooden laths, which carries it forward horizontally to the *opener*, where fluted rollers, and cylinders armed with rows of teeth, revolving 1,000 times or more per minute, tear open the tufts of cotton, and convey them onward in a cleaned condition. — *Scutching*. A *scutcher*, comprising feed-rollers and toothed cylinders, receives the opened *C.* at one end, and drags or combs it out into a flat layer, which becomes thinner and

C. is never woven in its natural state. It always receives a dressing or coating of some kind of liquid size, which is allowed to dry before the weaving begins. The object is to diminish the roughness on the fibrous surface of the yarns, and thereby facilitate the weaving. The yarns from several rollers are unwound and made to pass through a vessel of hot liquid size, and then between rollers which squeeze the glutinous composition into the very heart of the thread. Thence the yarns pass over *drying cylinders*, made of sheet iron or copper, heated within by steam-pipes. This quickly dries the size, and prepares the yarn to be wound upon the *weaver's beam*, a roller which receives uniform layers from end to end — *Wet Beaming*. The *beaming* is for the warp threads; the *unwinding* for the weft. The yarn for the weft, usually softer and finer than for the warp, is placed in the shuttle. (See SHUTTLE.) — *Weaving*. Then comes the actual weaving process, for which we refer to LOOM and WEAVING. — *Folding*. When the C cloth has been woven, it winds itself upon a roller called the *cloth beam*, which is then taken to the *folding-machine*, by which the cloth is unwound, measured, and folded with great precision — *Pressing into bales*. Whether the cloth is to be sold in the gray or unbleached state, or whether it is to be bleached (with or without subsequent dyeing or printing), it is removed from the folding-machine to the *hydraulic press*, where it is compressed into compact bales of definite size, the weights of which are made to suit various markets. See BLEACHING, CALICO-PRINTING, DYEING, FUSTIAN, MUSLIN, etc.

#### Import Duties on Raw and Manufactured Cotton.

Cotton, raw, free	
" on spools, not over 100 yds. per spool, 6 cts. per dozen and 1 3/4 per cent	
" on spools, over 100 yds. per spool (each additional 100 yds.), 6 cts. per dozen and 35 per cent	
" thread, yarn, warp or warp-yarn, not wound upon spools, single or advanced beyond the condition of single by twisting two or more single yarns together, whether on beams or in bundles, skeins, or cops, or in any other form, value not exceeding 40 cts. per lb., 10 cts. per lb. and 20 per cent.	
" value over 40 cts., not over 60 cts. per lb., 20 cts. per lb. and 20 per cent.	
" value over 60 cts., not over 80 cts., 30 cts. per lb. and 20 per cent.	
" value over 80 cts. per lb., 40 cts. per lb. and 20 per cent.	
" tissues (exclusive of jeans, denims, drillings, etc., for which see below) weighing over 5 oz. per sq. yd., not over 100 threads per sq. inch, warp and filling, unbleached, 5 cts. per sq. yd.	
" bleached, 5 1/2 cts. per sq. yd.	
" colored, printed, painted, or stained, 5 1/2 cts. per sq. yd. and 10 per cent.	
" the same, exceeding 200 threads to the sq. inch, or, being finer and lighter than above, and not exceeding 20 threads, unbleached, 5 cts. per sq. yd.	
" bleached, 5 1/2 cts. per sq. yd.	
" colored, printed, painted, or stained, 5 1/2 cts. per sq. yd. and 20 per cent.	
" jeans, denims, drillings, bed-tickings, gingham, plaids, cottonades, pantaloons stuffs, and goods of like description, weighing over 5 oz. per sq. yd., and not exceeding in value 16 cts. per sq. yd., not over 100 threads per sq. inch, warp and filling, unbleached, 6 cts. per sq. yd.	
the same, bleached, 6 1/2 cts. per sq. yd.	
the same, colored, printed, painted, or stained, 6 1/2 cts. per sq. yd. and 10 per cent.	
" over 100, and not over 140 threads per sq. inch, warp and filling, unbleached, 6 cts. per sq. yd.	
the same, bleached, 6 1/2 cts. per sq. yd.	
the same, colored, printed, painted, or stained, 6 1/2 cts. per sq. yd., and 15 per cent.	
" over 140, and not over 200 threads per sq. inch, warp and filling, unbleached, 6 cts. per sq. yd.	
the same, bleached, 6 1/2 cts. per sq. yd.	
the same, colored, printed, painted, or stained, 6 1/2 cts. per sq. yd. and 15 per cent.	
" over 200 threads per sq. inch, warp and filling, unbleached, 7 cts. per sq. yd.	
the same, bleached, 7 1/2 cts. per sq. yd.	
the same, colored, printed, painted, or stained, 7 1/2 cts. per sq. yd. and 15 per cent.	
" goods, plain-woven, not included in the foregoing schedules, unbleached, valued over 16 cts. per sq. yd.; bleached, valued over 20 cts. per sq. yd.; colored, valued over 25 cts. per sq. yd.; and cotton jeans, denims, and drillings unbleached, valued at over 20 cts. per sq. yd.; and all other cotton goods, value exceeding 25 cts. per sq. yd., 35 per cent.	
" all bags, cotton-bags and bagging, and all other like manufactures, not herein otherwise provided, except bagging for cotton composed wholly or in part of flax, hemp, jute, gunny-cloth, gunny-bags, or other material, 40 per cent.	

Cotton, bobbinet, 35 per cent.	
" braids, 35 per cent.	
" caps, hose, leggings, ulits, socks, made on frames, bleached or colored, 35 per cent.	
" carpets and carpeting, 40 per cent.	
" cords, gimpes, galleons, braces, or suspenders, 35 per cent.	
" drawers, shirts, and other articles made on frames, 35 per cent.	
" embroidered or tambooured, in the loom or otherwise, by machinery or with the needle, or other process, 35 per cent.	
" hat bodies, 35 per cent.	
" lace, insertings, trimmings, 35 per cent.	
" velvets, 35 per cent.	
" waste, free.	
" manufactures not otherwise provided, 35 per cent.	

**Cottonade**, cotton checks for men's wear, or heavy cotton fabrics for trousers, etc.

**Cotton-Bagging**, a coarse wrapping material for baling raw cotton, and for sacking. They are generally made of gunny-cloth.

**Cotton-Bats**, carded cotton in sheets, put up in rolls, usually of 1 lb.

**Cotton-Broker**, a commission merchant, whose regular occupation is to purchase or sell on samples cotton in the bale.

**Cotton-Flannel**, a term commonly used in the trade for Canton flannel.

**Cotton-Floater**, an india-rubber envelope or casing, in which bales of cotton are floated down rivers.

**Cotton-Gin**, a machine for clearing cotton-wool from the seeds, husks, and other impurities. See COTTON.

**Cotton Goods**, all manufactures of cotton. The term, however, is usually restricted to cotton piece-goods.

**Cottonier**, a name for the wild asparagus of Canada, the fibre of which is believed to be of importance as a substitute for flax and hemp.

**Cotton Manufactures**, all fabrics and goods generally manufactured from cotton.

**Cotton-Mills**, works where cotton-wool is spun by machinery into yarn, etc. There are about 100 cotton-mills in the U. States, of which 700 are in the Northern and 200 in the Southern States. The number of spindles at work in these mills is about 10,100,000. See COTTON.

**Cotton-Picker**. See PICKING.

**Cotton-Press**, a press in which cotton is baled for transportation. See PRESS.

**Cottons**, a general term for all kinds of closely woven piece-fabrics, light or heavy, bleached, unbleached, or printed, manufactured of cotton. It does not include cotton laces, bobbinets, and such like goods. — *T. McElrath*.

**Cotton-Seed Oil**. See OIL.

**Cotton-Seed Oil-Cake**, an oil-cake made from the pressed seeds of cotton, after the oil has been extracted, and used for cattle food and manure. Its price in New York varies from \$20 to \$35 per ton.

**Cotton-Spinner**, the owner of cotton works; also, a workman at a cotton-mill.

**Cotton-Thread**. See THREAD.

**Cotton-Tick**, a material for bed and pillow cases, etc., which is either plain or twilled, and sometimes composed partly of linen, as in union-tick.

**Cotton-Topper**, a machine which passes along and prunes the row of growing cotton plants, in order to curb its rampant luxuriance. — *E. H. Knight*.

**Cotton-Waste**, the refuse from cotton-mills; a commercial article, classified as A No. 1 cop waste, and No. 1 cop; No. 1 white machine, and No. 2 do.; No. 1 colored, No. 2 do.; white bleached,

colored washed, strip and fly, and spinners' waste. The last-named is the least valuable, and generally sells for about one half the price of A No. 1 cop. The inferior cotton-wastes are called wadding-stock, willowed picker, oily card waste, and sweepings. *T. McElrath*.—The waste of cotton in spinning is about  $1\frac{1}{2}$  oz. in a pound.

**Cotton-Wood**, the *Populus canadensis*, a forest tree of N. America, particularly abundant on the upper parts of the Mississippi and Missouri, and valued for its timber.

**Cotton-Wool**, a name given to cotton after it is cleaned.

**Cotton-Yarn**. See YARN.

**Cotton-Yarn Measure**, in the cotton trade, a thread is equal to 54 inches; a skein or rap of 80 threads, equal to 120 yards; a hank of 7 skeins, 840 yards; a spindle of 18 hanks, 15,120 yards.

**Cottrel**, a hook or trammel to hang a boiler or pot on for cooking purposes.

**Couch**, a frame on which barley is malted; a kind of sofa or long soft reclining seat.

**Couching**, in paper-making, the operation of taking the flake of pulp still imperfectly compacted from the mould on which it has been formed.

**Coulage**, the French term for leakage.

**Coulisse**, **Cullis**, a groove or channel; the gutter in a roof.

**Counter**, part of the stern of a vessel.—A table or bench on which money is counted.—Imitation money.—The back leather or heel part of a boot.

**Countercheck**, a plane for working out the groove which unites the two sashes of a window in the middle.

**Counterfeit**, a copy or imitation intended to be passed off as an original; a forgery.

**Countermand**, a contrary order; a stoppage *in transitu*.

**Countermark**, an additional or special mark put upon a package of goods belonging to several merchants, that it may not be opened unless in the presence of all.

**Counterpane**, **Counterpoint**, a bed-covering woven with little protuberances of various patterns. A more elegant species is the Marseilles quilts. These have a double cloth with a softer fabric quilted between them in the loom.

**Counterpart**, a copy or duplicate, as of a contract or indenture.

**Counterpoise**, a weight connected with an instrument or machine, either for the purpose of giving steadiness, or diminishing the pressure on some particular point; as, for example, the pressure of the pivots of a transit-instrument on its supports.

**Counter-Security**, security given to one who has become security for another.

**Countersign**, to authenticate by an additional signature.

**Countersink**, a bit or drill, for widening the upper part of a hole in wood or metal, for the head of a screw or pin, and having a conical head. Those for wood have one cutter in the conic surface, and have the cutting edge more remote from the axis of the cone than any other part of the surface. *C.* for brass have 11 or 12 cutters round the conic surface, so that the horizontal section represents a circular saw. These are called *rose*. The conic angle at the vertex is about 90°. *C.* for iron have two cutting edges, forming an obtuse angle.

**Coup**, a Scotch term for exchanging or bartering, buying and selling.

**Coupe**, a Swiss grain measure, in Fribourg equal to 7 gallons, in Geneva to 17.

**Coupling-Box**, a connection for joining the ends of shafts.

**Couplings**, the connecting link by which motion is added from one machine to another from the same motive-power; also, the rod or chain which unites railway carriages.

**Coupon** [Fr.], a warrant for payment of the periodical dividends on public stocks, a number of which, being appended to the bonds, are severally cut off for presentation as the dividends fall due. The practice of appending coupons to bonds prevails chiefly in reference to foreign stocks.

**Courbaril**. See ANIMÉ and COPAL.

**Courier** [Fr.], an express or special messenger.

**Course**, in masonry, a continuous layer or range of stones or bricks, placed even throughout the front of a building, horizontally.

**Course of Exchange**, the sum merchants pay to each other for bills to enable them to make remittances from one country to another.

**Courses**, the chief sails belonging to a ship, as the main-course, fore-course, etc.; to brail up the courses.

**Courtage**, the business or remuneration of a courtier, or broker, in France.

**Courtier**, the French name for broker.

**Court-Plaster**. See PLASTER.

**Coury**, a superior kind of catechu, said to be made in S. India from the areca or betel nut.

**Cous-Cous**, **Couzu-Couzu**, **Kous-Kous**, African names for the pounded grain of *Penicillaria spicata*, a species of millet.

**Coutelier**, the French name for a cutler.

**Coutil** [Fr.], canvas, ticking, drill, or duck.

**Covado**, a Portuguese cloth measure =  $26\frac{1}{2}$  inches.

**Cover**, the movable top of anything.

**Coverlet**, a counterpane or quilt; the upper covering of a bed.

**Covetta**, or **Quarter-Round**, a plane used for moulding framework.

**Covid**, an Eastern cloth measure of variable length. In Calcutta and Bombay it is 18 inches; in Madras, 19 $\frac{1}{2}$ ; in Arabia, 19; in Malacca, 18 $\frac{1}{2}$ ; and in China, 14 $\frac{1}{2}$  inches.

**Cow**, the female of the bovine tribe of animals; a *Milch-cow* is a cow yielding milk. In 1878, there were in the U. States 11,300,100 milch-cows, valued at \$298,499,866, the average price being \$26.41. See CATTLE and DAIRY.

**Cowan**, a Scotch fishing boat.

**Cowbeck**, a mixture of hair and wool for hats.

**Cowhage**, **Cowitch**, a name given to the small hairs on the pods of *Mucuna urens* and *pruriens*, climbing plants of the East and West Indies. They are slender, brittle, easily detached, and readily stick into the skin, producing an intolerable itching. *C.* is used in medicine as a vermifuge, by being mixed with sirup till of the consistence of honey. *Imp. free.*

**Cowhair**, the hair taken from the hides of slaughtered cattle, which is used for various purposes,—for making rope, for stuffing, and for mixing with mortar. The white hair is employed in coarse blanket-making, and the brown hair by felt-makers, and for ships' sheathing, etc.

**Cow-Heel**, the foot of a calf or cow boiled for jelly.

**Cowhide**, the skins of cattle used for making leather, for rope, and for packing-bales, etc.—A whip made by twisting strips of the hide.

**Cowl**, a revolving chimney-pot or cover to facilitate the escape of smoke.

**Cowry**, the shell of the *Cypræa moneta*, a small univalve found abundantly on the shores of the Maldives, Borneo, and the various islets of the Eastern Archipelago, as also on the eastern coasts of Africa. For many ages this shell has been used as a currency in parts of Hindostan and Africa, and the *C.* fishery was and perhaps still is the chief occupation of most of the natives who inhabit the islands where it is found. The nominal exchange of the *C.* in Bengal is at the rate of 640 to the anna (which is worth about 3 cents). In Siam they are still cheaper. But their value is far higher—at least 10 times—in Africa. Of course these rates are variable, and the delay of the *C.* ships used in India to raise the price greatly, so that occasion was taken to turn the *C.* trade into a gambling transaction. Since the abolition of the slave-trade, the supply of *C.* has become a matter of comparatively small importance.

**Cowslip**, the *Primula veris*, the flowers of which, when fermented with sugar, form a domestic wine used for wheys.

**Cowsong**, **Coosong**, a kind of nankeen dyed black; an article of trade in the Philippine and Sunda islands.

**Coxswain**, a steersman or chief boatman; one who has charge of a boat.

**Coyan**, a dry measure of common use in Asiatic and Eastern countries, containing more or less piculs, according to the articles measured and the locality. In some parts it is reckoned at 3,000 lbs. In Java it is 27 piculs, or 3,581 lbs. avoirdupois; in Amboyna, 25 piculs, or 3,255½ lbs.; in Singapore, 40 piculs of 133½ lbs. each.

**Crab**, a small portable crane or lifting-machine (Fig. 113), with a single or double purchase. — A capstan used by miners for raising or lowering pumps in a pit. — A well-known crustaceous animal (*Cancer pagurus*), common on our rocky shores, and brought to market both in a boiled and in a raw state. The animal is so tenacious of life that it does not lose its vital powers until two or three days after leaving the sea. May, June, and July are the months in which it is generally out of season. The male is of greater value than the female, and has larger claws. Before boiling, a good *C.* is known by the roughness of its shell, particularly on the claws. When boiled, its quality is known by holding the claws tight and shaking the body, which will rattle or seem as if water were in the inside if it be not in perfection.

**Crab-Tree**, the wild or ungrafted apple-tree (*Pyrus malus*). Its fruit is small, austere, and unpalatable, but loses much of its acidity under cultivation. The fruit of several varieties cultivated in this country is used for cooking and for making cider.

**Crack**, a flaw or fissure.

**Cracker**, a small, dry, hard biscuit, made of wheat flour, in various ways and forms. The manuf. of *C.* is the object of a considerable industry in this country. 113,223 lbs. of *C.*, valued at \$730,317, were exported in 1878, chiefly to the West Indies and South America. They are shipped in barrels or casks, packed in bulk, or in wooden, tin, or paper boxes.

**Cracklings**, the refuse of tallow when prepared by the chandler or candle-maker.

**Cracknells**, a kind of crisp sweet biscuit.

**Cradle**, a strong frame of timber, etc., placed under the bottom of a ship to conduct her steadily in her ways when being launched. — A child's cot, moving on rockers. — A gold-sifting machine. — A miner's name for a suspended scaffold used in shafts.

**Cradle-Scythe**, a rake or support to a scythe for receiving the straw as it is cut.

**Craft**, a trade. — A name given to small vessels.

**Craftsman**, a skilled mechanic or artificer.

**Craig** [Scotch], a rock or cliff.

**Craig-Herring**, a Scotch name for the shad.

**Cramboo**, a name in some parts of India for cloves.

**Cramps**, bent irons for holding things together;

Fig. 113. — CRAB.

metal ties or holdfasts for securing large stones in a wall.

**Cran**, a fish measure, equal to about 37½ gallons; as many fresh herrings as will fill a barrel. — A name in the shoe-trade for any secret method of performing work.

**Crannage**, the money hire of a crane for loading and unloading ships, and warehousing goods.

**Cranberry**, the acid fruit of the slender trailing kind of shrub, the *Oxycoccus macrocarpus*, which is indigenous to N. America, and extensively cultivated in New Jersey and other States. They are sown broadcast on wet land, and on drier soils the plants are drilled in and bear fruit the third year, yielding on the average about 150 bushels to the acre, which sell at 15 to 20 cts. the bushel. They are largely used for tarts and puddings, and are exported to England, preserved in spring-water.

**Crane** [Fr. *grue*; Ger. *Krahn*], a powerful lifting-machine (Fig. 114), of great use on wharves and docks, etc., for hoisting goods. It consists of a vertical post rotating on its axis, and a projecting arm or jib over which the chain or rope passes in its way from the winch at the foot of the post to the load to be lifted. There are also double *C.* with two arms; one of which is employed in raising a load, while the other is depositing its load in position. Small iron *C.* are used at private stores

and warehouses, and on ships. — An iron support for a pot or kettle over a fire.

**Crane's Bill**, the *Geranium maculatum*, sold by herbalists as a styptic, astringent, and tonic. — Also a surgical instrument, consisting of a pair of long-nosed pinchers.

**Crang**, a name for the blubber or carcass of the whale.

**Cranimeter**, an instrument for measuring the skulls of animals.

**Crank**, a rigid arm fixed at one extremity on a shaft perpendicular to its own axis, and receiving at the other an alternative impulse which causes it to revolve in a circle. It is the most usual mode of converting alternative, circular, or rectilinear motions into continuous circular motion, or vice versa :

Fig. 114. — CRANE.

and for this purpose the crank requires to be connected with the prime mover by a cord or a rigid rod. In building operations, it is used to change the direction of the motion of bell-wires, or other similar works. — A ship is said to be *crank*, when, by the form of the construction, or by want of a sufficient quantity of ballast or cargo, or by being loaded too much above, it is incapable of carrying sail without being exposed to the danger of over-setting.

**Crank-Axle**, a driving-axle.

**Crank-Pin**, the cylindrical piece joining the ends of the crank arms, and attached to the connecting rod, or, in vibrating engines, to the piston-rod ; if the crank has only one arm, the pin projects from the end of it.

**Crap**, a name for buckwheat, daniel, etc.

**Crape** [Fr. *crêpe* ; Ger. *Flohr* ; It. *espumilla* ; Port. *sendal* ; Sp. *crespon*], a silk fabric of a gauzy tex-

ture, having a peculiar crisp or crimply appearance. It is woven of hard-spun silk yarn "in the gum" or natural condition. There are two distinct varieties of the textile, — 1st, soft, Canton, or Oriental *C.*, and 2d, hard or crisped *C.* The wavy appearance of Canton *C.* results from the peculiar manner in which the weft is prepared, the yarn from two bobbins being twisted together in the reverse way. The fabric when woven is smooth and even, having no *crêpe* appearance, but when the gum is subsequently extracted by boiling it at once becomes soft, and the weft, losing its twist, gives the fabric the waved structure which constitutes its distinguishing feature. Canton *C.* are used, either white or colored, for ladies' scarfs and shawls, bonnet trimmings, etc. The

Chinese and Japanese excel in the manufacture of soft *C.* The crisp and elastic structure of hard *C.* is not produced either in the spinning or in the weaving, but is due to processes through which the gauze passes after it is woven. What the details of these processes are is known to only a few manufacturers, who so jealously guard their secret that, in some cases, the different stages in the manufacture are conducted in towns far removed from each other. Commercially they are distinguished as single, double, three-ply, and four-ply *C.*, according to the nature of the yarn used in their manufacture. They are almost exclusively dyed black and used in mourning dress, and among Roman Catholic communities for nuns' veils, etc. *C.* are chiefly imported from France. *Imp. duty*: for veils, 50 per cent ; in piece silk, or for dresses, 60 per cent.

**Crape-Morette**, a white or colored gauzy woollen fabric of fine texture, the warp being light and open, and the weft relatively heavy and fleecy.

**Crap-Leather**, **Crops**, leather made from thin cowhides, used chiefly for pumps and light walking-shoes.

**Crash**, a heavy, narrow, low-priced linen fabric, used for towels, etc.

**Crat**, a Mocha weight of three grains.

**Crate**, a large wicker hamper with strong wooden supports, used for packing crockery-ware.

**Cravat**, a necktie or kerchief made of various materials.

**Cray**, a small sea vessel.

**Cray-Fish**, **Craw-Fish**, a long-tailed crustaceous animal (*Artacus fluvialilis*) of the lobster kind, found in fresh waters. It thrives best in rivers, and is commonly taken by nets or bundles of thorns in which flesh in a state of decomposition is placed.

**Crayon**, a material for drawing on paper, is of two kinds, — native and artificial. The former is generally of a black, white, or red color. The best black is a species of earth brought from Italy, of a bright even tint, and of a smooth and moderately hard texture. The best white is a kind of chalk, and is procured in France ; it is of a brilliant color, but very brittle. Pipe-clay is sometimes employed as a substitute, though of an inferior tint. Red *C.* is a clayey ochreous kind of chalk. The artificial *C.* are composed of earths of different colors, and other pigments, rolled into

sticks with some tenacious substance, such as milk or beer-wort. *Imp. duty, 30 per cent.*

**Manuf.** Take pale shell-lac, 5 parts; wood naphtha, 12 parts; dissolve, and with this fluid mix up the coloring powder, previously stirred up with an equal weight of fine pale-blue clay; dry by a stove heat. When this process is well managed, it produces crayons equal to those of the best Parisian houses. — The composition may be formed into *C.* by simply rolling it on a slab; but to insure their solidity the manufacturers generally employ a metallic cylinder of 2 or 3 inches in diameter, with one end open and the other firmly secured to a perforated plate, having holes of the same size as the intended crayons. The *C.* composition, in the state of a stiff paste or dough, is introduced into the open end, and is forced down and through the holes, by means of a small plug or piston, that exactly fits the inside of the cylinder, and which is driven by the equable motion of a small screw. The pieces that pass through the holes are then cut into lengths and dried. The substances employed as coloring matters for *C.* are very numerous, and their choice offers a wide field for the skill and fancy of the artist. The pigment having been selected, it may be reduced to any shade or tint by admixture with other pigments, and by "dilution" with a proper quantity of elutriated or prepared chalk. As, however, *C.* colors do not admit of being mixed together at the time of using them, like liquid colors, it is usual to make 3 to 6 different shades of each color, so as to enable the artist at once to produce any effect he chooses.

**Black C.** From prepared black-lead, ivory-black, lamp-black, etc. Black chalk and charcoal are frequently made into *C.* by simply sawing them into suitably sized pieces. — They may then be put into a pipkin of melted wax, and allowed to macerate for an hour; after which they should be taken out, drained, and laid on a piece of blotting-paper to dry. Drawings made with these *C.* are very permanent, and if warmed slightly on the wrong side, the lines will adhere, and become almost as durable as ink.

**Blue C.** From ludwig, smalts, Prussian blue, verditer, etc.

**Brown C.** From umber (raw and burnt), terra di Sienna (raw and burnt), Cullen's earth, brown ochre, etc.; and some peculiar shades, from a mixture of black, carmine, and either of the above colors.

**Green C.** From a mixture of king's yellow, or yellow ochre, with blues.

**Purple C.** From any of the more brilliant blues, mixed with carmine, lake, or vermillion.

**Red C.** From carmine, carminated lakes, vermillion, hematite, and any of the earthy or mineral colors commonly used as pigments. *C.* of red chalk may be prepared in the manner pointed out for *C.* of black chalk.

**White C.** From pure clay and chalk.

**Yellow C.** From king's yellow, Naples yellow, orpiment, yellow ochre, etc.

**Crayon-Board,** thick drawing-paper or card-board for crayon drawings.

**Crayon-Painting, Crayon-Drawing,** the art or practice of drawing with crayons.

**Craze-Mill,** a crushing or grinding mill for tin ore.

**Crazing,** the cracking of the glaze upon articles of pottery or porcelain.

**Cream,** the oleaginous portion of milk, which collects in a thin stratum upon the surface, when that fluid is left undisturbed for some time. By violent agitation, as in the process of churning, the fatty globules unite together, forming butter; whilst the liquid portion, consisting of caseum, serum, and a little butter, constituting the residuum, is called buttermilk. This separation is effected the most readily when the *C.* has become partially sour and coagulated by being kept a few days, a change which occurs in consequence of the conversion of some of the sugar of the serum into lactic acid, which precipitates the caseous matter contained in the small portion of the milk with which the cream is mixed. On these simple facts chiefly depend the successful manufacture of butter. The *C.* intended for churning should therefore be kept until it turns slightly sour, and assumes the condition above referred to, as then the butter will readily "come." If churned while quite sweet the operation will be tedious, and will frequently fail. The addition of a little rennet or vinegar is the proper remedy in this case, and will cause the almost immediate separa-

tion of the butter. — When *C.* is suspended in a linen bag, and allowed to drain, it gradually becomes drier and harder, by the separation of the liquid portion, and then forms what is known by the name of *C. cheese*. By the application of slight pressure the separation of the whey is more completely effected, and the product is not only better, but will keep longer. — *C.*, in a dietetic point of view, may be regarded in the same light as butter, as it is converted into butter in the process of digestion. On this account much *C.* should never be taken at once by persons of delicate stomachs. In eating *C.* with fruit persons are hardly aware of the large quantity they consume, until they find it disagree with the stomach, when the condiment is blamed for the indiscretion of those who take it.

**Cream-Slice,** a wooden knife for parting cream.

**Cream of Tartar.** See POTASH.

**Creance,** a book debt in France.

**Creancier,** the French term for creditor; one to whom money is due.

**Creaser,** a tool used for making single or double lines on leather, to form guides or creases to sew by.

**Creasote.** See CREOSOTE.

**Creaze,** a mining term for tin, in the washing tub or buddle.

**Credit,** the term used to express the trust or confidence placed by one individual in another, when he assigns him money, or other property in loan, or without stipulating for its immediate payment. The party who lends is said to give *C.*, and the party who borrows to obtain *C.* In the earlier stages of society *C.* is in a great measure unknown. This arises partly from the circumstance of very little capital being then accumulated, and partly from government not having the means to enforce that punctual attention to engagements so indispensable to the existence of confidence and *C.* But as society advances, capital is gradually accumulated, and the observance of contracts is enforced by authority. *C.* then begins to grow. The day on which it suits a merchant to purchase and send away a large quantity of goods may not be that on which he finds it convenient to pay for them. If it is made necessary for him to give ready money in return, he must always have in his hands a very large stock of money; and for the expense of keeping this fund (an expense consisting chiefly in the loss of interest) he must be repaid in the price of the commodities in which he deals. He avoids this charge, and also obtains time for preparing and adjusting his pecuniary concerns, by buying on *C.*; that is to say, by paying for his goods not by money, but by the delivery of a note, in which he promises the money on a future day. He is thus set more at liberty in his speculations; his judgment as to the propriety of buying or not buying, or of selling or not selling, and also as to the time of doing either, may be more freely exercised. But the custom of taking and of giving long credit has its inconveniences as well as its advantages. It increases the amount of the bad debts incurred in the course of commercial transactions. The apprehension of loss is therefore continually operating on the mind of the lender as a restraint on the custom of giving *C.*, while the compensation he receives for the use of the capital which he supplies acts as an encouragement to the practice. The subsisting state of *C.* may in general be considered as resulting out of a comparison made both by lenders and borrowers, of the advantages and disadvantages which each discover that they

derive from giving and taking *C.* Mercantile confidence, however, is not always dealt out in that proportion in which there is reasonable ground for it. At some periods it has risen to a most unwarrantable height, and has given occasion to the most extravagant and hurtful speculations. — Evils of this kind, however, have a tendency to correct themselves. In a country possessed of commercial knowledge and experience, confidence, in most instances, will not be misplaced. Some persons are of opinion, that when the custom of buying on *C.* is pushed very far, and a great quantity of individual dealings is in consequence carried on by persons having comparatively little property, the national commerce is to be considered as unsupported by a proper capital; and that a nation, under such circumstances, whatever may be its ostensible riches, exhibits the delusive appearance of wealth. It must, however, be remembered, that the practice of buying on *C.*, in the internal commerce of the country, supposes the habit of selling on *C.* also to subsist, and to prevail, on the whole, in an exactly equal degree. In respect to the foreign trade of a country, the practice of dealing on *C.* indicates poverty or riches, in proportion as the *C.* generally taken is longer or shorter than the credit given. *C.*, though of itself it can add nothing to capital, yet is thus often the invigorating influence that aids the processes by which it is fed. Capital might sometimes be frost-bound and stagnant, did not *C.*, as it were, lend the heat to thaw it, and set it flowing. Supposing all *C.* to be prohibited, every capitalist who may be incapable of employing his money successfully will either not invest it, or if he does, he will lose it; while those who have no capital, but are possessed of skill and capacity for its profitable management, are deprived of all opportunity of exercising the talent and activity with which they are endowed, — at least in the manner in which they might be most efficiently exercised. In both ways are inflicted private injury as well as public loss. But under a law permitting and protecting *C.*, the capital in the community is brought into combination with the skill of the community, and the result is the most productive application of both. These observations refer to the *C.* given to individuals engaged in business, who mean to employ the capital which they borrow in industrious undertakings, rather than to that which is given to individuals not so engaged, and who employ the advances made to them in supporting themselves and their families. That irregular description of *C.* which frequently takes place between the retailer and the consumer is decidedly a social evil. It is opposed to habits of frugality and prudence, and almost always leads to disaster both the trader and the borrower.

**Crédit Foncier** and **Crédit Mobilier** are finance institutions, which had their origin in the joint-stock speculation and sanguine promotion of public works which marked many years of the second empire in France, and to which the introduction of limited liability in England has given a great stimulus on the British side of the Channel. The parent institutions in Paris were followed by similar establishments in some other capitals. As the terms imply, the *C. F.* contemplates loans and advances on real securities, and the *C. M.* on personal or movable estate. Whether such limits and distinctions have been ever strictly observed in the practical working of these credit banks is doubtful. The *C. M.* of France has had a more unfortunate experience than the *C. F.*, though the latter has by no means sustained the promise of

its early years. While the mania of launching new projects continued, enormous profits were made, which could only be the result of heavy promotion charges, and the shares rose in value with the extraordinary liberality of the dividends. But the system of business pursued had the result of mixing the credit banks very closely with the various companies and undertakings they were promoting, and of throwing back upon them a growing mass of depreciated or unsalable securities; while the abatement or collapse of speculation restricted the business from which the main part of the former income had been derived. The rules of dividend and the value of the shares consequently fell as rapidly as they had risen. This has been the practical experience of the *C. F.* and the *C. M.* of France, which were the first, and remain the greatest, examples of the finance companies so named. The *C. F.* of England (there has been no *C. M.* in London) has had much the same course as the French companies; large profits for a few years were followed by increasing difficulties, and the locking up of large amounts of capital in hopeless undertakings. "The title *Credit Mobilier of America* was adopted by a joint-stock company organized in May, 1863, with a capital of \$2,500,000. In January, 1867, the charter having been purchased by a company organized for the construction of the Union Pacific railroad, the stock was increased to \$3,750,000, and afterward rose to a great value, paying enormous dividends. In 1872, in the course of legal proceedings in Pennsylvania respecting the ownership of stock, it appeared that several members of Congress, as well as the actual vice-president and one of the candidates for the vice-presidency, were more or less secret stockholders. This caused a great political scandal, as it was held to be highly improper for a member of Congress to be pecuniarily interested in a corporation whose profits might be so largely and directly affected by his vote on bills concerning the railway it was building. The fact that a presidential canvass was in progress, in which several of the persons implicated took an active part, added interest and excitement to the subject. The result was a congressional investigation in the session of 1872-73. On Feb. 27, 1873, the senate committee made a report, which closed with a resolution to expel one senator; but no action was taken on it, and five days later his term expired. In the House of Representatives resolutions censuring two members were passed." — *Cyclopedia Americana*.

**Creditor**, one to whom a sum of money or other thing is due; one who has a just claim for money or other obligation, — correlative to *debtor*.

**Credit Union**. See CO-OPERATION.

**Creeper**, a kind of small grapnel for dragging in search of anything lost in a harbor or river.

**Creosote, Creasote, Kreosote**, is the product of the distillation of wood-tar, more especially that made from beech-wood. *C.* is a highly refractive, colorless, oily liquid. It has a strong odor and hot taste, is non-conductive of electricity, and burns with a smoky flame. Sp. gr. 1.037. *C.* dissolves sulphur, phosphorus, resins, and many acids and coloring matters; and is soluble in alcohol, ether, and in 80 parts by volume of water. *C.*, like carbolic acid, is a powerful antiseptic, and readily coagulates albuminous matter; wood-smoke and pyroligneous acid, or wood-vinegar, owe to its presence their efficacy in preserving animal and vegetable substances from putrefaction. *C.* is given in medicine combined with acetic acid, sirup, spirit of juniper, and water. In small quantities it acts

as a sedative of the stomach, but in over-doses it is a violent poison, causing severe pain in the abdomen, nausea, headache, giddiness, and stupor. It is administered in cases of vomiting, diarrhoea, cholera, intestinal bleeding, and chronic gleet, and to assuage hunger and thirst in diabetes; in the form of a gargle it is of service in excessive salivation, and its vapor, mixed with that of water, is sometimes recommended for inhalation. Externally it is applied as a stimulant and styptic, and for the treatment of decayed teeth; and an ointment containing it is used as a remedy for ring-worm. *C.* is also employed for preserving timber from dry-rot, and for the curing of fish and hams. It is largely manufactured in and exported from this country. *Imp. duty*, 40 per cent.

**Crepon**, a thin stuff made of wool, silk, or mixed, resembling crape.

**Crequillas**, a textile cotton fabric of light and low-priced quality.

**Cress**, the general name of a number of plants possessing pungent and aromatic qualities. The garden *C.*, *Lepidium sativum*, is a hardy and esteemed salad plant.

**Crete**, or **Candia**, one of the largest islands in the Mediterranean, belonging to Turkey. It is situated to the S. of the Grecian Archipelago, between 34° 50' and 35° 40' N. lat., 23° 30' and 26° 20' E. lon. Length 160 m.; breadth varying from 10 to 35 m. By far the greater part of the surface of the island is occupied by ranges of mountains, some of which attain to a very considerable height. The coasts of *C.* present a very broken and varied outline. In the W. especially they form a number of rugged and lofty promontories, among which must be quoted the peninsula of Akrotiri, bounding the bay of Sudha, which constitutes a naturally sheltered harbor of sufficient size to afford protection to the fleets of all Europe. The Greek language is the only one spoken throughout the island. Pop. 200,000. The soil of *C.* is fertile, producing corn, especially barley, oil, honey, and wine, besides considerable quantities of cheese, wool, wax, silk, valonia, carobs, and a variety of fruits. The principal exports are white soap, sent chiefly to Turkey and Greece, oil, silk, raisins, carobs, valonia, almonds, chestnuts, oranges, lemons, and linseed; and the imports, grain, rice, cottons and piece-goods, timber, leather and hides, tobacco, sugar, barilla, butter, salt-fish, etc. The chief commercial intercourse is with Turkey, Greece, Austria, and Egypt. The principal ports are:—

**CANDIA**, the former cap. and still the most populous city of *C.*, on the N. shore, lat. 35° 20' N., lon. 25° 0' E. The harbor, which had grown almost inaccessible, has been deepened. It is formed for the most part by the ancient moles, and was never deep enough to admit the large vessels even of the Venetians, which were accustomed to anchor in the port of the neighboring island of Standia. Pop. 16,000.

**CANEA**, or **KHANIA**, the cap. of the island and its principal seaport, on the N. coast, finely situated on the isthmus of the Akrotiri peninsula, which lies between the Bay of Canea and the Bay of Sudha; lat. 35° 31' N., lon. 24° 1' E. The harbor, formed by an ancient transverse mole nearly 1,200 feet long, would admit vessels of considerable tonnage; but it has been allowed to silt up until it shoals up from 24 feet to 10 or even 8 feet, so that large vessels have to anchor about 4 or 5 miles out. Pop. about 12,000.

**Crevet**, a crucible or melting-pot.

**Crew**, the company of sailors belonging to any

ship or vessel. The duties and rights of seamen are explained under the articles **MASTER** and **SEAMAN** in this work. Ready obedience to the lawful orders of their superiors, ability to discharge their duties, and alacrity in their performance, at all times and under the most perilous circumstances, are the distinguished characteristics of good seamen.

**Crewel**, worsted twisted in knots, and sold for tapestry and embroidery work; now called Berlin wool.

**Crib**, a child's bed or cot, of iron, cane, or wood. — The rack or manger of a stable. — A reel for winding yarn in Scotland. — A small raft of timber in Canada. A crib of white pine generally contains 1,500 cubic feet; of red pine, 1,000 cubic feet.

**Cribbage-Board**, a marking-board with holes, on which players score the game of cribbage with pegs.

**Cribble**, a sieve.

**Crick**, a small jack-screw.

**Cricket**, a game played with a bat and ball, and stumps or wickets.

**Crimper**, in boot and shoe making, a curved board over which the *upper* is stretched, to give it the required form. There are several patented machines for expediting the process of crimping.

**Crimping-Iron**, an instrument for crimping and curling the hair; a curling-tongs.

**Crimping-Machine**, an apparatus for crimping the ruffles of a shirt, women's cap-borders, etc.

**Crimson**, a deep red color; a red tinged with blue; also, a red color in general.

**Crin**, the French name for horsehair.

**Cringle**, a nautical term for a ring or thimble fitted or spliced into the bolt-rope of a sail.

**Crinoline**, a distended petticoat; a hoop, made of various materials, such as hair-cloth, cane, whalebone, steel wire, etc., by which women's dresses are expanded. These articles of toilet, which for 25 years were the object of a considerable trade, are now entirely out of fashion.

**Crisper**, an instrument for crisping the nap of cloth.

**Cristal** [Fr.], cut glass.

**Crochet**, a species of knitting, performed by means of a small hook; the materials being fancy worsted, Berlin wool, cotton, or silk.

**Crochet-Lace**, hand-knitted lace, remarkable for cheapness, durability, delicacy, and elegance of design; qualities which have caused it to take the place, to a considerable extent, of the Honiton, Valenciennes, and Brussels laces.

**Crochet-Needle**, a lady's bone or metal knitting-hook for working crochet. *Imp. duty*, same as knitting-needles. See **NEEDLE**.

**Crockery-Ware**, a common name for the ordinary classes of cheap earthenware. See **POTTERY**.

**Crocus**. See **COLCOTHAN**.

**Crook**, a shepherd's hook. — Any bent-headed instrument.

**Croom**, a husbandman's fork with long prongs.

**Crop**, that which is cut off, plucked off, or gathered during the season; the yield of the fields; the harvest. — A miner's term for the best ore. — The commercial name for one side of sole-leather, with belly and shoulders cut off, and a rounded crop for an entire hide. — A fixed weight in different localities for sugar, tobacco, and other staples.

**Crop-Hogshead**, the usual recognized weight of a crop-hogshead of tobacco is from 1,000 to 1,300 lbs. net.

**Cropping-out**, in mining an exposure of the seam, or lode, to the surface.

**Crore**, in Hindoo enumeration, signifies ten millions. It is used to express 100 lacs of rupees; and as each lac is 100,000 rupees, or nearly \$50,000, the *C.* is about \$5,000,000.

**Cross-Cut**, in mining, a lode level, driven at right angles to the direction of the vein.

**Cross-cut Saw**. See **SAW**.

**Crossed-Check**. See **CHECK**.

**Crossing**, a casting placed at the rectangular intersection of two railroads, when the rails of each track are partly cut away to allow passage to the flanges of the crossing wheels.

**Cross-Piece**, a part of anything which is worked or fitted crosswise.

**Cross-Sill**, a railroad sleeper or tie lying transversely beneath the rails.

**Cross-Somer**, a beam of timber.

**Cross-Springer**, in groined vaulting, the rib which extends from one pier to another.

**Cross-Staff**, a surveyor's instrument for measuring offsets.

**Cross-Tie**, a railway sleeper. — A connecting band in building.

**Cross-Trees**, pieces of wood at the mast-head of a vessel.

**Crotalo**, a Turkish musical instrument.

**Crotches**, forked pieces of mahogany or other timber; not straight logs.

**Croton Oil**, the seeds of the *Croton tiglium*, a small tree growing in Hindostan, Ceylon, and the Moluccas. The whole plant contains an acrid, purgative principle. The seeds have been known in Europe, from the beginning of the 17th century, under the name of *grana Molucca* and *grana tiglia*. Unlike most other fixed oils, croton oil is soluble in alcohol. It is slightly viscid; color brownish yellow, taste acrid, odor faintly nauseous. It is the most powerful purgative known, and also a powerful local irritant and rubefacient. Rubbed on the skin, it produces a pustular eruption, and frequently purges. *Imp. duty*: bark, free; oil, \$1 per lb.

**Crottles**, a Scottish name for certain mosses and lichens used in the Highlands for dyeing woollen stuffs brown, etc.; *Parmelia physodes* is the dark brown *C.*; *Sticta pulmonacea*, the light brown *C.*; *Isidium corallinum*, the white *C.*, used in the preparation of a red or crimson dye; *Parmelia omphalodes* is the black *C.*; and *P. saxatilis* is one of the *C.* most frequently used in dyeing yarn.

**Crowbar**, a wrought-iron lever for prizing or lifting.

**Crow-Berry**, a name given to the fruit of the bilberry, *Vaccinium myrtillus*.

**Crown**, a kind of paper 15 inches by 20. — An English current silver coin weighing 18 dwt. 4.36 grains, worth 5s. or about \$1.21. Of this silver piece very few have been coined lately; the only issue from the mint in the last years was 466 crowns in 1851. The half-crown is also giving place to the florin, shilling, and smaller silver coins.

**Crown-Glass**. See **GLASS**.

**Crown-Saw**. See **SAW**.

**Crown-Wheel**. See **FACE-WHEEL**.

**Crow-Quills**, feathers of the crow which are used for pens, where very fine writing is required, as in lithography and tracing, etc.

**Crow's-Nest**, a lookout house at the main top-gallant mast-head in arctic vessels, consisting of a cask or other screen or shelter for a man.

**Croze**, a cooper's tool, resembling a *gauge*, but much larger. It is used for marking the grooves for the heads of casks.

**Crozing-Machine**, a machine used by coopers

for cutting on staves the croze, or groove for the reception of the edge of the head.

**Crucible**, a vessel used by metallurgists and chemists for holding substances whilst they are exposed to a high temperature. The *C.* commonly used for fusing metals are formed of clay, or a mixture of plumbago and clay. For certain purposes, crucibles of platinum, gold, silver, iron, porcelain, and lime are employed. *Imp. duty*: black lead, 20 per cent; sand, 25 per cent.

*Earthen C.* are made from fire-clay, mixed with silica, coke, burnt clay, or other infusible matter. The materials, having been ground and kneaded, are generally moulded by hand upon a wooden block of the shape of the cavity of the *C.* Another method of shaping a *C.* consists in ramming the ingredients into a suitable mould, formed of steel or gun-metal. Small *C.* are sometimes formed by pouring "slip," that is, clay mixed with sufficient water to give it the consistence of cream, into porous moulds, made of a species of stucco. A series of these moulds are placed upon a table and filled with the semifluid composition. By the time the whole (say 50 or 60) are filled, the "slip" may be poured out of the one first filled, leaving only a very small quantity behind to give the requisite thickness to the bottom. The second and third may then be treated in the same way, until the whole number have been attended to. In each mould a perfect *C.* is formed, by the abstraction of the water of that portion of the "slip" in immediate contact with the stucco, and the *C.* is either thicker or thinner in proportion to the time this absorbent action has been allowed to go on. 70 or 80 *C.* may thus be easily made in less than 15 minutes. The moulds and their contents are next placed in a stove or slow oven. In a short time, from the contraction of the clay in drying, the *C.* may be removed, and the moulds, as soon as they have become dry, may be again filled; by care they will last for years. Earthen *C.* are used both in the burnt and unburnt state.

*Graphite or Plumbago C.* are made from graphite, ground and sifted, mixed with sufficient refractory clay to render it plastic. They are shaped by hands on an ordinary potter's wheel, or by moulds of metal. Good black lead *C.* even when of the largest size, support the greatest and most sudden alternations of temperature without cracking, and may be used after repeated heating and cooling. Their surface, within as well as without, may be made very smooth, so that particles of melted metal will not hang about the sides. They are now almost universally used for melting the precious metals, and are extensively manufactured in this country, in Jersey City, N. J., by the Dixon Crucible Co., and in other places.

*Gold C.* are exceedingly useful for many operations, on account of the way which they stand caustic and carbonated alkalies, and nitric acid, which destroy platinum or silver *C.* respectively. Their drawbacks are their great expense and ready fusibility.

*Iron C.* are used chiefly for preparing common reagents, as sulphide of iron, etc., and also for preparing pure caustic potassa from the nitrate.

*Platinum C.* These are indispensable instruments in the laboratory of the analytical chemist. They are chiefly employed in the ignition of precipitates, and in the fusion of silicates with carbonated alkalies to render them soluble, a preliminary step to their analysis. The most ordinary form of the platinum *C.* is that of a cup with a flat bottom. They are always provided with lids, which are sometimes so constructed that they may be used, when separated from the *C.*, as capsules for ignitions and evaporations. Platinum *C.* are not acted on by carbonated alkalies at a high temperature, but they are liable to be seriously damaged by the caustic alkalies. Precipitates of the more reducible metals must never be ignited in these *C.*, as the reduction of the metals would infallibly destroy the vessels.

*Porcelain C.* These beautiful vessels are made in Germany and France of all shapes and sizes. They are formed of the most exquisitely white, thin, and hard porcelain, which does not crack when heated, and which is but little acted on by the most energetic chemical reagents. For some operations they supersede platinum *C.*, particularly in the ignition of the precipitates of the more reducible metals. They do not retain coloring matter, and are not porous. Their covers are excellently adapted for delicate cases of testing, the whiteness of the porcelain showing the changes of color in a single drop of liquid most distinctly.

*Silver C.* are much used for fusions of alkalies, being much less acted on than platinum *C.*; and also for water analyses, from their cheapness and light weight. They are easily destroyed, however, by acids.

**Crude**, raw; in a primary state; not manufactured.

**Cruet**, a vial or small glass bottle for holding condiments for the table; a caster. A *cruet-stand* is a frame for holding several cruet.

**Cruise**, to rove on the sea without any certain course, in search of an enemy's ship for capture, or for protecting commerce.

**Crumb-Brush**, a curve-shaped brush with short handle for sweeping the crumbs from a table-cloth.

**Crumb-Cloth**, a linen or holland carpet-cover for a living-room.

**Crupper**, a leather strap for the saddle to the horse's tail.

**Crusado, Cruzada**, a Portuguese gold coin; the old *C.* being worth 400 reis, and the new 480 = about 50 cents. There are, however, silver crusadoes of 240, 120, and 60 reis.

**Cruset**, a goldsmith's crucible.

**Crushing**, in mining, the process of pulverizing or grinding the ores without water.

**Crushing-Mill**, a mill of various kinds for crushing ore, stone (Fig. 44), malt, or other substance.

**Crutch**, wooden support made to assist lame persons or cripples in walking. — A knee, or piece of knee-timber, placed inside a vessel to secure the heels of the cant-timbers abaft.

**Cruth**, a Welsh musical instrument with six strings, played upon with a bow.

**Cryolite**, a massive, granular, cleavable, translucent, brittle mineral, of a snow-white (sometimes reddish or brownish) color, vitreous lustre; sp. gr. 2.9 to 3.7. Its transparency is increased by immersion in water. It is a double fluoride of aluminium and sodium, found only in Greenland. *C.* is used in the manufacture of soap, soda, aluminium sulphate, alum, and cryolite glass. *Imp. free.*

**Crystal**, the common name for quartz, or pure crystalline silice; also for a superior description of glass. In chemistry, however, a *C.* is any inorganic solid, bounded by plane surfaces symmetrically arranged, and produced by the operation of chemical affinity in the transition from the fluid to the solid state. See CRYSTALLIZATION.

**Crystalene**, a kind of mineral oil, newly introduced in the trade, and whose composition is kept a secret. It has neither taste nor smell, and is not affected by water, oils, acids, alkalies, or heat. This seemingly wonderful product is capable of almost universal use, as a paint, a varnish, an enamel, etc., or it can be made into plastic form, in which latter state it can be made into ornaments, and many useful articles, being easily moulded into any shape. As a paint for outside or inside work, it gives a surface superior to anything in the market, hard, firm, smooth. As a varnish and enamel, it produces a very superior surface. Frescoed walls made with it can be washed the same as a plain wood-work; and a keg coated with it has held kerosene oil for months, and the shelf on which it stood had not a mark of oil on it. *C.* can be applied to wood, iron, tin, etc., leather, paper, cloth, silk, etc. It does not crack or peel off under any ordinary use, and seems capable of standing the severest tests. Applied to leather, a fine enamelled surface is produced, which will not crack, even under the greatest pressure, until the texture of the leather has been destroyed; and while producing a hard, flint-like surface, it leaves to leather its flexibility.

**Crystallization**, the act or process by which crystals are formed. The frequent reference to this subject in the pages of this work, and the constant employment of the process of *C.* in the manufacture of salts, etc., in the laboratory, seem to point out the necessity of a few explanatory remarks thereon under this head. When fluid substances are suffered to pass with adequate slow-

ness to the solid state, or when solutions of solids are slowly concentrated by evaporation, or the solvent powers of the menstruum, gradually lessened by cooling, the ultimate particles of matter so arrange themselves as to form regular geometrical bodies, familiarly known by the name of crystals. This wonderful property, which is possessed by a great variety of substances in the mineral kingdom, and by nearly all saline bodies, is resorted to for many useful and important purposes in the chemical arts. It is by means of *C.* that the majority of salts are obtained in a state of purity; for in the act of passing into the crystalline state, the foreign substances with which they are united are left behind in the mother-liquor.

Salts are crystallized, either by allowing their hot and saturated solutions to cool slowly, or by simply evaporating the menstrua as long as crystals form. In the first case, the liquid is commonly evaporated until a pellicle appears on the surface, when the vessel is set aside in some sheltered situation until cold, at which time the crystals are collected, and the process repeated for fresh crystals. In the second case, the crystals are usually removed from the liquid as soon as they are deposited. The first method is adopted for those salts that are considerably more soluble in hot than in cold water, as carbonate of soda, Epsom salts, etc.; the last method, for those that possess nearly equal solubility in both cases, and also for many salts which are not required in handsome crystals; thus common salt and chromate of potash are crystallized in this way. Many of the alkaloids, and their salts, are obtained in crystals, by allowing their solutions (generally alcoholic or ethereal) to evaporate spontaneously. By repeating the processes of solution and *C.* two or three times with the same body, the crystals obtained by the last operation will usually be found to be quite pure. Many solids may be readily obtained in a crystalline state by melting them and allowing them to cool very slowly. Thus, iodide of sulphur is crystallized by melting it in a flask placed in a salt-water bath, and allowing it to remain in the water until the whole becomes cold. Sulphur and many metals are crystallized by pouring them, in a state of fusion, into a hot vessel having a plug in the bottom, which is withdrawn as soon as the surface becomes cool, when the liquid portion runs out, and leaves the under surface in the form of a mass of agglomerated crystals. Perfectly pure wax, stearine, and spermaceti have a very pleasing appearance when treated in this way.

**Crystallo-Type**, a photographic picture on glass.

**Cuartane**, the twelfth part of the cuartera; a Spanish weight.

**Cuartas, Cuartel**, the most valuable kind of tobacco in Cuba, fit only for filling cigars.

**Cuartella**, a variable dry measure in Spain, ranging from 0.077 to 0.388 bushel. As a liquid measure for wine, it is generally equal to 1.065 gallon, and for oil 0.829 gallon; 4 *C.* make an azumbre. The Arragonese *C.* as a weight is 0.016 lb.

**Cuartera**, a Spanish corn measure; 2½ *C.* make one carga. 100 *C.* of Barcelona = 24½ quarters.

**Cuarteron**, an oil measure of Madrid = 0.033 gallon.

**Cuba**, the largest and richest of the West India Islands, and the most important colony of Spain. The island of *C.* is long and narrow, somewhat in the form of an irregular crescent, with its convex side towards the north. It divides the entrance to the Gulf of Mexico to the N.W., being 130 m. wide at the narrowest part, between the points of Yacacos in *C.* and Sable on the Florida coast, and the S.W. passage of nearly the same width, between the Cabo de San Antonio of *C.* and the Cabo de Catoche, the most salient extremity of the peninsula of Yucatan. On the N.E., E., and S.E., narrow channels separate it from the Bahamas, Hayti, and Jamaica. *C.* lies between lon. 74° and 85° W., lat. 19° and 23° N. Its length, following a curved line through its centre, is 730 m.; average breadth 80 m. Its area is 43,319 sq. m.; the neighboring island of Pinos, 1,214 sq. m.; and the smaller coast islands, 1,350 sq. m.; in all, 45,883

sq. m. *C.* is ruled over directly by a governor-captain-general of the class of lieutenant-general of the Spanish army, whose authority for the time being is despotic. He is appointed by the Crown, the term of office being generally from 3 to 5 years, is responsible only to the sovereign of Spain, and is supreme head of the civil, military, and ecclesiastical jurisdictions of *C.* The captain-general is assisted by governors of departments, who have under their orders the lieutenant-governors, commanders of the 32 jurisdictions of the islands, each of which is subdivided into *partidos*, or captaincies. In each city or town a municipal body termed the *ayuntamiento*, or town council, is at the head of affairs, but municipal representation exists only in appearance. The military division is into two departments, — that of the W., with Havana for its capital, and that of the E., with Santiago de Cuba for its headquarters. The *Real Audiencia*, holding session at Havana, is a species of council of state which the captain-general consults on all difficult matters of administration. The maritime division

*criollos*, those born on the island. *C.* was long notorious for the extent to which the slave-trade was carried on there, and the ineffectual efforts made to suppress it. The importation of African slaves has, however, ceased for a number of years. In their place Asiatic coolies were introduced in considerable numbers, and treated as slaves in almost every sense; but in June, 1879, by treaty between Spain and China, the immigration of Chinamen by contract was entirely prohibited, and Spain has engaged to treat the Chinese in *C.* with the same consideration as foreigners of the most favored nation. — Under a better and more liberal system of government, there can be no doubt that *C.* would speedily attain a much higher state of prosperity and importance than it has yet enjoyed. Great as is its productiveness at present, some writers assert that under good government it would be increased fivefold; its mineral resources would then be fully developed, and it would be able fully to take advantage of its admirable position to develop its trade. Owing to the disturbed

Fig. 115. — HAVANA.

is subject to a commander-general, and consists of 5 stations or provinces, with their centres at Havana, Trinidad, San Juan de los Remedios, Nuevitas, and Santiago de Cuba. In popular language, the different portions of the island are distinguished as the *Vuelta Abajo*, or the portion extending from the meridian of Havana to the W. extremity of the island; the *Vuelta Arriba*, from the meridian of Havana toward the E. as far as Cienfuegos; *Las Cinco Villas* from the meridian of Cienfuegos to that of Santo Espiritu; and *Tierra Adentro* from that of Santa Espiritu to Holguin and the extreme E. of the island. The inhabitants of *C.* are divided into 4 classes, — the native Spaniards, who occupy nearly all the offices of power and trust; the creoles, who are mostly planters, farmers, or lawyers, and are generally looked upon with contempt by the Spaniards; the third class, composed of free mulattoes and free negroes in about equal parts, who are excluded by law from all civil offices, — those under servitude, constituting the fourth class, divided into the *bozales*, those recently brought from Africa, the *ludinos*, those imported before the law of 1821 prohibiting the slave-trade, and the

condition of the island, no census of the inhabitants has been taken since that of 1861. The results of the enumeration of that year made the total pop. 1,396,530, distributed thus: —

Naturalized whites.....	780,994
Asiatic coolies.....	34,834
Mexicans (Yucatec).....	1,047
	766,775
Free colored.....	232,493
Slaves.....	370,553
	603,046
Resident foreigners.....	5,298
Passing.....	3,937
Spaniards.....	17,424
	26,709

An official statement, made in 1872, gives a total of 1,359,437 (including 50,000 coolies), or 1,034,816 in the W. division, of which Havana (pop. 230,000) is the chief city; 75,725 in the central districts round Puerto Principe (pop. 31,000); and 249,096 in the E. division, the chief town of which is Santiago de Cuba (pop. 37,000). The only other town of importance is Matanzas, with a pop. of 36,000.

Numerous lines of steamers run between Havana and New York, New Orleans, Key West, Philadelphia, and Baltimore; and with Europe, communication is maintained by English mail as well as French and German lines of Ocean steamers. The island is connected by telegraph with the U. States.

The coast of *C.* is generally low and flat, and is surrounded by numerous islands and reefs, which render the approach both difficult and dangerous to those not acquainted with the proper channels. The low nature of the shore subjects it to frequent floods and inundations; and especially on the N. side there are many large lagoons, from which a considerable quantity of salt is obtained. No island, however, in proportion to its size, has a greater number of excellent harbors, many of them accessible even to ships of the line. Of these, the chief are the ports of Bahía Honda, Mariel, Havana, Matanzas, Cardenas, Nuevitás, and Nipe on the N. side, and Guanamo, Santiago de Cuba, Trinidad, and Cienfuegos on Xagua Bay on the S. The highest part of the island is in the range of mountains extending in the S. E. from the Punta de Maysí to Cape Cruz, called the Sierra or Montañas de Maestra, or Cobre, the summits of which are the Pico de Tarquino, 7,670 feet, the highest point of the whole island; Gran Piedra, 5,200 feet; Yunque and Ojo del Toro, 3,500 feet. From this Sierra, a ridge of much smaller general elevation follows nearly the central line of the island westward throughout its extent, rising to form a more marked range in the extreme W. of *C.*, on which the Pan de Guajabón attains 2,530 feet. An almost isolated mass, of which the Pico de Potrerillo is the summit, 2,900 feet above the sea, rises immediately behind the harbor of Trinidad, near the centre of the S. coastland. The S. E. sierra is one great calcareous mass, resting on a schistose formation. The summits are for the most part rocky and naked, occasionally interrupted by more gentle undulations. The central and western parts of the island contain two formations of compact limestone, one of clayey sandstone, and another of gypsum. Caverns abound in the limestone formations. — *Climate.* Situated within and near the border of the N. tropical zone, the climate of the low coastlands of *C.* is that of the torrid zone, but the higher interior of the island enjoys a more temperate atmosphere. As in other lands on the border of the tropics, the year is divided between a hotter and wetter season, corresponding to the northern declination of the sun, and a cooler and drier period. The months from the beginning of May to Oct are called the wet season, though rain falls in every month of the year. With May, spring begins in the island, rain and thunder are of almost daily occurrence, and the temperature rises high, with little daily variation. The period from Nov to April is called the dry season by contrast. On a mean of 7 years, the rainfall at Havana in the wet season has been observed to be 27.8 inches, of the dry months 12.7, or 40.5 inches for the year. At Havana, in the warmest months, those of July and August, the average temperature is 82° F., fluctuating between a maximum of 88° and a minimum of 76°; in the cooler months of Dec. and Jan., the thermometer averages 72°, the maximum being 78°, the minimum 68°; the average temperature of the year at Havana, on a mean of 7 years, is 77°. But in the interior, at elevations of over 300 feet above the sea, the thermometer occasionally falls to the freezing point in winter, hoar-frost is not uncommon, and during N. winds thin ice may form, though snow is unknown in any part of the island. The prevailing wind is the easterly trade breeze, but from Nov. to Feb. cool N. winds (*los noristes*, or "northerners"), rarely lasting more than 48 hours, are experienced in the W. portion of the island, to which they add a third seasonal change. From 10 to 12 o'clock are the hottest hours of the day; after noon a refreshing breeze (*la cirazon*) sets in from the sea. Hurricanes may occur from August to Oct., but are less frequent than in Jamaica or Hayti, and sometimes 5 or 6 years may pass without such a storm. Slight shocks of earthquake are occasionally felt. There are no diseases specially indigenous to the island; the yellow fever, which breaks out with renewed virulence regularly with the wet season in the coastlands and seaports of *C.*, annually causing great loss of life, is quite unknown in the interior. — *Minerals.* The mineral riches of *C.* have not yet been explored to any considerable extent. Though gold and silver have undoubtedly been found in the island, the quantity has never been sufficient to repay the labor of search. The Cobre copper-mines, 12 m. from San-

tiago, are of great extent, and very rich. As much as 50 tons of ore are taken out daily the richest part of which, being broken up, is shipped to Europe, while the poorer part is smelted at the works, yielding about 14 per cent of metal. Coal of a highly bituminous character, affording a strong heat, and leaving very little solid residue in the form of ashes or cinders, is very abundant. In some places it degenerates into a form resembling asphaltum, and near the coast it is often found in a semi-liquid state like petroleum or asphalt. In the quarries near Havana a thick slate is found, fit for floors and pavements. Marbles and jaspers of various colors, and susceptible of a high polish, are found in many parts of the island, and particularly in the Isle of Pines. It is generally believed that iron exists in various districts; but from the difficulty of access, the scarcity of fuel, and the want of capital, no extensive mining operations have been engaged in. Native loadstone, however, has been found in various parts, and

Fig 116. — BAMBOOS

chalybeate springs are numerous. — *Vegetable products.* The forests are of vast extent, and so dense as to be almost impenetrable. It is estimated that of nearly 20,000,000 acres of land still remaining perfectly wild and uncultivated, nearly 13,000,000 are uncleared forest. Mahogany and other hard woods, such as the Cuban ebony, cedar, sabel, and granadilla, valuable for manufactures, cabinet-work, and ship-building, are indigenous, and are exported to a considerable extent. The palm is the queen of the Cuban forests, and the most valuable tree. The most common species, the *Palma real* (*Oreodora regia*), is found in all parts, but especially in the W. The tree-like bamboo (Fig. 116), rising to a height of 60 and even 80 feet, is found in several parts of the island. The fruits of *C.* are those common to the tropics, of which the pineapple and orange are the most esteemed. Of the alimentary plants, the plantain is by far the most important. Next in order

come the sweet and bitter cassava, — the sweet root being eaten as a vegetable, and the bitter converted into bread after its poisonous juice has been extracted. The sweet potato and other farinaceous roots are also common. Indian corn is indigenous, and rice is extensively cultivated; cocoa or chocolate is also grown. The chief agricultural products of C. are, however, sugar, coffee, and tobacco. The *ingenios* or sugar estates, with large buildings and mills for sugar-refining and distillation of rum, are the most important industrial establishments of the island, varying in extent from 500 to as much as 10,000 acres. Of late years, partly from the effects of the insurrection, and partly from the rapidly extending cultivation of beet-root sugar in other countries, the demand for Cuban sugar has been diminishing, and the sugar estates have not flourished. The U. States take about 70 or 80 per cent of the sugar grown in C., the greater part of the remainder passing to Europe. The quantity exported in 1873 from the ports of Havana, Matanzas, Cardenas, Sagua la Grande, Remedios, Nuevitas, Santiago de Cuba, Trinidad, and Cienfuegos exceeded 700,000 tons, of a value of about \$70,000,000. Besides this, 286,000 tons of molasses were exported. After the "*ingenios*," the *cafetates*, or coffee estates, are the most important establishments. They vary in extent from 100 to upwards of 1,000 acres, or even more in the mountain districts, — the number of hands employed being as high as 100 in the low country, but generally averaging 50 or 60 negroes to 1,000 acres. The first coffee plantation was established in 1748, the seeds having been brought from San Domingo. Though at one time coffee was sent out from Cuba in enormous quantities, it does not now figure largely in the exports. Tobacco is indigenous to Cuba, and its excellent quality is celebrated in all parts of the world. The estates devoted to its cultivation are scattered over the greater part of the island, but the finest qualities of tobacco are those grown in the country west of Havana, known as the "*vuelta abajo*." In 1873, 196,850,000 cigars were exported, besides about 14,500,000 lbs. of leaf, to the U. States, Great Britain, Hamburg and Bremen, Holland, France, and Spain. Among the other industrial establishments of C. may be mentioned the numerous cattle farms, cotton plantations, fruit and vegetable farms, chocolate plantations, and *colmenaries*, or farms devoted to the production of honey and wax.

The imports consist mainly of jerked beef from S. America, codfish from Canada and New England, flour from Spain, rice from the Carolinas, Spain, and the East Indies, wine and olive oil from Spain, coals from Europe and N. America, and petroleum from the U. States, besides large quantities of American, British, German, and Belgian manufactures and hardware. Heavy differential duties in favor of goods imported into C. in Spanish ships are in force, so that the greater part of the imports arrive in these. Cattle are imported from Florida and the coasts of the Mexican Gulf. There are no manufacturing industries of importance in the island. Under the continual apprehension of the insurrection, which lasted from 1868 to 1873, C. has seen her trade decrease, her crops reduced, and her taxes have been trebled in vain to meet the ever-increasing expenses and floating debts. In 1879, a commission was created by the governor-general to study, form, and submit to the consideration of the Spanish government, the basis of a commercial treaty with the U. States and Canada.

The following is a table of the General Commerce of C. with the U. States for the 20 years ending with 1873: —

Year.	Imports from the U. States.	Exports to the U. States.	Total imports and exports.
1859.....	12,238,202	34,054,424	46,322,626
1860.....	12,382,869	34,032,276	46,415,145
1861.....	12,892,077	32,557,357	45,428,434
1862.....	11,048,710	20,931,983	31,980,693
1863.....	15,059,292	21,534,065	36,593,357
1864.....	17,459,165	33,476,599	50,935,764
1865.....	20,083,312	30,600,796	50,684,108
1866.....	15,771,430	37,735,812	53,507,242
1867.....	15,318,075	39,324,765	54,642,840
1868.....	18,048,428	50,750,727	68,799,155
1869.....	19,708,742	58,201,374	77,910,116
1870.....	17,412,781	54,056,415	71,469,196
1871.....	15,840,202	58,240,584	74,080,786
1872.....	14,751,936	67,720,235	82,472,161
1873.....	15,628,768	77,469,826	93,098,594
1874.....	21,591,509	86,272,496	107,863,975
1875.....	21,961,009	66,745,527	88,706,536
1876.....	18,049,932	58,717,688	76,767,620
1877.....	16,070,424	67,689,269	83,759,723
1878.....	13,162,582	58,885,162	72,047,544
Total.....	325,204,496	990,052,350	1,315,256,846

The value of the principal articles imported from the U. States in 1878 was: Acids, \$15,424; agricultural implements, \$26,609; horses, \$34,470; mules, \$141,510; manuf. of brass, \$23,089; crackers, \$39,837; Indian corn, \$168,782;

oats, \$21,370; wheat flour, \$150,261; other small grain and pulse, \$349,267; brooms and brushes, \$13,399; carriages, \$23,390; railroad cars, \$54,684; bituminous coal, \$212,740; other coal, \$64,964; cordage, rope, and twine, \$94,600; manuf. of cotton, \$74,940; drugs and chemicals, \$127,741; fruits (green and preserved), \$47,165; glass and glassware, \$55,854; hay, \$43,397; manuf. of hemp, \$67,328; ice, \$45,182; iron manufactures, \$1,458,400; edge tools, \$28,983; manuf. of marble, \$82,252; mineral oil, \$391,653; paper and stationery, \$162,842; perfumery, \$43,295; bacon and ham, \$938,492; butter, \$56,111; fish (fresh, cured, dried, or smoked), \$279,973; lard, \$1,850,211; preserved meats, \$33,867; pork, \$26,750; onions, \$16,735; potatoes, \$408,476; scales, \$15,057; sewing-machines, \$66,631; tallow, \$25,965; manuf. of tobacco, \$38,271; trunks, \$35,423; wood (boards, shooks, staves, hog-heads, etc.), \$1,927,591; household furniture, \$79,627.

The value of the principal articles exported to the U. States during the same year was: — Foreign coin, \$1,791,037; American coin, \$160,719; brown sugar, \$44,702,311; molasses, \$1,265,196; melada and sirup of sugar-cane, \$1,119,975; tobacco leaf (7,767,955 lbs.), \$4,020,981; cigars (604,864 lbs.), \$2,239,455.

**Communication.** The roads of C. are generally in a very wretched condition. Several railroads have been established. The oldest, opened in 1838, extends from Havana to Guines, a distance of 45 m., and has branches to Batabano, San Antonio, and Los Palos. There are lines in operation from Matanzas to Sabanilla, Cardenas to Bamba and Jucaro, and thence to unite with the line which crosses the island between Sagua la Grande and Cienfuegos, as well as from Puerto Principe to Nuevitas. The whole length of lines in operation is nearly 400 m. Coastal communication is kept up by steamers which ply regularly between the different ports.

**Finances.** The crown revenues of the island are the *rentas maritimas*, including duties on imports, exports, and tonnage, and the local or municipal duties levied at some of the custom-houses; the *impuestas interiores*, including the tax on home manufactures, the sale of stamped paper, the profits derived from the lottery, and the impost on cock-fights; deductions from the *rentas eclesiasticas*, particularly those called the royal ninth and the consolidated fund, the sinking fund, the *media annata*, and the annual and monthly revenues of the clergy; personal deductions, such as from the pay of public functionaries and the price of exemption from military service; miscellaneous receipts, as the produce of the sale of royal lands, the rents of vacant livings and of unclaimed estates, the produce of vendible offices; and casual receipts, including deposits, confiscations, donations, and the recovery of arrears. Previous to the outbreak of the insurrection of 1868, the total revenue of C. had reached nearly to \$26,000,000, of which sum about \$6,000,000 was annually remitted to Spain, leaving the remainder to cover the expenses of the army, navy, and civil service of the island. Since 1868 the imposts have been much increased, but have not been sufficient to cover the enormous increase of expenditure consequent on the rebellion. The government of the island has thus been compelled to borrow large sums for its war funds. Public finances are specially under the management of the government bank called the Banco Español, and have fallen into an unsatisfactory and confused state, consequent on the steps taken by the island government for obtaining funds by the emission of large amounts of notes without additional security, and without a special guarantee for each issue from the Madrid government, resulting in the depreciation of the paper, or a premium on gold and silver.

**Money.** The coins in use are chiefly the old Spanish *doblon*, or *onza de oro*, worth 16 silver dollars of Spain, but it is legal tender for 17 dollars in the island. Gold coins of half a doblon, *media onza*, of 8 dollars 50 cents, and of half and quarter that amount, and the *peso*, or dollar in gold or silver, are also in circulation. There is scarcely any smaller silver currency in Cuba, excepting the American 10-cent piece, or dime, called the *real senella*.

**Weights and measures** are those of Spain (q. v.). A hog-head of sugar = 1,300 lbs.; a bag of coffee = 150 lbs.; a pipe of tafia or rum = 120 gallons; and a bale of tobacco = 100 lbs.

**Customs Duties.** The tariff of C., like that of Spain, is exceedingly complex, being divided into a great many classes, and embracing a vast number of articles, many of which are of very trifling importance. Most of the articles of import are valued at certain fixed rates, upon which the duties are charged at so much per cent. Hence, when the fixed or tariff prices exceed the real prices of the goods, the duties are proportionally increased, and conversely when the tariff prices are under the real prices. This tariff has been in part revised, but is still so deficient that disputes are constantly arising as to the classification of goods.

**Customs Regulations.** Every shipmaster is bound to have on his arrival, ready for delivery to the boarding officers of the revenue, a manifest, containing a detailed statement of his cargo and ship stores, and in the act of handing it over has to write thereon an oath that he has no other cargo on board, and the hour when he delivers it, taking care that it be countersigned by the boarding officers. Within 12 hours, which begin to count from the moment he delivers such manifest until 7 o'clock in the evening, and again from 6 o'clock in the

morning until the moment the said 12 hours elapse, he can make any alteration by *presenting a separate note* in which he specifies the errors he may have committed in the manifest. After the expiration of these 12 hours no alteration will be permitted. *Goods not manifested* will be confiscated without remedy; and if their value should not exceed \$1,000, the master of the vessel will be liable to pay a penalty of double the amount of such non-manifested goods; if they exceed that sum, and belong to the master or come consigned to him, his vessel, freight, and other emoluments will be forfeited to the revenue. *Goods over manifested* will pay duties as if they were on board. *Goods not manifested, but claimed in time by a consignee*, will be delivered up to the latter, but the master in this case will be subject to a fine equal in amount to that of such goods. *Gold and silver* not manifested by either master or consignee are liable to a duty of 4 per cent. *Goods falling short* of the quantity manifested, when landed, and not being included in any invoice of consignee, will render the master liable to a penalty of \$200 for each package so falling short. *Every master* must present himself, within 24 hours after his arrival, at the Custom House, in order to swear to his manifest, in neglect of which he is liable to a fine of \$1,000. *Every consignee* is obliged to present a detailed note of goods within 48 hours after the arrival of a vessel; if not, such goods are liable to 2 per cent extra duty; the same is the case if such notes do not contain a statement of the number of pieces, contents, quantity, weight, and measure. Every vessel is required to bring a bill of health certified by the Spanish consul at the port of her departure, or that nearest to it, otherwise they are placed in quarantine. If the vessel arrive and sail in ballast, or without breaking bulk, she avoids the health visit, Morro light, tonnage, and mud-engine dues. If she bring cargo, the translation of manifest is more, according to its length, wharfage dues are incurred for the time of discharge, and the tide-waiters charge \$5.50 for each day. Vessels taking entire cargoes of molasses pay no tonnage duty.

HAVANA, the capital and the most important city of the island, is situate in lat.  $23^{\circ} 8' 15''$  N., lon.  $82^{\circ} 22' 45''$  W. Its port is the finest in the West Indies, and one of the finest in the world. The entrance is narrow, but the water is deep, without bar or obstruction of any sort, and within it expands into a magnificent bay, capable of accommodating 1,000 large ships; vessels of the greatest draught of water coming close to the quays. The city lies along the entrance to, and on the W. side of, the bay. The suburb Regla is on the opposite side. The Morro and Punta castles, the former on the E., and the latter on the W. side of the entrance of the harbor, are strongly fortified, as is the entire city. The arsenal and dock-yard lie towards the W. angle of the bay, to the S. of the city. In the city, the streets are narrow and inconvenient; but in the suburbs, which are more extensive than the city itself, they are wider and better laid out. From its position, which commands both inlets to the Gulf of Mexico, its great strength, and excellent harbor, H. is, in a political point of view, by far the most important maritime station in the West Indies. As a commercial city, it also ranks in the first class; but it has long ceased to be, as it was formerly, the only port in the island for the exportation of sugar. The exports from Matanzas now usually amount to about a third part of those from H.; and there is also a considerable export from Cardenas, Trinidad, St. Jago de Cuba, Cienfuegos, and other ports. H., however, still engrosses the largest part of the foreign trade of the island. The exports from this port in 1878 were as follows: sugar in hogsheads, 150,472; sugar in boxes, 331,876; coffee, 14,400 lbs.; molasses in hogsheads, 9,333; honey, 154,109 gallons; wax, 197,075 lbs.; aguardiente in casks, 9,403; paper cigars, 11,284,062 packages; cigars, 110,832,000; tobacco leaf, 12,640,335 lbs. During that year 1,606 vessels entered the port, whose nationalities were as follows: Spanish steamers, 201; American, 200; English, 53; French, 25; German, 20; Swedish, 2; Spanish sailing vessels, 354; foreign, 757. Pop. 230,000.

MATANZAS a seaport town of the N.W. coast, about 52 m. E. of Havana, in lat.  $23^{\circ} 3' 3''$  N., lon.  $81^{\circ} 40' 4''$  W. It is finely situated on both sides of the San Juan River, is strongly fortified, and ranks next to Havana in commercial importance. Pop. 33,000.

ST. JAGO DE CUBA, a seaport town, is situate on the river Santiago, 6 m. from its mouth, on the S. coast of the island, lat.  $19^{\circ} 55' 9''$  N., lon.  $75^{\circ} 50' 0''$  W. The harbor, 4 m. long, is fortified and well sheltered, and is next in commercial importance to the two above ports. Pop. 37,000.

**Cuba Tobacco.** See HAVANA TOBACCO.

**Cube.** See SQUARE.

**Cubebs** [Fr. *cubebs*; Ger. *Kubelen*; It. *cubebi*; Port. *cubebus*; Sp. *cubebus*], the produce of *Piper cubeba*, a plant which is cultivated in Java, and grows also in Penang and other parts of the East Indies. It is a small unripe fruit, dried like a pepper-corn, but somewhat longer. *C.* have a hot, pungent, aromatic, slightly bitter taste, and a characteristic odor. They should be chosen large, fresh, sound, and the heaviest that can be procured. When *C.* have been kept long, especially in powder, they lose a portion of their volatile oil, on which, it appears, their medicinal properties depend. They are said to be adulterated with Guinea grains and pimento. *C.* are imported from Batavia and Canton, and are used in medicine. *Imp. free.*

**Cubit**, an English measure of length = 18 inches.

**Cuca.** See COCA.

**Cuckoo-Clock**, a kind of clock imported from Germany and Switzerland, in which the hours are sounded by wind proceeding through reeds which simulate the voice of the bird after which it is named. — *Knight*.

**Cucumber** [Fr. *concombre*; Ger. *Gurke*; It. *cetrinolo*; Port. *pepinho*; Sp. *columbro*], the cooling fruit of a well-known annual (*Cucumis sativus*)

Fig. 117. — LABORATORY STILL.

A, Cucurbit, or boiler. B, Alembic, or head. S, Condenser, or worm-pipe.

of which several varieties are cultivated in this country. It is chiefly used with us as a salad or condiment; but in Egypt, Syria, and other Eastern countries, where it is grown in fields, it forms a considerable part of the food of the lower classes, especially during summer; and its employment for this purpose is repeatedly noticed in Scripture. *Wild C.*, or *Squirting-gourd*, a perennial (*Momordica elaterium*), is a native of the S. of Europe. The fruit is oblong, about  $1\frac{1}{2}$  inches in length, and of a green color; and its juice yields the purgative substance known in medicine under the name of elaterium.

**Cucumber-Tree**, a name given to the *Magnolia acuminata*, because its fruit when grown resembles a cucumber. It is about 3 inches long, and nearly 1 inch in diameter, and when steeped in whiskey it communicates a bitter to the spirit, which is drunk as a preventive of autumnal fevers. The bark dried and prepared is also used for the same purpose.

**Cucurbite**, an earthen, glass, or copper vessel used in distillation (A in Fig. 117). It is usually in the form of a gourd, whence the name; but it is sometimes made shallow, with a wide mouth.

**Cudbear**, a purple or violet colored powder used in dyeing violet, purple, and crimson, prepared from a species of lichen (*Lecanora tartarea*), or crustaceous moss, growing commonly on limestone rocks in Sweden, Scotland, the North of England, etc. About 130 tons of this lichen are annually exported from Sweden. It commonly sells in the port of London for about \$100 per ton; but to prepare it for use, it must be washed and dried; and by these operations the weight is commonly diminished a half, and the price, in effect, doubled. Though possessing great beauty and lustre at first, the colors obtained from *C.* are so fugitive that they ought never to be employed but in aid of some other more permanent dye, to which they may give body and vivacity. It is chiefly used to give strength and brilliancy to the blues dyed with indigo, and to produce a saving in that article; it

Fig. 118 — CULTIVATOR.

is also used as a ground for madder reds, which commonly incline too much to yellow, and are made *rosy* by this addition. *Imp.* duty, free.

**Cue**, the straight rod used in impelling balls at billiards. The end or *tip* with which the ball is struck is usually shod with vulcanite or leather.

**Cuir**, the French name for leather and hide.

**Cuirasse**, an armor for the body, usually of metal, and consisting of a breast and a back plate buckled together under the arms.

**Cuir Color**, the color of tanned leather.

**Cuir de Lane**, the French trade name for double-milled woollen cloth.

**Culen**, or **Koulin**, a name for the *Psoralea glandulosa*, the leaves of which have a medicinal reputation, and are used as a tea substitute.

**Cull**, to pick out, to select the best quality, to sample.

**Cullet**, the trade name for broken crown or flint glass, used in the manuf. of crown or window glass.

**Cullings**, or **Culls**, refuse lumber.

**Culm**, the stem of grasses. The term is also applied both to an inferior kind of anthracite only worked for making lime, or for mixing with clay, and to the small pieces of good anthracite obtained

in working the true anthracite beds. It is also called *Blind Coal* and *Glance Coal*.

**Cumbi**, a kind of cloth made from the wool of the alpaca in Chili and Peru.

**Cumana**. See VENEZUELA.

**Cultivator**, an improved harrow consisting of a triangular frame set with teeth or shares, which, when the instrument is drawn along lands already ploughed, penetrate to the bottom of the furrow, and thoroughly pulverize the soil. The horse is hitched to the apex of the frame, and the implement is guided by a pair of handles at the rear. Fig. 118 shows one American form of *C.*, in which the ploughs are managed by levers in driving, and by the handles when walking behind the machine.

**Cumberland**. See MARYLAND.

**Cumberland and Pennsylvania R.R.**, owned by the Consolidation Coal Co. of Maryland, whose offices are at Baltimore. Runs from Cumberland to Piedmont, Md., 38 m., Eckhart or Cumberland division, 14 m., Branch to Pennsylvania State line, 3 m. Total length of road owned and operated, 55 m. Operations of the Coal R.R. Co. are reported together to 31st Dec. 1878. *Financial statement*: Cap. stock \$10,250,000; funded debt, \$2,764,500. Net earnings from R.R. mines, etc., \$354,525.49.

**Cumberland Valley R.R.** runs from Harrisburg, Pa., to Potomac River, Md., 82.20 m. This Co., whose offices are in Chambersburg, Pa., was chartered in 1831, and opened in 1837. *Financial statement*: Cap. stock, 1st preferred, \$241,000; 2d preferred, \$243,000; common, \$1,292,950. Funded debt, \$352,300, consisting of 1st mortgage 8% bonds, payable 1st April, 1904, \$161,000; 2d mortgage 8% bonds, payable 1st April, 1908, \$109,500; debenture 6% bonds, payable 1st Jan. 1884, \$81,800. Net earnings for 1878, \$49,007 17.

**Cumin-Seed**, the seeds of an annual plant (*Cuminum*

*cuminum*, Linn.), a native of Egypt, but extensively cultivated in Sicily and Malta. They have a strong, peculiar, heavy odor, and a warm, bitterish, disagreeable taste. This seed, which formed a favorite ingredient in old English cookery, has been supplanted by more agreeable condiments. It was employed in medicine, and is still used in farriery. *Imp.* free.

**Cuntline**, the space between the bilges of two casks stowed side by side in a ship. Where one cask is set upon the *C.* between two others, they are stowed *bilge* and *cuntline*.

**Cup**, a small vessel to drink out of. A cupping-glass.

**Cupel**, and **Cupellation**. See ASSAY.

**Cupola Furnace**, a furnace for melting iron in a foundry. The cupola, or dome, leading to the chimney, to which it owes its name, is now frequently omitted.

**Cupping-Glass**, a small bell-like glass, used by surgeons in the operation of cupping. See SCARIFICATOR.

**Cupule**, the cup of the acorn *Quercus cegilops*, which enters largely into commerce as a tanning substance under the name of valonia.

**Curacao**, or **Curaçao**, a Dutch island in the

Caribbean Sea, lying off the N. coast of Venezuela, in lat. 12° N., lon. 69° W.; area, 212 sq. m.; pop. 23,972. The shores, which are bold, are in some places deeply indented, and present several harbors, the chief of which is Santa Anna, on the S. W. side of the island. The entrance to this is narrow, but the harbor itself is large and secure, and is the port of the chief town Curaçao, or Willemstad. The island is hilly and deficient of water, being wholly dependent upon the rains, yet, owing to the industry of the Dutch planters, considerable quantities of sugar, cotton, indigo, tobacco, and maize are raised. A peculiar variety of orange, the *Citrus aurantium curassaviensis*, grows abundantly, and furnishes the distinguishing ingredient in the following liqueur.

**Curaçoa**, a sweet and agreeable liqueur, made in great perfection by the Dutch from the peel of the orange peculiar to the above island. The C. of commerce is, however, generally made from any orange-peel digested in sweetened spirits, and flavored with cinnamon, and cloves or mace. The spirits employed in its manufacture are usually reduced to nearly 50 under proof, and each gallon contains about 3½ lbs. of sugar. C. varies in color; the darker kind being produced by digesting it in powdered Brazil-wood, and mellowing the color by caramel or burnt sugar.

**Curarine**, the vegeto-alkaline base of curara, urari, woorara, or wourali, the arrow-poison of Central America.

**Curb**, the part of the bit of a horse's bridle which serves to guide, restrain, or manage him.

**Curb-Bit**, a stiff bit having *branches* by which a leverage is obtained upon the jaws of a horse. The lower end has rings or loops for the reins, and the upper end has loops for the *curb-chain* and the *check-straps* of the headstall. The curb-chain has usually twisted links, and is fast by one end to the loop of the *off* branch, and is hooked to the loop of the *near* branch. It forms the fulcrum for the leverage of the branches. — *Knight*.

**Curb-Chain**, a small chain passing from the bridle under the head of a horse. A kind of gold watch-guard.

**Curcumine**, the yellow coloring-matter of turmeric, obtained by digesting the alcoholic extract of the powder in ether, and evaporating the clear ethereal solution to dryness. A brownish-yellow mass, yielding a bright-yellow powder. It is scarcely soluble in water, but very soluble in both alcohol and ether. Boracic and hydrochloric acids redden it; alkalies turn it reddish brown.

**Curd**, the common name for the caseine of milk, a solid substance separated from milk by acids, which resembles albumen in several of its properties. It is the basis of cheese, contains nitrogen, and is highly nutritious. See CHEESE.

**Curd-Cutter**, a machine with revolving knives on a spindle or axis, for cutting the curd, and separating whey from the curd in cheese-making.

**Cured**, preserved from decay or corruption, as by drying, salting, jerking, etc.

**Curing**, the process of slightly salting meat, etc. — Also the operation of freeing newly potted sugar from its molasses prior to shipment, which, on sugar estates, is performed in buildings called curing-houses.

**Curled-Hair**. See HAIR.

**Curling-Irons**, iron tongs having one round member and one semi-tubular, between and around which, after they are heated in the fire, hair is wound to curl it.

**Curly-Maple**, the timber of a variety of maple, *Acer saccharinum*, used for cabinet work, and

so called from the fibres curling at the places where branches have shot out from the trunk of the tree.

**Currant** [Fr. *grosseille*; Ger. *Johannisbeere*; It. *ribes*; Sp. *grosella*], a hardy berry, produced by a bush (*Ribes*) common in our gardens. There are two species; one of a red or yellow color (*R. rubrum*), remarkable for its mixture of sweetness and acidity; the other of a black color (*R. nigrum*), without acidity, but containing a powerful and agreeable aromatic principle. Of the former, the finest varieties are, Wilmot's red, the White Dutch, Knight's sweet red, and the common white; of the latter, the best is the Black Naples. These currants are employed in confectionery, and in the manufacture of a kind of wine.

**Currants** [Fr. *raisins de Corinthe*; Ger. *Korinthen*; It. *uve passe di Corinto*; Port. *uras de Corinto*; Sp. *pasas de Corinto*], the raisins of a small seedless grape, growing in huge bunches, often as much as 18 inches long, and of proportionate breadth. They are trod into large casks, and exported. Enormous quantities are cultivated in the Grecian islands, principally in Corfu, Zante, and Ithaca. Originally, Corinth was the principal place where they were raised, whence the name "corinths," from which the word "currants" has been derived. They are extensively used in the making of puddings, confectionery, etc. *Imp.* duty, 1 cent per lb.

**Currency**, the paper money and coin established as, and passing for, the circulating medium of a country. See MONEY. See also GOLD, LEGAL TENDER NOTES, NATIONAL BANKS, and SILVER.

**Current** [from Lat. *curro*, to run, to flow] literally signifies running, flowing, passing. Hence, passing from person to person, or from hand to hand; circulating, as C. opinions, C. coin. In commerce it is applied in an analogous sense to the price of any commodity: as C. value, — that is, the ordinary or present value. As applied to time, it is equivalent to now present or passing: as the C. month or year. It is applied chiefly to the progressive movement of fluids, especially of air, electricity, and water.

**Curricie**, an open two-wheeled carriage drawn by a pair of horses.

**Currier** [Fr. *corroyeur*; Ger. *Zurichter*], one who curries and dresses leather after it is tanned.

**Currier's Knife**, a large, two-handled knife, with a recurved edge, used by curriers for shaving or paring the flesh sides of hides.

**Curry**, a noted dish in Indian cookery, much esteemed throughout the East. Curries are simply stews, of which rice usually forms a characteristic ingredient, highly flavored with fried onions and curry powder, to which sliced apples and lemon-juice are sometimes added. They are made from every variety of fish, meat, poultry, game, etc., according to the fancy of the parties. *Imp.* free.

**Curry-Comb**, an iron scraper for rubbing down and cleaning the coats of horses.

**Currying** [Fr. *corroyage*; Ger. *Zurichten*], the art of dressing skins after they are tanned, for the purposes of the shoemaker, coach and harness maker, etc., or of giving them the necessary smoothness, lustre, color, and suppleness. The currier's shop has no resemblance to the tanner's premises, having a quite different set of tools and manipulations. Every kind of tanned leather not intended for soles or such coarse purposes is generally curried before being delivered to the workmen who fashion it, such as shoemakers, coachmakers, saddlers, etc.

The chief operations of the currier are four: 1. Dipping the leather, which consists in moistening it with water, and beat-

ing it with the *mace*, or a mallet, upon the hurdle. He next applies the *cleaners*, both blunt and sharp, as well as the head-knife, to remove or thin down all inequalities. After the leather is shaved, it is thrown once more into water, and well scoured by rubbing the grain side with pumice-stone, or a piece of slaty grit, whereby it parts with the bloom, a whitish matter derived from the oak bark in the tan-pit. 2. Applying the pommel to give the leather a granular appearance, and correspondent flexibility. The leather is first folded with its grain side in contact, and rubbed strongly with the pommel, then rubbed simply upon its grain side; whereby it becomes extremely flexible. 3. Scraping the leather. This makes it of uniform thickness. The workman holds the tool nearly perpendicular upon the leather, and forcibly scrapes the thick places with both his hands. 4. Dressing it by the round-knife. For this purpose he stretches the leather upon the wooden cylinder, lays hold of the pendent under edge with the pincers attached to his girdle, and then with both hands applies the edge of the knife to the surface of the leather, slantingly from above downward, and thus pares off the coarser fleshy parts of the skin. This operation requires great experience and dexterity, and when well performed, improves greatly the look of the leather. — The hide or skin, being rendered flexible and uniform, is conveyed to the shed or drying-house, where the greasy substances are applied, which is called dubbing (daubing) or stuffing. The oil used for this purpose is prepared by boiling sheepskins or doeskins in cod oil. This application of grease is often made before the graining-board or pommel is employed. Before waxing, the leather is commonly colored by rubbing it with a brush dipped into a composition of oil and lamp-black on the flesh side, till it is thoroughly black; it is then black-sized with a brush or sponge, dried, talloved with the proper cloth, and slicked upon the flesh with a broad, smooth lump of glass; sized again with a sponge; and when dry, again curried as above described. *C.* leather on the hair or grain side, termed black on the grain, is the same in the first operation with that dressed on the flesh, till it is scoured. Then the first black is applied to it while wet, by a solution of copperas put upon the grain, after this has been rubbed with a stone; a brush dipped in stale urine is next rubbed on, then an iron slicker is used to make the grain come out as fine as possible. It is now stuffed with oil. When dry, it is seasoned; that is, rubbed over, with a brush dipped in copperas-water, on the grain till it is perfectly black. It is next slicked with a good grit-stone, to take out the wrinkles and smooth the coarse grain. The grain is finally raised with the pommel or graining-board, by applying it to the leather in different directions. When thoroughly dry, it is grained again in two or three ways. Hides intended for covering coaches are shaved nearly as thin as shoe hides and blacked upon the grain.

**Curry-Powder**, a seasoning or condiment, originally prepared in the East Indies. The *C. P.* prepared in England consists of coriander-seed, turmeric, cayenne, fenugreek-seed, and a large proportion of sago-flour. It should be kept in a bottle closely corked or stoppered. *Imp. free.*

**Curtain** [*Fr. rideau*; *Ger. Vorhang*], a cloth hanging at a window, round a bed, or in a theatre, which may be contracted or expanded at pleasure.

Window-*C.* are made in great variety, both of materials and manufacture, the principal difference being as to the former, which consist chiefly of silk, wool, or cotton. Silk is employed in *damasks* and *tabarets*, mixed with wool, the former being a flowery pattern of silk on a woollen foundation, whilst the latter is a satin stripe arranged in the same way as regards the composing materials. A species of *terry-velvet* is also used in which the two materials are blended, and which makes a rich and elegant *C.*; this is made also in wool without silk, and then called *rep.* When wool is used by itself, it then forms a *broadcloth* suited to dining-rooms, or a *damask* which is not so beautiful to the eye as the *silk damask*, but still sufficiently so for common purposes, or else a *moreen*, either plain or watered, or a *chall*, which is a thin twill material, printed with chintz patterns. Cotton is made into a plain article, without anything but a mere web and woof, which, when printed and glazed, is called *chintz*.

**Curtain-Paper**, a heavy paper, printed and otherwise ornamented, for window-shades.

**Curvilinear**, a drafting-instrument used in describing irregular curves. The various shapes of its marginal outline enable it to be fitted into position so as to project or transcribe the curve required. M. Desalier, of Paris, invented a machine for generating the curves and marking out the patterns. It is capable of making 1,200 varieties of curve.

**Cusco Bark**, a variety of Peruvian bark, with a white epidermis, and orange-red cortical layers, yielding an alkaloid called *Aricina*.

**Cuscuta Root**, sometimes written "Kuskus," a commercial name for the fragrant rhizoma obtained from a grass, the *Andropogon muricatus*, which, when wetted, emits a strong, penetrating, agreeable odor, and is used for making mats, fans, etc. The leaves, like those of the lemon grass, yield an aromatic stimulant essential oil, known as *vit-ever*.

**Cush**, one of the Indian names for the *Sorghum vulgare*, a species of millet.

**Cushion**, the padded side of a billiard-table. — A pillow or air-case for the seat of a chair, sofa, carriage, etc.

**Cusparia Bark**. See *ANGOSTURA BARK*.

**Custard**, a sweetened cream made of milk, eggs, and spice.

**Custard-Apple**, a name applied to the fruit of various small trees of the genus *Anona*. The fruit of *A. reticulata*, the common *C. A.*, or "bullock's heart," of the West Indies, is dark brown in color, and marked with depressions, which gives it a quilted appearance; its pulp is reddish-yellow, sweetish and very soft. It is sometimes as large as an orange, but usually more like a plum. The kernels of the seeds are said to be poisonous.

**Custard-Powder**, a dry material for making custards, used instead of eggs.

**Custom**, the patronage or support accorded to a trading establishment; patronage.

**Customer**, a regular and accustomed buyer of goods of any trading firm or house.

**Custom-House**, the house or office where commodities are entered for importation and exportation; where the duties, bounties, or drawbacks payable or receivable upon such importation or exportation are paid or received; and where ships are cleared out, etc. The most important American *C. H.* is that of New York, but there are *C. H.* in all considerable seaport and a few inland cities. For information as to the proceedings necessary at the *C. H.* on importing or exporting commodities, see *EXPORTATION, IMPORTATION, and WAREHOUSING*. See also *SHIPPING, SMUGGLING, TARIFF*, etc.

**Custom-House Broker**, a person who acts for merchants in the business of entering and clearing goods and vessels, and in the transaction of general business at the custom-house. The forms required to pass goods through the custom-house are complicated; and it is difficult for persons unaccustomed to the business to understand the necessity of passing from one desk to another, and from one department to another, merely to obtain the initials of a clerk, or the stamp or signature of an officer. Many a one, who, in order to save a few dollars, tries to perform the business himself, gives it up before he is half through, and is glad to avail himself of the services of a broker. — *T. McElrath*.

**Custom-House Entry**. See *IMPORTATION*.

**Customs Duties** are taxes charged upon commodities on their being imported into or exported from a country. They rank among the most ancient, as they continue to prevail as one of the most common modes in all countries of levying revenue for public purposes. The Athenians laid a tax of a fifth on the corn and other merchandise imported from foreign countries, and also on several of the commodities exported from Attica. The *portoria*, or customs payable on the commodities imported into and exported from the different ports in the Roman empire, formed

a very ancient and important part of the public revenue. The rates at which they were charged were fluctuating and various, and little is now known respecting them. Cicero informs us, that the duties on corn exported from the ports of Sicily were, in his time, 5 per cent. Under the imperial government, the amount of the *portoria* depended as much on the caprice of the prince as on the real exigencies of the state. Though sometimes diminished, they were never entirely remitted, and were much more frequently increased. Under the Byzantine emperors, they were as high as 12½ per cent. Customs duties existed in England previous to the Conquest. They appear to have derived their name from having been immemorially or customarily charged on certain articles when conveyed across the principal ferries, bridges, etc., within the kingdom, and on these and other articles of native and foreign produce when exported from or imported into the kingdom. Some European governments distinguish in their rates of duty between "dry" or land ports and "wet" or sea ports; and others vary their dues on foreign commodities according to the zones of the globe from which the commodities come. Nothing, on the whole, is more perplexing to the merchant than customs duties, chiefly in this country. They are a labyrinth through which he has to steer with caution and circumspection; while at the same time it offers to the more unscrupulous traders temptations to fraud. The smuggling which proceeds under customs duties is only to be checked by the most careful administration, by a system proceeding as far as possible on the simplicity of generally recognized principles, and by duties so moderate in amount as to reduce to a minimum the temptation of fraud. A customs duty on the *import* of commodities has to be paid by the domestic consumers of the commodities. The foreign producer will not sell them at less than they cost, and the importing merchant will not bring them in unless he obtain this cost, his own fair profit, and the import duty over and above these essential constituents of the transaction. An import duty is thus in some cases a tax which consumers may pay lightly or heavily as they choose, and has accordingly a flexibility that is not unimportant in taxation. But if the commodity be one of domestic as well as foreign supply, the effect of the customs duty is to raise the price of the domestic supply in some proportion to the duty; and the consumer, in so far as the commodity is one of necessity to him, has no choice. He has to pay the tax, with the further dissatisfaction of knowing that it goes to no public purpose, but only into the pockets of some of his own private neighbors. A customs duty on the *export* of commodities, on the other hand, has to be paid by the foreign consumers, one of the most agreeable forms of taxation to be conceived. But this desire of taxing foreigners for domestic revenue is met by the competition of general commerce, and nations have to be chary of levying duties on the export of the products of their own industry. It is only where they have some special monopoly of the product that they can enter upon such a course without the gravest disadvantage to themselves.

The tariff of the U. States is separately given in this work, under the name of each article of importation. The following table gives an account of the customs duties received on all commodities (exclusive of specie) imported from foreign countries and entered for consumption in the U. States for the 12 years 1867-1878; the expression "en-

tered for consumption" merely implying the delivery of the imported goods from the custody of the custom officers to the importer.

Year ended June 30 —	Value of merchandise.			Amount of duty collected.	Average ad- valorem rate of duty collected on —	
	Free of duty.	Dutiable.	Total.		Dutiable.	Free and dutiable.
1867	17,083,130	361,123,553	378,158,683	168,507,750	46.67	44.529
1868	15,147,618	329,661,792	344,809,410	160,522,779	46.86	44.537
1869	21,022,572	372,754,642	393,777,214	175,557,584	47.35	44.761
1870	20,214,105	446,181,065	466,395,170	191,515,574	47.15	44.919
1871	40,619,064	450,867,038	491,486,102	232,446,673	44.04	40.472
1872	47,683,747	512,735,287	560,419,034	212,619,105	41.46	37.351
1873	174,230,736	494,463,831	668,694,567	184,929,042	38.14	37.886
1874	151,034,824	415,484,831	566,519,655	169,922,285	38.01	38.288
1875	146,485,467	379,735,113	526,220,580	154,554,983	40.64	38.998
1876	149,561,281	324,924,936	474,486,217	145,178,003	44.85	31.240
1877	140,840,149	288,989,240	429,829,389	128,428,543	42.55	23.150
1878	141,353,639	276,083,409	417,437,048	127,155,139	42.815	23.012

**Customs of Merchants.** The law merchant is a peculiar system which prevailed throughout the whole of the Anglo-Saxon times; it was especially recognized in the time of Edward III.; when the staple was ordained, a mayor was to be chosen in each town, skilled in the law merchant to do right to every man according to that law. The modern law merchant is composed of three distinct elements, viz., the *customs* of merchants, the ordinances of foreign states, and the statute law, — as art precedes science, so customs precede law. Long are these customs practised before they are committed to writing. But though not written or declared by the legislative power, they acquire all the authority of law, and are gradually engrafted upon the common law of the country. The customs of merchants are part of the law. Judicial determinations settle what is the custom of merchants, and they become the *lex mercatoria* as to the different questions. In order that a custom be binding, it must be either the usage of the whole mercantile world or of a particular trade universally known as such. A usage of a particular place, or of a particular class of persons, would not be binding on other persons unless these were acquainted with those usages and adopted them. In all cases, however, no custom can be set against an express statute law. Among the most important customs among merchants are the establishment of boards of trade, the settlement of disputes by arbitrations, and the binding force of the decision of a referee.

**Cut**, a picture cut or carved upon a block or stamp of wood or copper. — A Scotch term for a skein or quantity of yarn. — Also the style of the notches of a file; as, *rough, bastard, second, smooth, dead-smooth* cuts.

**Cutch.** See CATECHU.

**Cut-Glass.** See GLASS.

**Cutlass**, a broad curving sword used chiefly by seamen in boarding or repelling boarders.

**Cutlery** [Fr. *coutellerie*; Ger. *Messerschmiedewaren*] is a branch of industry which originally embraced the manufacture of all cutlery implements of whatever form and materials. The progress of manufacturing industry has, however, detached from it the fabrication of several kinds of edge-tools, saws, and similar implements, the manuf. of which is now regarded as distinct branches of trade. On the other hand, modern *C.* includes a great number of articles which are not strictly cutting implements, but which, owing to their more or less intimate relation to table or pocket *C.*, are classed with such articles for con-

venience' sake. A fork, for example, is an important article of *C.*, although it is not a cutting tool. From the earliest period in English history the manuf. of *C.* has been peculiarly associated with the town of Sheffield, and at the present day that town not only practically monopolizes the ordinary *C.* trade of Great Britain, but still remains the chief centre of the industry for the whole world. The French, however, have an uncontested superiority in the manufacture of surgical instruments. The American manufacture of pocket *C.* has not reached that degree of excellence and superiority which now commands the European markets for our edge-tools, and we have still to import the best pocket *C.* from England; but the American table *C.* is not inferior to the English. In 1878 the value of *C.* imported (almost entirely from England and Germany) was \$1,161,382, while our exports (chiefly to Central and South America) were \$54,812. *Imp. duty*, 35 per cent.

*Manuf.* The variety of materials which go to complete any single article of *C.* is very considerable; and as the stock-list of a cutler embraces a vast number of articles different in form, properties, and uses, the master cutler must have a special knowledge of a wide range of substances. The leading articles of the trade may be classed under, — 1st, domestic *C.*, which includes carving and table knives and forks, pocket or clasp knives, razors, scissors, and similar articles; and 2d, tool *C.*, under which head may be arranged surgical knives and lancets, butchers' and shoemakers' knives, gardeners' pruning-knives, and a vast number of other allied cutting implements. The blades or cutting portions of a certain number of these articles are made of shear-steel, and for others cast steel only is employed. Sometimes the cutting edge alone is of steel, backed or strengthened with malleable iron, to which it is welded. Tongs on which handles are fastened, and other non-cutting portions, are also very often of malleable iron. Brass, German silver, silver, horn, tortoise-shell, ivory, bone, mother-of-pearl, and numerous fancy woods are all brought into requisition for handles and other parts of *C.*, each demanding special treatment according to its nature. The essential processes in making a piece of steel *C.* are, — 1st, forging; 2d, hardening and tempering; 3d, grinding; and 4th, polishing; and to these of course are added the divers operations of fitting and handling of various kinds. — The following outline of the steps in the manuf. of a razor will serve to indicate the sequence of operations in making an article which, though simple in form, demands the highest care and skill in the departments which strictly appertain to *C.* The first essential of a good razor is that it be made of the finest quality of cast steel. A razor must further present due proportions, form, temperature, fitness, and regularity of concavity. The steel for razors is obtained in bars half an inch in breadth, and the thickness of the back of the instrument. Such a bar the forger takes, and, heating one end of it to the proper forging temperature, he with great dexterity fashions it upon his anvil, giving it roughly the required form, edge, and concavity. It is then separated from the remainder of the bar, leaving only sufficient metal to form the tang, if that is to be made of steel; sometimes a tang of malleable iron is welded to the blade. The tang of the "mould," as the blade in this condition is termed, is next drawn out, and the whole "smithed," or beaten on the anvil, to compact the metal and improve the form and edge of the razor. At this stage the razor is said to be "forged in the rough," and so neatly can some workmen finish off this operation that a shaving edge may be given to the blade by simple whetting. The forged blade is next "shaped" by grinding on the dry stone, in which operation it is considerably reduced in weight, and the oxidized scale is removed, which allows the hardening and tempering to be done with certainty and proper effect. The shaped razor is now returned to the forge, where the tang is file-cut and pierced with the joint-hole, and into the blade is stamped either the name and corporate mark of the maker, or any mark or name ordered by the wholesale merchant for whom the goods are being manufactured. The hardening is accomplished by heating the blade to a cherry-red heat and suddenly quenching it in cold water, which leaves the metal excessively hard and brittle. To bring it to the proper temper for a razor, it is again heated till the metallic surface assumes a straw-color, and upon plunging it into water it is ready for the process of wet grinding. The wet grinding is done on stones which vary in diameter from 4 to 12 inches according to the concavity of surface desired. "Lapping," which is the first stage in polishing, is performed on a wheel of the same diameter as the wet-grinding stone. The lap is built up of segments of wood having the fibres towards the periphery, and covered with a metallic alloy of tin and lead. The lap is fed with a mixture of emery powder and oil. "Glazing" and "polishing," which follow, are for perfecting the polish on the surface of the razor, leather-covered wheels with fine emery being used; and the

work is finished off with crocons. The finished blade is then riveted into the scales or handle, which may be of ivory, bone, horn, or other material; and when thereafter the razor is set on a hone, it is ready for use. — The processes employed in making a table knife do not differ essentially from those required for a razor. Knife-blades are made from shear-steel, and, after forging the blade, a piece of malleable iron sufficient for the bolster or shoulder and tang is welded to it. The bolster is formed with the aid of a die and swage called "prints," and the tang is drawn out. The tang is variously formed, according to the method by which it is to be secured in the shaft, and the various processes of tempering, wet grinding, and polishing are pursued as described above. Steel forks of an inferior quality are cast and subsequently cleaned and polished, but the best quality are forged from bar steel, and the prongs are cut or stamped out of an extended flattened extremity called the mould or "mood." In the U. States machinery has been extensively adapted for performing the various mechanical operations in forging and fitting table cutlery. In the making of a common pocket-knife with three blades not fewer than one hundred separate operations are involved, and these may be performed by as many workmen. The diversity of quality and workmanship is probably greater in the *C.* trade than in any other, although differences are not readily apparent to the unskilled critic, and the range of prices is correspondingly wide. — *C.* grinding, which is one of the most important and distinctive departments of the trade, possesses the bad eminence of being one of the most unhealthy and deleterious of all occupations. Grinders are divided into three classes, — dry, wet, and mixed grinders, according as they work at dry or wet stones. This branch of trade, in large manufactories, is conducted in distinct establishments called "wheels," which are divided up into separate apartments or "hulls," dry grinding being as much as possible separated from the wet grinding. Dry grinding, such as is practised in the shaping of razors described above, the "humpling," or rounding of scissors, and other operations, is by far the most injurious and fatal process. Red-hot particles of steel fly off, injuring and sometimes blinding the eyes, unless they are protected; and the atmosphere is loaded with fine dust of silica and steel, inducing inflammation of the lungs, pleurisy, and grinders' asthma. The men work in a peculiarly constrained position, and under highly unsanitary conditions; and although a fan has been invented and extensively introduced which, placed behind the stones, by suction draws away a large proportion of the grinding dust, and renders the atmosphere comparatively pure, many grinders still neglect to keep it working or positively refuse to have it.

**Cutlings**, a name for groats, bruised oat seeds freed of the pericarp, used for gruel, porridge, etc.

**Cut-Meats**, an American term for certain cured meats, hams, shoulders, etc.

**Cut-Nails**, nails made by machinery, instead of wrought by hand from rods.

**Cut-Off**, a term applied to that mode of using steam or other elastic fluid in which it is admitted to the cylinder during a portion only of the stroke of the piston; the steam, after the induction ceases, working expansively in the cylinder during the remainder of the stroke of the piston. — *Knight*.

**Cuttee**, a bin to hold weaver's quills.

**Cutter**, a sharp, light-built vessel, with one mast, running bowsprit, and fore and aft sails. *C.* are chiefly used as cruisers after smugglers, for conveying despatches to a fleet, and for private sailing yachts. — A tailor's assistant. — A piercing instrument used in boring for water.

**Cutter (Revenue)**, a sloop belonging to the Customs, employed on the coast to prevent smuggling.

**Cutters**, a description of brick, also called firsts or marle-stocks, 8½ inches long by 4½ broad and 2½ thick, chiefly used for the arches of windows, doorways, quoins, etc.

**Cuttle, Cutty**, a Scottish term for short; hence it is frequently applied as an adjective, as cutty-pipe, cutty-stool, etc.

**Cuttle-Stoup**, a pewter vessel holding the 8th part of a Scotch chopin or English quart.

**Cutting-leaf Tobacco**, a new variety of tobacco, raised near Cincinnati, on both sides of the Ohio. The leaf, shaded down from a yellowish hue to a dark-red color, is much esteemed for plug purposes.

**Cutting-Plane**, a carpenter's smoothing tool.

**Cuttle-Fish** [*Fr. seiche*; *Ger. Dintenfisch*], the

*sepia*, a cephalopodous animal, of which there are several species inhabiting the seas of all quarters of the globe. They are able to exercise considerable locomotive powers, by means of their tentacles or arms which surround the mouth, and which are usually provided with numerous suckers. Head downward, they walk on these arms at the bottom of the ocean. The *sepia*s are also fleet swimmers; effecting their progress through the water either by making the expansion of their skin perform the same office as fins, or by the forcible projection of water from the cavity of their mouths, the reaction accompanying which operation drives them rapidly through the water in a different direction. They are provided sometimes with 8, and sometimes with 10, tentacles, and have naked bodies. The black fluid which the animal is capable of ejecting from its ink-sac, when pursued by its enemies, was formerly employed in the manufacture of the pigment called from its source

Fig. 119. — CUTTLE-FISH.

"sepia." The bone or skeleton of the *Sepia officinalis* (Fig. 119), or common cuttle-fish, is used to erase ink-marks from paper and parchment. Reduced to powder, it forms a valuable dentifrice and polishing powder, and also for forming the moulds for small silver castings. Large supplies are received at Bombay from the Persian Gulf. *Imp. free.*

**Cutty-Pipe**, a short tobacco-pipe.

**Cutwater**, the knee of the head of a ship; the foremost part of the prow which projects forward off the bows.

**Cuvette**, in glass manufacture, a basin for receiving the melted glass after it is refined, and decanting it on to the table to be rolled into a plate.

**Cwt.**, the commercial abbreviation for centum and weight, which is 112 lbs.

**Cyanide Powder.** See POTASSIUM.

**Cyanometer**, an instrument for determining the deepness of the tint of the atmosphere.

**Cylinder**, a long round case or body; the glass barrel of an electrifying machine; the body of a pump, etc.

In *steam-engines*, the *C.* is that part of the engine in which the piston works, and from which, by alternately admitting and condensing the steam, all the power of the machine is derived. The boring of cylinders for steam-engines requires very powerful and accurate machinery. The cylinder is cast hollow, and the object of the boring-machine is to produce a true *C.*

with an even surface, so that the piston may fit exactly and work freely. Some machines for this purpose act horizontally and others vertically; while the cutters revolve and advance by the action of some powerful prime mover. This operation is generally repeated three times, in the last of which the greatest care is required. — The *C. cover* is the lid bolted to a flange round the top of a cylinder, so as to be perfectly steam-tight; it has a stuffing-box cast in the centre, through which the piston-rod alternates. — The *C. cocks* are cocks placed in convenient parts of the cylinder for admitting oil to lubricate the piston; or by which to blow out the condensed steam, or any deposit in cylinders.

**Cylinder-Glass.** See GLASS.

**Cymbals**, musical clappers, concave brass plates used in military bands for producing a clashing sound. *Imp. duty*, 30 per cent.

**Cypress**, a forest-tree, the most important species of which are the evergreen *C. (Cupressus sempervirens)*, a native of the S.E. part of Europe and Asia; the white cedar of the southern parts of North America (*Cupressus thyoides*), and the *C. of California (Cupressus Lawsoniana)*. The *C.* grows to a great size, and is a most valuable species of timber. It is never attacked by worms, and exceeds all other trees, even the cedar, in durability. It is said to live to a great age; and this circumstance, combined with its thick, dark-green foliage, has made it to be regarded as an emblem of death and the grave. The white cedar, common in many parts of the Southern States and in Mexico, loves the deepest, most gloomy, inaccessible swamps; and south of 33° is generally found covered with sable festoons of long moss, hanging, like shrouds of mourning wreaths, almost to the ground. It seems to flourish best when water covers its roots for half the year. Unpromising as are the places and circumstances of its growth, no tree of the country where it is found is so extensively useful. It is free from knots, it is easily wrought, and makes excellent planks, shingles, and timber of all sorts. It is very durable, and incomparably the most valuable tree in the southern part of the Mississippi Valley. *C.* boards are preferred to those of pine for the inside of brick houses, and for window-sashes, and the panels of doors exposed to the weather; cabinet-makers also choose it for the inside of mahogany furniture. It is highly proper for the masts and sides of vessels, and wherever it grows it is chosen for canoes, which are fashioned from a single trunk, and are often 30 feet long and 5 feet wide, light, solid, and more durable than those of any other tree. It makes the best pipes to convey water under the ground, especially the black variety, which is more resinous and solid.

**Cyprus**, a large island in the Mediterranean, ceded by Turkey to Great Britain in 1878. It is situated nearly at equal distance from the coasts of Asia Minor to the N., and Syria to the E. The headland of Cape Kormakiti, in *C.*, is distant about 46 m. from Cape Anamur, in Cilicia, and its N.E. point, Cape St. Andrea, is about 60 m. from Latakiah, in Syria. It lies between lat. 34° 30' and 35° 40' N., and between lon. 32° 15' and 34° 35' E. Its greatest length is about 145 m., from Cape Drepano in the W. to Cape St. Andrea in the N.E.; and its greatest breadth, from Cape Gata in the S. to Kormakiti in the N., reaches nearly 60 m., while it retains an average width of from 35 to 50 m. through the greater part of its extent, but narrows suddenly to less than 10 m. in about 34° lon., and from thence sends out a long narrow tongue of land towards the E.N.E. for a distance of more than 45 m., terminating in Cape St. Andrea. It is the third largest island in the Mediterranean, considerably exceeding in area both Corsica and Crete. Great part of the island is occupied by two mountain ranges, both of which have a general

direction from W. to E. Of these, the most extensive as well as the most lofty is that which fills up almost the whole S. portion of the island, and is generally designated by modern geographers as Mount Olympus, though that name appears to have been applied by the ancients only to a somewhat isolated peak called Oros Stavro, or Hill of the Holy Cross, which is only 2,300 feet high, while the highest summit of the range, known as Mount Troödos, attains an elevation of 6,500 feet. The N. range of mountains begins at Cape Kormakiti, and is continued from thence in an unbroken ridge to the E. extremity of the island, Cape St. Andrea, a distance of more than 100 m. Between these two mountain ranges lies a broad tract of plain, extending quite across the island, from the Bay of Famagosta to that of Morphu on the W., through a length of nearly 60 m., with a breadth varying from 10 to 20 m. It is known by the name of Messaria, and is watered by two streams, both of which descend from the mountains on the south; but on reaching the plain the one turns eastward and flows into the Bay of Famagosta, close to the ruins of Salamis, the other flows westward into the Bay of Morphu. The greater part of this plain is open and uncultivated, and presents nothing but barren downs; but corn is grown in considerable quantities in the northern portions of it, and there is no doubt that the whole is readily susceptible of cultivation. It is remarkable that C. was celebrated in antiquity for its forests, which not only clothed the whole of its mountain ranges, but covered the entire central plain with a dense mass, so that it was with difficulty that the land could be cleared for cultivation. At the present day the whole plain of the Messaria is utterly bare and treeless, and it is only the loftiest and central summits of Mount Olympus that still retain their covering of pine woods. The disappearance of the forests has naturally affected the rivers, which are mostly mere torrents, dry in summer. The most considerable is that called in ancient times the Pedieus, which, as already mentioned, traverses the plain of the Messaria, and falls into the sea near Salamis. But even this does not reach the sea in summer, and its stagnant waters form marshes which contribute much to the unhealthy character of the plain. Considerable part of the wealth of ancient C. arose from its copper-mines, the most important of which were those of Tamassus in the centre of the island, Soli on the north coast, and Amathus and Cyrium on the south coast. In these mines gold and silver were also found. The precious stones of C. were also highly valued. The chief of these were the emerald, agate, malachite, jasper, opal, and the minerals asbestos and rock crystal. — C. was noted among the ancients for its fertility and beauty; and under the Venetian rule it carried on an extensive trade in its various natural productions; but this has greatly declined in modern times. Besides corn, however, the island exports considerable quantities of wine, oil, madder, the fruit of the carob-tree, silk, and wool. Tobacco and cotton are also grown in small quantities, and their cultivation might doubtless be largely increased. The small plains at the foot of the range of Mount Olympus, between the underfalls of the mountains and the sea, as well as the narrow strip of level land along the north coast, though limited in extent, are districts of great fertility; the latter especially is described as one of the most beautiful and best cultivated districts in Turkey. The great central plain, on the contrary, is in many parts marshy and unhealthy; and, indeed, the whole interior of

the island suffers much from unhealthiness, and is subject to fevers of a peculiarly dangerous description. — One of the greatest disadvantages of C. is the want of ports, there not being a good natural harbor in the whole island. Larnaca and Limasol, which are the chief places of trade at the present day, have nothing but mere roadsteads; and Salamis, which was the chief port of the island in antiquity, as well as Famagosta, which held that position under the Venetians, were only artificial harbors upon an open sandy coast. Tzerinia, on the N. coast, which serves as the place of direct communication with the mainland of Asia Minor, has a very small and bad port, which, bad as it is, is the only one on this side of the island. — The small town of Lefkosia, or, as it is more commonly called, Nicosia, has, since the time of the Lusignan kings, been the capital of the island. The increasing commerce of the Western nations of Europe with the Levant has given some stimulus to trade in C., and encouraged the cultivation of the natural productions of an island which, under British rule, may become one of the richest in the Mediterranean. The population, which, before English occupation, was estimated at about 135,000 souls, of which about two thirds were Greeks and the rest principally Turks, is now about 200,000.

**Cyprus Wines.** These wines, formerly so highly appreciated by connoisseurs, are now little known. The best, which much resembles Tokay, is still called the wine of the Commandery, and is raised in the country between Limasol, Paphos, and Mount Olympus range, which was anciently occupied by the Commandery of the Templars and the Knights of Malta. This wine, made from grapes of a red color, fines itself by age, so that at 8 or 10 years old it is of the same yellow hue as the sweet wines of Southern Europe. After 60 or 70 years it becomes as thick as sirup. Its age may be known by pouring it into a glass, and observing whether particles like oil adhere to the sides; this cannot be produced by art. It is often adulterated with luscious wines and perfumes. Cold is injurious to the quality of the wine; it should be placed before a fire, if drunk in the North during autumn and winter. One very remarkable circumstance attached to the wines of C. is the value of the lees: they are always exported with the wine, if possible. Before bottling, a month or two of rest must be given to the cask, that they may subside. They settle with greater difficulty abroad than in their native island. The casks must be pierced above the dregs, and the wine will come off limpid; but this should only be done for bottling. The wine deposits no tartar on the cask, but the dregs or lees are sometimes a mixture in color of black, red, and yellow, of the consistence of paste, but generally of the hue of Spanish snuff. The wine being poured upon them, they rise, clarify it, and subside. They are always left with the vender, unless there is an agreement to the contrary. Ten or twelve bottles in quantity are allowed to be kept back by the vender from each cask for this purpose. Casks with the lees sell for four times the price of those without, and hence wines that are adulterated by coloring, or with any other object, do not produce lees, and lose their strength. A small quantity of lees should be thrown into every cask prior to exportation, and when 8 or 10 years old the wine should be bottled. — A sort of wine *liqueur* is made in C., and exported to Syria and the parts adjacent, but little, if any, comes to the West. It is imitated in Paris under the name of *vin de Chypre*, and sold as a *liqueur* in the coffee-houses.

## D

**D**, the abbreviation for pence, from the Latin word *denarius*, a penny. — As a Roman numeral, D represents 500, and, with a dash over it, 5,000.

**Dab**, a small lump or mass of anything soft or moist, as a dab of butter. — A small flat fish about 8 or 9 inches in length; the *Pleuronectes limanda*.

**Dabber**, a silk ball, stuffed with wool, used by engravers for spreading the ground upon the hot places.

**Dabbing-Machine**, a machine employed in casting large metal type.

**Dabs**, refuse foots of sugar.

**Dace**, a river fish, the *Cyprinus leuciscus*.

**Dagger**, a weapon with a pointed blade, adapted for stabbing; a poniard.

**Daguerreotype**. See PHOTOGRAPHY.

**Dahlia**, a large, showy, and much-esteemed garden flower, of which there are numberless varieties. The common *D. (D. variabilis)* appears to be a variable plant in nature, and has received several names supposed to indicate distinct species, but they are now generally united under the above designation. In the wild state the central or disk florets are small, tubular, and yellow, and the mar-

stances of the variability of species under domestication, which is exemplified not only in the modification of the disk-florets but also in the wide range of colors. But so little is understood of the real nature of vegetable coloring matter and the cause of its variability, and to what influences the changes must be ascribed, that we cannot correctly estimate the importance of this phenomenon. We know that pure white flowers exist, and that various shades and tints of yellow, scarlet, and purple, and combinations of these colors, are common; but we are not sure whether these colors are not also found in natural varieties. There is evidently a limit in the production of colors, as nothing approaching blue has been observed in all the varieties raised. Perhaps chemistry may some day tell us why.

*Dahlia Dye*. The shade of color which is commonly termed *D.* is a reddish lilac. It is produced by combining a blue or purple with red when a compound color is used. Upon wool and silk it can be obtained directly by means of archil or cudbear, either alone or "blued" by a small quantity of sulphate of indigo. Upon cotton indifferent shades of *D.* are obtained by macerating in sumac liquor, working in tin solution, and dyeing in log-wood mixed with some red wood.

**Daiker**, a measure of certain commodities by number, usually 10, but sometimes 20; as, by the English statutes, a daiker of hides is 10 skins, a daiker of gloves is 20 gloves, or 10 pairs. It is also sometimes employed as the 10th part of the long hundred, in which case it is 12.

**Dainty**, a delicacy; in Scotland the term is applied to anything large or fine.

**Dairy** Milk, either in its natural state, or in the form of butter and cheese, is an article of diet so useful, wholesome, and palatable, that dairy management, which includes all that concerns its production and treatment, constitutes a most important branch of husbandry, given separately in this work under the headings, MILK, BUTTER, and CHEESE.

**Dairy-Farm**, a farm chiefly devoted to meadow and pasture.

**Dakota**, a territory of the U. States, bounded on the N. by the Dominion of Canada, E. by Minnesota and a small part of Iowa, S. by Nebraska, and W. by Montana and Wyoming. It is situated between 42° 28' and 49° N. lat., and 96° 20' and 104° W. lon., — thus extending about 400 m. from E. to W., and about as much from N. to S. with an area estimated at 150,932 sq. m. With the exception of a small portion drained by the Red River and the Minnesota, D. belongs to the basin of the Missouri, which enters at the N. W. corner, as a navigable river, and proceeds with considerable meandering for upwards of 1,000 m. in a S. E. direction across the Territory, receiving from the right the Little Missouri, the Big Knife, the Cannon Ball, the Grand River, the Owl, the Big Shyenne, the Bad River, and the White River, and from the left, besides a large number of small tributaries, one considerable affluent known as the James or Dakota River, which traverses nearly the whole length of the Territory with a predominant southern direction, and joins the larger stream at the S. E. corner. There are no mountains of any importance in the Territory except the Black Hills on the western frontiers, which attain a height of 5,700 feet; but a plateau called the Co-

Fig. 120 — DAHLIA.

ginal or ray florets only conspicuous and highly colored in some shade of scarlet. But every successive sowing brought forth new variations in color, and gradually the disk-florets were metamorphosed, assuming the same shape and color as the outer ones, until at length the "perfect flower" of florists was attained, in which all the florets are similar, forming an almost spherical head, erroneously termed a double flower (Fig. 120). The dahlia indeed offers one of the most striking in-

teau des Prairies, with a mean elevation of 1,450 feet above the level of the sea, occupies a considerable area on the eastern borders, and another known as the Coteau du Missouri stretches south between the Missouri and the Dakota. A large district in the southwest between the White River and one of the main branches of the Big Shenyenne bears the descriptive designation of the Mauvais Terres. In the Coteau des Prairies and several other parts of the Territory there are a large number of lakes, the most extensive of which is the Minniwakan or Devil's Lake, a sheet of salt water 40 m. long by about 12 m. in breadth. *D.* has hitherto been only partially explored, but the military expedition of 1874, under the command of General Custer, reports very favorably of the soil and climate of the virgin districts. A large part of the surface consists of open prairie-land finely adapted for the raising of stock, and most of the river-valleys appear suitable for the plough. The experience of the settlers shows that Indian corn, wheat, barley, oats, and potatoes, as well as apples, plums, grapes, and hops, can be successfully cultivated. The hills are covered with timber, mostly pine and spruce; while the banks of the rivers are in many places bordered with ash, elm, poplar, maple, and other trees. The mineral wealth of the region includes deposits of iron ore, extensive beds of limestone, gypsum, and sandstone, and a certain amount of plumbago and gold. Coal, lead, and petroleum have also been discovered. Buffaloes, bears, antelopes, and elk are still abundant in the remoter districts; and the beaver still builds his dam in many of the streams. The population of Dakota is mainly aboriginal, — the principal tribes being the Sioux in the south, who number about 26,000, and the Arickarees, the Gros-Ventres, and the Mandans in the northwest. The chief settlement of the whites, Yankton on the Missouri, the cap. of the Territory, had in 1870 a population of 737; and the whole amount of land under cultivation at the same date was 42,645 acres. The Northern Pacific railroad passes through the Territory from east to west, entering at Fargo, on the Red River, crossing the Missouri at Burleigh City, and proceeding onwards to cut the Yellowstone River at Wolf Rapids at Montana. White pop. in 1870, 14,181.

**Dakota Southern R.R.** runs from Sioux City, Iowa, to Yankton, Dak., 61.50 m. This Co., whose offices are in Sioux City, was chartered in 1871 and opened in 1873. It also runs the Sioux City & Pembina R.R. *Financial statement:* Cap. stock, \$1,500,000. Funded debt, 1st mortgage 7% 20-year gold bonds, payable Feb., 1894, \$558,000. Net earnings for 1878, \$101,138.73.

**Dali, Dari**, a large and majestic tree growing in Demerara, the *Virola sebifera*; the wood is light, and splits freely, and is used for staves and headings of casks. From the seeds candles equal to those of wax are made.

**Dalmes**, a name in Scotland for damask cloth.

**Dam**, a wall or mole built across a river, to confine or elevate the water for irrigation purposes, or for impelling mill-wheels, etc.; the mother, as applied to beasts or inferior animals.

**Dam, Daum**, an Indian copper coin, the fortieth part of a rupee, and therefore worth rather more than a halfpenny.

**Damage**, in law, mischief done by collision, etc.; any injury inflicted or sustained.

**Damaged Goods**, in the language of customs, are goods, subject to duties, that have received some injury either in the voyage home or in the bonded warehouse. See APPRAISEMENT, § 10.

**Damages**, the recompense awarded by a jury to a plaintiff, in certain forms of action, for the loss or damage he has sustained by the injury committed by the defendant.

The assessment of *D.* is peculiarly the business of the jury, and the court will only interfere with their decision on strong cause being shown. Thus a verdict may be set aside on the ground that *D.* are excessive, or that they are palpably insufficient. And if it appear that the result was arrived at by mere hazard, as, for instance, by each jurymen naming a sum and an average being struck, that would be an impropriety which would invalidate the verdict. There are, moreover, certain principles according to which the *D.* must be ascertained. — To take, first, cases of breach of contract. Here, it is said, the motive of the defendant is an irrelevant consideration. He has broken his contract, and all that has to be done is to fix the amount of the loss occasioned thereby. So wherever there has been a breach of contract, some *D.*, though they should be merely nominal, are recoverable. And when the contract was for a payment of a fixed sum of money, the *D.* recoverable for a breach thereof would be that sum with interest. Where, in other cases, the parties themselves have fixed the sum which should be due as *D.* in case of the contract not being fulfilled, such sum will be the proper *D.* to be awarded by a jury. On this point, however, the cases run rather fine. When a contract provides that a fixed sum shall be payable for breach, the law will ask whether it has been fixed as a *penalty* or as *liquidated* (i. e. ascertained) *D.* In the former case it will not allow the fixed sum to be awarded, but will require evidence to show what the amount of loss actually was. On the other hand, when the damage caused by a breach of contract is of its own nature uncertain, and the parties have positively fixed a sum as liquidating *D.*, that sum will be the proper *D.* Where no such arrangement is made, the general rule for the assessment of *D.* is that the aggrieved party is to be placed in the same position, so far as money can do it, as if the contract had been performed. Thus, in a contract for the sale of goods when the vendor makes default in delivery, the proper measure of *D.* is the difference between the contract price and the market price of the goods on the day when they ought to have been delivered; so that if the price has not risen in the interval, the vendee can only get nominal *D.* If he has in the mean time resold the goods to a sub-vendee, he cannot claim against his own vendor any *D.* which the sub-vendee may recover against him for breach of contract, because he ought to have gone into the market and purchased other goods. Again, if a buyer refuses to accept the goods when tendered to him, the measure of *D.* will be the difference between the contract price and the market price at the time of his refusal, if the latter is lower than the former. But in such cases the trouble and expense of finding a new purchaser or other goods may be taken account of in assessing the *D.* It has been held that in a breach of contract to replace stock lent, the measure of *D.* will be the price of the stock on the day when it ought to have been delivered or on the day of trial, at the plaintiff's option. Where goods inferior in quality to those contracted for are delivered, the difference between the value at the time of delivery of the goods contracted for and the value of those actually delivered will be the proper *D.* The controlling principle, in fact, is that compensation should be determined by the amount of the actual loss. In a case where a person had agreed

with a boarding-house keeper for a year, and quitted the house within the time, it was held that the measure of *D.* was not the price stipulated to be paid, but only the loss caused by the breach of contract. In contracts to marry, a special class of considerations is recognized, and the jury in assessing *D.* will take notice of the conduct of the parties. The social position and means of the defendant may be given in evidence to show what the plaintiff has lost by the breach of contract. — It is not every loss caused by the act or default complained of which can be taken in estimating the proper amount of *D.* The remoteness of the consequences is a bar to their being recognized in the assessment, and it is a question of no little difficulty what *D.* are and what are not excluded for remoteness. So also in cases of trust, the general rule is that the *D.* must be restricted to the "legal and natural consequences of the wrongful act imputed to the defendant." In an action by the proprietor of a theatre, it was alleged that the defendant had written a libel on one of the plaintiff's singers whereby she was deterred from appearing on the stage, and the plaintiff lost his profits; such loss was held to be too remote to be the ground of an action for *D.* The great difficulty of framing a rule which shall meet all cases is acknowledged by judges and legal writers. One judge declared that no rule could be made in the matter. Another declared that the rule in the majority of cases could have no application, because parties never contemplate the consequences of a breach of contract. The cases probably do not go beyond this, that, when from facts known to everybody, or from special facts proved to be known to the defendant, he ought to have anticipated the consequences of the breach of contract, he will be liable for them. — The rule that the contract furnishes the measure of the damages does not prevail in the case of unconscionable, *i. e.* unreasonable, absurd, or impossible contracts. The old school-book juggle in geometrical progression has more than once been before the courts as the ground of an action. Thus when a man agreed to pay for a horse a barleycorn per nail, doubling it every nail, and the amount calculated as 32 nails, was 500 quarters of barley, the judge directed the jury to disregard the contract, and give as damages the value of the horse. And when a defendant had agreed for \$5 to give the plaintiff two grains of rye on Monday, four on the next Monday, and so on, doubling it every Monday, it was contended that the contract was impossible, as all the rye in the world would not suffice for it; but one of the judges said that, though foolish, it would hold in law, and the defendant ought to pay something for his folly. And when a man had promised \$5,000 to the plaintiff if he should find his owl, the jury were directed to mitigate the damages. — In American law, interest is in the discretion of the court, and is made to depend on the equity of the case. In both England and America compound interest, or interest on interest, appears to have been regarded with the horror that formerly attached to usury. American lawyers generally hold that compound interest cannot be taken except upon a special agreement made after the simple interest has become due. (See INTEREST.) — In actions of tort the discretion of the jury is not so strictly limited as in cases of breach of contract. In estimating the damages for a civil injury, matter of aggravation may be taken into account. The right of the jury to give exemplary or vindictive damages has been repeatedly confirmed in recent cases by the United States

courts. — When both parties are in fault, if the plaintiff's conduct has contributed to the injuries, his claim for damages will not be sustained. This has been carried so far that it has been held that, when a person in one carriage receives injuries from the management of another carriage, he cannot recover damages if any negligence, either on his own part or on the part of the owner or managers of the carriage in which he was, has contributed to the accident. In the Courts of Admiralty, where the question constantly arises in cases of collision, a different rule has been adopted. When both vessels are in fault the whole amount of loss is divided between them. *D.* are said to be either *general* or *special*. The former are given for losses implied by law as the necessary consequences of the wrongful act. The latter are not implied by law, but are compensation for such loss as may be proved to have been in fact caused by the wrongful act. Thus, in an ordinary slander, special damage must be alleged and proved to entitle the plaintiff to pecuniary compensation. But if a slander touches a person in the way of his trade, the law will presume that it caused loss to the plaintiff, without calling on him to show what the loss actually was. Loss caused by an act which is not wrongful (*damnum absque injuria*) cannot be the ground of an action for *D.*; for instance, if A's business is injured by his neighbor B starting the same business, this is not an actionable loss. — *For Damages on Protested Bills of Exchange in the Several States, see Table under DAYS OF GRACE.*

**Damask**, a technical term applied to several distinct manufactures or manufacturing operations, from the fact that such products or operations were intimately connected with Damascus when that Syrian city was a great manufacturing centre. The principal application of the term is to variegated textile manufactures; and at the present day it generally indicates a twilled linen texture richly figured in the weaving with flowers, fruits, or ornamental scrolls, or with large designs of any description. The texture to which the name, however, was originally applied was of silk, with patterns elaborately woven in colors and sometimes in gold thread. — Linen *D.*, which are employed principally for table-cloths, napkins, and towels, are manufactured at Dunfermline, Kirkcaldy, and some other places in Fife-shire, Scotland; at Lisburn and Belfast, in Ireland; and in Holland, Belgium, and Russia. The fabric is usually woven in from four to eight leaf twills, that is, with the weft intersecting the warp from every fourth up to every eighth thread; and the pattern is produced by varying the intersections on principles which will be explained under WEAVING. Cotton *D.*, in imitation of the linen manufactures, are now much woven and used for toilet covers and for similar purposes. Colors are frequently introduced in cotton *D.*, manufactured in Glasgow and Paisley for dress purposes, and sent to the Indian and West Indian market. Silk *D.* are manufactured for curtains and for other upholstery uses in all the great silk-weaving centres. *Imp. duty is given under SILK, LINEN, and COTTON.*

**Damaskeening, or Damascening**, is the art of incrusting wire of gold (and sometimes of silver) on the surface of iron, steel, or bronze. The surface upon which the pattern is to be traced is finely undercut with a sharp instrument, and the gold thread by hammering is forced into and securely held by the minute furrows of the cut surface. This system of ornamentation is peculiarly Oriental, having been much practised by the early gold-

smiths of Damascus. It is still eminently characteristic of Persian metal-work.

**Damask Steel**, or **Damascus Steel**, has a peculiar watered or streaked appearance, as seen in the blades of fine swords and other weapons of Oriental manufacture. Several methods of producing the damask grain may be pursued successfully, one of which is described under **CUTLERY**. The art of producing damask steel has been generally practised in Oriental countries from a remote period, the most famous blades having come from Ispahan, Khorasan, and Shiraz in Persia. With great brightness and ductility the metal combines peculiar elasticity, and a capacity for taking and retaining a very fine edge.

**Damassin**, a name for silk damask containing gold or silver flowers in the fabric.

**Dammar**, or **Dammer**, a resin of the copal kind, obtained from *Dammara orientalis*, a huge pine-tree, which grows in Java, Sumatra, Borneo, and other Eastern islands. As found in commerce it is a hard, transparent, brittle, straw-colored resin, destitute of odor. It is readily soluble in ether, benzole, and chloroform, and with oil of turpentine it forms a fine transparent varnish which dries clear, smooth, and hard.

Fig. 121.—DAMMAR OF NEW ZEALAND.

*D.* is, besides, a generic Indian name for various other resins, which differ little from the above in physical properties, and are scarcely known in Western commerce. *Imp.* free.

**Damp**, a mining name for noxious and explosive gases, the choke-damp being carbonic acid, and the fire-damp carburetted hydrogen.

**Damper**. The *D.* of a furnace or fireplace is a door or valve, which, by rising, falling, sliding, or otherwise, lessens the passage for air, and thus damps or checks the intensity of the combustion. — The *D.* of a piano-forte also acts as a check; it is in the form of a small level, which presses against a string soon after it has begun to sound, and thus stops the vibration. An apparatus which communicates dampness is also called a *D.*; thus damping-machines have been invented for the purpose of moistening postage and other stamps.

**Damson**, a species of small black plum, much used in the preparation of tarts, etc. *D.* are rather apt to disagree with delicate stomachs, and also to affect the bowels. See **PLUM**.

**Damson-Cheese**, a conserve of dried damsons pressed into a cake.

**Dan**, a kind of small truck or sledge used in coal-mines.

**Dandelion**, the *Taraxacum dens-leonis*, a perennial composite herb, found in all parts of the world. Its root is employed in medicine, being diuretic and tonic. It is roasted and used as coffee, and when mixed with an equal weight of foreign coffee constitutes the article once so much

puffed under the name of *D.-coffee*. A similar mixture prepared with chocolate forms the *D.-chocolate* of the shops. The blanched leaves are used in salads, and the inspissated juice, extract, and decoction are employed in medicine, and are considered as detergent, aperitive, and deobstruent. *Imp.* duty, 3 cts. per lb.

**Dandy**, a sloop or cutter with a jigger-mast abaft, on which a mizzen lug-sail is set.

**Dandy-Brush**, a hard whalebone bristle brush.

**Dandy-Horse**, a velocipede.

**Dandy-Roller**, a woven wire sieve for a paper-mill.

**Danes**, a cotton fabric for handkerchiefs made at Manchester, in lengths of ten handkerchiefs and 27 inches wide; the varieties are Glasgow, Antipipo, and light glazed Danes.

**Dangerous Goods**, in the merchant shipping law, are easily inflammable or explosive goods which are only permitted to be placed on board vessels under certain restrictions.

*Revised Statutes of the U. States, Sect. 4288.* "Any person shipping oil of vitriol, unslaked lime, inflammable matches, or gunpowder, in a vessel taking cargo for divers persons or freight, without delivering at the time of shipment, a note in writing, expressing the nature and character of such merchandise, to the master, mate, officer, or person in charge of the lading of the vessel, shall be liable to the U. States in a penalty of \$1000. But this section shall not apply to any vessel of any description whatsoever used in rivers or inland navigation." See **NITRO-GLYCERINE**.

**Dangers of the Sea**, a phrase which occurs in a bill of lading, the master agreeing to deliver the goods therein mentioned to the consignee in like good order, "the dangers of the sea excepted." The phrase is understood to include only losses arising from some irresistible force, or which are of an extraordinary nature, and cannot be guarded against by the ordinary exertions of seamen, skill, and prudence. Thus, in case of shipwreck or loss or damage by reason of stress of weather, or other unavoidable cause incident to the voyage, the owners of the goods must resort to the underwriters, and not to the captain or owner of the vessel, to make good their loss. But loss or damage from a storm at sea, arising from a lack of skill on the part of the captain, or for want of good seamanship, will not exonerate the vessel. — *T. McElrath*.

**Dannemora Iron**. See **OREGROUND IRON**.

**Dant**, a heavy metal weight with a ring handle, used for beating down the layers of salted provisions in casks. The dant for pork casks weighs about 32 lbs., that for beef 40 lbs.

**Danter**, a person engaged in silk-throwing operations.

**Dantzic**. See **GERMANY**.

**Danube** [Ger. *Donau*; Hungarian, *Duna*], an important river, and, next to the Volga, the largest in Europe, traversing the southern part of Germany, Austria, Hungary, and the northern part of Turkey, and falling into the Black Sea, after a course of about 1,750 (or, including its windings, 2,000) miles. Its basin, which comprises a territory of nearly 300,000 sq. m., is bounded by the Black Forest, some of the minor Alpine ranges, the Bohemian Forest, and the Carpathian Mountains on the north, and by the Alps and the range of the Balkan on the south. The *D.* is generally considered to be formed by the union, at Donaueschingen, of the Brigach and the Brege, two mountain streams from the Black Forest; though a third stream, originating in a spring in the palace garden of Donaueschingen, at a height of about 2,850 feet above the sea, is by some held to be the true source. After pass-

ing N. E. through the kingdom of Württemberg and part of Bavaria to Ratisbon, it turns to the S. E., and maintains that direction till it approaches Linz in Austria. From this town its course is in the main easterly to Hungary, which it enters a little above Presburg. From Presburg it flows S. E. through the lesser Hungarian plain to its confluence with the Raab, whence it runs E. to Waitzen. At Waitzen it turns S., and flows with a slow current and numerous windings through the greater plain of Hungary for nearly  $2\frac{1}{2}$  degrees of latitude. After its junction with the Drave it again takes a general S. E. direction to Orsova, where it leaves the Austrian territories by the famous pass of the Iron Gate, with once formidable rapids. From Orsova, its course is generally S. by E. to Kalafat, thence mostly E. by S. to Sistova; it there takes an E. by N. direction to Rassoza, then turns N. to Galatz, and finally eastward to the Black Sea. Among its 400 tributaries, of which upwards of 100 are navigable, the principal are, — on the right, the Iller, Lech, Iser, Inn, Ens, Raab, Drave, Save, Morava, Timok, Isker, Vid, and Jantra; and on the left, the Altmühl, Nab, Regen, March, Waag, Gran, Theiss, Temes, Chyl, Aluta, Jalomniza, Sereth, and Pruth. The *D.* communicates with the Rhine by means of the Ludwigs-Canal, which unites the Altmühl with the Main, with the Elbe by means of the Moldau and other canals, and with the Theiss, its own tributary, by means of the Franzens-Canal. At Ulm the *D.* receives the Iller, and thus, at a height of 1,400 feet above the sea, becomes navigable for flat-bottomed boats of 100 tons. From Donauwörth to Passau it traverses the Bavarian plain, leaving which it intersects a mountainous region till it reaches Vienna. At Passau it is 800 feet above the level of the sea, and at Vienna 450. From Vienna to the mouth of the Drave it flows through an expanse of plain country, broken only in a few places, as at Presburg, Buda, and Waitzen. At Isackcha the channel is 1,700 feet broad and 50 feet deep. At extreme low water the total current is 70,000 cubic feet per second, at ordinary low water 125,000, at ordinary high water 324,000, and during extraordinary flood, 1,000,000, and thus, on a general average, from the observations of 10 years, 207,000 feet per second. About 15 m. below Isackcha the river breaks up into two branches, of which the northern or Kilia branch forms an irregular network of channels on its way to the sea, and after reuniting into one, gives rise to a secondary delta with nine or ten arms; while the southern or Tultcha branch subdivides before long into the central or Sulina branch and the southernmost or St. George's. The delta thus formed comprises an area of about 1,000 sq. m., almost totally destitute of cultivation, and broken in all directions by swamps and fresh-water lakes. In terms of the Peace of Paris, March, 1856, the river not only was placed under the protection of international law, and declared free to the ships of all nations, but a commission was constituted in November of that year for the purpose of putting the deltaic portion in the best possible state for navigation. It took the title of "European Commission of the *D.*" After a discussion which lasted from December, 1857, to April, 1858, the delegates could not come to an agreement in regard to the relative claims of the St. George's and the Sulina mouths, and had to refer the question to their respective governments. A technical commission appointed by France, England, Prussia, and Sardinia decided unanimously in favor of St. George's, but recommended,

instead of the embankment of the natural channel, the formation of an artificial canal closed by sluices at its junction with the river, and reaching the sea at some distance from the natural embouchure. The choice of St. George's made by this commission was adopted at Galatz in December, 1858, and six of the seven representatives voted for the canalization; but, owing to various political and commercial considerations, it was ultimately decided to do nothing more in the mean time than render permanent and effective the provisional works already commenced at the Sulina mouth. These consisted of two piers, forming a seaward prolongation of the fluvial channel, and had been commenced in 1858, according to Sir Charles Hartley's plan calculated for a period of six or eight years. In their permanent form they were completed on the 31st July, 1861, having required for their construction 200,000 tons of stone, and 12,500 piles. The northern pier had a length of 4,631 feet, the southern of 3,000, and the depth of water in which they were built varied from 6 feet to 20 feet. At the commencement of the works the depth of the channel was only 9 feet, but by their completion it had increased to 19 feet. Ten years afterwards it was found expedient to make the total length of the piers 5,332 and 3,457 feet. Various minor rectifications of the channel were also effected, and in 1865 a lighthouse was established in  $44^{\circ} 51' N.$  lat. and  $29^{\circ} 36' 32'' E.$  lon. Of what value the works of Sulina have proved may be shown by the fact that of 2,928 vessels navigating the lower *D.* in 1855, 36 were shipwrecked, while of 2,076 in 1865 only 7 were thus unfortunate. By the treaty of March 13, 1871, signed at London by the seven powers, the commission is to exist for twelve years, and the works accomplished under its superintendence are declared permanently neutral. It is independent of the Roumanian Government, and has various sovereign powers over the *D.* below Isackcha, such as the control of the police, the collection of taxes, and the disposal of its revenue. The same treaty authorizes the permanent commission of riparian states (Austria, Bavaria, Württemberg, Turkey, Moldavia, Wallachia, and Servia), which commenced its labors at Vienna in 1856, to collect a tax from all the vessels navigating the river, in order to pay the expenses of the proposed removal of the obstructions that still render dangerous the passage of the Iron Gate.

**Dardanelles** [Turkish, *Bahr-sefid Boghazı*], the strait forming the communication between the Sea of Marmora and the Archipelago. Its shores are formed by the peninsula of Gallipoli on the N. W., and by the mainland of Asia Minor on the S. E.; and it extends for a distance of about 47 m., with an average breadth of 3 or 4 m. For details on the currents of the *D.* see BLACK SEA, in the *Appendix*. In terms of the Paris Peace of 1856, merchant vessels are only allowed to pass the defending castle of Chanka-Kalesi during the day.

**Darger**, a day-laborer in Scotland.

**Darmstadt**. See HESSE-DARMSTADT.

**Darning-Needle**, a long needle for mending holes or rents.

**Darsena**, a Spanish name for a place in a harbor for laying up and repairing ships.

**Dash**, a flourish in writing — A bold effort. — In Scotland, a cant term for a hat or cap. — On the W. coast of Africa, a present made by traders to headmen or native chiefs.

**Date**, that part of a writing or letter which expresses the day of the month and year in which it was written.

**Date-Palm.** The dates of commerce are the fruit of a species of palm, *Phoenix dactylifera* (Fig. 122), a tree which ranges from the Canary Islands through N. Africa and the S. E. of Asia to India. It has been cultivated and much prized throughout most of these regions from the remotest antiquity. In Arabia, indeed, it is the chief source of national wealth, and its fruit forms the staple article of food in that country. The tree has also been introduced along the Mediterranean shores of Europe; but as its fruit does not ripen so far north, the European plants are only used to supply leaves for the festival of Palm Sunday among Christians, and for the celebration of the Passover by Jews. The date-palm is a beautiful tree, growing to a height of from 60 to 80 feet, and its stem, which is strongly marked with old leaf-scars, terminates in a crown of graceful shining pinnatisect leaves.

Fig. 122. — DATE-PALM.

The flowers spring in branching spadices from the axils of the leaves, and as the trees are unisexual, it is necessary in cultivation to fertilize the female flowers by artificial means. The fruit is an oblong drupe, which varies as much in size, color, and quality, under cultivation, as does the apple in temperate regions, while the recognized and named varieties of the one fruit are quite as numerous as those of the other. Regarding this fruit Mr. W. G. Palgrave (*Central and Eastern Arabia*) remarks: "Those who, like most Europeans at home, only know the date from the dried specimens of that fruit shown beneath a label in shop-windows, can hardly imagine how delicious it is when eaten fresh and in Central Arabia. Nor is it, when newly gathered, heating, — a defect inherent to the preserved fruit everywhere; nor does its richness, however great, bring satiety; in short, it is an article of food alike pleasant and healthy." In the oases of Sahara, and in other parts of N. Africa, dates are pounded and pressed into a cake for food; and it is said

that there the fruit is the food of man and beast, and is eaten by horses and camels, and even by dogs. The dried fruit used for dessert in European countries contains more than half its weight of sugar, about 6 per cent of albumen, and 12 per cent of gummy matter. All parts of the date-palm yield valuable economic products. Its trunk furnishes timber for house-building and furniture; the leaves supply thatch; their footstalks are used as fuel, and also yield a fibre from which cordage is spun.

**Date sugar** is a valuable commercial product of the East Indies obtained from the sap or toddy of *Elate sylvestris*, a tree so closely allied to the date-palm that it has been supposed to be the parent stock of all the cultivated varieties. The juice, when not boiled down to form sugar, is either drunk fresh, or fermented and distilled to form arrack. The uses of the other parts and products of this tree are the same as those of the date-palm products. **Date-palm meal** is obtained from a small species, *Elate farinifera*, growing in the hill country of Southern India; it is occasionally resorted to in times of distress or famine.

**Datum-Line**, a given level or base from which to calculate elevations, etc. In the construction of a plan, as of a railway or canal, the surface points are reckoned or measured from the datum level.

**Datura.** See THORN-APPLE.

**Daub**, a smear, or rough covering of paint or plaster.

**Daucus**, a name for Cretan birds' nests imported into Spain.

**Daugh**, in Scotland, a division of land, capable of producing 48 bolls of grain; sometimes written Dawache.

**Daum**, an imaginary Indian money, the fortieth part of a rupee, which is 2s.

**Daundee** (Hindustani), a waterman.

**Davenport**, a piece of furniture in which to keep music-books, etc.

**Davenport and Northwestern R.R.** runs from Davenport, Ia., to Fayette, Ia., 128.40 m., with branch from Eldridge to Maynoketa, Ia., 32.25 m., total 160.65 m. This Co., whose offices are in Davenport, Ia., was formed by the reorganization of the Davenport and St. Paul's R.R. Co., which was sold under foreclosure in 1876. *Financial statement*: Cap. stock, \$3,520,000. Funded debt, 1st mortgage, 5% 30-year bonds, payable 1 Dec. 1906, \$1,710,000. Net earnings for 1878, \$17,738.

**Davit**, a projecting wooden crane at the bow of a ship for hoisting the flukes of the anchor to the gunwales; davits are also pieces of timber or iron protruding over a ship's side or stern, having sheaves or blocks to hoist a boat up to.

**Davit-fall Hook**, a hook having a means for instant unclutching or release, and used at the end of a davit-fall to engage a ring-bolt at the stem or stern of a boat.

**Davy-Lamp.** See FIRE-DAMP.

**Day**, the light of a window in a bay; the distance between mullions.

**Day-Book.** See BOOK-KEEPING.

**Days of Grace**, the period of three days allowed by law or custom beyond the fixed day of payment to meet an acceptance or note, unless "without grace" is expressed on the paper. The Laws of Grace on Sight Drafts and Damages on Protested Bills of Exchange in the U. States are as follows: —

STATES.	Laws of Grace on sight drafts	Damages for Protested Bills.

\* No statute in force.

**Dayton and Michigan R.R.** runs from Dayton to Toledo, Ohio, 140.71 m. This Co., whose offices are in Cincinnati, was chartered in 1851, and the road was opened in 1862. It was leased in 1863 to the Cincinnati, Hamilton, and Dayton R.R. Co. *Financial statement:* Cap. stock, common, \$2,401,527.74; preferred, \$1,280,100; funded debt, \$2,728,800; lessees, \$523,740.31.

**D-Block**, a block bolted to the ship's side in the channels, to receive the lifts through.

**De**, another name for the Dutch *Vingerhoed* (q. v.).

**Dead**, *false*; as of imitation doors and windows, put in as architectural devices to balance parts. — *Motionless*; as the *dead-spindle* of a lathe, which does not rotate; a *dead-lock*; the *dead-centre* of a crank. — *Opaque*; as a *dead-light* or shutter over a cabin window. — *Solid, without light or opening*; as a *dead-wall*, a *dead-plate*, or unperforated portion of a furnace-grate; the *dead-wood* of a ship. — *Useless*; as *dead steam*, that is, exhausted; *dead-head*, a *feeding-head* or *sullage-piece*; *dead-weight*. — *Soundless*; as a *dead floor*, which absorbs the sound. — *Flat*; as a *dead-smooth file*, having the least possible height of teeth.

**Dead-beat Escapement.** See **ESCAPEMENT**.

**Dead Color.** In painting, a color is said to be dead when it has no gloss upon it. This is generally effected by the use of less oil and more turpentine than in ordinary paints.

**Dead coloring** is the first layer of colors, consisting usually of some shade of gray. Its design is to receive and preserve the finishing colors; and it is called *dead* because it is not seen when the work is completed.

**Dead-Eyes**, oblate solid blocks of wood, with a groove and 3 holes bored through them, fixed to the channels of a ship, for reeving the lanyards of the shrouds through.

**Dead-Freight.** See **FREIGHT**.

**Dead-Lights**, strong shutters for the stern lights or cabin windows of a ship in boisterous weather.

**Dead-Plate**, a flat iron plate, sometimes fitted before the bars of a furnace for the purpose of allowing the bituminous coal to assume the character of coke before it is thrust back upon the fire.

**Dead-Reckoning**, a nautical computation of a ship's position, by the distance run, according to the log line, in a given time.

**Deadly Nightshade.** See **BELLADONNA**.

**Deads**, in mining, the earth, or other substances, which enclose the ore on every side.

**Dead-stroke Hammer**, a power-hammer which delivers the blow without being affected by the recoil of the shaft on which the ram, or hammer, is stocked.

**Dead-Weight**, the heaviest part of a ship's cargo, laid at the bottom of the hold to maintain her proper equilibrium and hold of the water.

**Dead-Wind**, a wind blowing right in the ship's face.

**Dead-Wood**, blocks of timber laid upon each end of a vessel's keel, where her sheer narrows.

**Dead-Wool** is wool taken from the skin of the carcass instead of being shorn from the live animal.

**Dead-Works**, those parts of a ship's hull which appear above water-line, when she is fully laden.

**Deal**, a plank of fir or pine timber, for carpenters' use, above 7 inches wide, differing from a batten, which must not exceed 7 inches; a whole deal is 12 feet long, 11 inches wide, and 2½ inches thick. When sawed of other sizes, they are reduced to that cubic dimension in computing them. See **TIMBER** and **WOOD**.

**Dealer**, a trader in goods of any kind, the specialty being indicated by the prefix, as tea-dealer, wholesale-dealer, etc.

**Déballer** [Fr.], to unpack.

**Débarquement** [Fr.], landing.

**Débarquer** [Fr.], to unlade.

**Debase**, to lessen in value by adulteration or inferior admixtures.

**Debenture**, the certificate given at the custom-house to the exporter of goods, on which a bounty or drawback is allowed, bearing that he has complied with the statutory regulations, and is entitled to such bounty or drawback. See **DRAWBACK**.

**Debentured Goods** are goods upon which the drawback has been paid.

**Debit**, to charge in an account; a sum due for goods sold on credit; also, the balance of an account. — *Debit-side*, in book-keeping, is the left-hand page of the ledger.

**Débris**, a word adopted from the French, signifying rubbish, waste, or refuse.

**Debt**, that which one person owes to another for goods, or money had, etc. See **NATIONAL DEBT**.

**Debtor**, one who owes money or any kind of debt; one who is indebted.

**Déca**, a term derived from the Greek, signifying 10, and used as a prefix in the French Decimal

system of weights and measures, to express a weight or measure ten times the amount of the unit which follows it, as *déca*gramme, *déca*mètre, etc.

**Decachordon**, an ancient form of harp, having ten strings.

**Decade**, a measure of time now applied to a period of 10 years.

**Déca**gramme, a French weight represented by a centilitre of pure water. It is the 100th part of a kilogramme, and is divided into 10 grammes = 100 décigrammes = 1,000 centigrammes = 154.3402 English grains. In Holland it bears the name of lood, and in Venetian Lombardy, gros or grosso.

**Décalitre**, a French measure of capacity, of 10 litres, or 2.201 gallons, the tenth part of the hectolitre. It is the new French bushel for grain, and velt for liquids. As a dry measure it is rather more than the English peck, viz.: 1.10 peck. In Holland, where the decimal system of measures is adopted, they give the name of *schepel* (boisseau) to the décalitre, and in the kingdom of Venetian Lombardy they call it a *mina* or *mine*.

**Decamalee-Gum**, an East Indian gum obtained from the *Gardenia lucida* of Roxburgh.

**Décamètre**, a French measure of length. The décamètre is 1.984 English pole. It is the 100th part of the kilomètre, and is divided into 10 metres = 100 décimètres = 1,000 centimètres = 10,000 millimètres = 10.936389 yards.

**Decantation**, the operation of pouring or drawing off the clear portion of a liquid from the impurities or grosser matter that has subsided. It is

Fig. 123. — DECANTATION.

commonly performed either by gently inclining the vessel or by the use of a siphon or pump. In the laboratory and the arts it is much resorted to in the purification of precipitates, or other similar operations, where repeated edulcoration or washing is required, for which purpose it is preferable to filtration, from being less troublesome and more economical. In these cases, after a sufficient time having been allowed for the subsidence of the precipitate or powder, or for the clearing of the supernatant fluid, the latter is decanted, and its place supplied by a fresh portion of water, which, after sufficient agitation, is similarly treated, and the whole operation repeated as often as nec-

essary. 1, in Fig. 123 is the best apparatus for *D*. The siphon is kept in equilibrium by a flat, *a*, and a weight, *p*, so that as the level decreases in the vase, the siphon descends with it; the difference in height between *a b* and *b c* being thus always the same, there is a constant flow. When the pressure in the mouth of the liquid to be decanted would be objectionable, use is made of a siphon (2, Fig. 123) to which is soldered a second tube, *M*, parallel to the longest branch. The siphon is filled by closing the end, *P*, and sucking at *O*. See SIPHON.

**Decanter**, a clear glass bottle for holding wine, etc., for the table.

**Decarbonization** is an operation performed on cast-iron to convert it into soft iron. The articles to be decarbonized are packed in finely powdered hematite, or native oxide of iron, to which iron filings are often added, and exposed for some time to a strong red heat, by which the excess of carbon is abstracted or burnt out. The process somewhat resembles annealing or cementation.

**Décare** [Fr.], an agrarian or superficial measure, equal to the 10th part of the hectare, and divided into 10 ares. It is never legally used, being considered superfluous, and fully expressed by ares, hectares, and centiares.

**Décastere**, a French solid measure of 10 stères = 353.1741 cubic feet.

**Decennial**, occurring every 10 years.

**Décharger** [Fr.], to unload.

**Déchéance** [Fr.], a forfeiture.

**Déciatine**. See DESIATINE.

**Décigramme**, a nominal French weight, the 10th part of the gramme = 1.5434 grains.

**Décilitre**, a French measure of capacity for liquids, often called a verre, the 10th part of the pint or litre = .704 gill. As a dry measure the décilitre is equal to .176 English pint (6.1028 cubic inches).

**Decimal**, any number expressed in the scale of tens; a 10th part, multiplied by 10.

**Decimal Fractions** differ from vulgar fractions in this respect, that their denominators are always 10, or some power of 10, as 100, 1000, etc., and instead of *writing* the denominator under the numerator, it is *expressed* by pointing off from the right of the numerator as many figures as there are ciphers in the denominator; thus, .5, .43, 5.26 denote, respectively,  $\frac{5}{10}$ ,  $\frac{43}{100}$ ,  $5\frac{26}{100}$ , or  $5\frac{13}{50}$ . The value of each figure in a decimal decreases from the left to the right in a tenfold proportion; that is, each figure is ten times as great as if it were removed one place to the right, as in whole numbers; thus, .5, .05, .005, are  $\frac{5}{10}$ ,  $\frac{5}{100}$ ,  $\frac{5}{1000}$ , etc., and the decimal .438 is four tenths, three hundredths, and eight thousandths of a unit.

Adding ciphers to the right of a decimal does not alter its value; thus, .5, .50, .500, or  $\frac{5}{10}$ ,  $\frac{50}{100}$ ,  $\frac{500}{1000}$ , are equal to each other, the numerator and denominator having been multiplied by the same number.

Decimals may be reduced to a common denominator by adding ciphers to the right, where it is necessary, till the number of decimal places is the same in all. Thus, .5, .03, and .564, reduced to a common denominator, are  $\frac{500}{1000}$ ,  $\frac{30}{1000}$ , and  $\frac{564}{1000}$ ; that is,  $\frac{500}{1000}$ ,  $\frac{30}{1000}$ , and  $\frac{564}{1000}$ .

To reduce a vulgar fraction to a decimal, add ciphers at pleasure, as decimals in the numerator, and divide by the denominator, according to the rule for the division of decimals.

$$\text{Example: } \frac{3}{4} = \frac{3.00}{4} = .75.$$

From the very nature of numbers, it must frequently happen that this division may be continued without termination;

but, as the figures always decrease a tenth in value by each remove to the right from the point, decimals may be stopped, except in long calculations, at 3 or 4 places, without any great degree of error; and even in continued multiplications, when the decimals are stopped at a given place, we have only to increase the last figure by 1, if the next figure was to be 5 or above it, in order to compensate for cutting them short.

The value of a decimal, of any denomination, is found by multiplying it by the number of parts in the next less denomination, and cutting off as many places to the right hand as there are decimals, and so on until the terms are exhausted. Thus, 634 oz. is =

$$\begin{array}{r} .634 \\ \times 8 \\ \hline 5.072 \text{ drachms.} \\ \times 60 \\ \hline 4.320 \text{ grains.} \end{array}$$

or, 5 dr.  $4\frac{1}{2}$  gr. (nearly).

The value of a decimal of any foreign money in terms of a lower denomination is found by the same rule. Example: Required the value of £0.69875 (being known that there are 20 shillings in a pound sterling, 12 pence in a shilling, and 4 farthings in a penny) =

$$\begin{array}{r} .69875 \\ \times 20 \\ \hline 13.97500 \text{ shillings.} \\ \times 12 \\ \hline 4.500 \text{ pence.} \\ \times 4 \\ \hline 20 \text{ farthings.} \end{array}$$

Hence, the value required is 13s.  $4\frac{1}{2}$ d.

The following table of equations between vulgar and decimal fractions will be found useful in practice:—

TABLE OF DECIMAL EQUIVALENTS.

$\frac{1}{2}$	.5000	$\frac{1}{4}$	.2500	$\frac{1}{8}$	.1250	$\frac{1}{16}$	.0625	$\frac{1}{32}$	.0312	$\frac{1}{64}$	.0156	$\frac{1}{128}$	.0078	$\frac{1}{256}$	.0039	$\frac{1}{512}$	.0019	$\frac{1}{1024}$	.0009

**Decimal Weights and Measures.** See WEIGHTS AND MEASURES.

**Décime**, a copper coin and money of account in France of ten centimes, and nearly equal to 2 cents.

**Décimètre**, a French measure of length, being the tenth part of a mètre = 3.9371 inches.

**Décistère**, a French solid measure, being the tenth part of a stère = 3.531741 cubic feet.

**Deck**, the planked flooring of a ship, resting on the beams. *D.* may run from stem to stern, or be but partial. Some fishing-craft have a partial *D.* forming a cuddy. Vessels are classed, for some purposes, by the number of their *D.*; as, *single-decked*, *two-decked*, *three-decked*. In three-decked ships the *D.* above the water-line are known as the *upper or spar*, *main*, *middle*, *gun* or *lower*, *D.*; in two-decked ships, the *upper or spar*, *main*, and *gun*, *D.*; in frigates and merchant-vessels, the

upper and main *D.* The *D.* next below the water-line is the *orlop-D.* in two or three deckers, but is known as the lower *D.* in vessels of the lower grades. The after-part of the *orlop-D.* is the *cockpit*. A passage round the *orlop-D.*, to get at the ship's side for repairs during action, is called the *wing-passage*. On this *D.* are the cabins and berths of officers and men. A complete *D.* over the main-deck is the *spar* or *flush D.* The *forecastle* is the foremost part, and the *quarter-D.* the aftermost part, of the *spar-D.*; the *waist* is the space amidships. A small *D.* at the after end is the *poop* or *round-house*, and usually extends to the mizzen. Above it is the *poop-D.* A similar *D.* at the forward end is called the *topgallant-forecastle*. A transverse *D.* extending across the middle of the vessel is called a *hurricane-D.*, *bridge-D.*, or *bridge*. It is common in steam-vessels, covering the space between the paddle-boxes. Detached buildings on a *D.* are *D.-houses*. The openings in a *D.* are *ladder-ways* or *hutchways*. *Tween-D.* is the space below the *spar-D.* The coverings of a *hutchway* are *hatches*. The raised ledges around the hatchway are *coamings* in the fore and aft direction, *head-edges* in the parts athwartships. Glasses inserted in holes made in a deck are called *deck-lights*, and serve to light cabins below.—*E. H. Knight.*

**Decker**, a ship having a deck or decks; as, a *three-decker*.

**Deckle**, in paper-making, a thin frame of wood fitting on the shallow mould in which the paper pulp is placed; also the rough or raw edge of paper.

**Deck-Passenger**, one who goes a short channel journey at a cheaper fare, and has not the privilege of the cabins.

**Declaration**, a report of entry.—An official affirmation or statement made before a properly authorized officer.—In law, that part of the process or pleadings in which a statement of the plaintiff's complaint against the defendant is set forth.

**Declinator**, an instrument used in dialling, for taking the declination and inclination of a plane.

**Declinometer**, an instrument for measuring the variation of the magnetic needle, or the force of terrestrial magnetism in the plane of the horizon.

**Decoction**, an aqueous solution of the active principles of any substance obtained by boiling; also the process of preparing such solution.

The effect of *D.* in water differs greatly from that of infusion. At the temperature of 212° Fahr., the essential oils and aromatic principles of vegetables are dissipated or decomposed; while by infusion in hot water, in covered vessels, they remain for the most part uninjured. The solvent powers of boiling water are, however, much greater than those of hot water; and many vegetable principles scarcely acted on by the one are freely soluble in the other. This is the case with many of the alkaloids, on which the medicinal virtues of several vegetables depend. On the other hand, the solutions of many substances, though more readily made by boiling, are speedily weakened or rendered inert by ebullition, in consequence of the active principles being either volatilized along with the steam, or oxidized or decomposed by exposure to the atmosphere. This is particularly the case with substances abounding in extractive or astrigent matter. When the medicinal properties of vegetables are volatile, or are injured by a strong heat, infusion should be had recourse to, in preference to boiling; but when a solution of the fixed constituents is alone sought, *D.* is preferable. The substances employed for making *D.* should be well bruised, or reduced to a very coarse powder, or, if fresh and soft, they should be sliced small. In the former case, any very fine powder or adhering dust should be removed with a sieve, as its presence tends to make the product thick and disagreeable, and also more troublesome to strain. The vessel in which the ebullition is conducted should be furnished with an accurately fitting cover, the better to exclude the air; and the application of the heat should be so conducted that the fluid may be kept simmering, or only gently boiling, as violent boiling is not only quite unnecessary, but absolutely injurious to the quality of the product. In every case the liquor should

be strained whilst hot, but not boiling, and the best method of doing this is to employ a fine hair sieve, or a coarse flannel bag. In general it is found that, as *D.* cool, a sediment is formed, in consequence of the boiling water dissolving a larger portion of vegetable matter than it can retain in solution when cold. This deposit for the most part consists of the active principles of the solution, and, unless when otherwise ordered, should be mingled with the clear liquid by agitation, when the *D.* enters into extemporaneous compositions, or when the dose is taken. The length of time occupied by the ebullition is another point demanding some attention. Long boiling is in no case necessary, and should be avoided, especially in decoctions prepared from aromatic vegetables, or those abounding in extractive.

**Decoloration**, the blanching or removal of the natural color of any substance. Sirups and many animal, vegetable, and saline solutions are decolored or whitened by agitation with animal charcoal, and subsequent subsidence or filtration. Many fluids rapidly lose their natural color by exposure to light, especially to the direct rays of the sun. In this way castor, nut, poppy, and several other oils are whitened. Fish oils are partially deodorized and decolored by filtration through animal charcoal. Cottons and lineus are still commonly bleached by the joint action of light, air, and moisture. The peculiar way in which light produces this effect has never been satisfactorily explained. The *D.* of textile fabrics and solid bodies generally is called *bleaching* (q. v.).

**Decomposition**, the resolution of compounds into their elements, or the alteration of their chemical composition in such a manner that new products are formed.

**Decorator**, an ornamenter; one who adorns or paints and embellishes houses.

**Decorticate**, to peel off the bark.

**Decoy**, a lure; a cage, snare, or enclosure for catching wild-fowl.

**Dédit** [*Fr.*], a forfeit; a consideration.

**De do** [*Sp.*], a finger's breadth, the forty-eighth part of a Spanish yard or vara.

**Deed**, a written or printed legal instrument or agreement between contracting parties, executed under seal. When made by one party only, a *D.* is called a *deed-poll*; when several parties are concerned, an *indenture*.

**Deep-sea-Line**, a line with a plummet, shot, or other attachment for taking soundings at great depths at sea.

**Deer**, a general name for ruminating animals of the genus *Cervus* (Fig. 124), which have decidu-

Fig. 124. — DEER.

ous horns or antlers: their flesh is termed venison. Deer's horns enter largely into commerce. The dry skins of different species are imported into this country, chiefly from Central and South America; they come in bales, and are sold by the

lb., Para skins being the most esteemed. When tanned, they are called buckskins. See **BUCKSKIN**.

**Defaulter**, an officeholder who embezzles public money, or fails to account for money intrusted to his keeping. His offence is called *defalcation*. — Also a trader who fails in his payments, or is unable to meet his engagements.

**Defecation**, the separation of a liquid from its lecs, dregs, or impurities, by subsidence or decantation.

**Defect**, want or absence of something necessary or useful toward fruition or perfection; fault; flaw; imperfection; a failure or blemish.

**Defence**, a justification; a legal reply to a plaintiff's declaration.

**Defendant**, the person accused or summoned, in a court of law, to answer the charges of a plaintiff.

**Deficiency Bills**, a kind of short loan or advance made to the British government by the Bank of England, whenever the taxes received are insufficient to pay the public dividends due on government stocks.

**Deficit**, something short or wanting; the deficiency which is discovered in the accounts of an accountant.

**Deflagration**, the sudden combustion of any substance for the purpose of producing some change in its composition by the joint action of heat and oxygen. The process is commonly performed by projecting into a red-hot crucible, in small portions at a time, a mixture of nitrate of potash and the body to be oxidized.

**Defrauder**, a cheat; an embezzler; one who wrongs another.

**Degree**, 60 geographical miles, the 360th part of the circumference of a circle, and the 90th part of a right angle. A degree is subdivided into 60 minutes, and each minute into 60 seconds. The notation employed for an angle of 8 degrees, 14 minutes, and 16 seconds is  $8^{\circ} 14' 16''$ . See **LATITUDE** and **LONGITUDE**.

**Déjeuner**, the French word for breakfast.

**De Laine**. The original French fabric for ladies' dress goods called *mousseline de laine* was, as the name imports, all wool; the English and American de laine are composed of cotton and wool, or worsted. All muslin de laine and all de laine of every kind, except what are called cashmere de laine, are woven perfectly plain, and in the gray or natural colors of the wool, cotton, or hair, and are dyed in the piece by being plunged in the dye; they are also printed in colors, and may be striped or figured. — *T. McElrath*.

**Délaissement** [*Fr.*], an abandonment.

**Delaware**, one of the middle U. States, next to Rhode Island the smallest in extent, is situated on the Atlantic seaboard, forming part of the peninsula between the Chesapeake and Delaware Bays. It is bounded N. by Pennsylvania, W. and S. by Maryland, and E. by the Atlantic Ocean and the Delaware Bay and River. Area, 2,120 sq. m. A somewhat elevated table-land passes through a portion of the State from N. to S., dividing the waters which fall into the Chesapeake Bay from those which flow into Delaware Bay. This table-land contains a chain of swamps in the W. part of the State, from which its principal streams originate. The soil in the N. is a strong clay. Along the Delaware River, and for about 20 m. W. of it, the soil is generally a rich clay, well adapted to agriculture; but between this and the swamps the soil is light and sandy. Proceeding southward, the soil becomes more sandy, and in Sussex Co. sand greatly predominates. Kaoline, or porcelain clay, is found in the N., bog-iron ore in the S., and shell

marl throughout the State. The rivers are small and unimportant. The Delaware and Chesapeake

Fig. 125 — SEAL OF DELAWARE.

Canal connects the two great bays, and makes an easy water transit for produce between Philadelphia and Baltimore. *D.* is an agricultural state; a part of it is in a high state of cultivation. Besides wheat, Indian corn, and other grain, peaches are grown in immense quantities, and sent over the country; small fruits are also raised for transportation. In the northern parts of the State are numerous manufactories. Wilmington is the principal centre of industry. New Castle, also, has important rolling-mills, and cotton and woollen factories. Dover is the cap. of *D.* The Philadelphia, Wilmington, and Baltimore Railroad runs through the northern part of the State, and the Delaware Railroad goes through the whole length of the peninsula. The Wilmington and Reading Railroad makes a connection with the Pennsylvania coal-region. The debt of the State is \$1,224,000, and as the cost of the government is moderate, the taxes are small. Pop. in 1840, 78,085; in 1850, 91,532; in 1860, 112,216; in 1870, 125,015; in 1879 (estimated), 140,000.

WILMINGTON, the principal commercial town of *D.*, is a port of entry situated in New Castle Co., between Brandywine and Christiana Creeks, 1 m. above their junction. Its manuf. are important, among which are machinery for steamboats, railroad cars, locomotives, mill-machinery, powder, carriages, flour, leather, shoes, cotton and woollen goods, farming implements, etc. On Brandywine Creek are some of the finest flouring-mills in the U. States, to which vessels drawing 8 feet of water can come. Christiana Creek is navigable for vessels drawing 14 feet of water. The tonnage of the port in 1879 was 15,228. During 1878, 6 steamboats, 1 ocean steamer, 2 barks, 11 schooners, and 1 sloop, of an aggregate burden of 9,475 tons, were built. The foreign trade of *D.* is effected chiefly through Baltimore, New York, and Philadelphia, especially the last; so that its direct foreign trade is very inconsiderable, the direct exports for the year 1878 amounting to \$28,000, and the imports to \$1,750. During the same year 66 vessels, aggregating 17,112 tons, entered the port, and 27 vessels, aggregating 14,619 tons, cleared it. Pop. 35,000.

**Delaware R.R.** runs from Delaware Junction, Del., to Delmar, Md., 82.83 m., branches 16.68 m., total extent of line, 99.51 m.; this Co., whose offices are in Dover, Del., was chartered in 1849, and the road was leased at its opening in 1860, at a rental of 30% of its gross earnings and an annual dividend of 6%, to the Philadelphia, Wilmington, and Baltimore R.R. Co. *Financial statement:* Cap. stock, \$1,450,323.37. Funded debt, \$760,600. Net earnings for 1878, 30 % of receipts, \$109,674.04.

**Delaware and Bound Brook R.R.** runs from Bound Brook, N. J., to Delaware (Pa. line), 27 m.; branch line to Trenton, 3.7 m. This Co., whose offices are in Philadelphia, was chartered in 1874, and the main line was opened in 1876. *Financial statement:* Cap. stock, \$1,514,000, funded debt, 1st mortgage 7% 30-year bonds, dated Aug. 2, 1875, \$1,500,000, and floating debt,

\$279,620.66. Total stock, bonds and debts, \$3,293,620.66. Net earnings for 1878, \$119,022.32.

**Delaware and Chesapeake R.R.** runs from Clayton, Del., to Oxford, Md., 53.75 m. This Co., whose offices are in Easton, Md., was chartered in 1854 as the Maryland and Delaware R.R. Co., and completed in 1857. The road was sold in 1877, under a decree of foreclosure in favor of 1st mortgage bondholders, for \$94,200, bought in for the bondholders, and reorganized under its present title in 1878. *Financial statement* (before sale): Cap. stock, \$500,000; funded debt, 1st mortgage 6% bonds, payable 1885, \$850,000, and 2d mortgage 6% bonds, \$150,000. Total stock and bonds, \$1,500,000.

**Delaware and Hudson Canal Co.** This Co. was chartered in 1823, to construct a canal and R.R. from the coal-fields of Pa. to the Hudson at Rondout, N. Y., and the canal, 108 m., from Honesdale to the latter place, was completed in 1828, and the Gravity R.R. to the coal-fields in 1829. Besides this R.R., in length 62.41 m., the Co. owns the Lackawanna and Susquehanna R.R., running from Nineveh, N. Y., to Jefferson R.R., Pa., 22.01 m., and from Carbondale, Pa., to Scranton, Pa., 16.60 m., total, 38.61 m. It also operates under lease or contract the following lines: Jefferson R.R., from Susquehanna Junction, Pa., to Carbondale, Pa., 34.60 m.; Union R.R., from Greenridge, Pa., to Mill Creek, Pa., 16.69 m.; Plymouth and Wilkesbarre R.R., and branches from Junction, to Plymouth, Pa., 3.22 m.; and under lease on separate account, the Albany and Susquehanna R.R. from Albany to Binghamton, 142.59 m.; the Cherry Valley, Sharon, and Albany R.R., from Cobleskill to Cherry Valley, 20.91 m.; the Schenectady and Duanesburg R.R., between both named places, 13.84 m.; Rensselaer and Saratoga R.R., from Troy to Whitehall, and branches, 182.62 m.; New York and Canada R.R., from Whitehall to Rouse's Point, and branches, 149.93. Total of all lines owned, leased, and operated, 665.40 m. *Financial statement:* Cap. stock, \$20,000,000; bonds, 1884, \$3,500,000; ditto, 1891, \$5,000,000; ditto, 1877-91, \$1,482,000; ditto, 1894, \$4,856,000; ditto, 1917, \$2,450,000; Loan, 1880, \$1,045,000. Net earnings for 1878, \$398,218.72.

**Delaware, Lackawanna, and Western R.R.** runs from Delaware River (N. J. line) to N. Y. State line, 115 m. Branches, Scranton to Northumberland, Pa., 80 m.; Greenville to Winton, Pa., 7.50 m.; Junction to Keyser Valley, Pa., 5 m.; total, 192.50 m. This Co., whose offices are in Carlisle, Pa., also leases the following lines in New York State: Cayuga and Susquehanna, from Owego to Cayuga Lake, 34.61 m.; Greene from Greene to Chenango Forks, 8 m.; Oswego and Syracuse, between those places, 34.98 m.; Utica, Chenango, and Susquehanna Valley, from Utica to Greene, 97.75 m.; Valley, from Pa. State line to Binghamton, 11.50 m.; total, 186.84 m. It controls the Syracuse, Binghamton, and New York, from Geddes to Binghamton, 81 m. It operates the Rome and Clinton R.R., between those two places, 12.70 m.; and the Utica, Clinton, and Binghamton R.R., from Utica to Smith's Valley, 31.30 m. It leases the following lines in New Jersey: the Chester R.R., from Dover to Chester, 10 m.; the Morris and Essex, from Hoboken to Phillipsburg and Boonton Bridge, 118.22 m.; the Newark and Bloomfield, from Newark Junction to West Bloomfield, 4.25 m.; and the Warren R.R., from Delaware River to Hampton Junction, 18.25 m.; total, 150.72 m. Total of all lines owned, leased, and operated, 670.00 m. The Co. was formed in 1853,

by the consolidation of the Lackawanna and Western R.R., and the Delaware and Cobbl's Gap R.R. *Financial statement*: Cap. stock, \$26,200,000. Funded debt, \$5,887,100. Net earnings for 1878, \$2,320,481.42.

**Delaware River and Bay.** The *D. River* rises on the W. side of the Catskill Mountains, State of New York, and after separating Pennsylvania from New York and New Jersey, falls into the *D. Bay* 5 m. below New Castle. It is formed by the union of two streams, the Mohawk and the Popacton, which unite 8 m. below the Pennsylvania boundary line, in lat. 42° N. The river then pursues a winding S. E. course between New York and Pennsylvania for 60 m. to the N. W. corner of New Jersey, where it receives the Neversink River. It then turns S. W., along the base of the Kittatinny range, for 35 m., in passing through

gable for vessels of the largest class to Philadelphia, 40 m., and for sloops 35 m. farther, to Trenton. Above the falls at Trenton it is navigable for boats of 8 or 9 tons for 100 m. The *D.* is connected with the Hudson River and the bays of New York by the *D.* and Hudson Canal, the Morris Canal, and the *D.* and Raritan Canal. — The *D. Bay* is a large arm of the sea, 75 m. long, 20 m. wide between Cape May on the N. and Cape Henlopen on the S., and 30 m. wide in the middle. The navigation is difficult and dangerous, being interrupted by many shoals. Its low and sandy shores were without harbors until the construction of the *D. Breakwater*, situated at the entrance into *D. Bay*, near Cape Henlopen. The anchorage ground, or roadstead, is formed by a cove in the S. shore, directly W. of the pitch

of the cape, and the seaward end of an extensive shoal called *The Shears*. The entrance from the ocean is 1,950 feet in width, and is accessible during all winds from the sea. The depth of water is from 24 to 36 feet deep, at low tide, throughout the harbor. There are two dikes, one of 1,500 feet, and the other of 6,000 feet, giving a secure harbor of seven tenths of a sq. m. The objects of this artificial harbor are to protect vessels from winds from E. to N. W., by way of N. and against the floating ice of the bay.

**Del Credere** [It., *in trust*], a commercial term seldom used in the U. States, which, in its restricted sense, is an engagement by an insurance broker, for an additional premium, to guarantee the insured against the consequences of the failure of the underwriter. In its ordinary mercantile acceptance it embraces every commercial transaction in which the person who transacts for another engages for the solvency of the person with whom he so bargains. A factor employed to dispose of property, in the usual manner, is only responsible to his principal for the consequence of neglecting that degree of care which a prudent man takes of his own affairs; and if he sell to a person in good credit, and that person fail, he is not responsible for the debt. If the factor or agent, however, hold a *del credere* commission, he engages, in consideration of an additional premium, to guarantee all his transactions. His responsibility extends to the absolute payment, and so it is not sufficient that he remit the

price by bills to his principal, — he is responsible for their being honored.

**Delineation**, a draught, or outline sketch.

**Deliquescence**, spontaneous liquefaction by absorption of the moisture of the atmosphere. Deliquescent salts are those which by exposure gradually assume the liquid state. They should all be kept in well-closed bottles or jars.

**Delivery**, the act of transferring the possession of goods from one person into the possession of another. See **SALE** and **STOPPAGE IN TRANSITU**.

**Delve**, to dig, to open the ground with a spade.

**Demand**, a claim made for a debt due; the asking or requiring of a price for goods offered for sale.

**Demand and Supply**, these terms, in political economy, express the relation between consump-

Fig. 126 — DELAWARE RIVER.  
(Sherman Waterfall in the Catskill Mountains.)

which it forms what is called the "water gap," a great natural curiosity. The banks here rise precipitately from the water's edge to the height of 1,600 feet, overhung by immense masses of rock, and at the S. E. entrance leaving scarcely room for a road. The passage, however, widens towards the N. W. Its entire length is about 2 m. From this point it pursues a S. E. and then a S. W. course to Easton, where it receives the Lehigh, a large tributary from the W. A little below this the river passes through South Mountain, and has a S. E. course to Trenton, 60 m. below Easton; having in that distance 25 rapids, with a total fall of 165 feet. These falls are navigable at high water. The river below Trenton turns to the S. W. until near the bay, which it enters in a S. E. direction, after an entire course of 309 m. It is navi-

tion and production, — between the demand of purchasers and the supply of commodities by those who have them to sell. The relations between the demand for an article and its supply determine its price or exchangeable value: the relations between the demand for labor and its supply determine the amount of wages to be earned by the laborer. For causes explained elsewhere, the price of an article will rarely vary, for any length of time, very much above or below its cost of production; nor will the wages of labor, for any length of time, much exceed or fall below the amount necessary to maintain laborers and their families in such comforts as their habits of life have accustomed them to believe necessary for their subsistence; but, bearing in mind that, in the prices of commodities and labor, there is a certain point, determined by causes independent of demand or supply, above or below which prices cannot materially vary for any considerable time, all variations of price, if the medium in which they are calculated remain unchanged, may be referred to the proportion which exists between the demand for commodities and the supply of them, — between the quantities which purchasers are willing and able to buy, and the quantities which producers are able and willing to sell. The first effect of a demand exceeding the supply of a commodity, is to raise its price. As more persons want to buy the commodity than the producers are able or willing to supply, they cannot all obtain what they desire, but must share the supply between them in some manner. But their wants are very much regulated by the cost of gratifying them. One man would purchase an article for a dollar for which he may be unwilling or unable to pay two; while others, rather than forego the purchase, will consent to pay that amount. Those who have commodities to sell, finding that they have more customers than they can satisfy, immediately infer that they are selling them too cheaply, and that they could dispose of all their stock at a higher price. The price is accordingly raised, when the sale becomes limited to those who are not restrained from buying by the increased price. Some commodities are positively necessary for the support of the people, of which the supply may fall very short of the demand and be incapable of increase. This is the case when there is a bad harvest in a country which is excluded from a foreign supply by war or by fiscal restrictions. Here the price rises in proportion to the deficiency of the crops. The competition for food is universal. The number of consumers is not diminished, while the supply is reduced; and the price must, therefore, rise and continue high until a fresh supply can be obtained. A similar effect is produced if the supply, without being deficient, be confined to the possession of a small number of persons, who limit it to the consumers in order to secure higher prices. However abundant corn might be in a besieged town, if one man were exclusively authorized by law to sell it, it might rise to a famine price, unless the people broke into the granaries, or the government interfered with the monopoly. Less in degree, but similar in principle, is the effect upon prices of every limitation of the market by fiscal restriction. When any sellers are excluded, the others are enabled to raise their prices. These are cases in which the supply cannot be increased to meet the demand, or in which the supply is monopolized. But the greater number of commodities may be increased in quantity, and the supply of them is not artificially limited. The price of these also rises when the demand exceeds

the supply; but the increased price raises the profit of the producer, and attracts the competition of others in the market. Fresh capital and labor are applied to the production of the profitable article, until the supply is accommodated to the demand, or exceeds it. The prices gradually fall, and at length the profits are reduced to the same level as the profits in other undertakings, or even lower. The encouragement to further production is thus withdrawn, and prices are adjusted so as to secure to the producer the ordinary rate of profits, and no more. — When a supply exceeds the demand, that is to say, when there is more of a commodity than people are prepared to buy, its price must fall. Its sellers must offer it for sale at the price at which they can induce people to purchase. All is now in favor of consumers. They are no longer bidding against each other: but the sellers are competing among themselves to get rid of their goods. The price falls generally in proportion to the excess of the quantity, but this result is very much qualified by the nature of the article. If there be an excess of supply in perishable goods, there is nothing to prevent the natural fall of prices. When fish is unusually abundant, it must be cheap, or a great part of it will be destroyed: it must be eaten at once, or not at all; and to induce people to eat it, it must be offered to them at a low price. But with articles which may be held back, in expectation of higher prices, their value may be partially sustained. Production may be reduced, and the stock gradually brought into the market, until the supply has been equalized with the demand; and wherever the article is such as to admit of voluntary increase or diminution, the natural result of an excessive supply is to reduce production, until the balance of supply and demand has been restored. This mutual adjustment is in perpetual operation, and is ordinarily effected with such precision, that it may be said, without exaggeration, that a large city is supplied exactly with everything its inhabitants require, — even down to an egg or a pint of milk. There is always enough of everything, and rarely too much. — Whenever there is an excessive production of any commodity, it is an evil almost as great as scarcity. It is true that the consumer derives benefit from it, but the producing classes are most injuriously affected. In order to raise the value of the produce of their labor, they must cease to produce, or must produce in less quantities. The workmen are thus either deprived of employment altogether for a time, or are employed for a portion of their time only, at reduced wages; while their employers are disposing of their goods at low prices, which scarcely repay the outlay of their capital. Nor does the penalty of over-production fall exclusively upon those engaged in the trade in which supply has exceeded the demand. Their distresses extend to other classes. It has been shown already that it is to production we must look as the cause of sustained consumption, and thus the pressure upon any considerable branch of productive industry must be sensibly felt by those who have the produce of their own labor to sell. Production has failed, and consumption must therefore be diminished. — The supply of markets is a very speculative business, and is often conducted with more zeal than discretion. When a particular trade is supposed to be more prosperous than others, capitalists rush into it in order to secure high profits; and in this country the abundance of capital, the perfection of our machinery, and the skill of our workmen, enable them to produce with extraordinary facility. Over-production in that particular trade is

the consequence, and all engaged in it suffer from the depreciation in the value of their goods; but if, instead of rushing into the favorite trade, they had distributed their enterprises more widely, their own interest and that of the community would have been promoted. When a ship is wrecked, if all the crew precipitate themselves into one boat, they swamp it; but if they wait till all the boats are lowered, and apportion their numbers to the size of each, they may all reach the shore in safety. And so it is in trade: one trade may easily be glutted, while there is room in other trades for all the capital and industry that need employment. In proportion to the extent of the market, and the variety and abundance of commodities to be exchanged, will be the facility of disposing of the products of capital and labor; and this consideration points out as the most probable antidote to gluts, a universal freedom of commerce. When the free interchange of commodities is restricted, not only is a glut caused more easily, but its causes are more uncertain, and dependent upon unforeseen events. With the whole world for a market, the operation of the laws of demand and supply would be more equable, and the universality of the objects of exchange would make gluts of rare occurrence. The market would still be liable to disturbance by bad harvests, by errors in the monetary system, by shocks to public credit, and by war; but apart from these causes of derangement, demand and supply would be adjusted, and the productive energies of all nations called into full activity.

**Demi**, a prefix signifying half.

**Demi-john** [from the Fr. *dame-jeanne*], a large round glass bottle, which is generally encased in osier basket or wicker work to prevent fracture; it holds about two gallons.

**Demurrage** is applied in commercial navigation to designate the time during which a vessel is detained beyond that originally stipulated in loading or unloading; but it is more commonly applied to the compensation which the freighter has to pay for such detention. The freighter usually agrees to load and unload within a certain time, and comes under a subsidiary stipulation to pay so much by way of *D.* if the time be exceeded, in which case it is generally fixed at a certain rate per day, — Sundays and legal holidays excluded. This holds even in cases where the delay is not occasioned by any fault on the freighter's part, but is inevitable. If, for instance, a ship be detained, owing to the crowded state of the port, for a longer time than is allowed by the contract, *D.* is due; and it is no defence to an action for *D.*, that it arose from port regulations, or even from the unlawful acts of the custom-house officers. *D.* is not, however, claimable for a delay occasioned by the hostile detention of the ship, or the hostile occupation of the intended port; nor is it claimable for any delay wilfully occasioned by the master, or owners, or crew, of the vessel. The claim for *D.* ceases as soon as the ship is cleared out and ready for sailing, though she should be detained by adverse winds or tempestuous weather. See **AF-FREIGHTMENT, BILL OF LADING, CHARTER-PARTY, SHIPPING.**

**Demy**, the name for a particular size of paper. Drawing demy is 15 × 20; printing demy, 18 × 22½.

**Dendrometer** an instrument constructed for measuring the heights and diameter of growing timber.

**Denim**, a coarse kind of blue or brown cotton drill, of which the warp only is dyed. It is exten-

sively manufactured at Lawrence and Lowell, Mass., Saco, in Maine, and other places in New England. *D.* is chiefly used for laborers' overalls.

**Denmark**, a kingdom lying in the N. W. of Europe, and now reduced to the peninsula of Jutland on the European continent and a group of islands in the Baltic. It lies between lat. 54° 34' and 57° 44' 52" N., lon. 8° 4' and 12° 34' E., with the exception of the island of Bornholm, which lies between lon. 14° 42' and 15° 10' E. It is bounded N. by the Skagerrack; E. by the Cattegat, the Sound, and the Baltic; S. by the Baltic, the Little Belt, and the German duchy of Schleswig; and W. by the North Sea. Area, 14,553 sq. m. With the exception of Bornholm, which is situated considerably to the E., between Pomerania and Sweden, the islands all lie close to one another, and form a cluster that almost closes the entrance to the Baltic. The largest island, and the nearest to Sweden, is Zealand, or Sjælland; the next in size, Funen, or Fyen, is divided from Jutland by only a minute channel; Lolland, Bornholm, Falster, Langeland, Møen, Samsø, Ærø, Læsø, Taasinge, Anholt, are, in order of their importance, the other noticeable islands. The government is a constitutional hereditary monarchy, the executive power being in the king and his responsible ministers, and the right of making and amending laws in the Rigsdag, or Diet, acting in conjunction with the sovereign. Copenhagen, the cap. of *D.*, is also the only large city and seaport of the kingdom. The colonial possessions of *D.* are the Faroe Islands, Iceland, Greenland, and the Danish West Indies (which last are given under their respective names). The *Faroe Islands* are an archipelago nearly midway between Shetland and Iceland. 17 of these islands are inhabited; the largest is Stromö, on the E. shore of which is built the cap., Thorshavn. *Iceland* is a large island at the N. W. extremity of the map of Europe, just outside the Arctic Circle. It received in 1874 a constitution and an independent administration. The whole peninsula or continent of Greenland is nominally in the possession of *D.*; but in point of fact her dominion there is limited to a few scattered trading stations along the W. coast. It is divided into 2 provinces, N. and S. Of these, the former contained, according to the census of 1876, 4,095 native inhabitants, and the other 5,512. The whole European pop. was only 236. In 1879, the following estimate of the population of *D.* and dependencies was made:—

Provinces.	Area in sq. m.	Population.
Zealand and Møen.....	2,793	693,000
Bornholm.....	221	34,000
Lolland and Falster.....	640	94,000
Funen, Langeland, etc..	1,302	253,000
Jutland.....	9,697	866,000
	14,553	1,940,000
Faroe Islands.....	495	10,600
Iceland.....	30,000	71,300
Greenland.....	.....	9,800
West Indies:—		
St. Croix.....	60	22,600
St. Thomas.....	14	14,000
St. John.....	13	1,000
Total.....	45,135	2,069,300

The coast of *D.* is generally low and sandy; the whole western shore of Jutland is a succession of sand-ridges and shallow lagoons, very dangerous to shipping. Skagen, or the Scaw, a long, low, sandy point, stretches far into the northern sea, dividing the Skagerrack from the Cattegat. On the eastern side the coast is not so inhospitable; on the contrary, there are several excellent havens, especially on the islands. Nowhere, however, is the coast very high, except at one or two points in Jutland, and at the eastern extremity of Møen, where limestone cliffs exist. The long fjords, or firths, into which the proximity of the islands divides the coast, form a distinguishing feature. There is little variety in the surface of *D.* It is

uniformly low, the highest point in the whole country, Himmelsbjerg, in Jutland, being only 550 feet above the sea. *D.*, however, is nowhere low in the sense in which Holland is; the country is pleasantly diversified, and rises a little at the coast, even though it remains flat inland. The landscape of the islands and the southeastern part of Jutland is rich in beech-woods, cornfields, and meadows, and even the minute islets are green and fertile. In the western and northern districts of Jutland this gives place to a wide expanse of moorland, covered with heather, and ending at the sea in low, whitish-gray cliffs. There is a melancholy charm even about these monotonous tracts, and it cannot be said that *D.* is wanting in natural beauty, though of a quiet order. It is obvious that in such a country there can exist no rivers. The Gudenaa, the longest of the Danish streams, is little more than a brook. Nor are there any large lakes. Pieces of water of considerable size, however, are numerous; of these the largest are the Arresø and the Esømsø in Zealand, and the chain of lakes of various names near Silkeborg in Jutland. Many of these meres, overhung with thick beech-woods, are extremely beautiful. The climate presents no remarkable features. The country lies at the division between Eastern and Western Europe, and partakes of the characteristics of both. Its climate differs from that of Scotland (which is in the same latitude) less in the nature of the seasons than in the rapidity of their transitions. Snow falls on an average on thirty days in the year, and westerly winds are more prevalent than easterly in the ratio of 16 to 10. Storms of wind and rain are exceedingly frequent, particularly in July and August. In the district of Aalborg, in the North of Jutland, a cold and dry N.W. wind called *skai* prevails in May and June, and is exceedingly destructive to vegetation; while along the west coast of the peninsula similar effects are produced by a salt mist, which carries its influence from 15 to 50 miles inland.

Denmark is pre-eminently a corn land, and the cereals grown are all the usual European varieties; in the light and sandy soils buckwheat takes the place of rye, wheat, barley, and oats. The potato is largely cultivated, as well as peas, clover, vetches, and turnips. The usual N. European fruit trees and bushes produce good crops, and even peaches and apricots ripen well in sheltered places. The produce of grass is not very large, the fertility of the ground tempting the farmers to use it all for grain. In relation to its size there is no country in Europe, except Belgium and England, that can compete with Denmark as a corn-producer. According to the latest official returns, there are 11,367,310 acres under some sort of crop, fallow, or in grass, or about 65 per cent of the total area of the country; 5,594,495 acres more are in woods and forests. The land in *D.* is minutely subdivided, owing partly to the state of the law, which interdicts the union of small farms, and encourages in various ways the parceling out of landed property. The large estates of the nobles are generally in the hands of farmers; but the greater part of the land is possessed by the peasantry, who maintain an hereditary attachment to their ancestral farms. The mineral products of *D.* are too unimportant to require enumeration. It is one of the poorest countries of Europe in this particular. It is rich, however, in clays, while it should be stated that in the island of Bornholm there are quarries of freestone and marble. There is but little coal yet discovered in the country.

Manufactures are not carried on to any great extent. The most notable Danish manufacture is the fabrication of porcelain. The nucleus of this important industry was a factory started in 1772, by F. H. Müller, for the making of china out of Bornholm clay. In 1779 it passed into the hands of the state, and has remained there ever since. Originally the Copenhagen potters imitated the Dresden china made at Meissen, but they are now famous for very graceful designs of their own invention, and their porcelain has a distinct character of its own. The inventions of Thorvaldsen have been very largely repeated and imitated in this charming ware. Besides the royal works, there are private factories employing a large number of men. Terra cotta and faience are also manufactured in Copenhagen. The iron-works of *D.* have made very considerable progress since the separation of Norway, and they are largely supplied with raw material imported from England. There are many iron foundries around Copenhagen, and in that city there are small manufactories of locomotives, and of machinery of various kinds. The woollen, linen, and cotton manufactures of *D.* are for the most part domestic, and carried on purely for local consumption. Linen is the principal article of domestic industry in Zealand. The woollen manufacture occupies about 2,000 men. The sugar refineries, of which the largest are at Copenhagen, prepare most of the sugar required for domestic consumption. Cherry-brandy is also prepared in that city, and largely exported. The making of paper and distillation are carried on at different parts of the country to some extent.

Commerce. Formerly the commercial legislation of *D.* was to such a degree restrictive that imported manufactures had to be delivered to the customs, where they were sold by public auction, the proceeds of which the importer received from the custom-houses after a deduction was made for the duty. To this restriction, as regards foreign intercourse, was added a no less injurious system of inland duties impeding the commerce of the different provinces with each other. The want of roads

also, and many other disadvantages, tended to keep down the development of both commerce and industry. Within the present century, however, several commercial treaties were concluded between *D.* and the other powers of Europe, which made the Danish tariff more regular and liberal. Of no less importance were the regulations made from time to time concerning the Sound toll, a question which in the 17th century led to many hostilities between *D.*, Sweden, and Holland. Having formerly possessed both sides of the entrance to the Baltic, the Danish Crown looked upon the Sound as exclusively her own, refusing to admit any foreign vessels without payment of a certain duty, and this right was never successfully contested by the other powers. An exception, however, was made in favor of Sweden, and of late the toll has been entirely abolished. The commerce of *D.* is carried on mainly with Germany and Great Britain. For the year 1878 the total imports amounted to \$64,334,770, and the exports to \$50,804,230. The commercial intercourse between *D.*, including the Danish West Indies, and the U. States is shown in the subjoined tabular statement, in each of the 20 years, 1859 to 1878:—

Years.	Imports of U. States produce into Denmark			Exports from Denmark to the U. States.
	Domestic	Foreign.	Total.	
1859 .....	990,798	61,079	1,051,877	297,713
1860 .....	1,284,413	44,135	1,328,548	216,925
1861 .....	912,331	43,695	956,026	266,305
1862 .....	1,007,667	45,627	1,053,294	232,271
1863 .....	1,164,212	50,400	1,214,612	281,838
1864 .....	1,262,639	52,954	1,315,593	229,177
1865 .....	1,558,166	40,447	1,598,613	294,759
1866 .....	1,288,792	8,235	1,297,027	462,346
1867 .....	1,123,993	48,780	1,172,773	641,871
1868 .....	1,354,732	27,351	1,382,083	608,907
1869 .....	1,674,115	39,121	1,713,236	638,550
1870 .....	1,405,455	82,944	1,488,399	628,870
1871 .....	2,521,394	13,993	2,535,387	673,175
1872 .....	1,799,998	68,116	1,868,014	750,215
1873 .....	2,437,506	36,623	2,474,129	473,840
1874 .....	2,430,791	22,156	2,452,947	457,390
1875 .....	1,840,172	9,026	1,849,198	555,947
1876 .....	1,586,684	13,498	1,600,182	394,836
1877 .....	4,072,889	8,592	4,081,481	293,523
1878 .....	4,042,194	7,613	4,049,797	821,880
Total .....	35,759,431	724,445	36,483,876	9,281,453

In the year 1878 the principal imports from and exports to the U. States (the Danish West Indies excluded) were as follows: Imports: Manuf. of brass, \$72,400; Indian corn, \$1,034,519; manuf. of hemp, \$12,761; fire-arms, \$102,400; resin and turpentine, \$18,164; mineral oil, \$1,316,601; cartridges, \$234,475; bacon and ham, \$102,693; lard, \$241,588; seeds, \$25,000; tobacco leaf, \$70,000. — Exports: not worth mentioning.

Finances. The annual revenue of the state during the 5 financial years 1874 to 1878 averaged \$13,750,000; the expenditure during this period was fully balanced by the revenue, with an annual surplus, employed for the reduction of the public debt. The public debt of *D.* which, before the establishment of parliamentary government in 1866, amounted to 292,232,680 kroner, or \$72,842,415, was reduced in 1878 to 174,781,950 kroner, or \$43,550,540.

Banking. The National Bank of *D.*, established in 1818, has its head office in Copenhagen, with branches at Odensee and Flensborg. It issues notes of 200, 100, 50, 20, and 10 kroner, payable in specie on demand, and transacts all sorts of business.

Communication, both by land and water, is well provided for in *D.* A railroad from the Schleswig frontier proceeds to Fredericia, from whence one branch passes to the extreme north of Jutland, another crosses the island of Funen, from Middelfort to Nyborg. This is the direct line from Germany to Copenhagen. From Nyborg a packet crosses the Great Belt to Korsør, and thence another line runs through Zealand to Copenhagen. There is also a South Zealand line, from Roskilde to Vordingborg, which is continued through the island of Falster, besides a short line in Lolland. On Jan. 1, 1879, the total length of railroads open to traffic was 854 m. The only canal is the Thyborøn, a short canal which connects the Lim Fjord (the arm of the sea which penetrates so far into the N. of Jutland) with the German Ocean. There is no direct line of steamers between the U. States and *D.*, the best way to Copenhagen being from New York to Hamburg, and thence by German and Danish railroads.

Money. Under a law which came into force on Jan. 1, 1875, the decimal system of currency was introduced in *D.*, the unit being the *krona*, or crown, divided into 100 *ore*. The *krona* is generally accounted of one half the value of the *Rixdaler*, the old unit of currency, of which it took the place. 18 *krona* = \$5 (about).

*Weights and measures:—*

The Pound = 100 Krint.....	= 1.102 airoirdupois, or about 100 lbs. to the cwt.
" Ship Last.....	= 2 tons.
" Tunde, or Barrel of Grain and Salt.....	= 3.8 bushels.
The Tunde, or Barrel of Coal..	= 4.7 "
" Foot.....	= 1.03 foot.
" Viertel.....	= 1.7 gallon.

*Commercial marine.* On Jan. 1, 1879, the commercial fleet of *D.* consisted of 3,263 vessels, of an aggregate burthen of 260,180 tons. Of these 180, of 43,720 tons, were steamers. Included in this account were all vessels of not less than 4 tons. The mass of the shipping consisted of vessels under 300 tons. Of vessels over 300 tons there were 134, of an aggregate burden of 71,213 tons. To the port of Copenhagen belonged 446 vessels, of a total burthen of 76,518 tons. The principal ports of *D.* are Copenhagen (see below), Helsingör, Korsör, Aarhus, Aalborg, and Frederikshavn.

Copenhagen, one of the best built cities in Europe, stands on the E. coast of Zealand, in lat. 55° 41' N., lon. 12° 35' E. Pop. in 1879, 205,000 (with suburbs, 250,000). In going into *C.*, the course is between the buoy on the Stubben Bank to the left, and the buoy on the Middle-grounds, and those in advance of the three Crowns batteries on the right, W. S. W. by compass. From the three Crowns to the roads the course is S. S. W. The water in the channel is from 6 to 4 fathoms deep; but it is narrow, and the navigation rather difficult. There is no obligation to take a pilot on board; but if a vessel wish for one, she may heave to abreast of the battery, when he will come to her. Vessels not intending to come into harbor bring up in the roads, at from  $\frac{1}{2}$  to  $\frac{1}{4}$  mile from shore, in about 4 fathoms, the town bearing S. S. W. In the harbor, within the boom, the water is from 17 to 18 feet deep. Vessels in harbor load and unload alongside the quay. The anchorage in the roads is good and safe.—*Credit.* Goods imported into *C.* are commonly sold on credit; 3 months is the term generally allowed on most sorts of goods, and in a few instances 6 months. The discount for ready money is 4 per cent. Bankruptcy is of rare occurrence.—*Commission* on purchases is generally 2 per cent, and on sales 3 per cent, including 1 per cent *del credere*.

**Denmark-Satin**, a stout worsted stuff used for covering ladies' shoes, etc.

**Dennet**, a kind of light, open, two-wheeled carriage.

**Deurée**, the French word for commodity or produce.

**Density** denotes the quantity of matter which a body contains under a given or determinate surface. This term is commonly used synonymously with *specific gravity*, which, however, refers to comparative weights of equal bulks. Thus quicksilver is said to have a *D.* greater than that of copper, and alcohol one less than that of oil of vitriol.

**Dent** [the French name for tooth], a mark, an impression.—A tooth of a gear-wheel, of a comb or metallic brush, etc.

**Dentelle**, the French term for lace.

**Dentifrice**, a substance applied to the teeth, to cleanse and beautify them.

The solid ingredients used in *D.* should not be so hard or gritty as to injure the enamel of the teeth; nor so soft or adhesive as to adhere to the gums, after rinsing the mouth out with water. Pumice-stone (in fine powder) is one of those substances that acts entirely by mechanical attrition, and is hence also an objectionable ingredient in tooth-powder intended for daily use. It is, however, very generally present in the various advertised dentifrices, which are remarkable for their rapid action in whitening the teeth. Bath brick is another substance of a similar nature to pumice, and, like that article, should be only occasionally employed. Cuttle-fish bone, coral, and prepared chalk are also commonly used for the same purpose, but the last is rather too soft and absorbent to form the sole ingredient of a tooth-powder. Charcoal, which is so very generally employed as a dentifrice, acts partly mechanically and partly by its chemical property of destroying foul smells and arresting putrefaction. For this purpose it should be newly burnt, and kept in well-closed vessels until used, as by exposure to the air it rapidly loses its antiseptic powers. Powdered rhatany, cinchous bark, and catechu are used as astringents, and are very useful in foulness or sponginess of the gums. Myrrh and mastic are employed on account of their odor, and their presumed preservative action and power of fixing loose teeth. Insoluble powders have been objected to on account of their being apt to accumulate between the folds of

the gums and in the cracks of the teeth, and thus impart a disagreeable appearance to the mouth. To remedy this defect, a reddish or flesh-colored tinge is commonly given to them with a little rose-pink, red coral, or similar coloring substance, when any small portion that remains unwashed off is rendered less conspicuous. Some persons employ soluble substances as tooth-powders, which are free from the above objection. Thus, sulphate of potash and cream of tartar are used for this purpose, because of the grittiness of their powders and their slight solubility in water. Phosphate of soda and common salt are also frequently employed as dentifrices, and possess the advantage of being readily removed from the mouth by means of a little water. Among those substances that chemically decolor and remove unpleasant odors, the only ones employed as dentifrices are charcoal and the chlorides of lime and soda. The first has been already noticed; the others may be used by brushing the teeth with water to which a very little of their solutions has been added. A very weak solution of chloride of lime is commonly employed by smokers to remove the odor and color imparted by tobacco to the teeth. Electuaries, made of honey and astringent substances, are frequently employed in diseases of the gums. The juice of the common strawberry has been recommended as an elegant natural dentifrice, as it readily dissolves the tartarous incrustations on the teeth, and imparts an agreeable odor to the breath. See PASTE, POWDER, and WASHES.

**Dentistry** is the art of extracting teeth, of treating their diseases and lesions, and supplying artificial substitutes in the place of these organs when lost. The progress of *D.* as a science has been very marked in this country, and has placed American dentists at the head of the profession through the world. The art of *D.* is difficult to acquire, and comprehends in itself processes appertaining to several separate branches of manufacture. It is, however, an extremely useful art, and has done valuable service, since it is not too much to say that in all probability many lives have been saved, and a still greater number prolonged, through the instrumentality of the aid afforded by the use of artificial teeth.

**Dentist's chair**, a chair provided with numerous adjustments to suit the exigencies of surgical dentistry. The chair itself is pivoted on a stand which has casters. The seat is vertically adjustable, the back inclinable. The head-rest is adjustable vertically and as to inclination.

**Denture**, an artificial tooth, block, or set of teeth. The former are partial dentures, the latter is a full denture.

**Denver.** See COLORADO.

**Denver and Boulder Valley R. R.**, from Hughes, Col., to Boulder City, Col., 27 m. This Co., whose offices are in Denver City, Col., was chartered in 1870, and the road opened in 1874. It is leased for 99 years from 1873 to the Denver Pacific R. R. Co., at a rental of 40 % of gross earnings; \$550,000 bonds and interest thereon are guaranteed by lessees. *Financial statement, 1878:* Cap. stock, \$700,000; funded debt, 1st mortgage 7 % 30-year bonds, dated Oct. 1, 1870, payable Nov. 1, 1900, coupons, May and Nov., \$500,000.

**Denver and Rio Grande R. R.** (in progress) from Denver, Col., to El Paso, Texas, 850 m. Branches, Pueblo, Col., to Cañon City and coal-mines, 42.9 m.; Pucharas, Col., to El Moro, Col., 36 m. It is in operation from Denver to Alamosa, 250.6 m. Offices in Colorado Springs, Col. *Financial statement, 1877:* Cap. stock, \$8,500,000; funded debt, \$6,628,751.05.

**Denver Pacific R. R.** from Denver City, Col., to Cheyenne, Wyoming Ter., 108 m. This line, whose offices are in Denver, was opened in 1871, and has been in the hands of a receiver since 1878. *Financial statement:* Cap. stock, \$4,000,000; funded debt, \$2,271,000; total stock and bonds, \$6,271,000. Cost of road and equipment, \$6,495,350; cost per mile, \$61,276.90.

**Deodorizer**, any substance having the power of absorbing and destroying fetid effluvia. Chlo-

rine, chloride of lime, chloride of zinc, carbolic acid, nitrate of lead, sulphate of iron, and freshly burnt charcoal are the most effective and convenient *D.* See DISINFECTANT.

**Dépenses** [Fr.], expenditure.

**Depilatory**, any substance employed to remove superfluous hairs from the human skin. *D.* act either mechanically or chemically. To the first class belong adhesive plasters, that, on their removal from the skin, bring away the hair with them. The second class includes all those substances which destroy the hair by their chemical action.

The use of Orpiment (sulphide of arsenic), which forms the principal ingredient in most fashionable *D.*, is not free from danger. The two best and safest *D.* are perhaps the following: 1. Take sulphide of sodium (crystallized), 3 parts; quicklime (in fine powder), 10 parts; starch, 10 parts; mix. To be mixed with water and applied to the skin, and scraped off in 2 or 3 minutes with a wooden knife. — 2. Make a paste with a strong solution of sulphide of barium and powdered starch, and apply immediately.

**Depoh**, a long measure of Sumatra, = 72 inches.

**Déport**, the French stock exchange term equivalent to the English word BACKWARDATION (q. v.).

**Déposant** [Fr.], a depositor in a bank.

**Deposit**, a lodgment. — Money paid on account of a purchase. — A pledge or pawn. — Anything intrusted to the care of another.

**Depositor**, one who has money lodged in a savings' or other bank, etc. — The owner of goods, etc., entrusted to the care or safe-keeping of another.

**Deposit-Receipt**, a note or acknowledgment for money lodged with a banker for a stipulated time, upon which an agreed rate of interest is allowed.

**Dépot** [Fr.], a railroad station. — An agency, warehouse, or temporary repository for goods.

**Depreciation**, a diminished value; a reduction of worth.

**Depth**, the measure of anything from the surface downwards.

**Deputy**, a subordinate officer; one commissioned to act for another, as deputy-commissary, deputy-lieutenant, etc.

**Deraa**, an Arabian cloth measure. The ancient "deraa belleli," used for local purposes, in measuring linen, etc., made in the country, is 22½ inches; but the "deraa Stambouli," employed to measure European cloths, is 26½ inches. Another deraa, the "hindazeh," of 25 inches, is used to measure goods coming from the East Indies.

**Derbyshire Cheese**. See CHEESE.

**Derbyshire Spar**. See FLUOR SPAR.

**Derelicts**, anything forsaken or left. It is used to express vessels forsaken at sea, and found without any person in them. Of this the government has the custody, and the owner may recover them within year and day. An allowance is made for the salvage of *D.* vessels, when it has been attended with danger.

**Derham**, or **Derhem**, a weight in Persia of 150 troy grains, by which gold and silver are weighed.

**Derrick**, a form of hoisting-machine, used for lifting machinery, raising wrecks, and other great weights, and transporting them from one place to another. A floating derrick, or crane, consists of an iron pontoon, divided into several water-tight compartments, from the centre of which rises a tripod mast. Across the mast turns a boom of

great strength: one arm of the boom is furnished with fourfold blocks, through which pass the chains intended to hoist the weight; the chains pass over the top of the mast to the opposite end of the boom, and thence descend to the side of the vessel, where they are connected with steam-engines in the pontoon. Water is admitted into the compartments of the pontoon as a counterpoise to the weight suspended.

**Descarga** [Sp.], a clearance at the custom-house; a discharge; the unloading of a ship.

**Desertion** from the ship by a seaman without just cause, or the justifiable discharge of a seaman by the master for bad conduct, will work a forfeiture of the wages previously earned; and this is a rule of justice and of policy which generally pervades the ordinances of the maritime nations.

By act of Congress, *D.* from the ship is accompanied with a forfeiture of all the wages that are due, and an absence of 48 hours without leave is made conclusive evidence of *D.*; and whatever unjustifiable conduct will warrant the act of the master in discharging a seaman during the voyage, will equally deprive the seaman of his wages. But the forfeiture is saved if the seaman repents, makes compensation or offer of amends, and is restored to his duty. Public policy and private justice here move together, and the maritime ordinances unite in this conclusion. The master has power to remit a forfeiture, and the penalty of forfeiture is not applied to slight faults, either of neglect or disobedience. There must be either an habitual neglect, or disobedience, or drunkenness, or else a single act of gross dishonesty, or some other act of a heinous and aggravated nature, to justify the discharging a seaman in a foreign port, or the forfeiture of wages; nor will the admiralty courts, except in cases of great atrocity, visit the offences of a seaman with the cumulated load of forfeiture of wages and compensation in damages. They stop at the forfeiture of the wages antecedently earned, and in the application of the forfeiture the advanced wages are made a charge on the forfeited wages, but the hospital money is apportioned ratably on the wages for the whole voyage. In these regulations, the moderation of the courts, and the solicitude which the peculiar condition and character of seamen excite, are equally manifest. So, if the seaman quits the ship involuntarily, or is driven ashore from necessity, from want of provisions, or by reason of cruel usage and for personal safety, the wages are not forfeited, and he will be entitled to receive them in full to the prosperous termination of the voyage. On the other hand, it is the duty of the seamen to abide by the vessel as long as reasonable hope remains; and if they desert the ship under circumstances of danger or distress from the perils of the sea, when their presence and exertions might have prevented damage, or restored the ship to safety, they forfeit their wages and are answerable in damages. And even when a seaman might well have been discharged in the course of the voyage for gross misbehavior, if the master refuses to discharge him, and leaves him in imprisonment aboard, he will, in that case, be entitled to his wages until his return to the U. States, after deducting from the claim his time of imprisonment. See DISCHARGE OF SEAMEN.

**Déshabillé** [Fr.], an undress.

**Desiatine**, a Russian land measure; 104 *D.* make a sq. verst, 3 versts being equal to 2 English miles. As a superficial measure, it is ordinarily equal to 2.70 Eng. acres, or 117,600 sq. feet; but in Kazan it is greater by one half. As an imperial measure in Russia the *D.* is 2,400 sq. sachine or sagine = 21,000 sq. arsheens = 13,000½ sq. yards.

**Desiccation**, a process of extracting moisture by chemical agency or by the use of air and heat. Chloride of calcium, quicklime, fused carbonate of potash, and oil of vitriol are used for this purpose.

**Design**. See PATTERN.

**Designer**, an inventor or draughtsman; one who sketches figures and patterns for enriching stuffs, etc.

**De-Silvering**. See SILVER-LEAD.

**Desk**, a writing-flap or inclined table with enclosure.

**Des Moines and Fort Dodge R.R.** runs from Des Moines, Ia., to Fort Dodge, Ia., 87.20 m. This Co., whose offices are in Des Moines, was organized at the sale, under foreclosure, of the

Des Moines Valley R.R. Co. in 1873. *Financial statement*: Cap. stock paid in: common, \$3,000,000; preferred, \$1,000,000; funded debt, \$2,178,000, consisting of \$1,089,000 6% coupon bonds, dated 1874, payable 1905, and \$1,089,000 income bonds, payable only in case of surplus.

**Despatch, or Dispatch**, to transmit or forward goods, invoices, or other advices.

**Despensero**, a Spanish butler; a ship's steward or providore.

**Dessert-Service**, the china or glass requisite for the after-dinner confections.

**Destemper, or Distemper**, a method of painting in which the pigments are ground up with size and water, with gum-water, or similar vehicles. It is employed in scene-painting, and in the preparation of wall-paper. The rapidity in which the vehicle dries renders it difficult to blend the tints in *D*.

**Détaillant** [Fr.], a retailer.

**Detector**, an arrangement in a lock, by which an over-lifted tumbler is caught by detent, so as to indicate that the lock has been tampered with.

Fig 127.—IMHAUSER'S WATCHMAN'S TIME DETECTOR.

The *Watchman's Time Detector* is a very ingenious and useful instrument to check and control the watchman on his duty. Such contrivances have been in use in Europe since the beginning of this century, and have been introduced in the U. States for the last twenty-five years; but it is only from late that they have been brought to a state of perfection, which has won for them a deserved popularity. By the use of this watch-clock on the various stations of the watchman's beat, keys are placed and fastened within or outside the buildings, to indicate the stations by the number up to 12 or more. The watchman, before entering upon his duties in the evening, receives the watch, which is provided with a fresh paper dial. He makes his rounds, and visits the different stations, according to instructions received from his employer. In making his rounds, and arriving at a station, the watchman will insert the key into the keyhole on the side of the watch, and turn it round to the right once; and while doing this, a figure will be punched on the dial of the watch at exactly the minute the hand on the watch shows the time.

The improved instrument, patented by Mr. Wm. Imhauser, of New York, in 1875, 1876, and 1877, and represented in Fig. 127, is so contrived that the insertion of 12 or more different

keys, numbered from 1 to 6, mark a figure between the circles 1, 2, 3, 4, 5, or 6, on the paper disk, which is slowly revolving by clock-work; some other keys, numbered from 7 to 12, make a figure on the line of the circles, so that the one does not interfere with the other, as seen on the numbered dial. In this instrument the marking apparatus is in the cover of the case, the watch movement is separate, and therefore secured against dust entering the key-hole. Another important invention and improvement is the safety-lock attachment, which is a provision against the acts of dishonest watchmen, who might open the watch with false keys, and mark the paper dial, without going their rounds. It consists in providing the watch with an additional stationary marker, which marks the dial in a separate circle whenever the case is opened, and also when it is shut again.

**Detent**, a pin, stud, or lever forming a stop in a watch, clock, tumbler-lock, or other machine. It is variously called in specific cases; as, *click, pawl, dog, fence*, etc. It is usually capable of motion, either at certain intervals, as in some escapements, or by operation of a key, as in locks.

A detent-catch falls into the striking-wheel of a clock, and stops it from striking more than the right number of times.—*Knight*.

**Détenteur** [Fr.], a holder or possessor of funds, notes, etc.

**Detergent**, an agent having the power of removing offensive matter from the skin. The name is now generally restricted to applications that tend to cleanse foul wounds and ulcers.

**Deterioration**, damage done; wear and tear.

**Detonation**, combustion with explosive rapidity, accompanied with sound and light, as in the case of gunpowder, percussion-caps, and fulminating-powder. When a mixture of oxygen and hydrogen is inflamed by the electric spark, it is said to *detonate*. *D.* is due either to the sudden liberation and

expansion of large volumes of gases, or to the sudden contraction of gaseous matter, and its reduction to a liquid or solid state. See **FULMINATING COMPOUNDS**.

**Detroit**, the metropolis of the State of Michigan, cap. of Wayne Co., and port of entry, situated on the west bank of the Detroit River (from the French for a *strait*), opposite the Canadian town of Windsor. It is about 7 m. S. W. of Lake St. Clair, 55 m. from Lake Huron, and 18 m. N. of Lake Erie, in lat. 42° 20' N., lon. 83° 3' W. The river, which there separates the U. States from Canada, is of varying width, being half a mile broad opposite the city, and 5½ fathoms deep, and flows with a pretty swift current. *D.*, with its suburbs, stretches about 5 m. along the river, and the central part extends for about 2 m. back from the shore. The site upon which the city is built rises from the edge of the river, the inclination being gradual, at the rate of about 58 feet per mile, affording the most perfect drainage, which has been taken advantage of by the building of a system of sewers over 80 m. in length, costing \$1,264,890, and permeating every quarter of the city. The commercial facilities of *D.* are very extensive. The *D.* river is a connecting link in the

great chain of lake navigation, and affords the best harbor on the lakes. The city is the centre of an extensive railroad system, which presents important channels of transportation in almost every direction. *D.* is the terminus of the Michigan Central and its branches, also of the Lake Shore and Michigan Southern, the Detroit, Eel River, and Illinois, the Detroit, Lansing, and Lake Michigan, the Detroit and Milwaukee, the Detroit and Bay City, the Grand Trunk of Canada, the Great Western of Canada, and the Canada Southern, which crosses the river at Trenton, a few miles below, and has a branch running to the city. 312 vessels, with an aggregate tonnage of 68,307, are owned here, and from 10 to 13 daily lines of steamers run to various points on the lakes. There is a considerable foreign trade with Canada, the imports in 1878 amounting to \$944,104, and the exports to \$3,492,940. During that year, 3,931 vessels (aggregate tonnage, 683,718) entered, and 3,892 (tonnage, 674,546) cleared the port in the foreign trade; 3,621 vessels (tonnage, 718,428) entered, and 2,857 (tonnage, 694,265) cleared in the coastwise trade. The large quantities of produce, chiefly from Michigan, passing eastward through the city by rail and water, give to *D.* an extensive domestic commerce. The manufacturing industries of the city are extensive and important. *D.* has many foundries, blast-furnaces, copper-smelting works, locomotive and car works, ship-yards, dry-docks, iron-bridge works, safe manufactories, furniture and other establishments using wood as the chief material, and the most extensive tobacco and cigar factories in America, producing each year goods worth many millions of dollars. There are also some pork-packing establishments. The extensive Pullman car works, with a capital of about \$12,000,000, are situated here; also one of the seven pin factories in the U. States. The city glass-works produce about \$200,000 worth of glass a year, and the copper-smelting works more than \$2,000,000 worth of ingot copper from Lake Superior ore. There are in *D.* 10 lines of street railway, with more than 45 m. of track intersecting the city in every direction, and 10 national banks, with an aggregate capital of \$3,210,000. The population, which has increased from 21,019 in 1850 to 45,009 in 1860, 79,577 in 1870, and 101,205 (State census) in 1874, is now about 125,000.

**Detroit and Bay City R.R. Co.**, from Detroit, Mich., to Bay City, Mich., 109.80 m., with branches from Lapeer to Five Lakes, 8.75 m.; from Vassar, Mich., to Caro, Mich., 12.75 m.; and from Denmark to Saginaw, 16.75 m. Total, 148.05 m. This Co., whose offices are in Detroit, Mich., was organized in 1871, and the road opened in 1872. *Financial statement:* Cap. stock, \$1,325,750; funded debt, 1st mortgage 8% 30-year bonds, \$2,180,000, due 1902, and \$150,000 due 1903, interest payable May and Nov. Net earnings for 1878, \$78,317.34.

**Detroit Fire and Marine Insurance Co.**, of Detroit, Mich., organized in 1866. *Statement*, 1st Jan., 1879: Cap. stock paid up in cash, \$250,000; net surplus, \$198,858.67; total cap. and surplus, \$448,858.67. Risks in force, \$10,035,217; premiums, \$111,612.34. Premiums received since the organization of the Co., \$2,173,364.30; losses paid, \$1,253,232.37. Cash dividends paid to stockholders, \$205,000; cash dividends paid during the year, \$25,000.

**Detroit, Grand Haven, and Milwaukee R.R.**, from Detroit to Grand Haven, Mich., 189 m. Branches: Pontiac to Insane Asylum, 0.65 m., and Corunna Station to Coal Mines, 2 m.; total, 191.65

m. This Co., whose offices are in Detroit, was formed in 1878 by the reorganization of the Detroit and Milwaukee R.R. Co. on the sale of that road to a purchasing committee of its bondholders. The Great Western R.R. Co., of Canada, will henceforth control and operate this line.

**Detroit, Hillsdale, and S. Eastern R.R.** runs from Ypsilanti to Bankers, Mich., 64.8 m. This Co., whose offices are in Ypsilanti, was originally founded in 1871 as the Detroit, Hillsdale, and Indiana R.R., which was sold under foreclosure in 1874, and reorganized in 1875 under its present title. The first mortgage bondholders purchased the road for \$1,168,000, being \$16,000 over amt. of mortgage. *Financial statement*, 1878: Cap. stock, \$1,350,000. Funded debt, \$25,920, consisting of 8% scrip, dated 1 July, 1876, and payable 1 July, 1881. Profit and loss, etc., \$23,701.35. Net earnings, 1878, \$12,901.14.

**Detroit, Lansing, and Northern R.R.** runs from Detroit to Howard City, Mich., 156.60 m., with branches from Stanton Bridge Junction to Blanchard, Mich., 37.61 m., from Kiddville to Belding, 1.67 m., and from Slaghts Junction to Hemmingway, 1.40 m.; total, 197.28 m. This Co., whose offices are in Detroit, was formed by the consolidation in 1871 of the Detroit, Howell, and Lansing R.R. Co., the Ionia and Lansing R.R. Co., and Ionia, Stanton, and Northern R.R. Co., under the name of the Detroit, Lansing, and Lake Michigan R.R. Co. In 1876 the road was sold under foreclosure, and reorganized under its present title. *Financial statement:* Cap. stock, common, \$1,825,617.52; preferred, \$2,503,380. Funded debt, \$2,876,000, consisting of Detroit, Lansing, and Northern R.R. bonds, \$1,975,000, payable 1907, int. 7% (Jan. and July); Ionia and Lansing R.R., \$770,000, payable 1889, int. 8% (Feb. and July); Ionia and Lansing R.R., 2d mortgage, \$81,000, payable 1880, int. 8% (May and Nov.); D. L., and L. M. Depot grounds, \$50,000, payable 1881, int. 7% (May and Nov.). Net earnings for 1878, \$372,198.87.

**Deviation**, in Marine Insurance, is one of the implied warranties, in the contract of insurance, that the voyage insured for shall be strictly adhered to, and so if a different voyage is pursued, or that stipulated for is voluntarily departed from, the contract is terminated, and the underwriter is discharged from liability.

*D.* does not void the contract, for the underwriter retains his premium, and is liable to all loss up to the point of *D.* Though the loss happen after the ship has returned to her proper course, and though it were distinctly proved that it was not caused or even influenced by the *D.*, the insurer would still be released, for the contract having been terminated by the *D.* cannot become binding again without a new agreement. *A D.* is said to be "a voluntary departure, without necessity, from the usual course of the voyage." It is not to be inferred from this that the vessel must have followed the route that can be proved to be the most direct and expeditious, but that she has followed the usual customary track, sanctioned by safety and convenience. Therefore, the stopping at certain places in the course of the voyage, though out of the direct line, if it have been customary to do so, is not a *D.*, but a part of the voyage. Still, a few instances where vessels have taken a point out of their direct course will not constitute usage in favor of the practice. If *D.* is once shown to have taken place, the smallness of its extent will not justify it. It is *D.* if a ship insured, with liberty to touch at a particular port, touches at another. It was formerly maintained that a ship entitled to touch at a port was not entitled to trade there, but it has been since held, that if there is no delay, and no increase of risk, trading is not a breach. If there are several ports of discharge, it is held *D.* to visit them in an order different from that in which they appear on the policy, and it certainly is so, if the risk is thereby increased. If the ports of discharge be not specifically named in the policy, they should be taken in their geographical order. It appears to be no *D.* to proceed direct to any one of a set of ports thus insured to, if the others are not visited at all. It is *D.* to touch at a port at which

It is not customary to touch, although the ship must pass it; or, there being several tracks, to select a less safe and eligible one for the purpose of accomplishing objects foreign to the voyage. Where a ship is insured for a voyage, with liberty to touch "at any one port" of some country, it is held to mean a port in the course of the voyage, if the country be so situated as to admit of this interpretation. Unnecessary delay is always a *D*. It appears to be considered *D.* to prescribe any one of several tracks to the master. If a specific track is predetermined by the insured, it ought to appear on the policy, and if it do not, the underwriter is entitled to expect that he will have the benefit of the master's choice of tracks, whose duty it is, when he is at liberty so to do, to adopt the best. Though there be an intention to deviate, and instructions given to that effect, the underwriter's responsibility will not be affected till the dividing point is reached, and if the vessel be previously lost, he is liable. *D* will be justified by necessity, though proceeding from a cause not insured against, as, from stress of weather, want of repairs, desertion or mutiny among the crew, attempt to escape from an enemy, or the taking advantage of an opportunity of joining convoy in time of war. The ship may deviate to be relieved of part of her cargo, if too heavily laden, or to take in additional cargo, where necessary for ballast. *D* to succor ships in distress is held justifiable on principles of public policy. It is a general principle that *D* will not be justified, if for the purpose of providing against the consequences of a fault of the insured, so as to allow one warranty to be infringed to cover the infringement of another.

**Devil**, a rag-engine or spiked mill for tearing woollen rags into shoddy, or linen and cotton rags to make paper pulp. — A machine for making wood screws, etc. — A printer's boy. — A fire-work.

**Devis**, the French word for estimate.

**Devon Cattle**. See CATTLE (*neut*).

**Dew-Retting**. See RETTING.

**Dextrin**, or **British Gum**, a substance produced from starch by the action of dilute acids, alkalies, and malt extract, and by roasting it at a temperature between 284° and 320° F. till it is of a light brown color, and smells like over-baked bread. *D.* is an uncrystallizable, insipid, odorless, yellowish-white, translucent substance, brittle and friable when thoroughly dried. It dissolves in water and dilute alcohol. It resembles gum arabic, instead of which it is generally substituted for a great variety of purposes. It is employed for sizing paper, for stiffening cotton goods, and for thickening colors in calico printing, also in the making of lozenges, adhesive stamps and labels, and surgical bandages. *Imp. duty*, 20 per cent.

**Dhoney**, a native coasting vessel in India, sloop-rigged or with two masts, seldom more than 150 tons.

**Dhoona**, an Indian name for the dammar or resin obtained from the *Shorea robusta*.

**Dhoop**, an Eastern name for the *Vateria Indica*, a tree the fruit or nut of which, about the size of a large walnut, furnishes a fine solid oil known as Piney tallow, which is wholesome and edible, and also used for lamps.

**Dhotee**, **Dhoty**, a waistcloth or loose wrapper; a long narrow strip of cotton or gauze worn by the male Hindoos instead of pantaloons; it is sometimes ornamented with a silk border.

**Dhow**, an Arabian coasting vessel trading between the Persian Gulf, the Red Sea, and the peninsula of India.

**Dhurra**, a variable Eastern measure of capacity in the Bombay presidency it contains 10 seers, and is equal to 19 lbs., 11 ounces, 6½ drachms; occasionally it is 12 to 13 seers. In some parts of Guzerat the dhurra, or dhuurree, is only 12 lbs., 8 ounces, 7½ drachms, and in Malwa it is but 3 lbs., 12 ounces.

**Dhurra**, **Dourah**, a species of *Holcus*, the principal grain crop of Egypt after wheat, which is largely used there by the laboring classes for food, and also forms the currency of Nubia. Varieties of this grain are grown in many parts of Africa.

**Diachylon-Plaster**, a medicinal adhesive plaster used as a strapping, the basis of which is litharge and olive oil.

**Diagram**, a rough delineation; an explanatory sketch or drawing.

**Dial**, or **Sun-Dial**, an instrument for registering time by the sun's rays falling upon an index, or gnomon, whose shadow marks the progress of the hours. There are a variety of *D.*, horizontal, oblique, or vertical, and also depending on their aspect with reference to the sun.

In the construction of a *D.* the object is to find the sun's distance from the meridian by means of the shadow. When this is known, the hour also is known, provided we suppose the sun's apparent motion to be uniform, and that it moves in a circle parallel to the equator during the whole day. In point of fact, neither of these conditions is fulfilled, but the error arising from this is of small amount. Although *D.* have many different constructions, the general principles are the same. The style, gnomon, or axis of the *D.*, is either a cylindrical rod or the edge of a thin plate of metal. It must be parallel to the earth's axis, and thus it may be considered, on account of the smallness of the earth's diameter compared with the distance of the sun as coinciding with the axis of the diurnal rotation; consequently the plane which passes through the centre of the sun and the style will coincide with the shadow, and will turn with the sun as the sun turns round the style, by the effect of the diurnal motion. An *Equatorial D.* is one whose plane is at right angle with the style, and therefore parallel to the equator. It is the simplest of all *D.* A circle (Fig 128) divided into 24 equal arcs is placed at right angles to the style, and hour divisions are marked upon it. Then if care be taken that the style point accurately to the pole, and that the noon division coincide with the meridian plane, the shadow of the style will fall on the other divisions, each at its proper time. The divisions must be marked on both sides of the *D.*, because the sun will shine on opposite sides in the summer and in the winter months, changing at each equinox.

Fig. 128. — EQUATORIAL DIAL

**Dial-Plate**, the face of a clock or watch on which the hours are marked, or of a dial on which the lines are drawn.

**Dialyser**, in practical chemistry, an instrument for separating substances by dialysis, or diffusion through a system of gelatinous matter. In its most convenient form it consists of a hoop of gutta percha, over which a circular piece of parchment paper is stretched. The paper is applied to the hoop while wet, and is kept stretched by a second hoop, by an elastic band, or by a few turns of string. The instrument, when complete, resembles an ordinary tambourine. It is distinguished as the *hoop D.* The fluid to be "dialysed" is poured into the hoop upon the surface of the parchment paper, to the depth of about half an inch, and the dialyser is then floated upon water in a large glass basin. Another form of *D.*, termed the *bulb D.*, consists of a small glass bell-jar, the mouth of which is covered by a piece of parchment paper. This is suspended or otherwise supported in a large vessel of water in such a manner that the parchment paper septum just dips below the surface.

**Diameter**, width; measurement across the centre.

**Diamond**, the smallest kind of regular printing-type that is cast in American and British foundries.

**Diamond** [Dutch, Fr., and Ger., *diamant*; It., Port., and Sp., *diamante*; Latin, *adamans*], the most highly valued and brilliant of precious stones,

which seems to have attracted notice at a very early period, especially in India, the chief source of supply in ancient times. Its most frequent forms are the octahedron, or double four-sided pyramid, the rhombic dodecahedron with 12 faces, and others with 24 and 48 faces. Cubes also occur, but are rare. Many of the crystals are round almost like spheres, or the smaller ones like grains of sand. This does not arise, however, from attrition during transport by water, but is the original shape of the stones. *D.* is only pure carbon in the crystallized condition, and like it insoluble in acids. It has a perfect cleavage parallel to the faces of the octahedron, and breaks readily both in this and other directions. Contrary to the old and still common opinion, it is rather brittle, and is easily injured by a slight blow or fall. Its hardness—10 in the mineralogical scale—far surpasses that of all other known stones. In sp. gr. 3.52 (or 3.515 to 3.525), it is considerably higher than rock crystal, but nearly the same as the topaz, which may thus be mistaken for it. By friction it becomes positive electric. The so-called compact *D.*, or *carbónado*, of the stone-polishers, found as round grains or masses of 1 to 2 lbs. weight in the washings near Bahia, of a brownish black color and sp. gr. = 3.012 to 3.416, is porous *D.* mixed with a small amount of other matter.—The optical properties of *D.* are also very remarkable. The purest stones, or those of the first water, are highly transparent and colorless. But more generally it is less transparent, and shows various tints, especially white, gray, or brown; more rarely blue, red, yellow, green; and very seldom black. Such stones, when the colors are pure, are often highly valued. It is also distinguished by its brilliant adamantine lustre. *D.* is infusible before the blowpipe, and closely packed in powdered charcoal it can resist a very high temperature. But when oxygen is present it burns slowly at a temperature usually given at about that of melting silver. There has been much speculation regarding the mode of origin of these gems, but hitherto leading to no certain results. It may here also be mentioned that all attempts to produce *D.* artificially have hitherto failed. India is the oldest, and was long the most celebrated or rather the only source of *D.* During the end of the last and the beginning of the present century the supply of *D.* came chiefly from Brazil. They were first recognized in 1727 in the province of Minas Geraes, where they had been long used by the negroes as counters in playing cards. The principal mines are still in that province near Diamantina (formerly Tejuco), and near Diamantino in Matto Grosso. Mines have also been recently worked in the province of Bahia. Other localities are enumerated in the article BRAZIL. The *D.* are chiefly obtained from the Cascalho, a loose, gravelly deposit mixed with red clay, and containing large lumps of quartz and grains of gold. When first brought to Europe the Brazil *D.* were regarded as inferior to those from India, but without reason. Though the mines are strictly watched as Crown property, the produce is not well ascertained. Martius estimated that in the 46 years from 1772 to 1818, *D.* weighing about 3,000,000 carats, and worth \$35,000,000, were exported. Mr. Mawe stated the produce at 25,000 to 30,000 carats annually of rough *D.*, equal to 8,000 or 9,000 carats when reduced to brilliants. After his time it seems to have greatly decreased, and the discovery of the Cape *D.* has further reduced the amount. The stones are mostly small, averaging little more

than one carat, and very rarely exceeding twenty carats. The largest *D.* from Brazil was long, an uncut octahedron of 120 carats, but in 1854 a fine stone of 234½ carats was sent to London. It was an irregular dodecahedron, but of brilliant lustre and with no flaws. Since cut it weighs about 124 carats, and is known as the "Star of the South." *D.* have been found in Mexico, in Georgia, N. Carolina, California, and Arizona. They have also been discovered on the European side of the Ural Mountains, and in Australia; but far more important are the *D.* fields of S. Africa. In 1867 a Dutch farmer obtained from a boer a bright stone which his children were using as a plaything. This stone was sent to the Cape, where its true nature as a *D.* was recognized, and subsequently forwarded to the Paris exhibition and sold for \$2,500. This valuable discovery soon led to further researches, and *D.* were obtained from various places near the Orange and Vaal rivers in Griqua Land West. They were first collected by washing recent alluvial or supposed lacustrine deposits, apparently the detritus of rocks in the vicinity, that are spread over the lower river valleys, but are now rather sought for in "pans," or "pipes," of a circular form running down into the inferior strata, or shale, and filled with a peculiar igneous rock, named diabase, or gabbro, often much changed near the surface. Throughout this rock, which has been penetrated to a depth of from 100 to 200 feet, *D.* are disseminated, weighing from over 150 carats down to the 100th of a carat, or less. Many are entire, well-formed crystals, but a large proportion are broken and isolated fragments. Hence it has been inferred that the rock in which they now occur is not the matrix or mother rock in which they were originally formed, but that the "pipes" are rather channels by which volcanic matter has made its way to the surface, bringing the *D.* along with it from some inferior deposit. However this may be, *D.*-digging has become a regular branch of industry to a large population; and it is probable, though no very accurate estimate can be formed, that nearly \$75,000,000 worth of *D.* have been obtained from this district since their discovery. The largest *D.* from the Cape we have seen mentioned is the Stewart, of 288½ carats, found on the Vaal River in 1872. It was an irregular octahedron of the purest water, and 1½ inch in diameter, and is of a light yellow since cut. *D.* are chiefly used and valued as ornamental stones, and for this purpose they are cut in various forms according to the original shape of the crystals. It is probable that the Indians knew some method of doing this at an early period, and it is said there were diamond-polishers in Nuremberg even in 1373. Berghem of Bruges has the credit of having first used, in 1450, their own powder for this purpose. He found that by rubbing two *D.* on each other their surfaces were polished and facets formed, and acting on this hint, he employed diamond powder and a polishing-wheel. His countrymen continued to follow out the art with great success, but some two centuries ago the English cutters were the more celebrated. The trade then reverted to Holland, but is again returning to Britain, where many of the finest stones are cut. The method has undergone little change, and is still chiefly effected by the hand, partly by rubbing one stone on another, partly by a wheel and diamond powder. Where there are flaws or large pieces of value to be removed, they are occasionally cut by iron wires armed with the powder, or split by a blow of a hammer and chisel in the direction of the natural cleavage.

The latter is, however, a dangerous process, as the *D.* is very brittle, and many valuable gems have been thus destroyed. When reduced to a proper form, the facets are polished on a lapidary's wheel. The process demands not only great skill, but much time and labor. The period required to reduce a stone of 24 or 30 carats to a

Fig. 129. — SHOWING CUTTING OF BRILLIANTS.

regular form extended formerly to at least seven or eight months of constant work; but the time is now greatly shortened by the use of machinery driven by steam. Jewellers have long cut *D.* in three forms,—the brilliant, the rose, and tables. The *brilliant* is most esteemed, as giving highest effect to the lustre, and implying less reduction of the stone. It is, as it were, a modification of the

Fig. 130. — ROSE-CUT.

primary octahedron, the most common form of crystal, and is shown in its first form in 1 and 2, Fig. 129, and with the full number of facets in 3 and 4 of the same Fig. The upper surface, with the *table*, or principal face, in the middle, surrounded by the *bezil*, or upper faces, lying between its edge and the *girdle*, or common base of the two pyramids, is shown in 1 of Fig. 129. The lower facet corresponding to the table is

Fig. 131. — TABLE-DIAMONDS.

named the *collet*, and the whole portion below the girdle the *collet* side. Brilliants are usually set open, both the upper or table side and the lower collet-side being exposed. The *rose-cut* (Fig. 130, 1 upper view, 2 lateral view) is given to stones which have too little depth to be cut as brilliants;

it has the whole upper curved surface covered with equilateral triangles. The *table-D.* (Fig. 131), the least beautiful, is adopted for broad stones of trifling depth, showing a series of four-sided facets above and below the girdle. Recently brilliants are cut in the *star* form (*taille à étoile*), with the table above only one fourth the diameter, and thus with less loss of weight. There are also "mixed" or less regular forms used to suit the shape of the stone; and even splinters of *D.* of  $\frac{1}{8}$  carat are faceted. In all the forms the girdle ought to be perfectly smooth, as a rough edge often appears through some of the facets as a flaw, and injures the brilliancy of the stone. The value of *D.* is determined chiefly by their size, purity, color, freedom from flaws or stains, and the skill with which they are manufactured. Their weight is reckoned by the carat, or four *D.* grains, originally an Indian weight. In England the carat is estimated as = 3.174 grains troy; but it varies in different places, being, according to Schrauf, in Amsterdam = 205.70 milligrammes, in Florence = 197.20, in London = 205.409, in Madras = 207.353, in Paris = 205.50, and in Vienna = 206.13. The usual rule is that the value of the stone increases with the square of the weight in carats, and assuming \$40 to \$50 as the value of a cut brilliant of first quality in water and shape weighing 1 carat, a similar stone of 2 carats would be worth 4 ( $2 \times 2$ ) times \$40 or \$50, i. e. \$160 to \$200; one of 3 carats, nine ( $3 \times 3$ ) times, or \$360 to \$450; and so in proportion. Fine brilliants, however, of the sizes most in demand sell much higher, or from \$60 to \$100 or more the first carat; whilst roses and tables are of considerably smaller value, and rough or uncut *D.*, generally sold in lots, fetch only about \$10 or even less, the value being further diminished in all cases where the stones are "off color," that is, milky or tinted, or imperfect in other respects. Still more important is the state of supply and demand, especially for the largest and most valuable stones, for which there are often very few purchasers, and their price is thus lower than the rule would imply. Even political events affect the price by bringing many into the market, as at the time of the first French Revolution. Cape *D.* are stated to be worth,—yellows under 5 carats, \$10 to \$12.50; above that weight, \$15 to \$20 per carat; pure white stones under 5 carats, \$15 to \$20; and above 5 carats, \$20 to \$35, or more, according to form or lustre.

Perhaps even more important is the use of the *D.* for cutting glass, for polishing gems and other hard bodies, and recently by engineers for boring-machines, used in forming tunnels and artesian wells. The glazier's *D.* is about the size of a pin's head, and is set in copper or brass. The curvature of the fracture faces gives a sharp edge that cuts and not scratches merely. Each costs about \$3 to \$4.50, and, as it will weigh only about  $\frac{1}{8}$  carat, the price is higher than that used as gems. For polishing purposes the so-called *bort*, i. e. stones so imperfect in form and quality as to be useless for ornament, are broken down and crushed into *D.* powder. The carbonado from Bahia is also employed both for polishing and for boring-machines. In the latter the stones are fixed in a ring of steel, made to revolve with great rapidity, and kept cool by a current of water, which also removes the detritus. In consequence its price has risen lately from about 25 cents to \$4.50 or \$5 a carat.

*Tests of D.*—To ascertain whether any specimen is a true *D.* or not, a fine file may be used; and if the surface of the

stone be the least abraded or scratched by its action, it is not a *D*. The difference will also appear upon close examination without this instrument; the rays of light easily pass through other gems, but in the *D*, they are refracted to the surface, which occasions superior brilliancy.

*Imp. duty*: dust or bort, free; rough or uncut, free; glazier's, free; cut, 10 per cent; set, 25 per cent.

**Diamond Bort or Powder**, the crushed refuse fragments of the gem, which is used by lapidaries, seal-engravers, watch-jewellers, and others.

**Diamond Cement**. See CEMENT (*Armenian*).

**Diamond-Cutter**, a lapidary; one who cuts, sets, and works gems.

**Diamond-Drill**. See DRILL.

**Diamond-Pencil**, a glazier's diamond set in a socket of steel, lead, or silver, with a wooden handle. See DIAMOND.

**Diaper** [*Dutch, drel*; *Fr. lingouvré*; *Ger. Drell*; *It. tela tessuta a opere*; *Sp. manteles alemanseas*], a kind of textile fabric, either of linen or cotton, or a mixture of the two, with a figured pattern on the exterior surface, produced by a peculiar method of twilling. *D*. are much used for table-linen and fine towels. With the exception of damask, *D*. are the most ornamental kind of twilled cloths. The name is a corruption of *d'Ypres*, a town of Flanders where it was first manufactured. It is also manuf. in Ireland, France, Germany, and Scotland.

**Diaphane**, a woven silk stuff with transparent and colored figures.

**Diaphoretics**, sweating medicines.

**Diary**, a note-book or journal; a register or record of daily business or events.

**Diastase**, a chemical substance extracted by water from crushed malt, which possesses the remarkable property of converting starch into sugar in an hour or two.

**Diastimeter**, a philosophical instrument for measuring distances.

**Dibble**, a small spade. — A pointed garden instrument for making holes in the ground for planting.

**Dice** (plural of *die*) [*Fr. dés (à jouer)*; *Ger. Würfel*; *It. dadi*; *Sp. dados*], small cubes used in playing certain games of chance. They are made of bone, ivory, or close-grained wood, having their six sides marked with dots or pips from one up to six. These dots are so arranged that the numbers on two opposite sides taken together always count seven. The dice are shaken in a box called a *dice-box*, and then thrown on a board or table, and the number of dots on the upper faces decides the game. *Imp. duty*, 35 per cent.

**Dicker**, a commercial term for ten of some things, and for the long hundred, of others; as ten skins make a dicker of hides, ten bars a dicker of iron, ten dozen a dicker of gloves, and so on. See DAIKER.

**Dicky**, a loose shirt-front to be worn over a soiled shirt.

**Die** (plural *dies*), a stamp or reversed impression used for striking medals, coining, etc. Dies are also required for a variety of purposes, such as the manufacture of buttons, steel seals, screws, and ornamental articles of metal, calico-printing, etc.

**Die-Sinking**. The preparation of dies for stamping coins and medals is a work requiring considerable skill and care. The steel selected should be of moderately fine grain and uniform texture, and, when polished, should show no spots or patches under a magnifying glass. Two short lengths having been cut from bars of this, and forged into rough dies, are next made as soft as possible by careful annealing, — being put in an iron pot of animal charcoal, heated to a cherry red, and allowed to cool gradually. After being faced up flatly and smoothly in a lathe, they pass into the hands of the engraver, who traces upon them their appropriate images, obverse and

reverse, and works these out, with steel tools, in intaglio. (The inscription is generally stamped with punches and hammer.) The new matrices, or maternal dies, when, after repeated impressions on clay, etc., and alteration, they are found correct, are ready for hardening, — a process simple enough as regards plain steel, but here very critical, seeing that a delicate engraving has to be kept intact. Each matrix is first protected with a mask, composed of fixed oil thickened with animal charcoal, or of lampblack and linsed oil. They are then placed face downwards in a crucible, and burned in animal charcoal. After being heated to a cherry red, they are taken out with a pair of tongs, plunged in a large body of water, moved about rapidly till all noise ceases, and left in the water till quite cool. If the matrix pipes or sings, there is probably a crack in it. The hardened die is next polished and tempered, — the former by holding it against a running iron disk coated with flour-emery and oil; the latter by putting it in water, which is gradually raised to the boiling point, then allowing it to cool slowly, or by placing it on a heated bar of iron till it acquires a rich straw-color. To increase its strength an iron ring may be shrunk upon it like a mechanical jacket. The matrix, treated as here described, might now be used to multiply coins or medals, but it is preferred to use it for first producing punches, or steel impressions in relief. With this view a steel block is procured, softened by annealing, and turned in the lathe, being made flat at the bottom and obtusely conical at the top. The block is put in the bed of a die-stamping press, and the matrix brought down on it with force by means of the central screw. Thus a copy is produced in relief on the conical surface. Further strokes may be required to perfect it, and the punch is therefore first re-annealed (its surface having been hardened by compression), then replaced in the press; the matrix, detached from the screw, is fitted on to it, and pressed in contact by the descent of a block of steel attached to the screw. Thus, after repeated blows and frequent annealing, the impression is completed, and after being retouched by the engraver is hardened and tempered like the matrix. The matrix is now laid aside, and the punch used to produce any number of steel dies by an operation substantially similar to that by which the punch itself was obtained. These are, of course, fac-similes of the matrix, and when completed are used for purposes of coining.

**Dieppe**. See FRANCE.

**Dietary**, a table of rations supplied daily, on board ship, or to soldiers, persons in prisons, work-houses, etc.

**Digest**, an abstract of a speech or decision; a compendium or summary of mercantile law, disposed under proper heads.

**Digester**, a metal vessel with a detached cover to be screwed down, and some elastic interposing substances to prevent the loss of heat by evaporation. It is chiefly used in chemical operations to raise the boiling fluid to a higher temperature than the ordinary boiling point of 212° F. It is employed in obtaining gelatine from bones, which could not be done at the usual temperature.

**Digging**, the operation of moving, stirring, or breaking up earth with a spade, pickaxe, or other sharp instrument or machine.

**Diggings**, a popular name for the localities where gold is found in California, Australia, etc.

**Digitalis**, a genus of plants of the order *Scrophulariaceæ*. The Foxglove (*D. purpurea*) has narcotic and poisonous leaves and seeds, which are valued for their medicinal properties. The fresh leaves are cathartic and emetic, and when dried are administered in diseases of the heart, brain, and nervous system, in which they act as a powerful sedative. They contain a crystalline principle called *digitalin*.

**Digue**, a sea-wall, breakwater, or dike.

**Dike**, in engineering, a work of stone, timber, or fascines, raised to oppose the entrance or passage of the waters of the sea, a river, lake, or the like.

**Dilapidation**, waste or decay in buildings, etc.

**Dilator**, a surgical instrument for extending parts, such as the eyelids, or dilating the walls of a cavity.

**Diligence**, a French stage-coach.

**Dill-Oil**, an essential oil, obtained from the seeds of *Anethum graveolens*, which are stimulant and carminative.

**Dime**, a silver coin of the U. States, the tenth part of a dollar; there are also half-*D.*: both legal tenders to the amount of five dollars. *D.* and half-*D.* were authorized to be coined by act of April 2, 1792; weight, 41.6 and 20.8 grains; fineness, 892.4. By act of Jan. 18, 1837, weight was changed to 41½ and 20½ grains, and fineness to 900; by act of Feb. 21, 1853, weight was changed to 38.4 and 19.2 grains. By act of Feb. 12, 1873, the weight of *D.* was changed to 2½ grams, or 38.58 grains, and the coinage of half-*D.* was discontinued. Total amount of *D.* coined to close of fiscal year ended June 30, 1878, \$16,904,677.30. Total amount of half-*D.* coined, \$4,906,946.90.

**Dimension**, the extension of a body considered as capable of being measured; bulk, extent, capacity.

**Dimity** [Fr. *basin*; It. *dobletto*; Sp. *dimitel*], a cotton stuff, similar in fabric to fustian, from which it differs chiefly in having ornaments woven in it, and in not being dyed. Its color should be delicately white. In the weaving, longitudinal stripes are usually raised just above the surface of the piece, and dimities are called *single corded* or *broad striped*, according to the flatness and breadth of these stripes.

**Dingy**, a small ship's boat. It is clinker-built, from 12 to 14 feet, and has a beam one third of its length.

**Dining-Table**, a massive, solid table usually supported on four legs, sometimes extensible and capable of being materially enlarged by extra leaves or flaps.

**Dioptric Light**. See **LIGHTHOUSE**.

**Diorama**, a mode of scenic representation, which does not possess all the advantages of a panorama, but produces a far greater degree of optical delusion. The peculiar effects of the *D.* arise more particularly from the contrivances employed in exhibiting the painting. In the first place the picture is viewed through a proscenium; the room in which the spectators are is almost in darkness; and the light, which is admitted through colored glass, falls upon the picture alone. It is principally used to illustrate architectural and interior views. By means of slides and shutters the light can be increased or diminished at will, and hence very pleasant effects may be represented; such as the ordinary change from daylight to sunshine, and from sunshine to cloudy weather, or twilight.

**Dip**, the vertical angle which a freely suspended magnetized needle makes with the horizon. — The geological term for the angle at which strata slope downward into the earth. This angle is measured from the plane of the horizon, and may be readily ascertained by the common spirit-level and plummet, or, as is usual among geologists, by a small pocket-instrument called the *clinometer*. To describe the opposite of *dip*, the term *rise* is used; and, as every bed that dips in one direction must necessarily rise in another, either may be used, according to the position of the observer.

**Dippel's Oil**, an empyreumatic oil produced during the destructive distillation of bones.

**Dipper**, an instrument used in photography for immersing negative plates in upright baths containing nitrate of silver, hyposulphide of soda, cyanide of potassium, etc., and withdrawing the same after sensitizing or fixing. They are slender flat strips of hard rubber, wood, glass, porcelain, and sometimes silver wire, having short projections upon which to rest the edge of the plate, which stands nearly upright in the bath while the chemical changes take place. (*E. H. Knight.*) — The vatman in a paper manufactory.

**Dipping**, the process of heighening in color small, ornamental brass-work by cleansing in an alkaline lye, scouring with sand and water, dipping into a bath of pure nitrous acid for an instant, washing with water, drying in sawdust burnishing, and lacquering. — The process of washing sheep to cleanse the fleece before shearing. — In photography, immersing the collodionized plate in a sensitizing bath. — The plunging wicks in the tallow-vat, the wool or fabric in the dyetub, the paper forms in the pulp, etc. — The Scotch name for *dubbing*. See **DUBBING**.

**Dipping-Needle**, an instrument for indicating the direction of magnetic force. It consists of a graduated horizontal brass circle, *m* (Fig. 132), supported on three legs, provided with levelling screws. Above this circle there is a plate, *A*, movable about a vertical axis, and supporting by means of two columns a second graduated circle, *M*, which measures the inclination. The needle rests on a frame, *r*, and the diameter passing

Fig. 132. — DIPPING-NEEDLE.

through the two zeros of the circle, *M*, can be ascertained to be perfectly horizontal by means of the spirit level, *n*. To observe the inclination, the magnetic meridian must first be determined, which is effected by turning the plate *A* on the circle *m*, until the needle is vertical, which is the case when it is in a plane, at right angles to the magnetic meridian. The plate *A* is then turned 90° on the circle *m*, by which the vertical circle, *M*, is brought into the magnetic meridian. The angle, *dca*, which the magnetic needle makes with the horizontal diameter, is the angle of inclination.

**Dips**, a common name for small or store candles, which are made by merely dipping cotton wicks repeatedly in a cistern of melted tallow.

**Director**, a manager; a member of a board, one of a number of persons chosen by a plurality of votes from among the body of shareholders to conduct the affairs of some joint-stock undertaking, as a bank, railroad, insurance company, and the like.

**Directory**, an alphabetical address or guide-book to the inhabitants, trades, etc., of a city, with their places of abode.

**Dirk**, a short dagger.

**Disbursements**, money paid out.

**Discharge**, the unloading of the cargo of a vessel. — Release from obligation, debt, or penalty; an acquittance.

**Discharging-Rod**, an instrument much used in electricity for discharging Leyden jars without partaking of the shock. The jointed *D.* is that most generally employed. It consists of two brass wires, terminated by two brass balls. The wires are jointed at the middle, and are attached to a glass handle. With this instrument it is easy to discharge a jar or battery, by bringing one ball in contact with the exterior, and the other with some part of the interior. The glass handle, as an insulator, forms a protection from all the effects which take place in the restoration of electrical equilibrium.

**Discolored**, altered in color; stained or tarnished.

**Discount**, an allowance paid on account of the immediate advance of a sum of money not due till some future period. A bill or note is said to be discounted when a third party, in respect of the credit of the names on it, agrees to pay its contents to the holder before it becomes due, deducting the interest, and, in some cases, commission for trouble and expense. When a bill of exchange is presented at a banker's for discount, it is the practice to calculate the simple interest for the time the bill has to run, including the days of grace, which interest is called the *discount*; and this being deducted from the amount of the bill, the balance is paid over to the presenter of the bill. This is the method followed by bankers, and by commercial men in general. But it is, notwithstanding, inaccurate. The true discount of any sum for any given time is such a sum as will in that time amount to the interest of the sum to be discounted. Thus, if interest be seven per cent, the proper discount to be received for the immediate advance of \$100, due 12 months hence, is not \$7, but \$6.54, for this sum will, at the end of the year, amount to \$7, which is what the \$100 would have produced. Those, therefore, who employ their money in discounting make somewhat more than the ordinary rate of interest upon it; for a person discounting \$100 due at the end of a year advances, supposing interest to be 7 per cent, only \$93; so that, as this \$93 produces \$100 at the period in question, the interest received has really been \$7.46 per cent.

The rule for calculating discount on correct principles is as follows: As the amount of \$100, increased by its interest at the rate and for the time given, is to the given sum or debt, so is the interest of \$100, at the rate and for the time given, to the discount of the debt. Thus, to find the discount of \$100 for one year at 7 per cent, we have:—

$$\$107 : \$100 :: \$7 : \$6.54$$

which is 46 cents less than the interest for the same time; the difference being in all cases equal to the interest on the discount for the given time.

The name of discount is also applied to certain trade allowances upon the nominal prices of goods. In some branches of trade these allowances vary according to the circumstances which affect the markets; and what is called discount is in fact occasioned by fluctuations in prices which it is thought convenient to maintain nominally at unvarying rates.—The term discount is also employed to signify other mercantile allowances, such, for example, as the abatement of 12 per cent made upon the balances which underwriters, or insurers of sea risks, receive at the end of the

year from the brokers by whom the insurances have been effected. The word "discount" is further used, in contradistinction to premium, to denote the diminution in value of securities which are sold according to a fixed nominal value, or according to the price they may have originally cost. If, for example, a share in a railroad company, upon which \$100 has been paid, is sold in the market for \$98, the value of the share is stated to be at 2 per cent discount. See **INTEREST**.

**Discount-Broker**, one who cashes bills of exchange, or makes advances on securities.

**Discount-Day**, the day of the week on which a bank discounts notes and bills.

**Dish**, a broad open vessel of earthenware or metal, for holding food. — A large trough having a capacity of 672 cubic inches, in which miners measure ore.

**Dishonored**, a commercial term for the return, unpaid, of a draft or acceptance legally due when presented.

**Disinfectant**, any agent or substance employed to prevent the spread of contagious or infectious disease. Recent investigations all tend to demonstrate that the efficiency of any *D.* is due to its power of destroying, or of rendering inert, specific poisons or disease germs which possess in themselves an independent existence; and which, when introduced into the animal system under favorable conditions, increase and multiply, thus producing the phenomena of special diseases. Therefore, antiseptic substances generally, which check or stop putrefactive decay in organic compounds, by preventing the growth of those minute organisms which produce putrefaction, are, on that account, *D.* So also the deodorizers, which act by oxidizing or otherwise changing the chemical constitution of volatile substances disseminated in the air, or which prevent noxious exhalations from organic substances, are in virtue of these properties effective *D.* in certain diseases. A knowledge of the value of *D.*, and the use of some of the most valuable agents, can be traced to very remote times; and much of the Levitical law of cleansing, as well as the origin of numerous heathen ceremonial practices, are clearly based on a perception of the value of disinfection.

The means of disinfection, and the substances employed, are very numerous, as are the classes and conditions of disease and contagion they are designed to meet. Nature, in the oxidizing influence of freely circulating atmospheric air, in the purifying effect of water, and in the powerful desodorizing properties of common earth, has provided the most potent ever-present and acting disinfecting media. Of the artificial *D.* employed or available three classes may be recognized: 1st, volatile or vaporizable substances, which attack impurities in the air; 2d, chemical agents for acting on the diseased body or on the infectious discharges therefrom; and 3d, the physical agencies of heat and cold. In some of these cases the destruction of the contagion is effected by the formation of new chemical compounds by oxidation, deoxidation, or other reaction, and in others the conditions favorable to life are removed or life is destroyed by high temperature. Of the first class—*aerial D.*—those most employed are the gaseous sulphurous anhydride, the fumes of nitrous acid and other acid substances, including vaporized carbolic acid, with chlorine gas and the vapors of bromine and iodine. The use of sulphurous anhydride, obtained by burning sulphur, is of great antiquity, and it still is unequalled as a *D.* of air on account both of its convenience and general efficacy. Camphor and some volatile oils have also been employed as *air D.*, but their virtues lie chiefly in masking, not destroying noxious effluvia. In the 2d class—non-gaseous disinfecting compounds—all the numerous antiseptic substances may be reckoned; but the substances principally employed in practice are oxidizing agents, as potassic manganates and permanganates (Condy's fluid), and solutions of the so-called chlorides of lime, soda, and potash, with the chlorides of aluminium and zinc, soluble sulphates and sulphites, solutions of sulphurous acid, and the tar products,—carbolic, creosylic, and salicylic acids. Of the physical agents, heat and cold, the latter, though a powerful natural *D.*, is not practically available by artificial

means; heat is a power chiefly relied on for purifying and disinfecting clothes, bedding, and textile substances generally. Different degrees of temperature are required for the destruction of the virus of various diseases; but as clothing, etc., can be exposed to a heat of about 250° Fahr. without injury, provision is made for submitting articles to nearly that temperature.

**Disintegrator**, a machine for grinding or pulverizing bones, guano, etc., for manure. — A mill in which grain is broken into a fine dust by beaters projecting from the faces of parallel metallic disks revolving in contrary directions. See FLOUR-MILL.

**Dismantled**, said of a vessel laid up in dock with her spars, upper masts, rigging, etc., removed.

**Dispatch**, or *Despatch*, a letter, etc., forwarded by an express messenger. To send away in haste, as a messenger, letters, etc.

**Dispensary**, a place where medicines are made up and distributed; but used more generally for a charitable institution, where the poor are supplied with medicines and advice. Institutions of this nature are now to be met with in every town of any importance, both in this country and in Europe. To every *D.* there are always attached one or more physicians, surgeons, and apothecaries, whose duty it is respectively to prescribe and dispense medicines to the poor, and to visit them in their own houses in the event of their being too ill to attend personally at the institution. In most cases *D.* are supported by voluntary contributions.

**Dispensatory**, a medical book, which, in addition to containing the whole *Materia Medica*, or history of all the drugs and medicaments used in the practice of physic, embraces an account of the manner in which each article is prepared, with directions how to compound all prescriptions. It contains the *Materia Medica*, *Pharmacy*, and the *Pharmacopœia*, in one volume, and forms the authority and reference of every chemist, druggist, and medicine vender.

**Dispenser**, one who distributes or administers: usually applied to medicines.

**Disponer**, a person who legally transfers property from himself to another.

**Dispose**, to sell or get rid of; to apply to any purpose or use.

**Dissect**, to investigate; to cut to pieces.

**Dissolution**, a breaking up, as of a contract or partnership.

**Distaff**, an implement formerly used in spinning flax or wool, which was fastened on a staff from which the thread was drawn by the fingers. The *D.* is at present not much used, except in rude and barbarous countries; but no spinning-wheel, much less any machinery driven by water or steam, has ever produced work which can compare in delicacy with the finest products of the *D.*

**Distemper**. See DESTEMPER.

**Distillation**, a generic name for a class of chemical operations, which all agree in this, that the substance operated upon is heated in a close vessel (*retort still*), and thereby wholly or partially converted into vapor, which vapor is then condensed, by the application of cold, in another apparatus (the *condenser*) connected with the vessel, and allowed to collect in a third portion of the apparatus called a *receiver*. In most cases the substance is a liquid, or assumes the liquid form previous to emitting vapors, and the product obtained (the *distillate*) is also in greater proportion liquid. The comparatively few and special cases of *D.*, wherein solids are converted into vapors which condense directly from the gaseous into the solid form, are designated *sublimations*. Thus, we speak of the *D.* of water or of spirits, while we speak of the sublimation of sal-ammoniac. *D.* may be divided into two classes: 1st, those which are

not, and 2nd, those which are, accompanied by chemical change. The word *D.*, in a narrower sense, is generally understood to apply to the first class only. The second might be called *destructive D.*, if it were not customary to reserve this term for the particular case in which the substance operated on consists of vegetable or animal matter which is being decomposed by the decomposition of heat alone, i. e. without the aid of reagents. The general object of simple *D.* is to separate one substance from others of different degrees of volatility with which it may be mixed. The theory and successful execution of the process assume their greatest simplicity when the substances to be separated differ so greatly in their volatility that, without appreciable error, one can be assumed to be non-volatile at the boiling point of the other. A good illustration of this special case is afforded by the customary process used for the purification of water. A natural sweet water may in general be assumed to consist of three parts: 1st, water proper, which always forms something like 98 per cent or more of the whole; 2d, non-volatile salts; 3d, gases. To obtain pure water from such material, we need only boil it in a distillation apparatus, so as to raise from it dry steam, which steam when condensed yields water contaminated only with the gases. To expel these, all that is necessary is to again boil it for a short time; the gases go off with the first portions of steam, so that the

Fig 133. — COMMON DISTILLING APPARATUS.

residue, when allowed to cool in absence of air, constitutes pure water. In the *D.* of two substances of approximately equal molecular weight and latent heats of vaporization, supposing neither to predominate overwhelmingly over the other, the one with the lower boiling point will predominate in the early, and the other will gradually accumulate in the later, fractions of the distillate. And similarly with mixtures of three or more bodies. The further the respective boiling points are removed from one another the more complete a separation can be effected; but in no case is the separation perfect. It is, however, easily seen that the analytic effect of a *D.* can be increased by causing the vapor, before it reaches the condenser, to undergo *partial* condensation, when naturally the less volatile parts chiefly will run back. This artifice is largely employed by chemists, technical as well as scientific. The simplest mode is to let the vapor ascend through a long vertical tube before it reaches the condenser, and to distil so slowly that a sufficiently large fraction of the vapor originally formed fails to survive the ascent through

the cooling influence of the atmosphere. A more effective method is to let the condensed vapor accumulate in a series of small receptacles inserted between flask and condenser, constructed so that the vapor cannot pass through the receptacles without bubbling through their liquid contents, and so that the liquid in the receptacles cannot rise above a certain level, the excess flowing back into the next lower receptacle or into the still. But the most effective method is to let the vapor ascend through a slanting condenser kept by means of a bath at a certain temperature, which is controlled so that while the liquid in the flask boils rapidly, the *D.* only just progresses and no more. — As the preparation of alcoholic spirit is the most important industry in which the operation of *D.* occupies a prominent place, the establishments in which the manufacture is conducted are known as *distilleries*. But there are many other important industries in which *D.* is an essential feature, being in them employed either for the separation, purification, or concentration of various products. A large proportion of the essential oils are, for example, obtained by the *D.* of the substances containing them from water, or a mixture of salt and water. The treatment of other bodies in which *D.* plays a part will be found under their respective headings.

*D. of spirits.* The art of separating alcoholic spirit from fermented liquors appears to have been known in the far East from the most remote antiquity; but, notwithstanding the enormous scale on which this industry is now prosecuted, it is only in modern and comparatively recent times that it has attained to the important position which it now occupies. The preparation of ardent spirit involves two separate series of operations: 1st, the making of an alcoholic solution by means of vinous fermentation; and 2d, the concentration of the alcoholic solution so obtained by the process of *D.* and rectification. The vegetable principle, which is essential to the formation of alcohol, is *sugar*; and this is sometimes used *directly*, as where molasses and analogous saccharine products are subjected to immediate fermentation, or it is *indirectly* obtained by subjecting amylaceous grains to certain processes, by which the starch they contain is first converted into sugar, and then that sugar afterwards alcoholized. In our distilleries the latter alternative is adopted, and various kinds of grain, but chiefly corn, barley, wheat, and rye, with more or less malt, are subjected to the operation of *mashing*. For this purpose the ground grain and the bruised malt are duly mixed, and infused under constant agitation in a proper quantity of hot water in the *mash-tun*; the wort is then run off, and fresh water added, till the soluble materials of the grain are extracted. The mixed worts, or *leach*, thus obtained, is run into the fermenting vats, where, mixed with a small quantity of yeast, it is subjected to the process of fermentation, which continues from 6 to 10 or 12 days, the time required for its completion varying with the mass of liquid, and with the temperature of the atmosphere. During mashing, the starch passes into sugar, and during fermentation the sugar changes into alcohol; the consequence of which is, that the wash gradually decreases in density, or *attenuates*; and as soon as this attenuation has reached its maximum, which may be determined by the hydrometer, it should be distilled in order to prevent the commencement of acetic fermentation. — The modifications of stills or of distilling apparatus used in the preparation of alcoholic liquor are exceedingly numerous, and many of the later inventions are of most complicated structure. The simple and primitive varieties of apparatus yield only a comparatively weak spirit on the first distillation, while the effect of the complex appliances now generally used is to produce, in one operation, a highly concentrated spirit, and that with a great saving of fuel, time, and labor. All varieties of distillatory apparatus resolve themselves under these heads: 1st, stills heated and worked by the direct application of the heat of a fire; 2d, stills worked by the action of steam blown direct into the alcoholic solution from a steam-boiler; and 3d, stills heated by steam passing in coiled pipes through the alcoholic solutions to be acted upon. To the first of these classes — stills heated by direct fire — belong the earliest and simplest forms of distilla-

tory apparatus, and for producing particular classes of alcoholic liquor, stills very simple in their construction are yet employed. The common still (Fig. 133) is a flat-bottomed, close vessel of copper, with a high head to prevent the fluid within from boiling over. To the top of this head a tube is connected, which is carried in a spiral form round the inside of a tub or barrel (the condenser or refrigerator), filled with cold water; and from its twisted form this tube receives the name of the *worm*. The tube terminates at the bottom of the barrel, passing through it to the outside, and is conducted into the vessel termed the receiver, a stop-cock, or more commonly a vessel termed a *safe*, being usually placed on the tube where it leaves the refrigerator. In distilling with an apparatus of this simple construction, it is obvious that at the beginning of the operation, when the wash or liquid to be distilled is rich in alcohol, and its boiling point consequently low, the distillate will pass over at a low temperature and contain a high percentage of alcohol. But as the operation progresses, the boiling point of the mixture in the still rises; the heat has therefore to be forced, and the quantity of watery vapor which passes over with the alcohol is proportionately increased. As the wash or liquid in the still continually weakens, a point is arrived at when the value of the weak distillate produced will not balance the expenditure on fuel for maintaining the heat of *D.* One of the earliest devices for economizing the heat of *D.* consisted in interposing between the still and the refrigerator a wash-warmer, or vessel charged with liquid ready for *D.* Through this vessel the pipe conveying the hot vapors to the refrigerator coil passed, and the vapors, partly condensing there, heated up the wash, which was thus prepared to pass into the still at an elevated temperature. The *jet* stills, in which the markedly flavored Irish whiskey is made, are of this construction. In large establishments, simple stills, of a capacity of 20,000 gallons, are erected, having a rousing apparatus within them to keep the wash in agitation so as to prevent solid particles from settling on the bottom and burning. Beyond a wash-warmer, or intermediate charger interposed between the still and the condenser, there is no other appliance attached to the apparatus. The first distillate from the still is termed "low wines," and passes into the "low wines receiver," whence it passes into No. 1 "low wine still" to undergo a second distillation. The product of the second distillation, under the name of "faints or feints," is caught in the "faints receiver," from which it passes to No. 2 low wine still, and from this it is discharged as Irish whiskey. — The introduction of another principle into distillatory apparatus is illustrated by Dorn's still, which was introduced into Germany in the early part of the century, and is yet much used in smaller establishments in that country. In that apparatus, the vessel of copper interposed between the still and the condenser is divided horizontally into two unequal compartments by a diaphragm of copper. The upper and larger portion acts as a wash-warmer (*Gier Verwärmer*), and through it the pipe from the still body coils,

Fig. 134 — COFFEY'S STILL.

opening into the lower division. For a time the whole distillate condenses in this division, but as the temperature of the wash in the upper division rises, and the heat of the more watery distillate from the still also increases, the condensed liquor in the lower division in its turn begins to boil, and undergoes a second distillation or rectification, the vapors from it passing onwards to be condensed in the ordinary refrigerator. In many forms of distillatory apparatus two or more such rectifiers are placed between the primary still and the final condenser. The principle of the rectifier is easily understood. Supposing the operation of distilling to commence, the vapors which condense in rectifier No. 1 are much richer in alcohol than the liquid remaining in the still. The boiling point of the condensed liquid is consequently proportionately lower, and the vapor from the still passing into it gradually raises it to the boiling point, so that in its turn rectifier No. 1 distills into rectifier No. 2 a liquid of still higher alcoholic richness.

The relation of No. 2 to No. 1 is the same as that of No. 1 to the still body, and thus the concentration and redistillation might be carried on to any practicable or desired extent. — Another principle brought into play in complex stills for the separation of stronger from weaker alcoholic solutions consists of dephlegmation, or the submitting of the vapor to a temperature so regulated that a portion of it, and that, of course, the most watery, is condensed and separated, running back into the still or into a special vessel, whilst the richly alcoholic vapor passes on to the rectifier or condenser. In Dorn's still the wide and lofty head attached acts as a dephlegmator, watery vapors condensing on it, and thence falling back into the body; but in the more recent forms of apparatus, such as those of Pistorius and Siemens, special dephlegmators of an elaborate nature are introduced. — Of the second class of stills, — those in which the operation is conducted by the heat of steam generated in a boiler, and forced into the apparatus, — the Coffey still may be taken as an example. It is the form most frequently adopted in Great Britain for the manufacture of "silent" spirit, and it is generally recognized as the best and most economical device for preparing a highly concentrated spirit in a single operation. The Coffey still may further be regarded as a type of continuous distilling apparatus, as in it the necessity for withdrawing exhausted solutions and recharging the still with fresh wash is avoided. Beginning, as the Coffey still does, with the steam of pure water, the principle of rectification formerly alluded to is here carried out from the first step. The watery vapor becomes more and more highly charged with alcoholic fumes, till in the end the strongest spirit falls, condensed, into the receiver. In Coffey's apparatus, the saccharine solution, or *wash*, is pumped from the wash-charger, *a*, through the pipe, *b*, into the worm-tube, which passes from top to bottom of the rectifier, *c*; in circulating through this tube its temperature is somewhat raised, and on arriving at the bottom it passes through the pipe, *d*, in at the top of the analyzer, *e*. Here it falls successively from one to another of a series of shelves, perforated, and having valves for the entry of steam from the boiler, *f*, by which they are heated. As the wash gradually descends in the analyzer, it becomes rapidly weaker, partly from condensation of the steam which passes into it, and partly from the loss of alcohol either evaporated or expelled by the steam, till when it arrives at the bottom it has parted with all its spirit. At the same time, the vapor as it rises through each shelf of the analyzer becomes richer in alcohol. On arriving at the top it passes through the pipe, *g*, in at the bottom of the rectifier; here it ascends in a similar way through the descending wash, until it arrives at *h*, above which it merely circulates around the upper convolutions of the wash-pipe, the low temperature of which condenses the spirit, which, collecting on a shelf, flows off by a tube into the finished-spirit condenser, and is finally conveyed to the receiver. — In order to economize heat, the water-supply pipe of the boiler is of spiral form, and is immersed in a trough which receives the boiling hot spent wash. — Flat-bottomed and fire-heated stills are considered the best for the *D.* of malt spirit, as by them the flavor is preserved. Coffey's still, on the other hand, is the best for the *D.* of grain spirit, as by it a spirit is obtained almost entirely destitute of flavor, and of a strength varying from 55 to 70 over proof. Spirit produced of this high strength evaporates at such a low temperature that scarcely any of the volatile oils on which the peculiar flavor of spirits depends are evaporated with it, hence the reason why it is not adapted for the *D.* of malt whiskey, which requires a certain amount of these oils to give it its requisite flavor. The spirit produced by Coffey's still is, therefore, chiefly used for making gin and factitious brandy by the rectifiers, or for being mixed with malt whiskeys by the wholesale dealers.

**Distiller**, a manufacturer or preparer of spirits, one who distills from malt, or prepares perfumes; a rectifier and compounder.

**Distillery**, a building in which distillation and the rectification of spirits is carried on. The Internal Revenue Laws of the U. States, laying down the regulations to be followed by the distillers in the manufacture of spirits, are given in this work under **SPIRITS**.

**Distinguishing Pennant**, the special flag of a ship, or a particular pennant hoisted to call attention to signals.

**Distribution**, in printing, the breaking up of a form, or page, etc., of type; and replacing the letters in their proper cells in the compositor's cases.

**Ditch**, a trench in the earth made by digging.

**Ditto**, a word derived from the Italian word *dello* (that which has been said), and used in accounts to avoid repetition. It is commonly abbreviated into *Do*.

**Diuretics**, medicines which operate by increasing the discharge of urine.

**Dividend**, the commercial name for the interest allowed on government stocks, foreign bonds, and various other public securities, which are usually payable half-yearly. *D.* is also the proportionate payment made to creditors out of the estate of a bankrupt, and the profits received by stock and shareholders in joint-stock companies at stated periods. — *Ex div.* is a Stock Exchange abbreviation, implying that a security is dealt in without the dividend due or accruing.

**Dividend Warrant**, an order or authority upon which shareholders or stockholders receive their half-yearly interest.

**Divi-Divi**, the commercial name of the pod of the *Cesalpinia coriaria*, a leguminous plant found in low, marshy situations in the N. parts of S. America, principally in the U. States of Colombia and Venezuela, and in some parts of the West Indies. It is used both for dyeing and tanning, but chiefly for the latter purpose. The pod is from 2 to 3 inches in length by  $\frac{1}{4}$  inch in breadth, and when in perfection is of a rich brown color. It contains a few small seeds, but the only valuable portion is a resinous matter of a bright yellow color, easily pulverized, which lies betwixt the outer skin and the husk that encloses the seed, and contains a large quantity of tannin. *D.* is used by dyers, not for the coloring principle which it contains, but for its strong astringent qualities as a mordant. For this purpose it is at present used to some extent instead of sumac, which is scarce and dear. In tanning it accelerates the process, and imparts to the leather a clean and healthy appearance. *Imp. free.*

**Diving**. The art of *D.* to considerable depths under water to bring up pearls, corals, and sponges,

Fig. 135. — SECTION OF DIVING-BELL.

has been practised in the Indian seas from very early times. It is obvious, however, that, not having the aid of any artificial appliances for supplying air, the powers of early divers, both as regards the depth to which they could descend and the length of time they could remain submerged, were comparatively limited. At an early

period, therefore, the attention of philosophers and mechanics was turned to the discovery of a contrivance for aiding the diver in prosecuting his daring but useful calling, which was rendered all the more important from its being no longer confined to the acquisition of Eastern luxuries, but to the raising of treasure from sunken vessels. It is not considered expedient to occupy space by reference to the feats of the early or modern divers, but rather to pass at once to the description of the *D.* apparatus of modern times, as illustrated by the *D.*-Bell and the *D.*-Dress at present in use. And here it may be stated that, in addition to the sponge and coral trade of foreign lands, which has been greatly advanced by the use of modern appliances, there are the works of the naval engineer, and more particularly of the civil engineer, in which *D.* apparatus is so extensively employed and so essentially necessary as to place the art of *D.* on a wider basis, and to give it an importance only fully developed during the present century.

*D.*-Bell. The most useful of ancient contrivances is the *D.*-bell, which, first mentioned in Europe in the works of John Taisnier (born 1509), and gradually improved, is now the well-known apparatus used by engineers in the present day. The conception of the *D.*-bell is very simple. The air contained in an inverted jar sunk in a vessel of water excludes the water from the interior, and if the vessel be made of sufficient size to contain persons within it, it may be sunk without their being wetted, and they may continue to be submerged so long as the air within the bell continues pure enough to support animation. Such were the "*D.*-chests" of the first makers, which, though they differed in form and details, were constructed on the same principle as the modern bell, and were generally formed of wood, girded with iron hoops, like a barrel. A section of the bell as now used is shown in Fig. 135. It is a cast-iron chest weighing about 6 tons, and is suspended by block and tackle. On the top of the bell there are 8 apertures, fitted with very thick glass for admitting light; and in the centre is the passage, *b*, into which the hose is screwed for admitting the air supplied. The interior is fitted with two seats, *c*, which can be removed to make room when the men are at work; and in the centre is a lifting chain, *c*, to which stones are attached to facilitate their being lifted and properly adjusted to the beds on which they are to be laid. The bell is used according to two different systems, depending on the nature of the work to be performed. In building masonry under water it is suspended from a staging of timber; but in excavating rock or removing boulders, scattered over a considerable area, where a staging would be inapplicable, it is suspended from a barge or lighter. Fig. 135 shows the arrangement as employed in laying stones or blocks of concrete. It represents a cross section of the staging, bell-framing, and bell-carriage, in which *a* is the staging, *b*, longitudinal beam on which the bell-framing, *c*, traverses on the wheels and toothed racks, *d*. The *D.*-bell, *e*, is suspended from the bell-carriage, *f*, which traverses on the bell-framing by the wheels and toothed rack, *g*, across the whole breadth of the pier. The stones, *h*, are brought along the surface of the finished part of the pier, and lowered down by the travelling crab-winch, *i*. The force-pumps by which the bell is supplied with air are shown at *m*, and the air-hose at *n*. It will be understood, from this description, that the bell-framing, *c*, moves freely along the staging, while the bell-carriage has a motion at right angles across the work, so that the position of the bell can be altered with the greatest ease so as to bring it over any spot within the area of the staging. In proceeding to work, the men take their seats in the bell from a boat, and the bell is then lowered to the required depth. If the work be that of building a wall, a stone is lowered at the same time. The changes in the position of the bell are all made according to signs given by the divers by strokes of a hammer on the bell, which experience has shown can be heard at any depth at which the *D.*-bell has been employed. These signals are narrowly observed by a watchman stationed in a boat, and reported to the men working the bell-carriage. The rule for the supply of air both of the bell and *D.*-dress is to give it so freely that there shall be a constant escape of air rising to the surface in air-bubbles all the time the men are under water. After being lowered, the bell is first moved over the

stone to be laid; the divers then unhook the lowering chain from the lewis in the stone, and at the same time make fast the stone to the tackle within the bell, which is at once signalled to be raised, and carries the stone with it. The bell is then moved over the site on which it is to be placed; it is then lowered until it has nearly reached its bed, on which it is finally deposited. The lewis is then removed, and the bell raised for another stone; and with trained workmen it is surprising how expeditiously the bell is moved from place to place, and stone after stone is built in the walls. The staff of men required to work the bell is two divers, one watchman, four men working the air-pump, and four working the bell carriage, besides the men required to bring forward and send down the stones. The men engaged generally work in shifts of from 3 to 6 hours according to the depth, and the *D.* work may be continued as long as in ordinary day-work, as in clear water the light is good to the greatest depth at which the bell is used in harbor building. — When engaged in blasting, the bore is made in the ordinary way, and charged with a shot enclosed in a water-tight canvas case, to which is attached a length of 6 or 8 feet of patent fuse. The bell is then moved from above the bore, and the fuse ignited, and when the shot is fired the smoke rises to the surface clear of the bell.

*D.*-Dress is peculiarly well fitted for such works as the repair or overhaul of rollers and sluices of lock gates, cleaning or repairing ships' bottoms, and, in short, everything that cannot be done from the interior of a bell. The inexpensiveness also of the *D.*-dress, dispensing with all costly staging, and its ease of transport and appliance, are much in favor of its use. The invention of the *D.*-dress, like that of most useful appliances,

Fig. 135. — BLOCK-LAYING BY DIVING-BELL.

was gradual, and the work of many minds. The long-continued experience gained in *D.* during the first half of this century had a great effect in bringing the *D.*-dress to its present perfection. The *D.*-dress, as will be understood from Fig. 137, envelops the whole body of the diver, the upper portion, *a*, being the "helmet," the intermediate portion, *b*, the "breastplate," and the lower portion, *c*, the "dress." The hose by which the air is supplied is shown at *d*, and *e* is the "life" or "signal" line, which is attached to the diver's waist, and by which he makes signals and is hauled to the surface. The waterproof material of which the dress is made is very generally sheet india-rubber, covered on both sides with tanned twill to protect the india-rubber from injury. The cuffs fit tightly round the wrists, leaving the hands free, and india-rubber bands slipped over them render the joint water-tight. The breastplate, *b*, is made of tinned copper with an outer edge of brass, which has screws fitted to it projecting upwards and passing through corresponding holes in the collar of the dress. On the top of this, and with holes in it corresponding to the screws, four pieces of a metal band are firmly screwed down by wing nuts, nipping the soft material of the collar between the metal of the breastplate and band, and thus insuring a water-tight joint. On the front of the breastplate two studs are fastened for securing the back and front weights, *g*. Some makers put a valve, *k*, on the front of the breastplate, by means of which the diver can regulate the pressure inside his dress at will, and in this way has the power, by simply inflating

was gradual, and the work of many minds. The long-continued experience gained in *D.* during the first half of this century had a great effect in bringing the *D.*-dress to its present perfection. The *D.*-dress, as will be understood from Fig. 137, envelops the whole body of the diver, the upper portion, *a*, being the "helmet," the intermediate portion, *b*, the "breastplate," and the lower portion, *c*, the "dress." The hose by which the air is supplied is shown at *d*, and *e* is the "life" or "signal" line, which is attached to the diver's waist, and by which he makes signals and is hauled to the surface. The waterproof material of which the dress is made is very generally sheet india-rubber, covered on both sides with tanned twill to protect the india-rubber from injury. The cuffs fit tightly round the wrists, leaving the hands free, and india-rubber bands slipped over them render the joint water-tight. The breastplate, *b*, is made of tinned copper with an outer edge of brass, which has screws fitted to it projecting upwards and passing through corresponding holes in the collar of the dress. On the top of this, and with holes in it corresponding to the screws, four pieces of a metal band are firmly screwed down by wing nuts, nipping the soft material of the collar between the metal of the breastplate and band, and thus insuring a water-tight joint. On the front of the breastplate two studs are fastened for securing the back and front weights, *g*. Some makers put a valve, *k*, on the front of the breastplate, by means of which the diver can regulate the pressure inside his dress at will, and in this way has the power, by simply inflating

his dress more or less, of making himself of any specific gravity, so as to float at any desired depth or rise to the surface without the assistance of the attendant. This arrangement in the hands of a skilled diver is undoubtedly a great convenience. But it is still a matter of difference of opinion whether it is not safer to trust to being hauled up by the watchman on the surface, whose duty it is to hold the *life* or *signal* line in one hand, and the air-hose in the other, while the diver is at work, and to attend to whatever signal he may give by pulling the life-line. The inconvenience of the air bubbling up in front of the bell's eyes, and the danger of inexperienced divers becoming giddy and turning the valve the wrong way, have induced some makers to do away with this useful valve, and to substitute at the back of the helmet a valve which the diver can

Fig. 137. — DIVING-DRESS.

be opened by the diver himself the moment his head is above water, and being attached to the helmet it cannot be dropped accidentally into the sea or otherwise mislaid. An outlet valve, *a*, is fixed at the back of the helmet, which, opening outwards, permits the escape of the foul air but prevents the entrance of water. The inlet valve, *b*, to which the hose is attached, is also fixed at the back of the helmet, and is so constructed as freely to admit the air from the force-pump; but should anything occur to the hose or pumps the valve at once shuts, enclosing a sufficient supply of air in the dress to support the diver till he can be hauled to the surface. The air, after entering by the inlet valve, is conducted in tubes, *c*, to the front of the helmet, so that the diver has the advantage of inhaling fresh air, and the front glasses are kept free from the condensation of his breath, which would otherwise take place. On each side of the helmet is a hook over which the cords pass which carry the front and back weights, and a brass stud to one of which the life-line, and to the other the air-tube, are attached; *d d* is the point by which the helmet is screwed upon the breastplate. The back and front weights weigh about 40 lbs. each, and are held close to the diver's body by means of a lashing passing under his armpits. The boots are made of stout leather, with leaden soles, secured by two buckles and straps, each boot weighing about 20 lbs. The cost of a *D*-dress, with all its appliances, is about \$700. — At moderate depths, not exceeding 30 to 40 feet, and with clear water, sufficient light is transmitted to enable the diver to perform any ordinary work, and in working in turbid water with the *D*-bell candles are employed. An electric lamp and an oil lamp are employed when light requires to be used by divers at great depths. Captain Eads states that at the St. Louis Bridge, built across the Mississippi in 1870, candles were at first employed, which, under a pressure of 100 feet, were found to be burnt down in about three fifths of the time required in the open air; under a pressure of 80 feet it was found that a candle, if blown out by the breath, would immediately re-ignite; and at the depth of 108½ feet a candle was blown out thirteen consecutive times in
